MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

This feature enables you to set up a Virtual Private Network (VPN) service provider network so that the autonomous system boundary routers (ASBRs) exchange IPv4 routes with Multiprotocol Label Switching (MPLS) labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPNv4 routes by using multihop, multiprotocol, External Border Gateway Protocol (EBGP). This configuration saves the ASBRs from having to store all the VPNv4 routes. Using the route reflectors to store the VPNv4 routes and forward them to the PE routers results in improved scalability.

The MPLS VPN—Inter-AS—IPv4 BGP Label Distribution feature has the following benefits:

- Having the route reflectors store VPNv4 routes results in improved scalability—This configuration scales better than other configurations where the ASBR holds all of the VPNv4 routes and forwards the routes based on VPNv4 labels. With this configuration, route reflectors hold the VPNv4 routes, which simplifies the configuration at the border of the network.
- Enables a non-VPN core network to act as a transit network for VPN traffic—You can transport IPv4 routes with MPLS labels over a non MPLS VPN service provider.
- Eliminates the need for any other label distribution protocol between adjacent LSRs—If two adjacent label switch routers (LSRs) are also BGP peers, BGP can handle the distribution of the MPLS labels. No other label distribution protocol is needed between the two LSRs.
- Includes EBGP multipath support to enable load balancing for IPv4 routes across autonomous system (AS) boundaries.

Feature History for MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(21)ST</td>
<td>This feature was introduced.</td>
</tr>
<tr>
<td>12.0(22)S</td>
<td>This feature was implemented on the Cisco 12000 series routers (for specific line cards supported, see Table 1) and integrated into Cisco IOS Release 12.0(22)S.</td>
</tr>
<tr>
<td>12.0(23)S</td>
<td>Support was added for the Cisco 12000 Series Eight-Port OC-3c/STM-1c ATM Line Card (8-Port OC-3 ATM) and the Cisco 12000 Series Three-Port Gigabit Ethernet Line Card (3-Port GbE).</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>This feature was integrated into Cisco IOS Release 12.2(13)T.</td>
</tr>
</tbody>
</table>
12.0(24)S  Support was added for the Cisco 12000 Series One-Port 10-Gigabit Ethernet Line Card (1-Port 10-GbE) and the Cisco 12000 Series Modular Gigabit Ethernet/ Fast Ethernet Line Card (Modular GbE/FE) and implemented on Cisco IOS 12.0(24)S.

12.2(14)S  This feature was integrated into Cisco IOS Release 12.2(14)S and implemented on Cisco 7200 and Cisco 7500 series routers.

12.0(27)S  Support was added for EBGP multipath on the provider edge (PE)-customer edge (CE) links.

12.2(28)SB  This feature was integrated into Cisco IOS Release 12.2(28)SB.

Software images for Cisco 12000 series Internet routers have been deferred to Cisco IOS Release 12.0(27)S1.

Finding Support Information for Platforms and Cisco IOS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.
Prerequisites for MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

The network must be properly configured for MPLS VPN operation before you configure this feature. **Table 1** lists the Cisco 12000 series line card support added by Cisco IOS S releases.

Restrictions for MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

This feature includes the following restrictions:

- For networks configured with EBGP multihop, a labeled switched path (LSP) must be established between nonadjacent routers. (RFC 3107)
- The PE routers must run images that support BGP label distribution. Otherwise, you cannot run EBGP between them.
MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

- Point-to-Point Protocol (PPP) encapsulation on the ASBRs is not supported with this feature.
- The physical interfaces that connect the BGP speakers must support Cisco Express Forwarding (CEF) or distributed CEF and MPLS.

Information About MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

To configure MPLS VPN—Inter-AS—IPv4 BGP Label Distribution, you need the following information:

- MPLS VPN—Inter-AS—IPv4 BGP Label Distribution Overview, page 4
- BGP Routing Information, page 5
- Types of BGP Messages and MPLS Labels, page 5
- How BGP Sends MPLS Labels with Routes, page 6
- Using Route Maps to Filter Routes, page 6

MPLS VPN—Inter-AS—IPv4 BGP Label Distribution Overview

This feature enables you to set up a VPN service provider network to exchange IPv4 routes with MPLS labels. You can configure the VPN service provider network as follows:

- Route reflectors exchange VPNv4 routes by using multihop, multiprotocol EBGP. This configuration also preserves the next hop information and the VPN labels across the autonomous systems.
- A local PE router (for example, PE1 in Figure 1) needs to know the routes and label information for the remote PE router (PE2). This information can be exchanged between the PE routers and ASBRs in one of two ways:
  - **Internal Gateway Protocol (IGP) and Label Distribution Protocol (LDP):** The ASBR can redistribute the IPv4 routes and MPLS labels it learned from EBGP into IGP and LDP and vice versa.
  - **Internal Border Gateway Protocol (IBGP) IPv4 label distribution:** The ASBR and PE router can use direct IBGP sessions to exchange VPNv4 and IPv4 routes and MPLS labels.
    Alternatively, the route reflector can reflect the IPv4 routes and MPLS labels learned from the ASBR to the PE routers in the VPN. This is accomplished by enabling the ASBR to exchange IPv4 routes and MPLS labels with the route reflector. The route reflector also reflects the VPNv4 routes to the PE routers in the VPN (as mentioned in the first bullet). For example, in VPN1, RR1 reflects to PE1 the VPNv4 routes it learned and IPv4 routes and MPLS labels learned from ASBR1. Using the route reflectors to store the VPNv4 routes and forward them through the PE routers and ASBRs allows for a scalable configuration.
- ASBRs exchange IPv4 routes and MPLS labels for the PE routers by using EBGP. This enables load balancing across CSC boundaries.
BGP Routing Information

BGP routing information includes the following items:

- A network number (prefix), which is the IP address of the destination.
- Autonomous system (AS) path, which is a list of the other ASs through which a route passes on its way to the local router. The first AS in the list is closest to the local router; the last AS in the list is farthest from the local router and usually the AS where the route began.
- Path attributes, which provide other information about the AS path, for example, the next hop.

Types of BGP Messages and MPLS Labels

MPLS labels are included in the update messages that a router sends. Routers exchange the following types of BGP messages:

- Open Messages—After a router establishes a TCP connection with a neighboring router, the routers exchange open messages. This message contains the AS number to which the router belongs and the IP address of the router who sent the message.

- Update Messages—When a router has a new, changed, or broken route, it sends an update message to the neighboring router. This message contains the Network Layer Reachability Information (NLRI), which lists the IP addresses of the usable routes. The update message also includes any routes that are no longer usable. The update message also includes path attributes and the lengths of both the usable and unusable paths. Labels for VPNv4 routes are encoded in the update message as specified in RFC 2858. The labels for the IPv4 routes are encoded in the update message as specified in RFC 3107.

- Keepalive Messages—Routers exchange keepalive messages to determine if a neighboring router is still available to exchange routing information. The router sends these messages at regular intervals. (Sixty seconds is the default for Cisco routers.) The keepalive message does not contain routing data; it only contains a message header.

- Notification Messages—When a router detects an error, it sends a notification message.
How BGP Sends MPLS Labels with Routes

When BGP (EBGP and IBGP) distributes a route, it can also distribute an MPLS label that is mapped to that route. The MPLS label mapping information for the route is carried in the BGP update message that contains the information about the route. If the next hop is not changed, the label is preserved.

When you issue the `neighbor send-label` command on both BGP routers, the routers advertise to each other that they can then send MPLS labels with the routes. If the routers successfully negotiate their ability to send MPLS labels, the routers add MPLS labels to all outgoing BGP updates.

Using Route Maps to Filter Routes

When both routers are configured to distribute routes with MPLS labels, all the routes are encoded with the multiprotocol extensions and contain an MPLS label. You can use a route map to control the distribution of MPLS labels between routers. Route maps enable you to specify the following:

- For a router distributing MPLS labels, you can specify which routes are distributed with an MPLS label.
- For a router receiving MPLS labels, you can specify which routes are accepted and installed in the BGP table.

How to Configure MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

This section contains the following procedures:

- Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels, page 7
- Configuring the Route Reflectors to Exchange VVPNv4 Routes, page 9
- Configuring the Route Reflectors to Reflect Remote Routes in Its AS, page 11
- Creating Route Maps, page 14
- Applying the Route Maps to the ASBRs, page 17
- Verifying the MPLS VPN—Inter-AS—IPv4 BGP Label Distribution Configuration, page 19

Figure 2 shows the following sample configuration:

- The configuration consists of two VPNs.
- The ASBRs exchange the IPv4 routes with MPLS labels.
- The route reflectors exchange the VVPNv4 routes using multihop MPLS EBGP.
- The route reflectors reflect the IPv4 and VVPNv4 routes to the other routers in its AS.
Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels

Perform this task to configure the ASBRs so that they can distribute BGP routes with MPLS labels.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `neighbor {ip-address | peer-group-name} remote-as as-number`
5. `address-family ipv4 [multicast | unicast | vrf vrf-name]`
6. `maximum paths number-paths` (optional for EBGP multipath between the CSC-PE and CSC-CEs)
7. `neighbor {ip-address | peer-group-name} activate`
8. `neighbor ip-address send-label`
9. `exit-address-family`
10. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
### Step 3
**Command or Action:**
```
router bgp as-number
```
**Example:**
```
Router(config)# router bgp 100
```
**Purpose:**
Configure a BGP routing process and places the router in router configuration mode.
- The `as-number` argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.
- Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.

### Step 4
**Command or Action:**
```
eighbor {ip-address | peer-group-name} remote-as as-number
```
**Example:**
```
Router(config-router)# neighbor hh.0.0.1 remote-as 200
```
**Purpose:**
Add an entry to the BGP or multiprotocol BGP neighbor table.
- The `ip-address` argument specifies the IP address of the neighbor.
- The `peer-group-name` argument specifies the name of a BGP peer group.
- The `as-number` argument specifies the autonomous system to which the neighbor belongs.

### Step 5
**Command or Action:**
```
address-family ipv4 [multicast | unicast | vrf vrf-name]
```
**Example:**
```
Router(config-router)# address-family ipv4
```
**Purpose:**
Enter address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes.
- The `multicast` keyword specifies IPv4 multicast address prefixes.
- The `unicast` keyword specifies IPv4 unicast address prefixes.
- The `vrf vrf-name` keyword and argument specifies the name of the VPN routing/forwarding instance (VRF) to associate with subsequent IPv4 address family configuration mode commands.

### Step 6
**Command or Action:**
```
maximum-paths number-paths
```
**Example:**
```
Router(config-router)# maximum-paths 2
```
**Purpose:**
(Optional) Controls the maximum number of parallel routes an IP routing protocol can support.
The `number-paths` argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table, in the range from 1 to 6.

### Step 7
**Command or Action:**
```
eighbor {ip-address | peer-group-name} activate
```
**Example:**
```
Router(config-router-af)# neighbor hh.0.0.1 activate
```
**Purpose:**
Enables the exchange of information with a neighboring router.
- The `ip-address` argument specifies the IP address of the neighbor.
- The `peer-group-name` argument specifies the name of a BGP peer group.

### Step 8
**Command or Action:**
```
neighbor ip-address send-label
```
**Example:**
```
Router(config-router-af)# neighbor hh.0.0.1 send-label
```
**Purpose:**
Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.
- The `ip-address` argument specifies the IP address of the neighboring router.
Configuring the Route Reflectors to Exchange VPNv4 Routes

Perform this task to enable the route reflectors to exchange VPNv4 routes by using multihop, multiprotocol EBGP.

This procedure also specifies that the next hop information and the VPN label are preserved across the autonomous systems. This procedure uses RR1 as an example.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp as-number
4. neighbor \{ip-address | peer-group-name\} remote-as as-number
5. address-family vpnv4 [unicast]
6. neighbor \{ip-address | peer-group-name\} ebgp-multihop [ttl]
7. neighbor \{ip-address | peer-group-name\} activate
8. neighbor \{ip-address | peer-group-name\} next-hop unchanged
9. exit-address-family
10. end

**DETAILED STEPS**

### How to Configure MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

#### Step 3

**Command or Action**

```
router bgp as-number
```

**Example:**

```
Router(config)# router bgp 100
```

**Purpose:**

Configures a BGP routing process and places the router in router configuration mode.
- The `as-number` argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.
- Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
- The AS number identifies RR1 to routers in other autonomous systems.

#### Step 4

**Command or Action**

```
neighbor {ip-address | peer-group-name}
remote-as as-number
```

**Example:**

```
Router(config-router)# neighbor bb.bb.bb.bb remote-as 200
```

**Purpose:**

Adds an entry to the BGP or multiprotocol BGP neighbor table.
- The `ip-address` argument specifies the IP address of the neighbor.
- The `peer-group-name` argument specifies the name of a BGP peer group.
- The `as-number` argument specifies the autonomous system to which the neighbor belongs.

#### Step 5

**Command or Action**

```
address-family vpnv4 [unicast]
```

**Example:**

```
Router(config-router)# address-family vpnv4
```

**Purpose:**

Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard Virtual Private Network Version 4 (VPNv4) address prefixes.
- The optional `unicast` keyword specifies VPNv4 unicast address prefixes.

#### Step 6

**Command or Action**

```
neighbor {ip-address | peer-group-name}
ebgp-multihop [ttl]
```

**Example:**

```
Router(config-router-af)# neighbor bb.bb.bb.bb ebgp-multihop 255
```

**Purpose:**

Accepts and attempts BGP connections to external peers residing on networks that are not directly connected.
- The `ip-address` argument specifies the IP address of the BGP-speaking neighbor.
- The `peer-group-name` argument specifies the name of a BGP peer group.
- The `ttl` argument specifies the time-to-live in the range from 1 to 255 hops.

#### Step 7

**Command or Action**

```
neighbor {ip-address | peer-group-name}
activate
```

**Example:**

```
Router(config-router-af)# neighbor bb.bb.bb.bb activate
```

**Purpose:**

Enables the exchange of information with a neighboring router.
- The `ip-address` argument specifies the IP address of the neighbor.
- The `peer-group-name` argument specifies the name of a BGP peer group.
## Configuring the Route Reflectors to Reflect Remote Routes in Its AS

Perform this task to enable the RR to reflect the IPv4 routes and labels learned by the ASBR to the PE routers in the AS.

This is accomplished by making the ASBR and PE router route reflector clients of the RR. This procedure also explains how to enable the RR to reflect the VPNv4 routes.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `address-family ipv4 [multicast | unicast | vrf vrf-name]`
5. `neighbor {ip-address | peer-group-name} activate`
6. `neighbor ip-address route-reflector-client`
7. `neighbor ip-address send-label`
8. `exit-address-family`
9. `address-family vpnv4 [unicast]`
10. `neighbor {ip-address | peer-group-name} activate`

### Command or Action | Purpose
---|---
**Step 8**
neighbor (ip-address | peer-group-name)
next-hop unchanged

Example:
Router(config-router-af)# neighbor ip-address
next-hop unchanged

Enables an External BGP (EBGP) multihop peer to propagate the next hop unchanged.
- The `ip-address` argument specifies the IP address of the next hop.
- The `peer-group-name` argument specifies the name of a BGP peer group that is the next hop.

**Step 9**
exit-address-family

Example:
Router(config-router-af)# exit-address-family

Exits from the address family submode.

**Step 10**
end

Example:
Router(config-router-af)# end

(Optional) Exits to privileged EXEC mode.
### DETAILED STEPS

</tbody>
</table>
Creating Route Maps

The following procedures enable the ASBRs to send MPLS labels with the routes specified in the route maps. Further, the ASBRs accept only the routes that are specified in the route map.

- Configuring a Route Map for Arriving Routes, page 14
- Configuring a Route Map for Departing Routes, page 16

Route maps enable you to specify which routes are distributed with MPLS labels. Route maps also enable you to specify which routes with MPLS labels a router receives and adds to its BGP table.

Route maps work with access lists. You enter the routes into an access list and then specify the access list when you configure the route map.

Configuring a Route Map for Arriving Routes

This configuration is optional.

Perform this task to create a route map to filter arriving routes. You create an access list and specify the routes that the router should accept and add to the BGP table.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `route-map route-map-name [permit | deny] [sequence-number]`
5. `match ip address {access-list-number | access-list-name} [ ... access-list-number] [
   access-list-name]`
6. `match mpls-label`
7. `end`

**DETAILED STEPS**

</table>
Configuring a Route Map for Departing Routes

This configuration is optional.
Perform this task to create a route map to filter departing routes. You create an access list and specify the routes that the router should distribute with MPLS labels.

SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp as-number
4. route-map route-map-name [permit | deny] [sequence-number]
5. match ip address {access-list-number | access-list-name [... access-list-number |... access-list-name]}
6. set mpls label
7. end

DETAILED STEPS

<table>
<thead>
<tr>

- The `route-map-name` argument specifies the name of the route map.  
- The `out` keyword applies the route map to outgoing routes. |
| 7    | `neighbor ip-address send-label` | Advertises the ability of the router to send MPLS labels with routes. |
|      | **Example:** `Router(config-router-af)# neighbor ww.ww.ww.ww send-label` | - The `ip-address` argument specifies the router that is enabled to send MPLS labels with routes. |
| 8    | `exit-address-family` | Exits from the address family submode. |
|      | **Example:** `Router(config-router-af)# exit-address-family` | |
| 9    | `end` | (Optional) Exits to privileged EXEC mode. |
|      | **Example:** `Router(config-router-af)# end` | |

Verifying the MPLS VPN—Inter-AS—IPv4 BGP Label Distribution Configuration

If you use route reflectors to distribute the VPNv4 routes and use the ASBRs to distribute the IPv4 labels, use the following procedures to help verify the configuration:

- Verifying the Route Reflector Configuration, page 20
- Verifying that CE1 Has Network Reachability Information for CE2, page 21
- Verifying that PE1 Has Network Layer Reachability Information for CE2, page 22
- Verifying that PE2 Has Network Reachability Information for CE2, page 24
- Verifying the ASBR Configuration, page 25

Use Figure 3 as a reference of the configuration.
Figure 3  Configuring Two VPN Service Providers to Exchange IPv4 Routes and MPLS Labels

Verifying the Route Reflector Configuration

Perform this task to verify the route reflector configuration.

SUMMARY STEPS

1. enable
2. show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]
3. disable

Configuration Examples for MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

Configuration examples for MPLS VPN—Inter-AS—IPv4 BGP Label Distribution feature include the following:

- Configuring Inter-AS Using BGP to Distribute Routes and MPLS Labels Over an MPLS VPN Service Provider Example, page 27
- Configuring Inter-AS Using BGP to Distribute Routes and MPLS Labels Over a Non MPLS VPN Service Provider Example, page 33

Cisco IOS Release: Multiple releases (see the Feature History table)
Configuring Inter-AS Using BGP to Distribute Routes and MPLS Labels Over an MPLS VPN Service Provider Example

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over an MPLS VPN service provider included in this section are as follows:

- Route Reflector 1 Configuration Example (MPLS VPN Service Provider), page 28
- ASBR1 Configuration Example (MPLS VPN Service Provider), page 29
- Route Reflector 2 Configuration Example (MPLS VPN Service Provider), page 30
- ASBR2 Configuration Example (MPLS VPN Service Provider), page 31

Figure 4 shows two MPLS VPN service providers. The service provider distributes the VPNv4 routes between the route reflectors. They distribute the IPv4 routes with MPLS labels between the ASBRs.

The configuration example shows the two techniques you can use to distribute the VPNv4 routes and the IPv4 routes with MPLS labels of the remote RRs and PEs to the local RRs and PEs:

- AS 100 uses the RRs to distribute the VPNv4 routes learned from the remote RRs. The RRs also distribute the remote PE address and label learned from ASBR1 using IPv4 + labels.
- In AS 200, the IPv4 routes that ASBR2 learned are redistributed into IGP.

*Figure 4*  Distributing IPv4 Routes and MPLS Labels Between MPLS VPN Service Providers
Route Reflector 1 Configuration Example (MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPNv4 routes with RR2 using multiprotocol, multihop EBGP.
- The VPNv4 next hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
  - The VPNv4 routes learned from RR2
  - The IPv4 routes and MPLS labels learned from ASBR1

ASBR1 Configuration Example (MPLS VPN Service Provider)

ASBR1 exchanges IPv4 routes and MPLS labels with ASBR2.

In this example, ASBR1 uses route maps to filter routes.

- A route map called OUT specifies that ASBR1 should distribute the PE1 route (ee.ee) with labels and the RR1 route (aa.aa) without labels.
- A route map called IN specifies that ASBR1 should accept the PE2 route (ff.ff) with labels and the RR2 route (bb.bb) without labels.

Configuring Inter-AS Using BGP to Distribute Routes and MPLS Labels Over a Non MPLS VPN Service Provider Example

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over a non MPLS VPN service provider included in this section are as follows:

- Route Reflector 1 Configuration Example (Non MPLS VPN Service Provider), page 34
- ASBR1 Configuration Example (Non MPLS VPN Service Provider), page 35
- Route Reflector 2 Configuration Example (Non MPLS VPN Service Provider), page 36
- ASBR2 Configuration Example (Non MPLS VPN Service Provider), page 37
- ASBR3 Configuration Example (Non MPLS VPN Service Provider), page 38
- Route Reflector 3 Configuration Example (Non MPLS VPN Service Provider), page 40
- ASBR4 Configuration Example (Non MPLS VPN Service Provider), page 41

Figure 5 shows two MPLS VPN service providers that are connected through a non MPLS VPN service provider. The autonomous system in the middle of the network is configured as a backbone autonomous system that uses Label Distribution Protocol (LDP) or Tag Distribution Protocol (TDP) to distribute MPLS labels. You can also use traffic engineering tunnels instead of TDP or LDP to build the LSP across the non MPLS VPN service provider.

Figure 5  Distributing Routes and MPLS Labels Over a Non MPLS VPN Service Provider
Route Reflector 1 Configuration Example (Non MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPNv4 routes with RR2 using multiprotocol, multihop EBGP.
- The VPNv4 next hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
  - The VPNv4 routes learned from RR2
  - The IPv4 routes and MPLS labels learned from ASBR1

```

```
ASBR1 exchanges IPv4 routes and MPLS labels with ASBR2.

In this example, ASBR1 uses route maps to filter routes.

- A route map called OUT specifies that ASBR1 should distribute the PE1 route (ee.ee) with labels and the RR1 route (aa.aa) without labels.
- A route map called IN specifies that ASBR1 should accept the PE2 route (ff.ff) with labels and the RR2 route (bb.bb) without labels.

None.
Glossary

AS—autonomous system. A collection of networks that share the same routing protocol and that are under the same system administration.

ASBR—autonomous system boundary router. A router that connects and exchanges information between two or more autonomous systems.

BGP—Border Gateway Protocol. The exterior border gateway protocol used to exchange routing information between routers in separate autonomous systems. BGP uses Transmission Control Protocol (TCP). Because TCP is a reliable protocol, BGP does not experience problems with dropped or fragmented data packets.

CE router—customer edge router. The customer router that connects to the provider edge (PE) router.

EBGP—External Border Gateway Protocol. A BGP session between routers in different autonomous systems (ASs). When a pair of routers in different ASs are more than one IP hop away from each other, an EBGP session between those two routers is called multihop EBGP.

IBGP—Internal Border Gateway Protocol. A BGP session between routers within the same autonomous system.

IGP—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system. Examples of common Internet IGPs include Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), and Routing Information Protocol (RIP).

LDP—Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets. This protocol is not supported in Cisco IOS Release 12.0. The Cisco proprietary version of this protocol is the Tag Distribution Protocol (TDP).

LER—label edge router. The edge router that performs label imposition and disposition.

LSR—label switch router. The role of an LSR is to forward packets in an MPLS network by looking only at the fixed-length label.

NLRI—Network Layer Reachability Information. BGP sends routing update messages containing NLRI, which describes the route. In this context, an NLRI is a prefix. A BGP update message carries one or more NLRI prefixes and the attributes of a route for the NLRI prefixes. The route attributes include a BGP next hop gateway address, community values, and other information.

P router—provider router. The core router in the service provider network that connects to provider edge (PE) routers. In a packet-switched star topology, a router that is part of the backbone and that serves as the single pipe through which all traffic from peripheral networks must pass on its way to other peripheral networks.

PE router—provider edge router. The label edge router (LER) in the service provider network that connects to the customer edge (CE) router.

RR—route reflector. A router that advertises or reflects IBGP learned routes to other IBGP peers without requiring a full network mesh.

VPN—Virtual Private Network. A group of sites that, as a result of a set of administrative policies, can communicate with each other over a shared backbone.

VPNv4 addresses—When multiple VPNs use the same address space, the VPN addresses are made unique by adding a route distinguisher to the front of the address.

Note

Refer to the Internetworking Terms and Acronyms for terms not included in this glossary.
