VPLS Autodiscovery: BGP Based

First Published: February 19, 2007
Last Updated: February 19, 2007

VPLS Autodiscovery enables each Virtual Private LAN Service (VPLS) provider edge (PE) router to discover which other PE routers are part of the same VPLS domain. VPLS Autodiscovery also automatically detects when PE routers are added to or removed from the VPLS domain. You no longer need to manually configure the VPLS and maintain the configuration when a PE router is added or deleted. VPLS Autodiscovery uses the Border Gateway Protocol (BGP) to discover the VPLS members and to set up and tear down pseudowires in the VPLS.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for VPLS Autodiscovery: BGP Based” section on page 48.

Finding Support Information for Platforms and Cisco IOS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Prerequisites for VPLS Autodiscovery: BGP Based

Before configuring VPLS Autodiscovery, perform the Cisco 7600 router-specific tasks listed in the section called “Virtual Private LAN Services on the Optical Service Modules” in the Cisco 7600 Series Router IOS Software Configuration Guide, 12.2SR.

Restrictions for VPLS Autodiscovery: BGP Based

- VPLS Autodiscovery supports only IPV4 addresses.
- VPLS Autodiscovery uses Forwarding Equivalence Class (FEC) 129 to convey endpoint information. Manually configured pseudowires use FEC 128.
- VPLS Autodiscovery is not supported with Layer 2 Tunnel Protocol Version 3 (L2TPv3).
- VPLS Autodiscovery is not supported with interautonomous system configurations.
- You can configure both autodiscovered and manually configured pseudowires in a single virtual forwarding instance (VFI). However, the pseudowires cannot go to the same peer PE router.
- If you manually configure a neighbor using the neighbor (VPLS) command after you have enabled VPLS Autodiscovery and both peers are in autodiscovery mode, manually configure the route target (RT) values to prevent each peer from receiving discovery data for that VPLS.
- If you manually configure multiple pseudowires and target different IP addresses on the same PE router for each pseudowire, do not use the same virtual circuit identifier (VC ID) to identify the pseudowires terminated at the same PE router.
- You cannot configure a pseudowire by manually configuring a neighbor on one PE router and using autodiscovery on the other PE router to configure the same pseudowire in the other direction.
- Tunnel selection is not supported with autodiscovered neighbors.
- You can have up to 16 route targets only per VFI.
- The same RT is not allowed in multiple VFIs in the same PE router.
- The BGP autodiscovery process does not support dynamic hierarchical VPLS. User-facing PE (U-PE) routers cannot discover the network-facing PE (N-PE) routers, and N-PE routers cannot discover U-PE routers.
- Pseudowires for autodiscovered neighbors are provisioned with split horizon enabled. Therefore, manually configure the pseudowires for hierarchical VPLS. Make sure the U-PE routers do not participate in BGP autodiscovery for those pseudowires.
- Do not disable split horizon on autodiscovered neighbors. Split horizon is required with VPLS Autodiscovery.
- The provisioned peer address must be a /32 address bound to the peer’s Label Distribution Protocol (LDP) router ID.
- The peer PE router must be able to access the IP address that is used as the local LDP router ID. Even though the IP address need not be used in the xconnect command on the peer PE router, that IP address must be reachable.
- VPLS Autodiscovery is supported on the Cisco 7600 router hardware. For details on supported shared port adapters and line cards, see the following documents:
  - Guide to Supported Hardware for Cisco 7600 Series Routers with Release 12.2SR
  - Release Notes for Cisco IOS Release 12.2SR for the Cisco 7600 Series Routers
Information About VPLS Autodiscovery: BGP Based

To understand VPLS Autodiscovery, you should understand the following concepts:

- How the VPLS Feature Works, page 3
- How the VPLS Autodiscovery: BGP Based Feature Works, page 3
- How Enabling VPLS Autodiscovery Differs from Manually Configuring VPLS, page 3
- Show Commands Affected by VPLS Autodiscovery: BGP Based, page 4

How the VPLS Feature Works

VPLS allows Multiprotocol Label Switching (MPLS) networks to provide multipoint Ethernet LAN services, also known as Transparent LAN Services (TLS). All customer sites in a VPLS appear to be on the same LAN, even though those sites might be in different geographic locations.

How the VPLS Autodiscovery: BGP Based Feature Works

VPLS Autodiscovery enables each VPLS PE router to discover the other PE routers that are part of the same VPLS domain. VPLS Autodiscovery also tracks when PE routers are added to or removed from the VPLS domain. The autodiscovery and signaling functions use BGP to find and track the PE routers.

BGP uses the L2VPN Routing Information Base (RIB) to store endpoint provisioning information, which is updated each time any Layer 2 VFI is configured. Prefix and path information is stored in the L2VPN database, allowing BGP to make decisions on the best path. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, the endpoint information is used to configure a pseudowire mesh to support L2VPN-based services.

The BGP autodiscovery mechanism facilitates the configuration of L2VPN services, which are an integral part of the Cisco IOS Virtual Private LAN Service (VPLS) feature. VPLS enables flexibility in deploying services by connecting geographically dispersed sites as a large LAN over high-speed Ethernet in a robust and scalable IP MPLS network. For more information about BGP and the L2VPN address family in relation to VPLS Autodiscovery, see the following documents:

- The section called “L2VPN Address Family” in the Cisco BGP Overview.
- The document called BGP Support for the L2VPN Address Family

How Enabling VPLS Autodiscovery Differs from Manually Configuring VPLS

With VPLS Autodiscovery, you no longer need to manually set up the VPLS. The commands you use to set up VPLS Autodiscovery are similar to those you use to manually configure a VPLS, as shown in Table 1. VPLS Autodiscovery uses neighbor commands in L2VPN address family mode to distribute endpoint information to configure a pseudowire.
When you configure VPLS Autodiscovery, you enter the `l2vfi autodiscovery` command. This command allows the VFI to learn and advertise the pseudowire endpoints. As a result, you no longer need to enter the `neighbor` (VPLS) command in L2 VFI configuration mode.

However, the `neighbor` (VPLS) command is still supported with VPLS Autodiscovery in L2 VFI command mode. You can use the `neighbor` (VPLS) command to allow PE routers that do not participate in the autodiscovery process to join the VPLS. You can also use the `neighbor` (VPLS) command with PE routers that have been configured using the Tunnel Selection feature. You can also use the `neighbor` (VPLS) command in hierarchical VPLS configurations that have U-PE routers that do not participate in the autodiscovery process and have split-horizon forwarding disabled.

**Show Commands Affected by VPLS Autodiscovery: BGP Based**

VPLS Autodiscovery changes the following show commands:

- The `show mpls l2transport vc` command with the `detail` keyword has been updated to include FEC 129 signaling information for the autodiscovered VPLS pseudowires. See the `show mpls l2transport vc` command in the “Command Reference” section for more information.

- The `show vfi` command now displays information related to autodiscovered VFIs. The new information includes the VPLS ID, the route distinguisher (RD), the RT, and the router IDs of the discovered peers. See the `show vfi` command in the “Command Reference” section for more information.

- The `show xconnect` command has been updated with the `rib` keyword to provide RIB information about the pseudowires. See the `show xconnect` command in the “Command Reference” section for more information.
How to Configure VPLS Autodiscovery: BGP Based

To configure VPLS Autodiscovery, perform the following tasks:

- Enabling VPLS Autodiscovery: BGP Based, page 5 (required)
- Configuring BGP to Enable VPLS Autodiscovery, page 6 (required)
- Customizing the VPLS Autodiscovery Settings, page 9 (optional)

Enabling VPLS Autodiscovery: BGP Based

Perform the following task to enable each VPLS PE router to discover the other PE routers that are part of the same VPLS domain.

Prerequisites

Before configuring VPLS Autodiscovery, perform the Cisco 7600 router-specific tasks listed in the “Virtual Private LAN Services on the Optical Service Modules” section in the *Cisco 7600 Series Router IOS Software Configuration Guide, 12.2SR*.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `l2 vfi vfi-name autodiscovery`
4. `vpn id vpn-id`
5. `exit`
How to Configure VPLS Autodiscovery: BGP Based

**Configuring BGP to Enable VPLS Autodiscovery**

In Cisco IOS Release 12.2(33)SRB, the BGP L2VPN address family was introduced with a separate L2VPN RIB that contains endpoint provisioning information for VPLS Autodiscovery. BGP learns the endpoint provisioning information from the L2VPN database which is updated each time a Layer 2 virtual forwarding instance (VFI) is configured. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, the endpoint information is used to configure a pseudowire mesh to support aL2VPN-based services.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp autonomous-system-number
4. no bgp default ipv4-unicast
5. bgp log-neighbor-changes
6. neighbor [ip-address | peer-group-name] remote-as autonomous-system-number
7. neighbor [ip-address | peer-group-name] update-source interface
8. Repeat Step 6 and Step 7 to configure other BGP neighbors.
9. address-family l2vpn [vpls]
10. `neighbor {ip-address | peer-group-name} activate`
11. `neighbor {ip-address | peer-group-name} send-community [both | standard | extended]`
12. Repeat Step 10 and Step 11 to activate other BGP neighbors under L2VPN address family.
13. `exit-address-family`
14. `exit`
15. `exit`
16. `show vfi`
17. `show ip bgp l2vpn vpls {all | rd vpn-rd}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:** Router> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Router# configure terminal |
| **Step 3** router bgp autonomous-system-number | Enters router configuration mode for the specified routing process. |
| **Example:** Router(config)# router bgp 65000 |
| **Step 4** no bgp default ipv4-unicast | Disables the IPv4 unicast address family for the BGP routing process.  
**Note** Routing information for the IPv4 unicast address family is advertised by default for each BGP routing session configured with the `neighbor remote-as` router configuration command unless you configure the `no bgp default ipv4-unicast` router configuration command before configuring the `neighbor remote-as` command. Existing neighbor configurations are not affected. |
| **Example:** Router(config-router)# no bgp default ipv4-unicast |
| **Step 5** bgp log-neighbor-changes | Enables logging of BGP neighbor resets. |
| **Example:** Router(config-router)# bgp log-neighbor-changes |
## How to Configure VPLS Autodiscovery: BGP Based

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 6**

```
neighbor {ip-address | peer-group-name} remote-as autonomous-system-number
```

**Example:**
```
Router(config-router)# neighbor 10.10.10.1 remote-as 65000
```

- Adds the IP address or peer group name of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local router.
  - If the `autonomous-system-number` argument matches the autonomous system number specified in the `router bgp` command, the neighbor is an internal neighbor.
  - If the `autonomous-system-number` argument does not match the autonomous system number specified in the `router bgp` command, the neighbor is an external neighbor.
  - In this example, the neighbor at 10.10.10.1 is an internal BGP neighbor.

| **Step 7**

```
neighbor {ip-address | peer-group-name} update-source interface-type interface-number
```

**Example:**
```
Router(config-router)# neighbor 10.10.10.1 update-source loopback1
```

- (Optional) Configures a router to select a specific source or interface to receive routing table updates.
  - This example uses a loopback interface. The advantage to this configuration is that the loopback interface is not affected by the effects of a flapping interface.

| **Step 8**

Repeat Step 6 and Step 7 to configure other BGP neighbors

| **Step 9**

```
address-family l2vpn [vpls]
```

**Example:**
```
Router(config-router)# address-family l2vpn vpls
```

- Specifies the L2VPN address family and enters address family configuration mode.
  - The optional `vpls` keyword specifies that VPLS endpoint provisioning information is to be distributed to BGP peers.
  - In this example, an L2VPN VPLS address family session is created.

| **Step 10**

```
neighbor {ip-address | peer-group-name} activate
```

**Example:**
```
Router(config-router-af)# neighbor 10.10.10.1 activate
```

- Enables the neighbor to exchange information for the L2VPN VPLS address family with the local router.

| **Step 11**

```
neighbor {ip-address | peer-group-name} send-community {both | standard | extended}
```

**Example:**
```
Router(config-router-af)# neighbor 10.10.10.1 send-community extended
```

- Specifies that a communities attribute should be sent to a BGP neighbor.
  - In this example, an extended communities attribute is sent to the neighbor at 10.10.1.

| **Step 12**

Repeat Step 10 and Step 11 to activate other BGP neighbors under an L2VPN address family.

| **Step 13**

```
exit-address-family
```

**Example:**
```
Router(config-router-af)# exit-address-family
```

- Exits address family configuration mode and returns to router configuration mode.
Customizing the VPLS Autodiscovery Settings

Several commands allow you to customize the VPLS environment. You can specify identifiers for the VPLS domain, the route distinguisher, the route target, and the PE router. Perform the following steps to customize these settings.

SUMMARY STEPS

1. enable
2. configure terminal
3. l2 vfi vfi-name autodiscovery
4. vpn id vpn-id
5. vpls-id {autonomous-system-number:nn | ip-address:nn}
6. rd {autonomous-system-number:nn | ip-address:nn}
7. route-target [import | export | both] {autonomous-system-number:nnl ip-address:nn}
8. l2 router-id ip-address
9. exit

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 14 exit</td>
<td>Exits router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-router)# exit</td>
</tr>
<tr>
<td>Step 15 exit</td>
<td>Exits privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# exit</td>
</tr>
<tr>
<td>Step 16 show vfi</td>
<td>(Optional) Displays information about the configured VFI instances.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show vfi</td>
</tr>
<tr>
<td>Step 17 show ip bgp l2vpn vpls {all</td>
<td>rd vpn-rd}</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show ip bgp l2vpn vpls all</td>
</tr>
</tbody>
</table>
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> l2 vfi vfi-name autodiscovery</td>
<td>Enables VPLS Autodiscovery on the PE router and enters L2 VFI configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# l2 vfi vpls1 autodiscovery</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> vpn id vpn-id</td>
<td>Configures a VPN ID for the VPLS domain.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-vfi)# vpn id 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> vpls-id (autonomous-system-number:nn</td>
<td>(Optional) Specifies the VPLS domain. This command is optional, because VPLS Autodiscovery automatically generates a VPLS ID using the BGP autonomous system number and the configured VFI VPN ID. You can use this command to change the automatically generated VPLS ID. There are two formats for configuring the VPLS ID argument. It can be configured in the autonomous-system-number:network number (ASN:nn) format, as shown in the example, or it can be configured in the IP-address:network number format (IP-address:nn).</td>
</tr>
<tr>
<td>Router(config-vfi)# vpls-id 5:300</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> rd (autonomous-system-number:nn</td>
<td>(Optional) Specifies the RD to distribute endpoint information. This command is optional, because VPLS Autodiscovery automatically generates an RD using the BGP autonomous system number and the configured VFI VPN ID. You can use this command to change the automatically generated route distinguisher. There are two formats for configuring the route distinguisher argument. It can be configured in the autonomous-system-number:network number (ASN:nn) format, as shown in the example, or it can be configured in the IP-address:network number format (IP-address:nn).</td>
</tr>
<tr>
<td>Router(config-vfi)# rd 2:3</td>
<td></td>
</tr>
</tbody>
</table>
VPLS Autodiscovery: BGP Based

Step 7
route-target [import | export | both]
{autonomous-system-number:nn | ip-address:nn}

Example:
Router(config-vfi)# route-target 600:2222

(Optional) Specifies the route target (RT). This command is optional, because VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the RD and VPLS ID. You can use this command to change the automatically generated route target.

There are two formats for configuring the route target argument. It can be configured in the autonomous-system-number:network number (ASN:nn) format, as shown in the example, or it can be configured in the IP-address:network number format (IP-address:nn).

Step 8
l2 router-id ip-address

Example:
Router(config-vfi)# l2 router-id 10.10.10.10

(Optional) Specifies a unique identifier for the PE router. This command is optional, because VPLS Autodiscovery automatically generates a Layer 2 router ID using the MPLS global router ID. You can use this command to change the automatically generated ID.

Step 9
exit

Example:
Router(config-vfi)# exit

Exits L2 VFI configuration mode. Commands take effect after the router exits L2 VFI configuration mode.

What To Do Next

Perform the steps in “Configuring BGP to Enable VPLS Autodiscovery” section on page 6.

Configuration Examples for VPLS Autodiscovery: BGP Based

The following example shows the configuration of a network using VPLS Autodiscovery:

- VPLS Autodiscovery: BGP Based: Basic Example, page 12
VPLS Autodiscovery: BGP Based: Basic Example

Figure 1 show a basic configuration of VPLS Autodiscovery.

Command Reference

This section documents new and modified commands only.

- auto-route-target
- l2 router-id
- l2 vfi autodiscovery
- neighbor (VPLS)
- rd (VPLS)
- route-target (VPLS)
- show mpls l2transport vc
- show vfi
- show xconnect
- vpls-id
- xconnect
auto-route-target

To enable the automatic generation of a route target (RT), use the `auto-route-target` command in L2 VFI configuration mode. To remove the automatically generated RTs, use the `no` form of this command.

```
auto-route-target
no auto-route-target
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
The VPLS Autodiscovery feature automatically generates an RT, so you do not need to enter this command when you configure the feature.

**Command Modes**
L2 VFI configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SRB</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command works with the `l2 vfi autodiscovery` command, which automatically creates route targets. The `no` version of the command allows you to remove the automatically generated route targets. You cannot enter this command if route targets have not been automatically created yet.

**Examples**
The following example removes automatically generated route targets:
```
no auto-route-target
```

**Related Commands**

</tbody>
</table>
l2 router-id

To specify a router ID for the provider edge (PE) router to use with Virtual Private LAN Services (VPLS) Autodiscovery pseudowires, use the **l2 router-id** command in L2 VFI configuration mode. To revert to the MPLS global router ID, use the **no** form of this command.

```
l2 router-id ip-address
no l2 router-id ip-address
```

**Syntax Description**
```
ip-address
```
Router ID in IP address format.

**Defaults**
The Layer 2 router ID is set to the Multiprotocol Label Switching (MPLS) global router ID.

**Command Modes**
L2 VFI configuration

**Command History**
```
Release    Modification
12.2(33)SRB  This command was introduced.
```

**Usage Guidelines**
You can configure an arbitrary value in the IP address format for each router. However, each router ID must be unique.

The Layer 2 router ID is used in the forward equivalence class (FEC) 129 encoding for pseudowire signaling. It is also used in the network layer reachability information (NLRI) for peer discovery.

**Examples**
The following example specifies a Layer 2 router ID:
```
l2 router-id 10.1.1.1
```

**Related Commands**
```
Command           Description
l2 vfi autodiscovery  Enables the VPLS PE router to automatically discover other PE routers that are part of the same VPLS domain.
```
l2 vfi autodiscovery

To enable the Virtual Private LAN Service (VPLS) provider edge (PE) router to automatically discover other PE routers that are part of the same VPLS domain, use the **l2 vfi autodiscovery** command in global configuration mode. To disable VPLS autodiscovery, use the **no** form of this command.

```
  l2 vfi vfi-name autodiscovery
  no l2 vfi vfi-name autodiscovery
```

| Syntax Description | vfi-name | Specifies the name of the virtual forwarding instance. The virtual forwarding instance (VFI) identifies a group of pseudowires that are associated with a virtual switching instance (VSI). |

| Command Default | Layer 2 VFI autodiscovery is not enabled. |

| Command Modes | Global configuration |

<table>

<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.2(33)SRB</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

| Usage Guidelines | VPLS Autodiscovery enables each VPLS PE router to discover other PE routers that are part of the same VPLS domain. VPLS Autodiscovery also automatically detects when PE routers are added to or removed from the VPLS domain. Beginning with Cisco IOS Release 12.2(33)SRB, you no longer need to manually configure the VPLS neighbors and maintain the configuration when a PE router is added or deleted. However, you can still perform manual VPLS configuration even when you enable VPLS Autodiscovery. |

<table>
<thead>
<tr>
<th>Examples</th>
<th>The following example enables VPLS Autodiscovery on a PE router:</th>

<td>l2 vfi manual</td>
<td></td>
<td>Manually creates a Layer 2 VFI.</td>
</tr>
</tbody>
</table>
neighbor (VPLS)

To specify the type of tunnel signaling and encapsulation mechanism for each Virtual Private LAN Service (VPLS) peer, use the neighbor command in L2 VFI manual configuration mode. To disable a split horizon, use the no form of this command.

```
neighbor remote-router-id vc-id {encapsulation encapsulation-type | pw-class pw-name} [no-split-horizon]
no neighbor remote-router-id
```

**Syntax Description**

- **remote-router-id**
  - Remote peering router identifier. The remote router ID can be any IP address, as long as it is reachable.

- **vc-id**
  - The 32-bit identifier of the virtual circuit between the routers.

- **encapsulation encapsulation-type**
  - Specifies the tunnel encapsulation type; valid values are l2tpv3 and mpls.

- **pw-class pw-name**
  - Specifies the pseudowire class configuration from which the data encapsulation type is taken.

- **no-split-horizon**
  - (Optional) Disables the Layer 2 split horizon in the data path.

**Defaults**

Split horizon is enabled.

**Command Modes**

L2 VFI manual configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)SXF</td>
<td>This command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
<tr>
<td>12.2(33)SRB</td>
<td>This command was updated so that the remote router ID need not be the LDP router ID of the peer.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In a full-mesh VPLS network, keep split horizon enabled to avoid looping.

With the introduction on VPLS Autodiscovery, the remote router ID no longer needs to be the LDP router ID. The address you specify can be any IP address on the peer, as long as it is reachable. When VPLS Autodiscovery discovers peer routers for the VPLS, the peer router addresses might be any routable address.

**Examples**

This example shows how to specify the tunnel encapsulation type:

```
Router(config-vfi)# l2 vfi vfi-1 manual
Router(config-vfi)# vpn 1
Router(config-vfi)# neighbor 172.16.10.2 4 encapsulation mpls
```
This example shows how to disable the Layer 2 split horizon in the data path:

Router(config-vfi)# l2 vfi vfi-1 manual
Router(config-vfi)# vpn 1
Router(config-vfi)# neighbor 172.16.10.2 4 encapsulation mpls no-split-horizon

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>l2 vfi manual</td>
<td>Creates a Layer 2 VFI.</td>
</tr>
</tbody>
</table>
To specify the route distinguisher (RD) to distribute endpoint information in a Virtual Private LAN Service (VPLS) configuration, use the `rd` command in L2 VFI configuration mode. To remove the manually configured RD and return to the automatically generated RD, use the `no` form of this command.

```
rd {autonomous-system-number:nn \ ip-address:nn}
```

```
no rd {autonomous-system-number:nn \ ip-address:nn}
```

### Command Default

VPLS Autodiscovery automatically generates a route distinguisher using the Border Gateway Protocol (BGP) autonomous system number and the configured virtual forwarding instance (VFI) Virtual Private Network (VPN) ID.

### Command Modes

L2 VFI configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SRB</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

VPLS Autodiscovery automatically generates a route distinguisher using the BGP autonomous system number and the configured VFI VPN ID. You can use this command to change the automatically generated route distinguisher.

The same RD value cannot be configured in multiple VFI.

There are two formats for configuring the route distinguisher argument. It can be configured in the `autonomous-system-number:network-number` format, or it can be configured in the `IP address:network-number` format.

An RD is either:

- autonomous system-related—Composed of an autonomous system number and an arbitrary number.
- IP address-related—Composed of an IP address and an arbitrary number.

You can enter an RD in either of these formats:

- `16-bit-autonomous-system-number:32-bit-number`
  For example, 101:3.
- `32-bit-IP-address:16-bit-number`
  For example, 192.168.122.15:1.
Examples

The following example shows a configuration using VPLS Autodiscovery that sets the RD to an IP address of 10.4.4.4 and a network address of 70:

```bash
l2 vfi SP2 autodiscovery
vpn id 200
vpls-id 10.4.4.4:70
rd 10.4.5.5:7
```

The following example shows a configuration using VPLS Autodiscovery that sets the RD to an autonomous system number of 2 and a network address of 3:

```bash
l2 vfi SP2 autodiscovery
vpn id 200
vpls-id 10.4.4.4:70
rd 2:3
```

Related Commands

</tbody>
</table>
route-target (VPLS)

To specify a route target (RT) for a Virtual Private LAN Service (VPLS) virtual forwarding instance (VFI), use the route-target command in L2 VFI configuration mode. To revert to the automatically generated route target, use the no form of this command.

```
route-target [import | export | both] {autonomous-system-number:nn | ip-address:nn}
no route-target {import | export | both} {autonomous-system-number:nn | ip-address:nn}
```

**Syntax Description**
- **import** (Optional) Imports routing information from the target virtual private network (VPN) extended community.
- **export** (Optional) Exports routing information to the target VPN extended community.
- **both** (Optional) Imports both import and export routing information to the target VPN extended community.
- **autonomous-system-number:nn** The autonomous system number and a 32-bit number.
- **ip-address:nn** The IP address and a 16-bit number.

**Defaults**
VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the route distinguisher (RD) and VPLS ID.

**Command Modes**
L2 VFI configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SRB</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The same route target cannot be configured in multiple VFIs.

The route target specifies a target VPN extended community. Like a route distinguisher, an extended community is composed of either an autonomous system number and an arbitrary number or an IP address and an arbitrary number. You can enter the numbers in either of these formats:

- **16-bit-autonomous-system-number:32-bit-number**
  For example, 101:3.
- **32-bit-IP-address:16-bit-number**
  For example, 192.168.122.15:1.

**Examples**
The following example shows a VPLS Autodiscovery configuration that configures route-target extended community attributes for VFI SP1:

```
l2 vfi SP1 autodiscovery
vpn id 100
vpls-id 5:300
```
rd 4:4
route-target 10.1.1.1:29

</tbody>
</table>
show mpls l2transport vc

Usage Guidelines

If you do not specify any keywords or arguments, the command displays a summary of all the VCs.

Examples

The output of the commands varies, depending on the type of Layer 2 packets being transported over the AToM VCs.

The following sample output shows information about the interfaces and VCs that have been configured to transport various Layer 2 packets on the router:

```
Router# show mpls l2transport vc

<table>
<thead>
<tr>
<th>Local intf</th>
<th>Local circuit</th>
<th>Dest address</th>
<th>VC ID</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Se5/0</td>
<td>FR DLCI 55</td>

<td>55</td>
<td>UP</td>
</tr>
<tr>
<td>AT4/0</td>
<td>ATM AAL5 0/100</td>
<td>10.0.0.1</td>
<td>100</td>
<td>UP</td>
</tr>
<tr>
<td>AT4/0</td>
<td>ATM AAL5 0/200</td>
<td>10.0.0.1</td>
<td>200</td>
<td>UP</td>
</tr>
<tr>
<td>AT4/0.300</td>
<td>ATM AAL5 0/300</td>
<td>10.0.0.1</td>
<td>300</td>
<td>UP</td>
</tr>
</tbody>
</table>
```

Table 2 describes the fields shown in the display.
The following example shows information about the NSF/SSO and graceful restart capability. The SSO portion indicates when checkpointing data has either been sent (on active) or received (on standby). When SSO data has not been successfully sent or has been released, the SSO information is not shown.

Router# show mpls l2transport vc detail

Local interface: Fa5/1/1.2 down, line protocol down, Eth VLAN 2 up
Destination address: 10.55.55.2, VC ID: 1002, VC status: down
Preferred path: not configured
Default path: active
Tunnel label: imp-null, next hop point2point
Create time: 02:03:29, last status change time: 02:03:26
Signaling protocol: LDP, peer 10.55.55.2:0 down
MPLS VC labels: local 16, remote unassigned

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local intf</td>
<td>The interface on the local router that has been enabled to transport Layer 2 packets.</td>
</tr>
</tbody>
</table>
| Local circuit  | The type and number (if applicable) of the local circuit. The output shown in this column varies, depending on the transport type:  
  - For Frame Relay, the output shows the DLCI of the PVC.  
  - For ATM cell relay and AAL5, the output shows the VPI/VCI of the PVC.  
  - For Ethernet VLANs, the output shows the VLAN number.  
  - For PPP and High-Level Data Link Control (HDLC), the output shows the interface number. |
| Dest address   | The IP address of the remote router’s interface that is the other end of the VC. |
| VC ID          | The virtual circuit identifier assigned to one of the interfaces on the router. |
| Status         | The status of the VC. The status can be one of the following:  
  - ADMIN DOWN—The VC has been disabled by a user.  
  - DOWN—The VC is not ready to carry traffic between the two VC endpoints. Use the `detail` keyword to determine the reason that the VC is down.  
  - RECOVERING—The VC is recovering from a stateful switchover.  
  - UP—The VC is in a state where it can carry traffic between the two VC endpoints. A VC is up when both imposition and disposition interfaces are programmed.  
    - The disposition interface is programmed if the VC has been configured and the client interface is up.  
    - The imposition interface is programmed if the disposition interface is programmed and you have a remote VC label and an Interior Gateway Protocol (IGP) label. The IGP label can be implicit null in a back-to-back configuration. An IGP label means there is a label switched path (LSP) to the peer. |
VPLS Autodiscovery: BGP Based

show mpls l2transport vc

Group ID: local 0, remote unknown
MTU: local 1500, remote unknown
Remote interface description:
Sequencing: receive disabled, send disabled
SSO Descriptor: 10.55.55.2/1002, local label: 16
SSM segment/switch IDs: 12290/8193, PWID: 8193
VC statistics:
   packet totals: receive 0, send 0
   byte totals: receive 0, send 0
   packet drops: receive 0, send 0

The following example shows information provided when an AToM static pseudowire has been provisioned and the `show mpls l2transport vc detail` command is used to check the configuration. The Signaling protocol field specifies Manual, because a directed control protocol such as Label Distribution Protocol (LDP) cannot be used to exchange parameters on static pseudowires. The Remote interface description field seen for nonstatic pseudowire configurations is empty, because remote information is exchanged using signaling between the PEs and this is not done on static pseudowires.

Router# show mpls l2transport vc detail

Local interface: Et1/0 up, line protocol up, Ethernet up
Destination address: 10.1.1.2, VC ID: 100, VC status: up
   Output interface: Et2/0, imposed label stack {10003 150}
   Preferred path: not configured
   Default path: active
   Next hop: 10.0.0.2
Create time: 00:18:57, last status change time: 00:16:10
Signaling protocol: Manual
   MPLS VC labels: local 100, remote 150
   Group ID: local 0, remote 0
   MTU: local 1500, remote 1500
   Remote interface description:
   Sequencing: receive disabled, send disabled
   VC statistics:
      packet totals: receive 219, send 220
      byte totals: receive 20896, send 26694
      packet drops: receive 0, send 0

Table 3 describes the significant fields shown in the display.

<table>
<thead>
<tr>

<td>Interface on the local router that has been enabled to send and receive Layer 2 packets. The interface varies, depending on the transport type. The output also shows the status of the interface.</td>
</tr>
<tr>
<td>line protocol</td>
<td>Status of the line protocol on the edge-facing interface.</td>
</tr>
<tr>
<td>Destination address</td>
<td>IP address of the remote router specified for this VC. You specify the destination IP address as part of the mpls l2transport route command.</td>
</tr>
<tr>
<td>VC ID</td>
<td>Virtual circuit identifier assigned to the interface on the router.</td>
</tr>
</tbody>
</table>
Table 3  show mpls l2transport vc detail Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| VC status               | Status of the VC, which is one of the following:  
|                         | - ADMIN DOWN—The VC has been disabled by a user.  
|                         | - DOWN—The VC is not ready to carry traffic between the two VC endpoints.  
|                         | - Up—The VC is in a state where it can carry traffic between the two VC endpoints. A VC is up when both imposition and disposition interfaces are programmed.  
|                         |   - The disposition interface is programmed if the VC has been configured and the client interface is up.  
|                         |   - The imposition interface is programmed if the disposition interface is programmed and a remote VC label and an IGP label exist. The IGP label can be an implicit null in a back-to-back configuration. (An IGP label means there is an LSP to the peer.) |
| Output interface        | Interface on the remote router that has been enabled to transmit and receive Layer 2 packets. |
| imposed label stack     | Summary of the MPLS label stack used to direct the VC to the PE router. |
| Preferred path          | Path that was assigned to the VC and the status of that path. The path can be a Multiprotocol Label Switching (MPLS) traffic engineering tunnel or an IP address or hostname of a peer provider edge (PE) router. |
| Default path            | Status of the default path, which can be disabled or active.  
|                         | By default, if the preferred path fails, the router uses the default path. However, you can disable the router from using the default path when the preferred path fails by specifying the disable-fallback keyword with the preferred-path command. |
Table 3  show mpls l2transport vc detail Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tunnel label</td>
<td>An IGP label used to route the packet over the MPLS backbone to the destination router with the egress interface. The first part of the output displays the type of label. The second part of the output displays the route information. The tunnel label information can display any of the following states: • imp-null: Implicit null means that the provider (P) router is absent and the tunnel label will not be used. Alternatively, imp-null can signify traffic engineering tunnels between the PE routers. • unassigned: The label has not been assigned. • no route: The label is not in the routing table. • no adjacency: The adjacency for the next hop is missing. • not ready, no route: An IP route for the peer does not exist in the routing table. • not ready, not a host table: The route in the routing table for the remote peer router is not a host route. • not ready, Cisco Express Forwarding disabled: Cisco Express Forwarding is disabled. • not ready, LFIB disabled: The MPLS switching subsystem is disabled. • not ready, Label Forwarding Information Base (LFIB) entry present: The tunnel label exists in the LFIB, but the VC is down.</td>
</tr>
<tr>
<td>Create time</td>
<td>The time (in hours, minutes, and seconds) when the VC was provisioned.</td>
</tr>
<tr>
<td>last status change time</td>
<td>Last time (in hours, minutes, and seconds) the VC state changed.</td>
</tr>
<tr>
<td>Signaling protocol</td>
<td>Type of protocol used to send the MPLS labels on dynamically configured connections. The output also shows the status of the peer router. For AToM statically configured pseudowires, the field indicates Manual, because there is no exchange of labels using a directed control protocol such as LDP.</td>

</tr>
</tbody>
</table>
The following example shows the command output of the `show mpls l2transport vc detail` command with when VPLS Autodiscovery has configured the VPLS pseudowires. The output that is specific to VPLS Autodiscovery is shown in bold.

**Router# show mpls l2transport vc detail**

.Local interface: VFI my_test VFI up
MPLS VC type is VFI, interworking type is Ethernet
Destination address: 10.3.3.1, VC ID: 123456, VC status: up

**Next hop PE address: 10.55.55.2**
Output interface: Et3/0, imposed label stack {17 19}
Preferred path: not configured
Default path:
Next hop: 10.1.0.2
Create time: 2d05h, last status change time: 2d05h

Signaling protocol: LDP, peer 10.55.55.2:0 up
MPLS VC labels: local 21, remote 19
AGI: type 1, len 8, 0000 3333 4F4E 44C4
Local AII: type 1, len 4, 0909 0909 (10.9.9.9)
Remote AII: type 1, len 4, 0303 0301 (10.3.3.3)
Group ID: local 0, remote 0
MTU: local 1500, remote 1500
Remote interface description:
Sequencing: receive disabled, send disabled
VC statistics:
packet totals: receive 22611, send 22611
byte totals: receive 2346570, send 2853581
packet drops: receive 0, send 0

**Table 3**

**Examples**

This example shows an example of VFI status. The virtual circuit (VC) ID in the output represents the Virtual Private Network (VPN) ID; the VC is identified by the combination of the destination address and the VC ID.

Router# show vfi VPLS-2

VFI name: VPLS-2, state: up
VPN ID: 100
Local attachment circuits:
  Vlan2
Neighbors connected via pseudowires:
  Peer Address  VC ID  Split-horizon
  10.1.1.1      2      Y
  10.1.1.2      2      Y
  10.2.2.3      2      N

Table 5 describes the significant fields shown in the output.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VFI name</td>
<td>The name assigned to the VFI.</td>
</tr>
<tr>
<td>state</td>
<td>The status of the VFI (up or down).</td>
</tr>
<tr>
<td>Local attachment circuits</td>
<td>The interface or VLAN assigned to the VFI.</td>
</tr>
<tr>

Usage Guidelines

The show xconnect command can be used to display, sort, and filter basic information about all xconnect attachment circuits and pseudowires.

You can use the show xconnect command output to help determine the appropriate steps to take to troubleshoot an xconnect configuration problem. More specific information about a particular type of xconnect can be displayed using the commands listed in the “Related Commands” table.

Examples

The following example shows show xconnect all command output in the brief (default) display format:

Router# show xconnect all

38 Cisco IOS Release 12.2(33)SRA
VPLS Autodiscovery: BGP Based

For VPLS Autodiscovery, issuing the `show xconnect` command with the `rib` keyword provides Routing Information Base (RIB) detail, as shown in the following:

```
Router# show xconnect rib

Local Router ID: 10.9.9.9

Legend: O=Origin, P=Provisioned, TID=Target ID, B=BGP, Y=Yes, N=No

<table>
<thead>
<tr>

<td>10.1.1.1</td>
<td>10.111.111.111:12345</td>
<td></td>
</tr>
</tbody>
</table>
```

The additional fields displayed in the detailed output are self-explanatory.
Table 8 describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Router ID</td>
<td>A unique router identifier. VPLS Autodiscovery automatically generates a router ID using the MPLS global router ID.</td>
</tr>
<tr>
<td>O</td>
<td>The origin of the route.</td>
</tr>
<tr>
<td>P</td>
<td>Whether the pseudowire has been provisioned using a learned route.</td>
</tr>
<tr>
<td>VPLS/WPWS-ID</td>
<td>The Virtual Private LAN Service (VPLS) domain. VPLS Autodiscovery automatically generates a VPLS ID using the Border Gateway Protocol (BGP) autonomous system number and the configured VFI VPN ID.</td>
</tr>
<tr>
<td>TID</td>
<td>The target ID. The IP address of the destination router.</td>
</tr>
<tr>
<td>Next-Hop</td>
<td>The IP address of the next-hop router.</td>
</tr>
<tr>
<td>Route-Target</td>
<td>The route target (RT). VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the route distinguisher (RD) and VPLS ID.</td>
</tr>
</tbody>
</table>

For VPLS Autodiscovery, issuing the `show xconnect` command with the `rib` and `detail` keywords provides more information about the routing information base, as shown in the following example:

```
Router# show xconnect rib detail

Local Router ID: 10.9.9.9

VPLS-ID 10:123, TID 10.7.7.7
  Next-Hop: 10.7.7.7
  Hello-Source: 10.9.9.9
  Route-Target: 10:123
  Incoming RD: 10:10
  Forwarder: vfi VPLS1
  Origin: BGP
  Provisioned: Yes

VPLS-ID 10.100.100.100:1234, TID 0.0.0.2
  Next-Hop: 10.2.2.2, 10.3.3.3, 10.4.4.4
  Hello-Source: 10.9.9.9
  Route-Target: 10:123
  Incoming RD: 10:12
  Forwarder: vfi VPLS2
  Origin: BGP
  Provisioned: Yes

VPLS-ID 10.100.100.100:1234, TID 10.13.1.1
  Next-Hop: 10.1.1.1
  Hello-Source: 10.9.9.9
```
Route-Target: 10.111.111.111:12345
Incoming RD: 10:13
Forwarder: vf1 VPLS2
Origin: BGP
Provisioned: Yes

Table 9 describes the significant fields shown in the display.

</tbody>
</table>
vpls-id

To assign an identifier to the Virtual Private LAN Service (VPLS) domain, use the vpls-id command in L2 VFI configuration mode. To revert to the default VPLS ID, use the no form of this command.

```
vpls-id {autonomous-system-number:nn | ip-address:nn}
no vpls-id {autonomous-system-number:nn | ip-address:nn}
```

**Syntax Description**

- `autonomous-system-number:nn`: Specifies a 16-bit autonomous system number and 32-bit arbitrary number. The autonomous system number need not match the local autonomous system number.
- `ip-address:nn`: Specifies a 32-bit IP address and a 16-bit arbitrary number. Only IPv4 addresses are supported.

**Command Default**

The VPLS ID is generated automatically by VPLS Autodiscovery.

**Command Modes**

L2 VFI configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SRB</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

VPLS Autodiscovery automatically generates a VPLS ID using the Border Gateway Protocol BGP autonomous system number and the configured VFI VPN ID. You can use the vpls-id command to change the automatically generated VPLS ID.

The Label Distribution Protocol (LDP) uses the VPLS ID when signaling VPLS autodiscovered neighbors. The VPLS ID identifies the VPLS domain.

Only one VPLS ID can be configured per virtual forwarding instance (VFI), and the same VPLS ID cannot be configured in multiple VFIs on the same provider edge (PE) router.

The manually configured VPLS ID replaces the internally generated VPLS ID. The manually configured VPLS ID also changes the automatically generated route target (RT).

The vpls-id command defines the attachment group identifier (AGI) for the VPLS domain. Therefore, all provider edge (PE) routers in the same VPLS domain must use the same VPLS ID.

For interautonomous system configurations, you must manually configure the VPLS ID instead of using the automatically generated VPLS ID, because all PE routers do not share the same autonomous system number.

**Examples**

The following example sets the VPLS ID to the autonomous system and network number 5:300:

```
vpls-id 5:300
```

The following example sets the VPLS ID to IP address and network number 10.4.4.4:70:
vpl-s-id 10.4.4.4:70

<table>

**xconnect**

To bind an attachment circuit to a pseudowire, and to configure an Any Transport over MPLS (AToM) static pseudowire, use the `xconnect` command in one of the supported configuration modes. To restore the default values, use the `no` form of this command.

```
xconnect peer-ip-address vc-id encapsulation [l2tpv3 [manual] | mpls [manual]] [pw-class pw-class-name] [sequencing {transmit | receive | both}]
```

```
no xconnect
```

**Syntax Description**

- **peer-ip-address**
  - IP address of the remote provider edge (PE) peer. The remote router ID can be any IP address, as long as it is reachable.

- **vc-id**
  - The 32-bit identifier of the virtual circuit (VC) between the PE routers.

- **encapsulation**
  - Specifies the tunneling method to encapsulate the data in the pseudowire:
    - **l2tpv3**—Specifies Layer 2 Tunneling Protocol, version 3 (L2TPv3) as the tunneling method.
    - **mpls**—Specifies Multiprotocol Label Switching (MPLS) as the tunneling method.
    - **manual**—Specifies that no signaling is to be used in the attachment circuit. This keyword places the router in `xconnect` configuration mode for manual configuration of the attachment circuit. Use this keyword to manually configure an AToM or L2TPv3 static pseudowire.

- **pw-class**
  - (Optional) Specifies the pseudowire class for advanced configuration.

- **pw-class-name**
  - (Optional) Specifies the pseudowire class for advanced configuration.

- **sequencing**
  - (Optional) Sets the sequencing method to be used for packets received or sent. This keyword is not supported with the AToM Static Pseudowire Provisioning feature.

- **transmit**
  - Sequences data packets received from the attachment circuit.

- **receive**
  - Sequences data packets sent into the attachment circuit.

- **both**
  - Sequences data packets that are both sent and received from the attachment circuit.

**Command Default**

The attachment circuit is not bound to the pseudowire.

**Command Modes**

- Connect configuration
- Interface configuration
- l2transport configuration (for ATM)

## Usage Guidelines

The combination of the **peer-ip-address** and **vcid** arguments must be unique on the router. Each xconnect configuration must have a unique combination of **peer-ip-address** and **vcid** configuration.

**Note**

If the remote router is a Cisco 12000 series Internet router, the **peer-ip-address** argument must specify a loopback address on that router.

The same **vcid** value that identifies the attachment circuit must be configured using the **xconnect** command on the local and remote PE router. The VC ID creates the binding between a pseudowire and an attachment circuit.

With the introduction of VPLS Autodiscovery in Cisco IOS Release 12.2(33)SRB, the remote router ID need not be the LDP router ID. The address you specify can be any IP address on the peer, as long as it is reachable. When VPLS Autodiscovery discovers peer routers for the VPLS, the peer router addresses might be any routable address.

**Note**

The VPLS Autodiscovery feature is not supported with L2TPv3.

For L2TPv3, to manually configure the settings used in the attachment circuit, use the **manual** keyword in the **xconnect** command. This configuration is called a static session. The router is placed in xconnect configuration mode, and you can then configure the following options:

- Local and remote session identifiers (using the **l2tp id** command) for local and remote PE routers at each end of the session.
- Size of the cookie field used in the L2TPv3 headers of incoming (sent) packets from the remote PE peer router (using the **l2tp cookie local** command).
- Size of the cookie field used in the L2TPv3 headers of outgoing (received) L2TP data packets (using the **l2tp cookie remote** command).
- Interval used between sending hello keepalive messages (using the **l2tp hello** command).

For L2TPv3, if you do not enter the **encapsulation l2tpv3 manual** keywords in the **xconnect** command, the data encapsulation type for the L2TPv3 session is taken from the encapsulation type configured for the pseudowire class specified with the **pseudowire-class pw-class-name** command.

The **pw-class** keyword with the **pw-class-name** value binds the xconnect configuration of an attachment circuit to a specific pseudowire class. In this way, the pseudowire class configuration serves as a template that contains settings used by all attachment circuits bound to it with the **xconnect** command.
Software prior to Cisco IOS Release 12.2(33)(SRB) configured pseudowires dynamically using Label Distribution Protocol (LDP) or another directed control protocol to exchange the various parameters required for these connections. In environments that do not or cannot use directed control protocols, the `xconnect` command allows provisioning an AToM static pseudowire. Use the `manual` keyword in the `xconnect` command to place the router in `xconnect` configuration mode. MPLS pseudowire labels are configured using the `mpls label` and (optionally) `mpls control-word` commands in `xconnect` configuration mode.

### Examples

The following example configures xconnect service for an Ethernet interface by binding the Ethernet circuit to the pseudowire named 123 with a remote peer 10.0.3.201. The configuration settings in the pseudowire class named `vlan-xconnect` are used.

```bash
Router(config)# interface Ethernet0/0.1
Router(config-if)# xconnect 10.0.3.201 123 pw-class vlan-xconnect
```

The following example enters xconnect configuration mode and manually configures L2TPv3 parameters for the attachment circuit:

```bash
Router(config)# interface Ethernet 0/0
Router(config-if)# xconnect 10.0.3.201 123 encapsulation l2tpv3 manual pw-class ether-pw
Router(config-if-xconn) l2tp id 222 111
Router(config-if-xconn) l2tp cookie local 4 54321
Router(config-if-xconn) l2tp cookie remote 4 12345
Router(config-if-xconn) l2tp hello l2tp-defaults
```

The following example enters xconnect configuration mode and manually configures an AToM static pseudowire. The example shows the configuration for only one side of the connection; the configurations on each side of the connection must be symmetrical.

```bash
Router# configure terminal
Router(config)# interface Ethernet1/0
Router(config-if)# no ip address
Router(config-if)# xconnect 10.131.191.252 100 encapsulation mpls manual pw-class mpls
Router(config-if-xconn)# mpls label 100 150
Router(config-if-xconn)# exit
Router(config-if)# exit
```

Feature Information for VPLS Autodiscovery: BGP Based

Table 10 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Note

Table 10 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.
