Integrating Data and Voice Services for ISDN PRI Interfaces on Multiservice Access Routers

Revised: June 19, 2006, OL-10383-01
First Published: February 27, 2006

This document describes how to configure ISDN PRI interfaces to support the integration of data and voice calls on multiservice access routers. This feature enables data (dial-in, dial-on-demand routing [DDR], and DDR backup) and voice call traffic to occur simultaneously from the supported ISDN PRI interfaces. You can also enable multilevel precedence and preemption (MLPP) for DDR calls over the active voice call when no idle channel is available during the DDR call setup.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Integrating Data and Voice Services for ISDN PRI Interfaces” section on page 71.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Integrating Data and Voice Services for ISDN PRI Interfaces

- Establish a working H.323 or SIP network for voice calls.
- Perform basic ISDN PRI voice configuration, including dial-on-demand routing (DDR) configuration for data calls. For more information, see Configuring ISDN PRI Voice-Interface Support.
- To support PRI data calls, a VWIC-1MFT-E1 voice cards must have a packet voice data module (PVDM).

**Supported Modules**

- This feature supports the following modules:
  - NM-HD
  - NM-HDV2
  - Onboard DSPs
- This feature supports the following voice cards:
  - VWIC-XMFT-X interface modules
  - VWIC2-XMFT-X interface modules

**Note**

Data calls are supported only on the NM-HDV2-2T1/E1 and NM-HD-2V-E network modules, and the VWIC-2MFT-E1, VWIC-2MFT-T1 and VWIC2-T1/E1 voice cards.

Use the `isdn switch-type ?` command in interface configuration mode or global configuration mode to view the list of supported ISDN switch types. See the following example:

```
Router(config)# isdn switch-type ?
primary-4ess  Lucent 4ESS switch type for the U.S.
primary-5ess  Lucent 5ESS switch type for the U.S.
primary-dms100 Northern Telecom DMS-100 switch type for the U.S.
primary-dpns  DPNSS switch type for Europe
primary-net5  NET5 switch type for UK, Europe, Asia and Australia
primary-ni    National ISDN Switch type for the U.S.
primary-ntt   NTT switch type for Japan
primary-qsig  QSIG switch type
primary-ts014  TSG14 switch type for Australia (obsolete)
```
Restrictions for Integrating Data and Voice Services for ISDN PRI Interfaces

- This feature is supported only on C5510 DSP-based platforms.
- ISDN backhaul is not supported.
- This feature does not support modem calls.
- For platforms that support HDLC resources on the motherboard, the available on board HDLC resources are limited to 31 if all resources are not enabled.
- The Cisco 2801 platform does not support full channelized data or full integrated data and voice over T1/E1 PRI interfaces. However, data back up through one PRI channel, or one group of PRI channels for data backup, is supported on this platform.
- Only PPP with multilink is supported for multiple channels. HDLC is not supported for multiple channels.
- You can either configure ds0-groups or pri-groups on one controller, but not both. You receive a message, as in the following example:

  ```
  Router(config-controller)#ds0-group 19 timeslots 20 type e&m-imme$9 timeslots 20 type e&m-immediate-start
  %A pri-group was configured already. Please remove it to configure a ds0-group
  ```

- The following calls are not preempted by a DDR call:
  - Calls from a T.37 store-and-forward off-ramp gateway
  - Incoming ISDN calls
- This feature is not supported from a BRI interface.
- The following dialer commands are not supported with the integrated data and voice feature:
  - dialer aaa
  - dialer callback-secure
  - dialer callback-server
  - dialer dns
  - dialer order
  - dialer persistent
  - dialer redial
  - dialer vpdn
  - dialer watch-disable
  - dialer watch-group
  - dialer watch-list
  - dialer watch-list delay
Information About Integrating Data and Voice Services for ISDN PRI Interfaces

Before you configure integrated data and voice services on ISDN interfaces, you should understand the following concepts:

- Integrated Services for Multiple Call Types, page 4
- Resource Allocation for Voice and Data Calls, page 4
- MLPP Call Preemption over Voice Calls, page 5

Integrated Services for Multiple Call Types

ISDN interfaces can support both data calls and voice calls. Typically, this is done using one interface for data and another for voice. This feature enables data (dial-in, dial-on-demand routing [DDR], and DDR backup) and voice call traffic to occur simultaneously from the supported ISDN PRI interfaces. To enable integrated services, the interface used for incoming voice calls is configured to accept multiple voice call types.

Figure 1 shows an ISDN network configured for integrated data and voice services.

Figure 1 Integrated Voice with DDR Interface for WAN Failure Backup

Resource Allocation for Voice and Data Calls

Voice calls use DSP resources and data calls use HDLC resources for transmission. When an interface is configured for integrated services, the gateway allocates the HDLC resources dynamically during call setup and frees them back to the HDLC resource pools when the call terminates. This allows spare HDLC resources to support ISDN PRI data calls and DSP resources to support voice calls.
MLPP Call Preemption over Voice Calls

Multilevel precedence and preemption (MLPP) is the placement of priority calls through the network. Precedence designates the priority level that is associated with a call. Preemption designates the process of terminating lower-priority calls so that a call of higher precedence can be extended.

Preemption levels are assigned to outgoing voice calls and DDR backup calls. DDR backup is used to provide backup to a WAN link.

From the gateway, voice and DDR backup calls are controlled by different entities:
- The preemption level of an outgoing voice call is determined using the selected outbound POTS dial peer.
- The preemption level of a DDR backup call is determined using the dialer map class.

A trunk group is used as the common channel resource pool for outgoing voice call and DDR backup calls. Calls with a higher precedence preempt an active outgoing voice call, of a lower precedence, if an idle B channel is not available. An ISDN interface that is configured for integrated mode is assigned to this trunk group to allow dialer resources and voice resources to request an idle B channel from the same resource pool.

Preemption of Outgoing Voice Calls

The trunk group and preemption level are configured as part of a map class, which can be attached to a dialer map. The dialer map class supplies configuration parameters to dialer interfaces and can be referenced from multiple dialer interfaces.

During dial-on-demand routing (DDR) backup call setup, an idle B channel is selected from the trunk group. When no idle channel is found, the trunk group resource manager (TGRM) selects a B channel on the basis of the following:
- The B channel currently active with a connected outgoing voice call
- The preemption level of the connected voice call being lower than the preemption level of a DDR call

A guard timer, configured for the trunk group, is used to delay the idle channel notification and defer the DDR setup to allow the remote channel time to become ready and accept the incoming call with the higher precedence.

By default, the preemption level of dialer calls is set to the lowest level (routine) to disable the MLPP service for a DDR call.

The preemption level of an outgoing voice call is defined from the selected outbound POTS dial peer. During the voice call setup, the trunk group resource manager (TGRM) selects an idle B channel from a trunk group on the basis of the following:
- The call ID of an outgoing voice call
- The preemption level of an outgoing call as defined by the POTS dial peer
- The voice interface B channel information of an outgoing voice call

When the preemption call notification is received, the TGRM saves the outgoing voice call to the preemption level link list based on FIFO.
Preemption Tones

When an outgoing voice call is preempted by a DDR backup call, the preemption call treatment starts by providing a preemption tone and starting the tone timer.

An MLPP preemption tone is a special tone played to the voice call announcing that the line is about to be seized by a call with a higher precedence. A steady tone, 1060 ms in duration, is played on all legs of the call until the user hangs up or the preemption tone times out.

- For the telephony leg of the call, the preemption tone is played using the DSP.
- For the IP leg (across the VoIP network) of the call, the preemption tone is played as media.
- For the ephone leg on Cisco CME, a reorder tone is played for the local user and a preemption tone is played for the remote user.

Preemption Cause Codes

When the preemption tone timer is expired and the call is still in a connected state, both call legs are disconnected by the gateway with the following cause code:

Preemption - Circuit Reserved 0x8

If you release the call before the preemption tone timer expires, the following cause code is used:

Normal Call Clear 0x10

In both cases, the following internal cause code is used for the release calls:

Preemption Circuit Reserved 0x8

How to Configure Integrated Data and Voice Services for ISDN PRI Interfaces

This section describes the tasks required to configure integrated services for ISDN interfaces:

- Configuring the ISDN PRI Interface for Multiple Call Types, page 6 (Required)
- Configuring MLPP Call Preemption over Outgoing Voice Calls, page 14 (Optional)

Configuring the ISDN PRI Interface for Multiple Call Types

An ISDN serial interface configured for integrated mode supports data and voice calls using incoming call type checking to accept incoming voice and data calls when an inbound voice dial peer is matched. Perform the following tasks to configure integrated services:

- Prerequisites, page 7
- Configuring the POTS Dial-Peer Incoming Called Number, page 8
- Configuring the Data Dial Peer Lookup Preference, page 9
- Enabling Integrated Services, page 10
- Creating a Trunkgroup and Configuring Maximum Calls Based on Call Type, page 11
- Disabling Integrated Services, page 13
Prerequisites

Unlike voice calls, which use DSP resources, data calls use HDLC resources for transmission. To use the integrated services feature, the gateway must allocate HDLC resources dynamically during call setup and free them back to the HDLC resource pools when the call terminates.

Use the following `show` commands to view the availability of HDLC resources:

- **show tdm connections**

  The following example shows HDLC resources on the TDM side.

  ```
  Router# show tdm connections slot 0
  Active TDM connections for slot 0
  =============================
  (Key: GT=PLEX TDM, V0=VWIC0, V1=VWIC1, V2=VWIC2, V3=VWIC3

Configuring the POTS Dial-Peer Incoming Called Number

The call type of an incoming call is determined using the incoming dial-peer. For data dial peer matching, the called number of an incoming call is used to match the incoming called-number of POTS dial peers. Use the following procedure to configure the POTS dial peer and incoming called number.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `dial-peer data tag pots`
4. `incoming called number string`
Integrating Data and Voice Services for ISDN PRI Interfaces on Multiservice Access Routers

How to Configure Integrated Data and Voice Services for ISDN PRI Interfaces

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable          | Enables privileged EXEC mode.  
                            | • Enter your password if prompted. |
| Example:                  |         |
| Router> enable            |         |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example:                  |         |
| Router# configure terminal |         |
| **Step 3** dial-peer data tag pots | Creates a data dial peer and enters data dial-peer configuration mode. |
| Example:                  |         |
| Router(config)# dial-peer data 100 pots |         |
| **Step 4** incoming called number string | For data dial-peer matching, only the called number of an incoming call is used to match the incoming called number of POTS dial peers. Wild cards are accepted.  
Note: The *string* must match the dialer string on the remote gateway. |
| Example:                  |         |
| Router(config-dial-peer)# incoming called number 4085550110 |         |

Configuring the Data Dial Peer Lookup Preference

To optimize data or voice dial-peer searches for incoming ISDN calls, configure the preference of dial-peer lookup during the call type checking. Use the following procedure to configure a search for dial peers by type.

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer search type {data | none | voice} {data | voice}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable          | Enables privileged EXEC mode.  
                            | • Enter your password if prompted. |
| Example:                  |         |
| Router> enable            |         |
Integrating Data and Voice Services for ISDN PRI Interfaces on Multiservice Access Routers

How to Configure Integrated Data and Voice Services for ISDN PRI Interfaces

Enabling Integrated Services

Enabling integrated services allows data and voice call traffic to occur from ISDN PRI interfaces simultaneously.

When an interface is in integrated service mode:

- ISDN performs calltype checking for the incoming call. The call is rejected by ISDN if no voice or data dial peer is matched for an incoming call.
- The voice option for the \texttt{isdn incoming-voice} command, which treats incoming calls as voice calls, is not available.

By default, the integrated service option is disabled from the supported interfaces. Use the following procedure to enable integrated mode on a serial interface.

SUMMARY STEPS

1. \texttt{enable}
2. \texttt{configure terminal}
3. \texttt{interface serial slot/port:timeslot}
4. \texttt{shutdown}
5. \texttt{isdn integrate calltype all}
6. \texttt{no shutdown}
Integrating Data and Voice Services for ISDN PRI Interfaces on Multiservice Access Routers

Creating a Trunkgroup and Configuring Maximum Calls Based on Call Type

After an ISDN interface is assigned to a trunk group, you can configure maximum incoming and outgoing calls based on the call type (voice or data) or direction (inbound or outbound) through the trunk group.

**Note**

If trunk groups are not configured, data and voice calls are treated as first-come first-served.

Use the following procedure to create a trunk group and configure maximum calls based on call type.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. trunk group name
4. max-calls {any | data | voice} number [direction [in | out]]
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:** | 
Router> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | 
Router# configure terminal |
| **Step 3** trunk group name | Defines a trunk group and enters trunk group configuration mode.  
- name—Name of the trunk group. Valid names contain a maximum of 63 alphanumeric characters. |
| **Example:** | 
Router(config)# trunk group 20 |
| **Step 4** max-calls {any | data | voice} number [direction [in | out]] | Defines the maximum number of dial-in or DDR data calls, or voice calls (incoming or outgoing) that can be accepted.  
- any—Assigns the maximum number of calls that the trunk group can handle, regardless of the call type.  
- data—Assigns the maximum number of data calls to the trunk group.  
- voice—Assigns the maximum number of voice calls to the trunk group.  
- number—Specifies number of allowed calls. Range is from 0 to 1000.  
- direction—(Optional) Specifies direction of calls.  
- in—(Optional) Allows only incoming calls.  
- out—(Optional) Allows only outgoing calls. |
| **Example:** | 
Router(config-trunk-group)# max-calls data 100 direction out |

**Examples**

See the following sample configurations for the **max-calls** command:

- This example configuration for trunk group 1 accepts up to a maximum of 7 dial-in data or DDR calls and places no restriction on voice calls:
  
  trunk group 1  
  max-calls data 7  

- This sample configuration for trunk group 2 accepts up to a maximum of 2 data dial-in, 3 DDR calls, and 16 voice calls in any direction:
  
  trunk group 2  
  max-calls data 2 direction in  
  max-calls data 3 direction out  
  max-calls voice 16
- This sample configuration for trunk group 3 accepts up to a maximum of 10 incoming voice and dial-in data calls.

```
trunk group 3
max-calls any 10 direction in
```

**Disabling Integrated Services**

When the `isdn integrate calltype all` command is removed from the interface, the `isdn incoming-voice voice` setting is restored and the interface returns to voice mode. Use the following procedure to remove the integrated services option from the interface.

1. `enable`
2. `configure terminal`
3. `interface serial slot/port:timeslot`
4. `shutdown`
5. `no isdn integrate calltype all`
6. `no shutdown`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>

</tbody>
</table>
How to Configure Integrated Data and Voice Services for ISDN PRI Interfaces

Configuring MLPP Call Preemption over Outgoing Voice Calls

This feature adds support for multilevel precedence and preemption (MLPP) for dial-on-demand routing (DDR) backup calls over outgoing voice calls.

Precedence designates the priority level that is associated with a call. Preemption designates the process of terminating lower-precedence calls so that a call of higher precedence can be extended. DDR backup is used to provide backup to a WAN link using any DDR or a dial-capable interface, like ISDN PRI interfaces.

From the gateway, voice and DDR backup calls are controlled by different entities.
- The preemption level of an outgoing voice call is determined using the selected outbound POTS dial peer.
- The preemption level of a DDR backup call is determined using the dialer map class.

A DDR backup call with higher precedence preempts the active outgoing voice call with a lower precedence if the idle B channel is not available from a trunk group during the DDR backup call setup. If MLPP is not configured, data calls wait for a free channel.

Perform the following tasks to configure call preemption:
- **Enabling Preemption on the Trunk Group**, page 14
- **Defining a Dialer Map Class and Setting the Preemption Level**, page 16
- **Associating the Class Parameter on the Dialer Interface**, page 17
- **Disabling TDM Hairpinning on the Voice Card**, page 20
- **Configuring the POTS Dial Peer for Outgoing Voice Calls**, page 21
- **Troubleshooting Tips for Integrated Data and Voice Services**, page 22

### Enabling Preemption on the Trunk Group

A trunk group is used as a common channel resource pool for idle channel allocation for outgoing voice calls and DDR backup calls. Multiple ISDN PRI interfaces that have been configured for integrated services are assigned to this trunk group to build up a channel resource pool for both voice and data calls. Enabling preemption on the trunk group allows DDR call preemption over a voice call per trunk group.

#### Note

If the trunk group channel resource pool is not shared between voice and DDR calls, you should not enable preemption on the trunk group.
The tone timer defines the expiry timer for the preemption tone for the outgoing voice call, which is being preempted by a DDR backup call. When the tone timer expires, the call is disconnected.

Use the following procedure to create a trunk group resource pool and enable preemption on the trunk group.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **trunk group name**
4. **preemption enable**
5. **preemption tone timer seconds**
6. **preemption guard timer value**

**DETAILED STEPS**

--- | ---
**Step 5** |  
**preemption tone timer seconds** | Defines the expiry time for the preemption tone for the outgoing call being preempted by a DDR backup call.  
- **seconds**—Expiry time, in seconds. The range is 4 to 30. The default value is 10.  

**Example:**  
Router(config-trunk-group)# preemption tone timer 20

**Step 6** |  
**preemption guard timer value** | Defines the guard timer for the DDR call to allow time to clear the last call from the channel.  
- **value**—Guard timer, in milliseconds. The range is 60 to 500. When preemption is enabled on the trunk group, the default value is 60.

**Example:**  
Router(config-trunk-group)# preemption guard timer 60

---

### Defining a Dialer Map Class and Setting the Preemption Level

During dial-on-demand routing (DDR) call setup, an idle B channel is selected from the trunk group. The trunk group and preemption level are configured as part of a map class, which can be attached to a dialer map or dialer string. By default, the preemption level of dialer calls is set to the lowest level (routine) to disable the MLPP service for a DDR call.

Use the following procedure to define a map class for the dialer interface.

**SUMMARY STEPS**

1. enable  
2. configure terminal  
3. map-class dialer *class-name*  
4. dialer trunkgroup *label*  
5. dialer preemption level {flash-overide | flash | immediate | priority | routine}

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
</tbody>
</table>
**enable** | Enables privileged EXEC mode.  
- Enter your password if prompted.  

**Example:**  
Router> enable

| **Step 2** |  
**configure terminal** | Enters global configuration mode.  

**Example:**  
Router# configure terminal
### Command or Action

**Step 3**

map-class dialer class-name

**Example:**

Router(config)# map-class dialer dial1

**Purpose:**

Defines a class of shared configuration parameters associated with the `dialer map` command for outgoing calls from an ISDN interface. The class name is a unique class identifier.

- **class-name**—Unique class identifier.

**Step 4**

dialer trunkgroup label

**Example:**

Router(config-map-class)# dialer trunkgroup 20

**Purpose:**

Defines the dial-on-demand trunk group label.

- **label**—Unique name for the dialer interface trunk group. Valid names contain a maximum of 63 alphanumeric characters.

**Step 5**

dialer preemption level \{flash-override | flash | immediate | priority | routine\}

**Example:**

Router(config-map-class)# dialer preemption level flash

**Purpose:**

Defines the preemption level of the DDR call on the dialer interface. The default is `routine`.

- **flash-override**—Level 0 (highest)
- **flash**—Level 1
- **immediate**—Level 2
- **priority**—Level 3
- **routine**—Level 4 (lowest)

---

**Associating the Class Parameter on the Dialer Interface**

The trunk group preemption level is configured as part of a map class, which can be attached to a dialer map or dialer string.

- For legacy DDR, configure the dialer interface to associate the class parameter with the `dialer in-band` and `dialer map` commands.
- For dialer profiles, configure the dialer interface to associate the class parameter with the `dialer pool` and `dialer string` commands.

Use the following procedure to associate the class parameter on the dialer interface.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface dialer dialer-rotary-group-number
4. dialer in-band [no-parity | odd-parity]
   or
   dialer pool number
5. dialer map protocol-keyword protocol-next-hop-address [name host-name] [speed 56 | speed 64] [broadcast] class dialer-map-class-name [dial-string[:isdn-subaddress]]
   or
   dialer string dial-string [class class-name]

interface Dialer10
  ip address 192.168.254.1 255.255.255.0
dialer pool 1
dialer remote-name is2811
dialer string 4081234 class test
dialer-group 1

  map-class dialer test
dialer trunkgroup 1
dialer preemption level flash-override

Disabling TDM Hairpinning on the Voice Card

For TDM-only calls, or for calls that are hairpinned, the preemption tone is not heard as the DSPs are dropped. For this reason, you must disable TDM hairpinning on the voice card to use the MLPP DDR backup call preemption feature.

Use the following procedure to disable TDM hairpinning on the voice card.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice-card slot
4. no local-bypass

DETAILED STEPS

How to Configure Integrated Data and Voice Services for ISDN PRI Interfaces

Configuring the POTS Dial Peer for Outgoing Voice Calls

The preemption level of an outgoing voice call is defined from the outbound POTS dial peer. The preemption level defines the preemption priority level of an outgoing voice call. Use the following procedure to set the preemption level for outgoing voice calls on a POTS dial peer.

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice tag pots
4. trunkgroup name {preference number}
5. preemption level {flash-override | flash | immediate | priority | routine}

DETAILED STEPS

<tr>
<td>Step 3 dial-peer voice tag pots</td>
<td>Defines a particular dial peer, specifies the method of voice encapsulation, and enters dial-peer configuration mode.</td>
</tr>
<tr>
<td>Example: Router(config)# dial-peer voice 25 pots</td>
<td>• tag—Digits that define a particular dial peer. The range is from 1 to 2147483647.</td>
</tr>
<tr>
<td></td>
<td>• pots—Indicates that this is a POTS peer that uses VoIP encapsulation on the IP backbone.</td>
</tr>
</tbody>
</table>
Integrating Data and Voice Services for ISDN PRI Interfaces on Multiservice Access Routers

Troubleshooting Tips for Integrated Data and Voice Services

ISDN call failures are most commonly attributed to the following issues:

- Dial-on-demand routing (DDR)
- ISDN layers 1, 2 and 3
- Point-to-Point Protocol (PPP): including link control protocol (LCP), Authentication, or IP Control Protocol (IPCP) related issues.

Use the following commands to troubleshoot integrated data and voice for ISDN interfaces:

- `debug dialer events` — Used to display debugging information about the packets received on a dialer interface.
- `debug isdn q931` — Used to check outgoing dial-peer matching for an ISDN incoming call. Enable this command on both sides of the call. The output indicates whether the messages are generated by the calling party router (indicated by TX ->) or by the called party router (indicated by RX <-).
- `debug tgrm inout` — Used to check voice or DDR channel selection request and return status. From the output, you can determine what type of call enabled the preemption and which timeslot is selected from which trunkgroup.
- `debug voip ccapi individual 146` — Used to troubleshoot the call control application programming interface (CCAPI) contents. The `individual 146` command option is used to log call preemption indication information.
- `debug voip ccapi inout` — Used to show how a call flows through the system. From the output, you can see the call setup and teardown operations performed on both the telephony and network call legs.
- `show call history voice | i Cause` — Used to gather DisconnectCause information from the `show call history voice` command line display.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>trunkgroup name [preference-number]</code></td>
<td>Defines the trunk group associated with this dial peer.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-dial-peer)# trunkgroup 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>`preemption level (flash-override</td>
<td>flash</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-dial-peer)# preemption level flash</td>
<td></td>
</tr>
</tbody>
</table>

Note: The `preemption level flash-override` setting can prevent the call to be preempted by a DDR call.
• **show isdn active** and **show isdn status**—Used to show the active data and voice calls.

• **show trunk group**—Used to check the preemption active or pending calls counter for MLPP preemption calls. The output shows the number of active channels from the trunkgroup and the current preemption levels. If a data call with a higher priority initiates the preemption of a voice call, it is shown as pending against the higher priority preemption level.

### Configuration Examples for Integrating Data and Voice Services for ISDN PRI Interfaces

This section provides the following configuration examples:

- **MLPP DDR Backup Call Preemption over Voice Call: Example**, page 23
- **Legacy DDR (Dialer Map): Example**, page 29
- **Dialer Profiles: Example**, page 30
- **Maximum Number of Data and Voice Calls on the Dial-Out Trunk Group: Example**, page 32
- **Dial-Peer Configuration: Example**, page 35

### MLPP DDR Backup Call Preemption over Voice Call: Example

The following example shows that preemption is enabled on the trunk group, the trunk group is associated with a map class, and the preemption level is set on the dialer interface.

integrating data and voice services for ISDN PRI interfaces on multiservice access routers

configuration examples for integrating data and voice services for ISDN PRI interfaces

---

Dialer Profiles: Example

The following example shows how to associate the class parameter for dialer profiles.

Router# show running-config

Building configuration...

Current configuration : 1689 bytes

! version 12.3
! service timestamps debug datetime msec
! service timestamps log datetime msec
! no service password-encryption
! hostname host3

---

Prior to configuring the dialer profiles, you need to set up the PRI interface and associate the PRI timeslots. Here’s an example configuration:

```plaintext

pri-group timeslots 1-24
controller T1 1/1
framing sf

Maximum Number of Data and Voice Calls on the Dial-Out Trunk Group: Example

The following sample configuration shows a maximum number of 500 data and voice calls configured on the trunk group, includes all B channels in the trunk group, and associates dialer test with the trunk group.

Dial-Peer Configuration: Example

Data dial peers enable the configuration and order assignment of dial peers so that the gateway can identify incoming calls as voice or data. The incoming called number specifies the number associated with the data dial peer. The following example shows a configuration for the voice and data dial-peers and incoming called number.

```
Router# show running-config

Command Reference

This section documents the following new and modified commands:

New Commands

- `dialer preemption level`
- `dialer trunkgroup`
- `isdn integrate calltype all`
- `preemption enable`
- `preemption guard timer`
• preemption level
• preemption tone timer

Modified Commands
• debug voip ccap
• dial-peer data
• dial-peer search type
• show trunk group
debug voip ccapi

To troubleshoot the call control application programming interface (CCAPI) contents, use the `debug voip ccapi` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
debug voip ccapi [all | default | detail | error [call [informational] | software [informational]] | individual range | inout | function | protoheaders | service]

no debug voip ccapi
```

### Syntax Description

- **all** *(Optional)* Displays all CCAPI debugging messages.
- **default** *(Optional)* Displays CCAPI error and inout information. This option also runs if no keywords are added.
- **detail** *(Optional)* Displays CCAPI background messages.
- **error** *(Optional)* Displays CCAPI error messages. The `debug voip ccapi error` command traces the error logs in the call control API. Error logs are generated during normal call processing, if there are insufficient resources, or if there are problems in the underlying network-specific code, the higher call session application, or the call control API itself.
  - This debug command shows error events or unexpected behavior in system software. Usually no events will be generated.
- **call** *(Optional)* Displays call processing errors.
- **informational** *(Optional)* Displays minor errors and major errors. Without the `informational` keyword, only major errors are displayed.
- **software** *(Optional)* Displays software errors.
- **individual** *(Optional)* Enables individual CCAPI debug outputs.
  - **range** For the `individual` keyword, the range is an integer value from 1 to 146. For specific range values, see Table 1.
- **inout** *(Optional)* Displays CCAPI in/out functions. The `debug voip ccapi inout` command traces the execution path through the call control API, which serves as the interface between the call session application and the underlying network-specific software. You can use the output from this command to understand how calls are being handled by the router.
  - This command shows how a call flows through the system. Using this debug level, you can see the call setup and teardown operations performed on both the telephony and network call legs.
- **function** *(Optional)* Displays CCAPI function tracing.
- **protoheaders** *(Optional)* Displays CCAPI protocol headers passing information.
- **service** *(Optional)* Logs debug messages that are not call related.

**Examples**

The following examples show output for variations of the `debug voip ccap!` command:

- `debug voip ccap! detail` on the Originating Gateway: Example, page 48
- `debug voip ccap! detail` on the Terminating Gateway: Example, page 49
- `debug voip ccap! inout` on the Originating Gateway: Example, page 51
- `debug voip ccap! service` on the Terminating Gateway: Example, page 55
- `debug voip ccap! individual 146` on the Originating Gateway: Example, page 55

For these examples, the topology shown in Figure 2 is used.

debug voip ccapi
detail on the Originating Gateway: Example

Router# debug voip ccapi detail

voip ccapi detail debugging is on

Router#

*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_api_call_setup_ind_common:
  Interface Type=13, Protocol=0
*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/ccCheckClipClir:
  Calling Party Number Is User Provided
*Apr 18 20:35:35.779: //1/xxxxxxxxxxxx/CCAPI/cc_insert_call_entry:
  Total Call Count=0, Call Entry(Call Count On=FALSE, Incoming Call=TRUE)
*Apr 18 20:35:35.779: //1/xxxxxxxxxxxx/CCAPI/cc_insert_call_entry:
  Total Call Count=1

The following event shows that the CallEntry ID 11 is used for the incoming call leg.

*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_insert_guid_pod_entry:
  Incoming=TRUE, Call Id=11
*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_setupind_registration_lookup:
  Matching Parameters; Called Number=83103, Call Transfer Consult Id=
*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_setupind_registration_lookup:
  No Matching Node
*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/ccCheckClipClir:
  Calling Party Number Is User Provided
*Apr 18 20:35:35.779: //1/xxxxxxxxxxxx/CCAPI/cc_insert_call_entry:
  Total Call Count=1, Call Entry(Call Count On=FALSE, Incoming Call=FALSE)

The following event shows that the incoming call leg with CallEntry ID 11 is bound to the outgoing call leg with CallEntry ID 12.

*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_peer_bind:
  Bind=TRUE, Binder Call Id=11, Bindee Call Id=12

The next event shows that CallEntry ID 12 is used for the outgoing call leg.

*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_insert_guid_pod_entry:
  Incoming=FALSE, Call Id=12
*Apr 18 20:35:35.779: //1/xxxxxxxxxxxx/CCAPI/cc_api_supported_data:
  data_mode=0x10082

The next event shows an IP address for a remote device on the outgoing call leg, which indicates that this is the VoIP call leg.

*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_incr_if_call_volume:
  Remote IP Address=172.16.13.81, Hwidb=FastEthernet0/0
*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/cc_incr_if_call_volume:
  Total Call Count=1, Voip Call Count=1, MMoip Call Count=0
*Apr 18 20:35:35.779: //1/ABCE697D8005/CCAPI/ccCallGetContext:
  Context=0x652C0168, Call Id=11
*Apr 18 20:36:31.419: //1/ABCE697D8005/CCAPI/ccCallDisconnect:
  Start Calling Accounting;
  Call Entry(Incoming=TRUE)
*Apr 18 20:36:31.419: //1/ABCE697D8005/CCAPI/ccCallDisconnect:
  Cause Value=16, Call Entry(Disconnect Cause=16)
*Apr 18 20:36:31.419: //1/ABCE697D8005/CCAPI/ccCallDisconnect:
  Call Entry(Disconnect Cause=16)
At this point, the CallEntry ID changes as the call accounting process begins. The accounting data is sent over the outgoing call leg. The GUID, which identifies the unique call, remains the same.

*Apr 18 20:36:31.419: //12/ABCE697D8005/CCAPI/ccCallDisconnect:
  Start Calling Accounting;
  Call Entry(Incoming=FALSE)
*Apr 18 20:36:31.419: //12/ABCE697D8005/CCAPI/ccCallDisconnect:
  Cause Value=16, Call Entry(Disconnect Cause=0)

The change of the CallEntry ID indicates that the call is using the incoming call leg, which is the POTS call leg in this case.

*Apr 18 20:36:31.423: //11/ABCE697D8005/CCAPI/ccCallGetVoipFlag:
  Data Bitmask=0x1, Call Id=11
*Apr 18 20:36:31.423: //11/ABCE697D8005/CCAPI/ccCallGetVoipFlag:

voip ccapi service debugging is on

*May 1 19:08:41.803: //-1/xxxxxxxxxxxx/CCAPI/cc_setupind_match_search:
  Searching Node;
  Called Number=3600, Call Transfer Consult Id=

This debug shows noncall related events. In this case, information about the timer is shown.

*May 1 19:08:48.027: //-1/xxxxxxxxxxxx/CCAPI/cc_handle_periodic_timer:
  Calling The Callback, ccTimerctx=0x63B368C0
*May 1 19:08:48.027: //-1/xxxxxxxxxxxx/CCAPI/ccTimerStart:
  ccTimerctx=0x63B368C0
*May 1 19:10:08.615: //-1/xxxxxxxxxxxx/CCAPI/cc_api_icpif:
  ExpectFactor=0xA

dbvoip ccapi individual 146 on the Originating Gateway: Example

This debug shows the preemption tone timer getting initiated.

  PreemptionToneTimer=10(s)
dial-peer data

To create a data dial peer and to enter dial-peer configuration mode, use the `dial-peer data` command in global configuration mode. To remove a data dial peer, use the `no` form of this command.

```
dial-peer data tag pots
no dial-peer data tag
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tag</code></td>
<td>Specifies the dial-peer identifying number. Range is from 1 to 2147483647.</td>
</tr>
<tr>
<td><code>pots</code></td>
<td>Specifies an incoming POTS dial peer.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(13)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.4(4)XC</td>
<td>This command was implemented on the Cisco 2600XM series, Cisco 2800 series, Cisco 3700 series, and Cisco 3800 series.</td>
</tr>
<tr>
<td>12.4(9)T</td>
<td>This command was integrated into Cisco IOS Release 12.4(9)T.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A data dial peer should be defined only for incoming data calls. The `incoming called-number` and `shutdown` commands on the data dial peer are allowed. However, the following POTS dial-peer commands are disabled on a data dial peer:

- `answer-address`
- `carrier-id`
- `destination-pattern`
- `information-type`
- `port`
- `trunk-group-label`

**Examples**

The following example is a data dial-peer configuration:

```
dial-peer data 100 pots
incoming called-number 100
```
The following example is a voice dial-peer configuration:

dial-peer voice 2001 pots
  destination-pattern 2001
  no digit-strip
  port 3/1:1

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>dial-peer search</td>
<td>Optimizes voice or data dial-peer searches.</td>
</tr>
<tr>
<td></td>
<td>incoming called-number</td>
<td>Specifies an incoming called number of an MMoIP or POTS dial peer.</td>
</tr>
<tr>
<td></td>
<td>shutdown (dial peer)</td>
<td>Changes the administrative state of a selected dial peer from up to down.</td>
</tr>
</tbody>
</table>
dial-peer search type

To optimize voice or data dial-peer searches, use the `dial-peer search type` command in global configuration mode. To disable the search parameters, use the `no` form of this command.

```
dial-peer search type {data voice | voice data | none}

no dial-peer search type
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Searches for data dial peers.</td>
</tr>
<tr>
<td>none</td>
<td>Searches for all dial peers by order of input.</td>
</tr>
<tr>
<td>voice</td>
<td>Searches for voice dial peers.</td>
</tr>
</tbody>
</table>

### Command Default

`data` and `voice`

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(13)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.4(4)XC</td>
<td>This command was implemented on the Cisco 2600XM series, Cisco 2800 series, Cisco 3700 series, and Cisco 3800 series.</td>
</tr>
<tr>
<td>12.4(9)T</td>
<td>This command was integrated into Cisco IOS Release 12.4(9)T.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The search defines the search preference explicitly. If the `data` and `voice` keywords are specified, data dial peers are searched first. If no data dial peers are found, the voice dial peers are searched.

### Examples

The following is sample output that shows that data dial peers are searched first. Then voice dial peers are searched if no data dial peers can be matched for an incoming call:

```
dial-peer search type data voice
```

The following is sample output that shows that voice dial peers are searched first. Then data dial peers are searched if no voice dial peers can be matched for an incoming call:

```
dial-peer search type voice data
```

### Related Commands

</table>
dialer preemption level

To set the precedence for voice calls to be preempted by a dial-on-demand routing (DDR) call for the
dialer map, use the **dialer preemption level** command in map-class dialer configuration mode. To
remove the preemption setting, use the **no** form of this command.

```
dialer preemption level {flash-overwrite | flash | immediate | priority | routine}
```

```
no dialer preemption level {flash-overwrite | flash | immediate | priority | routine}
```

**Syntax Description**

- **flash-overwrite**: Sets the precedence for DDR calls to preemption level 0 (highest).
- **flash**: Sets the precedence for DDR calls to preemption level 1.
- **immediate**: Sets the precedence for DDR calls to preemption level 2.
- **priority**: Sets the precedence for DDR calls to preemption level 3.
- **routine**: Sets the precedence for DDR calls to preemption level 4 (lowest). This is the default.

**Command Default**
The preemption level default is **routine** (lowest).

**Command Modes**
Map-class dialer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.4(4)XC</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.4(9)T</td>
<td>This command was integrated into Cisco IOS Release 12.4(9)T.</td>
</tr>
</tbody>
</table>

**Examples**
The following example sets a preemption level of priority (level 3) for the dialer map-class dial1.
```
Router(config)# map-class dialer dial1
Router(config-map-class)# dialer preemption level priority
```

**Related Commands**

<td>Defines the expiry time for the preemption tone for the outgoing call being preempted by a DDR backup call.</td>
</tr>
</tbody>
</table>
**dialer trunkgroup**

To define the dial-on-demand trunk group label for the dialer interface, use the `dialer trunkgroup` command in map-class dialer configuration mode. To remove the trunk group label, use the `no` form of this command.

```
dialer trunkgroup label
no dialer trunkgroup label
```

**Syntax Description**

- `label` Unique name for the dialer interface trunk group. Valid names contain a maximum of 63 alphanumeric characters.

**Command Default**

No dialer trunk group is defined.

**Command Modes**

Map-class dialer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</tbody>
</table>
**isdn integrate calltype all**

To enable integrated mode on an ISDN PRI interface, use the `isdn integrate calltype all` command in interface configuration mode. To disable integrated mode, use the `no` form of this command.

```
isdn integrate calltype all
no isdn integrate calltype all
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Integrated mode is disabled on the interface.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.4(4)XC</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.4(9)T</td>
<td>This command was integrated into Cisco IOS Release 12.4(9)T.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Configure this command from a PRI interface only. This command is not supported from a BRI interface. Any incoming calls from an interface that has been configured for integrate calltype all is rejected with cause-code **invalid number 0x1C** if inbound dial-peer is not selected.

**Examples**

In the following example, the interface is shut down.

```
Router(config)# interface Serial4/1:15
Router(config-if)# shutdown
```

In the following example, integrated mode is enabled.

```
Router(config)# interface Serial4/1:15
Router(config-if)# isdn integrate calltype all
% This command line will enable the Serial Interface to "integrated service" mode.
% The "isdn incoming-voice voice" setting will be removed from the interface.
% Continue? [confirm]

When you confirm, the default incoming-voice configuration is removed from the interface, and the interface is now in integrated service mode. The interface does not reset back to voice mode if an incoming call is originated from the interface.

In the following example, the interface is set to active.

```
Router(config)# interface Serial4/1:15
Router(config-if)# no shutdown
```

</table>

### Examples

The following set of commands configures a 20-second preemption tone timer on trunk group dial2.

```
Router(config)# trunk group dial2
Router(config-trunk-group)# preemption enable
Router(config-trunk-group)# preemption tone timer 20
```

The default value is 10 seconds. To change back to the default value, enter the following command:

```
Router(config-trunk-group)# default preemption tone timer
```

show trunk group

To display one or more trunk groups, use the **show trunk group** command in privileged EXEC mode.

```
show trunk group [name | sort {ascending | descending}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(Optional) Trunk group to display.</td>
</tr>
<tr>
<td>sort</td>
<td>(Optional) Sorts the output by trunk group number, in ascending or descending order.</td>
</tr>
<tr>
<td>ascending</td>
<td>Specifies ascending display order for the trunk groups. This is the default.</td>
</tr>
<tr>
<td>descending</td>
<td>Specifies descending display order for the trunk groups.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

**Usage Guidelines**

Use the **name** argument to display the information for a specific trunk group.

Use the **sort** keyword to display all the trunk groups in either ascending or descending order.

**Examples**

The following sample output shows that for trunk group 1, preemption is enabled, with a preemption tone timer of 10 seconds, and the preemption level is flash.

```
Router# show trunk group 1
Trunk group: 1
  Description:
  trunk group label: 1
  Translation profile (Incoming):
  Translation profile (Outgoing):
  Preemption is enabled
  Preemption Tone Timer is 10 seconds
  Preemption Guard Timer is 60 milliseconds
  Hunt Scheme is least-used
  Max Calls (Incoming): NOT-SET (Any) NOT-SET (Voice) NOT-SET
  (Data)
```
Max Calls (Outgoing): NOT-SET (Any) NOT-SET (Voice) NOT-SET (Data)
Retries: 0

Trunk Se0/3/0:15 Preference DEFAULT
Member Timeslots : 1-5
Total channels available : 5
Data = 0, Voice = 0, Modem = 0, Pending = 0, Free = 5

Trunk Se0/3/1:15 Preference DEFAULT
Member Timeslots : 1-2
Total channels available : 0
Data = 0, Voice = 0, Modem = 0, Pending = 0, Free = 0

Trunk Se1/0/0:15 Preference DEFAULT
Member Timeslots : 1-31
Total channels available : 0
Data = 0, Voice = 0, Modem = 0, Pending = 0, Free = 0

Trunk Se1/0/1:15 Preference DEFAULT
Member Timeslots : 1-10
Total channels available : 0
Data = 0, Voice = 0, Modem = 0, Pending = 0, Free = 0

Total calls for trunk group: Data = 0, Voice = 0, Modem = 0
Pend = 0, Free = 5

Preemption Call Type: Active Pending
Flash-Override NA 0
Flash 0 0
Immediate 0 0
Priority 0 0
Routine 0 0
Total 0 0

Active preemption call-type shows the number of calls of each priority level which can be preempted by higher preemption level calls.

Pending preemption call-type shows the number of calls of each priority level which are pending for the completion of call preemption.

advertise_flag 0x00000000, capacity timer 25 sec tripl_config_mask 0x00000000

Feature Information for Integrating Data and Voice Services for ISDN PRI Interfaces

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

The following table lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release. Unless noted otherwise, subsequent releases of that Cisco IOS software release also support that feature.

<table>

Glossary

**multi-level precedence and preemption (MLPP)**—A service that allows placement of priority calls. Precedence designates the priority level that is associated with a call. Preemption designates the process of terminating lower-precedence calls so that a call of higher precedence can be extended.

See *Internetworking Terms and Acronyms* for terms not included in this glossary.
