

## Configuring Network Access to the GGSN

---

This chapter describes how to configure access from the gateway GPRS support node (GGSN) to a serving GPRS support node (SGSN), public data network (PDN), and optionally to a Virtual Private Network (VPN). It also includes information about configuring access points on the GGSN.

For a complete description of the GGSN commands in this chapter, refer to the *Cisco GGSN Release 5.2 Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

This chapter includes the following sections:

- [Configuring an Interface to the SGSN, page 7-1](#) (Required)
- [Configuring a Route to the SGSN, page 7-5](#) (Required)
- [Configuring Access Points on the GGSN, page 7-10](#) (Required)
- [Configuring Access to External Support Servers, page 7-36](#) (Optional)
- [Configuring Virtual APN Access on the GGSN, page 7-36](#) (Optional)
- [Blocking Access to the GGSN by Foreign Mobile Stations, page 7-43](#) (Optional)
- [Controlling Access to the GGSN by MSs with Duplicate IP Addresses, page 7-46](#) (Optional)
- [Configuring Routing Behind the Mobile Station on an APN, page 7-47](#) (Optional)
- [Configuration Examples, page 7-50](#)

### Configuring an Interface to the SGSN

To establish access to an SGSN, you must configure an interface to the SGSN. In general packet radio service/Universal Mobile Telecommunication System (GPRS/UMTS), the interface between the GGSN and the SGSN is referred to as the *Gn interface*. GGSN Release 4.0 and later supports both a 2.5G and 3G Gn interface.

On the Cisco 7200 series router platform, this interface is a physical one. On the Catalyst 6500 series switch / Cisco 7600 series Internet router platform, this interface is logical one (on which IEEE 802.1Q encapsulation has been configured) to the Layer 3 routed Gn VLAN configured on the Supervisor/Multilayer Switch Feature Card 2 (MSFC2).

For more information about the Gn VLAN on the Supervisor/MSFC2, see [Catalyst 6500 / Cisco 7600 Series Platform Prerequisites, page 2-2](#).

For more information about configuring interfaces, see the *Cisco IOS Interface Configuration Guide* and the *Cisco IOS Interface Command Reference*.

### Configuring Physical Interfaces

The type of physical interface that you configure on the GGSN depends on whether you are supporting an SGSN that is collocated with a GGSN, or an enterprise GGSN that is connected to the SGSN through a WAN interface.

When a GGSN is collocated with the SGSN, the physical interface is frequently configured for Fast Ethernet. The supported WAN interfaces for a remote SGSN include T1/E1, T3/E3, and Frame Relay. For information on configuring WAN interfaces, see the *Cisco IOS Interface Configuration Guide* and the *Cisco IOS Interface Command Reference*.

To configure a physical Gn interface to the SGSN that supports Fast Ethernet on a Cisco 7200 series router, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>interface</b> <i>type slot/port</i>	Defines a physical interface on the GGSN, where <i>type</i> is <b>fastethernet</b> , and <i>slot/port</i> is the hardware slot and port on the interface.
Step 2	Router(config-if)# <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]	Specifies an IP address for the interface, where: <ul style="list-style-type: none"> <li><i>ip-address</i>—Specifies the IP address of the interface in dotted decimal format.</li> <li><i>mask</i>—Specifies a subnet mask in dotted decimal format.</li> <li><b>secondary</b>—Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul>

### Configuring 802.1Q-Encapsulated Subinterfaces

To configure a subinterface that supports IEEE 802.1Q encapsulation to the Gn VLAN, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>interface gigabitethernet</b> <i>slot/port.subinterface-number</i>	Specifies the subinterface on which IEEE 802.1Q will be used.
Step 2	Router(config-if)# <b>encapsulation dot1q</b> <i>vlanid</i>	Defines the encapsulation format as IEEE 802.1Q (dot1q), and specifies the VLAN identifier.
Step 3	Router(config-if)# <b>ip address</b> <i>ip-address mask</i>	Sets a primary IP address for an interface.

## Verifying the Interface Configuration to the SGSN

### Cisco 7200 Platform

To verify the interface to the SGSN, you can first verify your GGSN configuration and then verify that the interface is available.

- Step 1** To verify that you have properly configured a Gn interface on the GGSN, use the **show running-config** command. The following example is a portion of the output from the command showing the Fast Ethernet 0/0 physical interface configuration (see bold text) as the Gn interface to the SGSN:

```
GGSN# show running-config
Building configuration...

Current configuration : 2875 bytes
!
version 12.2
. . .
!
interface FastEthernet0/0
  description Gn interface to SGSN
  ip address 10.10.1.3 255.255.255.0
  no ip mroute-cache
  duplex full
. . .
```

- Step 2** To verify that a physical interface is available, use the **show ip interface brief** command. The following example shows that the Fast Ethernet 0/0 interface (see bold text) to the SGSN is in “up” status and that the protocol is also “up”:

```
GGSN# show ip interface brief
Interface                IP-Address      OK? Method Status      Protocol
FastEthernet0/0        10.10.1.3     YES NVRAM  up         up
FastEthernet1/0          10.29.0.2      YES NVRAM   up          up
FastEthernet1/1          10.13.0.2      YES NVRAM   up          up
FastEthernet2/0          unassigned     YES NVRAM   administratively down down
Ethernet6/0              10.99.0.12     YES NVRAM   up          up
Ethernet6/1              unassigned     YES NVRAM   administratively down down
Ethernet6/2              unassigned     YES NVRAM   administratively down down
Ethernet6/3              unassigned     YES NVRAM   administratively down down
Ethernet6/4              unassigned     YES NVRAM   administratively down down
Ethernet6/5              unassigned     YES NVRAM   administratively down down
Ethernet6/6              unassigned     YES NVRAM   administratively down down
Ethernet6/7              10.35.35.2     YES NVRAM   up          up
Virtual-Access1          10.44.44.1     YES TFTP   up          up
Virtual-Template1        10.44.44.1     YES manual down         down
```

## Catalyst 6500 / Cisco 7600 Platform

- Step 1** To verify that you have properly configured a Gn interface on the Supervisor/MSFC2, use the **show running-config** command. The following example is a portion of the output from the command showing the Fast Ethernet 8/22 physical interface configuration (see bold text) as the Gn interface to the SGSN:

```
Sup# show running-config
Building configuration...

Current configuration :12672 bytes
!
version 12.2
...
interface FastEthernet8/22
no ip address
switchport
switchport access vlan 302
!
interface Vlan101
description Vlan to GGSN for GA/GN
ip address 10.1.1.1 255.255.255.0
!
interface Vlan302
ip address 40.0.2.1 255.255.255.0
```

- Step 2** To verify that the physical interface and the Gn VLAN are available, use the **show interface** command on the Supervisor/MSFC2. The following example shows that the Fast Ethernet 8/22 physical interface to the charging gateway is up, as is the Gn VLAN, VLAN 101.

```
Sup# show ip interface brief FastEthernet8/22
Interface                IP-Address      OK? Method Status        Protocol
FastEthernet8/22         unassigned      YES unset  up            up
```

```
Sup# show ip interface brief Vlan302
Interface                IP-Address      OK? Method Status        Protocol
Vlan302                  40.0.2.1        YES TFTP  up            up
```

```
Sup#
```

- Step 3** To verify the Gn VLAN configuration and availability, use the **show vlan name** command on the Supervisor/MSFC2. The following example shows the Gn VLAN Gn\_1:

```
Sup# show vlan name Gn_1

VLAN Name                Status    Ports
-----
302  Gn_1                    active    Gi4/1, Gi4/2, Gi4/3, Gi7/1
                                           Gi7/2, Gi7/3, Fa8/22, Fa8/26

VLAN Type  SAID          MTU   Parent  RingNo BridgeNo Stp    BrdgMode Trans1 Trans2
-----
302  enet    100302       1500  -       -       -       -       -       0       0

Remote SPAN VLAN
-----
Disabled

Primary Secondary Type                Ports
-----
```

- Step 4** On the GGSN, to verify that you have properly configured a Gn subinterface to the Gn VLAN, use the **show running-config** command. The following example is a portion of the output from the command showing a Gigabit Ethernet 0/0.2 physical interface configuration as the Gn interface to the charging gateway:

```
GGSN# show running-config
Building configuration...

Current configuration :7390 bytes
!
! Last configuration change at 16:56:05 UTC Wed Jun 25 2003
! NVRAM config last updated at 23:40:27 UTC Fri Jun 13 2003
!
version 12.3
.....
interface GigabitEthernet0/0.2
  description Ga/Gn Interface
  encapsulation dot1Q 101
  ip address 10.1.1.72 255.255.255.0
  no cdp enable
!
.....
ip route 40.1.2.1 255.255.255.255 10.1.1.1
```

- Step 5** To verify that the subinterface is available, use the **show ip interface brief** command. The following example shows that the Gigabit Ethernet 0/0.2 subinterface to the Gn VLAN is in “up” status and that the protocol is also “up”:

```
GGSN# show ip interface brief GigabitEthernet0/0.2
Interface                IP-Address      OK? Method Status          Protocol
GigabitEthernet0/0.2    10.1.1.72      YES NVRAM   up              up
```

## Configuring a Route to the SGSN

To communicate with the SGSN, you can use static routes or a routing protocol, such as Open Shortest Path First (OSPF).

### Note

For the SGSN to communicate successfully with the GGSN, the SGSN must also configure a static route, or be able to dynamically route to the IP address of the GGSN *virtual template*, not the IP address of a GGSN interface.

The following sections provide some basic commands that you can use to configure a static route or enable OSPF routing on the GGSN. For more information about configuring IP routes, see the *Cisco IOS IP Configuration Guide* and *Cisco IOS IP Command References*.

The following topics are included in this section:

- [Configuring a Static Route to the SGSN, page 7-6](#)
- [Configuring OSPF, page 7-6](#)
- [Verifying the Route to the SGSN, page 7-7](#)

## Configuring a Static Route to the SGSN

A static route establishes a fixed route to the SGSN that is stored in the routing table. If you are not implementing a routing protocol, such as OSPF, then you can configure a static route to the SGSN, to establish the path between network devices.

To configure a static route from an interface to the SGSN, use the following commands, beginning in global configuration mode:

Command	Purpose
<pre>Router(config)# ip route prefix mask {ip-address   interface-type interface-number} [distance] [tag tag] [permanent]</pre>	<p>Configures a static IP route, where:</p> <ul style="list-style-type: none"> <li>• <i>prefix</i>—Specifies the IP route prefix for the destination. (This is the IP address of the SGSN.)</li> <li>• <i>mask</i>—Specifies the prefix mask for the destination. (This is the subnet mask of the SGSN network.)</li> <li>• <i>ip-address</i>—Specifies the IP address of the next hop that can be used to reach the destination network.</li> <li>• <i>interface-type interface-number</i>—Specifies the network interface type and interface number that can be used to reach the destination network. (This is an interface on the GGSN for the Gn interface.)</li> <li>• <i>distance</i>—Specifies an administrative distance for the route.</li> <li>• <b>tag tag</b>—Specifies a tag value that can be used as a “match” value for controlling redistribution via route maps.</li> <li>• <b>permanent</b>—Specifies that the route will not be removed, even if the interface shuts down.</li> </ul>

## Configuring OSPF

As with other routing protocols, enabling OSPF requires that you create an OSPF routing process, specify the range of IP addresses to be associated with the routing process, and assign area IDs to be associated with that range of IP addresses.

### Note

On the Catalyst 6500 / Cisco 7600 platform, the OSPF routing process is configured on the Supervisor/MSFC2 to advertise only the GPRS tunneling protocol (GTP) server load balancing (SLB) virtual server and the GGSN virtual template addresses.

To configure OSPF, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>router ospf</b> <i>process-id</i>	Enables OSPF routing, and enters router configuration mode, where <i>process-id</i> specifies an internally used identification parameter for an OSPF routing process.  The <i>process-id</i> is locally assigned and can be any positive integer. A unique value is assigned for each OSPF routing process.
Step 2	Router(config-router)# <b>network</b> <i>ip-address wildcard-mask area</i> <i>area-id</i>	Defines an interface on which OSPF runs and defines the area ID for that interface, where: <ul style="list-style-type: none"> <li>• <i>ip-address</i>—Specifies the IP address to be associated with the OSPF network area.</li> <li>• <i>wildcard-mask</i>—Specifies the IP address mask that includes “don’t care” bits for the OSPF network area.</li> <li>• <i>area-id</i>—Specifies the area that is to be associated with the OSPF address range. It can be specified as either a decimal value or as an IP address. If you intend to associate areas with IP subnets, you can specify a subnet address as the area ID.</li> </ul>

## Verifying the Route to the SGSN

To verify the route to the SGSN, you can first verify your GGSN configuration and then verify that a route has been established.

### Cisco 7200 Platform

- Step 1** To verify the GGSN configuration, use the **show running-config** command and verify the static route that you configured to the SGSN or your OSPF configuration. The following example shows a partial configuration of an OSPF configuration for the 10.10.0.0 network (see bold text toward the end of the example) using the Fast Ethernet 0/0 interface (see bold text) to the SGSN:

```
GGSN# show running-config
Building configuration...

Current configuration : 2875 bytes
!
version 12.2
. . .
!
interface FastEthernet0/0
description Gn interface to SGSN
ip address 10.10.1.3 255.255.255.0
no ip mroute-cache
duplex full
!
interface FastEthernet6/0
ip address 172.16.43.243 255.255.255.240
no ip mroute-cache
duplex half
!
```

```

!
interface loopback 1
 ip address 10.11.11.1 255.255.255.0
!
interface Virtual-Template1
 ip unnumber loopback 1
 encapsulation gtp
!
router ospf 1
  log-adjacency-changes
  network 10.10.0.0 0.0.255.255 area 0
!
ip default-gateway 172.16.43.241
ip classless
ip route 10.22.22.1 255.255.255.255 FastEthernet2/0
ip route 192.64.0.0 255.0.0.0 172.16.43.241
ip route 172.16.0.0 255.255.0.0 172.16.43.241
no ip http server
no ip pim bidir-enable
. . .

```

**Step 2** To verify that the GGSN has established a route to the SGSN, use the **show ip route** command, as shown in bold in the following example:

```

GGSN# show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

    10.11.11.0/24 is subnetted, 1 subnets
C       10.11.11.0 is directly connected, Virtual-Access1
    172.16.0.0/16 is variably subnetted, 1 subnets, 2 masks
S       172.16.0.0/16 [1/0] via 172.16.43.241
C       172.16.43.243/28 is directly connected, FastEthernet6/0
    10.0.0.0/24 is subnetted, 1 subnets
O       10.10.1.0 [110/2] via 10.10.1.3, 00:00:10, FastEthernet0/0
C       10.10.1.0 is directly connected, FastEthernet0/0

```

---

### Catalyst 6500 / Cisco 7600 Platform

---

**Step 1** To verify the Supervisor/MSFC2 configuration, use the **show running-config** command and verify the route that you configured to the SGSN. The following example shows a partial configuration of a configuration to the SGSN:

```

Sup# show running-config
Building configuration...

Current configuration :3642 bytes
!
version 12.3
...
ip slb vserver V0-GGSN
 virtual 10.10.10.10 udp 3386 service gtp

```

```
!
vlan 101
  name Internal_Gn/Ga
!
vlan 302
  name Gn_1
!
vlan 303
  name Ga_1
!
interface FastEthernet8/22
  no ip address
  switchport
  switchport access vlan 302
!
interface FastEthernet8/23
  no ip address
  switchport
  switchport access vlan 302
!
interface FastEthernet8/24
  no ip address
  switchport
  switchport access vlan 303
!
interface Vlan101
  description Vlan to GGSN for GA/GN
  ip address 10.1.1.1 255.255.255.0
!
interface Vlan302
  ip address 40.0.2.1 255.255.255.0
!
interface Vlan303
  ip address 40.0.3.1 255.255.255.0
!
router ospf 300
  log-adjacency-changes
  summary-address 9.9.9.0 255.255.255.0
  redistribute static subnets route-map GGSN-routes
  network 40.0.2.0 0.0.0.255 area 300
  network 40.0.3.0 0.0.0.255 area 300
!
ip route 9.9.9.42 255.255.255.255 10.1.1.42
ip route 9.9.9.43 255.255.255.255 10.1.1.43
ip route 9.9.9.44 255.255.255.255 10.1.1.44
ip route 9.9.9.45 255.255.255.255 10.1.1.45
ip route 9.9.9.46 255.255.255.255 10.1.1.46
ip route 9.9.9.72 255.255.255.255 10.1.1.72
ip route 9.9.9.73 255.255.255.255 10.1.1.73
ip route 9.9.9.74 255.255.255.255 10.1.1.74
ip route 9.9.9.75 255.255.255.255 10.1.1.75
ip route 9.9.9.76 255.255.255.255 10.1.1.76
!
access-list 1 permit 9.9.9.0 0.0.0.255
!
route-map GGSN-routes permit 10
  match ip address 1
```

**Step 2** To verify the GGSN configuration, use the **show running-config** command. The following example shows a partial configuration of a configuration to the SGSN:

```
Sup# show running-config
Building configuration...

Current configuration :3642 bytes
!
version 12.3
!
...

interface GigabitEthernet0/0
 no ip address
!

interface GigabitEthernet0/0.2
 description Ga/Gn Interface
 encapsulation dot1Q 101
 ip address 10.1.1.72 255.255.255.0
 no cdp enable
!
ip route 40.1.2.1 255.255.255.255 10.1.1.1
ip route 40.2.2.1 255.255.255.255 10.1.1.1
ip route 40.1.3.10 255.255.255.255 10.1.1.1
ip route 40.2.3.10 255.255.255.255 10.1.1.1
```

**Step 3** To verify that the Supervisor/MSFC2 has established a route to the SGSN, use the **show ip route** command as shown in bold in the following examples:

```
Sup# show ip route ospf 300
9.0.0.0/8 is variably subnetted, 12 subnets, 2 masks
O      9.9.9.0/24 is a summary, 1wld, Null0
!
```

```
Sup# show ip route 9.9.9.72
Routing entry for 9.9.9.72/32
  Known via "static", distance 1, metric 0
  Redistributing via ospf 300
  Routing Descriptor Blocks:
    * 10.1.1.72
      Route metric is 0, traffic share count is 1
!
```

## Configuring Access Points on the GGSN

Successful configuration of access points on the GGSN requires careful consideration and planning to establish the appropriate access for mobile sessions to external PDNs and private networks.

The following topics are included in this section:

- [Overview of Access Points, page 7-11](#)
- [Basic Access Point Configuration Task List, page 7-12](#)
- [Configuring Real Access Points on the GGSN, page 7-14](#)
- [Configuring Other Access Point Options, page 7-25](#)
- [Verifying the Access Point Configuration, page 7-30](#)

Configuration of access points on the GGSN also requires properly establishing communication with any supporting DHCP and RADIUS servers that you might be using to provide dynamic IP addressing and user authentication functions at the access point.

Details about configuring other services such as DHCP and RADIUS for an access point are discussed in the “[Configuring Dynamic Addressing on the GGSN](#)” and “[Configuring Security on the GGSN](#)” chapters.

## Overview of Access Points

This section includes the following topics:

- [Description of Access Points in a GPRS/UMTS Network, page 7-11](#)
- [Access Point Implementation on the Cisco GGSN, page 7-12](#)

## Description of Access Points in a GPRS/UMTS Network

The GPRS and UMTS standards define a network identity called an access point name (APN). An APN identifies the part of the network where a user session is established. In the GPRS/UMTS backbone, the APN serves as a reference to a GGSN. An APN is configured on and accessible from a GGSN in a GPRS/UMTS network.

An APN can provide access to a public data network (PDN), or a private or corporate network. An APN also can be associated with certain types of services such as Internet access or a Wireless Application Protocol (WAP) service.

The APN is provided by either the mobile station (MS) or by the SGSN to the GGSN in a Create PDP Context request message when a user requests a session to be established.

To identify an APN, a logical name is defined that consists of two parts:

- **Network ID**—A mandatory part of the APN that identifies the external network to which a GGSN is connected. The network ID can be a maximum of 63 bytes and must contain at least one label. A network ID of more than one label is interpreted as an Internet domain name. An example of a network ID might be “corporate.com.”
- **Operator ID**—An optional part of the APN that identifies the public land mobile network (PLMN) in which a GGSN is located. The operator ID contains three decimal-separated labels; the last label must be “gprs.” An example of an operator ID might be “mnc10.mcc200.gprs.”

When the operator ID exists, it is placed after the network ID, and it corresponds to the Domain Name System (DNS) name of a GGSN. The maximum length of an APN is 100 bytes. When the operator ID does not exist, a default operator ID is derived from the mobile network code (MNC) and mobile country code (MCC) information contained in the international mobile subscriber identity (IMSI).

## Access Point Implementation on the Cisco GGSN

Configuring access points is one of the central configuration tasks on the Cisco GGSN. Proper configuration of access points is essential to successful implementation of the GGSN in the GPRS/UMTS network.

To configure APNs, the Cisco GGSN software uses the following configuration elements:

- Access point list—Logical interface that is associated with the virtual template of the Cisco GGSN. The access point list contains one or more access points.
- Access point—Defines an APN and its associated access characteristics, including security and method of dynamic addressing. An access point on the Cisco GGSN can be a virtual or real access point.
- Access point index number—Integer assigned to an APN that identifies the APN within the GGSN configuration. Several GGSN configuration commands use the index number to reference an APN.
- Access group—An additional level of router security on the router that is configured at an access point to control access to and from a PDN. When an MS is permitted access to the GGSN as defined by a traditional IP access list, the IP access group further defines whether access is permitted to the PDN (at the access point). The IP access group configuration can also define whether access from a PDN to an MS is permitted.

### Access Point Types on the GGSN

Cisco IOS GGSN Release 3.0 and later support the following access point types:

- Real—Uses real access point types to configure the GGSN for direct access to a particular target network through an interface. The GGSN always uses real access points to reach an external network.
- Virtual—Uses virtual access point types to consolidate access to multiple target networks through a virtual APN access point at the GGSN. Because the GGSN always uses real access points to reach an external network, virtual access points should be used in combination with real access points on the GGSN.

Cisco IOS GGSN Release 1.4 and earlier only support real access points.

GGSN Release 3.0 and later support virtual access point types to address provisioning issues in the PLMN. For more information about configuring virtual access point access to the GGSN from the PLMN, see the [“Configuring Virtual APN Access on the GGSN”](#) section on page 7-36.

## Basic Access Point Configuration Task List

This section describes the basic tasks that are required to configure an access point on the GGSN. Detailed information about configuring access points for specialized functions such as for virtual APN access are described in separate sections of this chapter.

To configure an access point on the GGSN, perform the following basic tasks:

- [Configuring the GPRS Access Point List on the GGSN, page 7-13](#) (Required)
- [Creating an Access Point and Specifying Its Type on the GGSN, page 7-13](#) (Required)

## Configuring the GPRS Access Point List on the GGSN

The GGSN software requires that you configure an entity called an *access point list*. You configure the GPRS access point list to define a collection of virtual and real access points on the GGSN.

When you configure the access point list in global configuration mode, the GGSN software automatically associates the access point list with the virtual template interface of the GGSN. Therefore, the GGSN supports only a single access point list.

### Note

Be careful to observe that the GPRS access point list and an IP access list are different entities in the Cisco IOS software. A GPRS access point list defines access points and their associated characteristics, and an IP access list controls the allowable access on the router by IP address. You can define permissions to an access point by configuring both an IP access list in global configuration and configuring the **ip-access-group** command in your access point configuration.

To configure the GPRS access point list and configure access points within it, use the following command, beginning in global configuration mode:

Command	Purpose
Router(config)# <b>gprs access-point-list</b> <i>list-name</i>	Specifies a name for a new access point list, or references the name of the existing access point list, and enters access-point list configuration mode.

## Creating an Access Point and Specifying Its Type on the GGSN

You need to define access points within an access point list on the GGSN. Therefore, before you can create an access point, you must define a new access point list or specify the existing access point list on the GGSN to enter access-point list configuration mode.

When you create an access point, you must assign an index number to the access point, specify the domain name (network ID) of the access point, and specify the type of access point (virtual or real). Other options that you can configure for an access point are summarized in the [“Configuring Other Access Point Options”](#) section on page 7-25.

To create an access point and specify its type, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>gprs access-point-list</b> <i>list-name</i>	Specifies a name for a new access point list, or references the name of the existing access point list, and enters access-point list configuration mode.
Step 2	Router(config-ap-list)# <b>access-point</b> <i>access-point-index</i>	Specifies an index number for a new access point definition, or references an existing access point definition, and enters access point configuration mode.

	Command	Purpose
Step 3	Router (config-access-point)# <b>access-point-name</b> <i>apn-name</i>	Specifies the network (or domain) name for a PDN that users can access from the GGSN at a defined access point.  <b>Note</b> The <i>apn-name</i> must match the APN that has been provisioned at the MS, home location register (HLR), and DNS server.
Step 4	Router (config-access-point)# <b>access-type</b> { <b>virtual</b>   <b>real</b> }	(Optional) Specifies the type of access point. The available options are: <ul style="list-style-type: none"> <li><b>virtual</b>—APN type that is not associated with any specific physical target network on the GGSN.</li> <li><b>real</b>—APN type that corresponds to an interface to an external network on the GGSN. This is the default value.</li> </ul>

## Configuring Real Access Points on the GGSN

The GGSN uses real access points to communicate to PDNs or private networks that are available over a Gi interface on the GGSN. Use real access point types to configure the GGSN for direct access to a particular target network through an interface.

If you have configured a virtual access point, you must also configure real access points to reach the target networks.

The GGSN supports configuration of access points to public data networks and to private networks. The following sections describe how to configure different types of real access points:

- [PDN Access Configuration Task List, page 7-14](#)
- [VPN Access Using VRF Configuration Task Lists, page 7-16](#)

### PDN Access Configuration Task List

Configuring a connection to a public PDN includes the following tasks:

- [Configuring an Interface to a PDN \(Gi interface\) \(Required\)](#)
- [Configuring an Access Point for a PDN \(Required\)](#)

#### Configuring an Interface to a PDN

To establish access to a PDN in the GPRS/UMTS network, you must configure an interface on the GGSN to connect to the PDN. This interface is referred to as the *Gi interface*.

On the Cisco 7200 series router platform, this interface is a physical one. On the Catalyst 6500 series switch / Cisco 7600 series Internet router platform, this interface is a logical one (on which IEEE 802.1Q encapsulation has been configured) to a Layer 3 routed Gi VLAN configured on the Supervisor/MSFC2.

For more information about the Gi VLAN on the Supervisor/MSFC2, see [“Catalyst 6500 / Cisco 7600 Series Platform Prerequisites” section on page 2-2](#).

For more information about configuring interfaces, see the *Cisco IOS Interface Configuration Guide* and the *Cisco IOS Interface Command Reference*.

### Configuring Physical Interfaces

To configure a physical interface to the PDN using Fast Ethernet over the Gi interface (Cisco 7200 series router platform), use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>interface</b> <i>type slot/port</i>	Defines a physical interface on the GGSN, where <i>type</i> is <b>fastethernet</b> , and <i>slot/port</i> is the hardware slot and port on the interface.
Step 2	Router(config-if)# <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]	Specifies an IP address for the interface, where: <ul style="list-style-type: none"> <li>• <i>ip-address</i>—Specifies the IP address of the interface in dotted decimal format.</li> <li>• <i>mask</i>—Specifies a subnet mask in dotted decimal format.</li> <li>• <b>secondary</b>—Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul>

#### Note

If you are using VPN routing and forwarding (VRF) for VPN access, you must enable Cisco Express Forwarding (CEF) switching on the GGSN. If you enable CEF switching at the global configuration level, then it is automatically enabled for each interface unless it has been specifically disabled at the interface.

### Configuring 802.1Q-Encapsulated Subinterfaces

To configure a subinterface that supports IEEE 802.1Q encapsulation to the Gi VLAN, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>interface gigabitethernet</b> <i>slot/port.subinterface-number</i>	Specifies the subinterface on which IEEE 802.1Q will be used.
Step 2	Router(config-if)# <b>encapsulation dot1q</b> <i>vlanid</i>	Defines the encapsulation format as IEEE 802.1Q (dot1q), and specifies the VLAN identifier.
Step 3	Router(config-if)# <b>ip address</b> <i>ip-address mask</i>	Sets a primary IP address for an interface.

## Configuring an Access Point for a PDN

To configure an access point for a PDN, you must define a real access point in the GPRS access point list.

To configure a real access point on the GGSN, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>gprs access-point-list</b> <i>list-name</i>	Specifies a name for a new access-point list, or references the name of an existing access-point list, and enters access-point list configuration mode.
Step 2	Router(config-ap-list)# <b>access-point</b> <i>access-point-index</i>	Specifies an index number for a new access point definition, or references an existing access point definition, and enters access point configuration mode.
Step 3	Router(config-access-point)# <b>access-point-name</b> <i>apn-name</i>	Specifies the network (or domain) name for a PDN that users can access from the GGSN at a defined access point.  <b>Note</b> The <i>apn-name</i> must match the APN that has been provisioned at the MS, HLR, and DNS server.
Step 4	Router(config-access-point)# <b>access-type</b> <b>real</b>	Specifies an APN type that corresponds to an interface to an external network on the GGSN. This is the default value.

For an example of a GPRS access point configuration, see the [“Access Point List Configuration Example”](#) section on page 7-52.

## VPN Access Using VRF Configuration Task Lists

The Cisco IOS GGSN software supports connectivity to a VPN using VPN routing and forwarding (VRF).

The GGSN software provides a couple of ways that you can configure access to a VPN, depending on your platform, network configuration over the Gi interface between the GGSN and your PDNs, and the VPN that you want to access.

### Note

VRF is not supported on the Catalyst 6500 / Cisco 7600 Supervisor II / MSFC2; therefore, if using the Supervisor II, you must tunnel encapsulated VRF traffic through the Supervisor via a generic routing encapsulation (GRE) tunnel from the GGSN to the PDN. For more information on configuring a tunnel, see the [“Configuring Access to a VPN With a Tunnel”](#) section on page 7-22.

The Catalyst 6500 / Cisco 7600 Sup720 supports VRF.

To configure VPN access using VRF on the GGSN, perform the following tasks:

- [Enabling CEF Switching, page 7-17](#) (Required)
- [Configuring a VRF Routing Table on the GGSN, page 7-17](#) (Required)
- [Configuring a Route to the VPN Using VRF, page 7-17](#) (Required)

- [Configuring an Interface to a PDN Using VRF, page 7-19](#) (Required)
- [Configuring Access to a VPN, page 7-21](#) (Required)

For sample configurations, see the “[VRF Tunnel Configuration Example](#)” section on page 7-52.

## Enabling CEF Switching

When you enable CEF switching globally on the GGSN, all interfaces on the GGSN are automatically enabled for CEF switching.

### Note

To ensure that CEF switching functions properly, wait a short time before enabling CEF switching after it has been disabled using the **no ip cef** command.

To enable CEF switching for all interfaces on the GGSN, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>ip cef</b>	Enables CEF on the route processor card.
Step 2	Router(config)# <b>gprs gtp ip udp ignore checksum</b>	Disables verification of the UDP checksum to support CEF switching on the GGSN.

## Configuring a VRF Routing Table on the GGSN

To configure a VRF routing table on the GGSN, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>ip vrf</b> <i>vrf-name</i>	Configures a VRF routing table, and enters VRF configuration mode.
Step 2	Router(config-vrf)# <b>rd</b> <i>route-distinguisher</i>	Creates routing and forwarding tables for a VRF and specifies the default route distinguisher for a VPN.

## Configuring a Route to the VPN Using VRF

Be sure that a route exists between the GGSN and the private network that you want to access. You can verify connectivity by using the **ping** command from the GGSN to the private network address. To configure a route, you can use a static route or a routing protocol.

### Configuring a Static Route Using VRF

To configure a static route using VRF, use the following command, beginning in global configuration mode:

Command	Purpose
<pre>Router(config)# <b>ip route vrf</b> vrf-name prefix mask [next-hop-address] [interface {interface-number}] [<b>global</b>] [distance] [<b>permanent</b>] [<b>tag</b> tag]</pre>	<p>Configures a static IP route, where:</p> <ul style="list-style-type: none"> <li>• <i>vrf-name</i>—Specifies the name of the VPN routing/forwarding instance (VRF) for the static route.</li> <li>• <i>prefix</i>—Specifies the IP route prefix for the destination.</li> <li>• <i>mask</i>—Specifies the prefix mask for the destination.</li> <li>• <i>next-hop-address</i>—Specifies the IP address of the next hop that can be used to reach the destination network.</li> <li>• <i>interface interface-number</i>—Specifies the network interface type and interface number that can be used to reach the destination network.</li> <li>• <b>global</b>—Specifies that the given next hop address is in the non-VRF routing table.</li> <li>• <i>distance</i>—Specifies an administrative distance for the route.</li> <li>• <b>permanent</b>—Specifies that the route will not be removed, even if the interface shuts down.</li> <li>• <b>tag tag</b>—Specifies a tag value that can be used as a “match” value for controlling redistribution via route maps.</li> </ul>

### Verifying a Static Route Using VRF

To verify that the GGSN has established the static VRF route that you configured, use the **show ip route vrf** privileged EXEC command as shown in the following example:

```
GGSN# show ip route vrf vpn1 static
      172.16.0.0/32 is subnetted, 1 subnets
U       172.16.0.1 [1/0] via 0.0.0.0, Virtual-Access2
      10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
S       10.100.0.3/32 [1/0] via 10.110.0.13
```

### Configuring an OSPF Route Using VRF

To configure an OSPF route using VRF, use the following command, beginning in global configuration mode:

Command	Purpose
Router(config)# <b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	<p>Enables OSPF routing, and enters router configuration mode, where,</p> <ul style="list-style-type: none"> <li><i>process-id</i>—Specifies an internally used identification parameter for an OSPF routing process. The <i>process-id</i> is locally assigned and can be any positive integer. A unique value is assigned for each OSPF routing process.</li> <li><b>vrf</b> <i>vrf-name</i>—Specifies the name of the VPN routing/forwarding instance.</li> </ul>

### Configuring an Interface to a PDN Using VRF

To establish access to a PDN, an interface on the GGSN to connect to the PDN. This interface is referred to as the Gi interface.

On the Cisco 7200 series router platform, this interface is physical. On the Catalyst 6500 series switch / Cisco 7600 series Internet router platform, this interface is a logical one (on which IEEE 802.1Q encapsulation has been configured) to a Layer 3 routed Gi VLAN configured on the Supervisor/MSFC2.

For more information about the Gi VLAN on the Supervisor/MSFC2, see [“Catalyst 6500 / Cisco 7600 Series Platform Prerequisites” section on page 2-2](#).

For more information about configuring interfaces, see the *Cisco IOS Interface Configuration Guide* and the *Cisco IOS Interface Command Reference*.

#### Configuring Physical Interfaces

To configure a physical interface to the PDN using Fast Ethernet over the Gi interface, use the following commands, beginning in global configuration mode:

Command	Purpose
<b>Step 1</b> Router(config)# <b>interface</b> <i>type slot/port</i>	Defines a physical interface on the GGSN, where <i>type</i> is <b>fastethernet</b> , and <i>slot/port</i> is the hardware slot and port on the interface.

	Command	Purpose
Step 2	Router(config-if)# <b>ip vrf forwarding</b> <i>vrf-name</i>	Associates a VRF with an interface or subinterface.  <b>Note</b> The <i>vrf-name</i> argument should match the name of the VRF that you configured using the <b>ip vrf</b> command.
Step 3	Router(config-if)# <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]	Specifies an IP address for the interface, where: <ul style="list-style-type: none"> <li>• <i>ip-address</i>—Specifies the IP address of the interface in dotted decimal format.</li> <li>• <i>mask</i>—Specifies a subnet mask in dotted decimal format.</li> <li>• <b>secondary</b>—Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul>

**Note** If you are using VRF for VPN access, you must enable CEF switching on the GGSN. If you enable CEF switching at the global configuration level, then it is automatically enabled for each interface unless it has been specifically disabled at the interface.

#### Configuring 802.1Q-Encapsulated Subinterfaces

To configure a subinterface that supports IEEE 802.1Q encapsulation to the Gi VLAN, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>interface gigabitethernet</b> <i>slot/port.subinterface-number</i>	Specifies the subinterface on which IEEE 802.1Q will be used.
Step 2	Router(config-if)# <b>encapsulation dot1q</b> <i>vlanid</i>	Defines the encapsulation format as IEEE 802.1Q (dot1q), and specifies the VLAN identifier.
Step 3	Router(config-if)# <b>ip address</b> <i>ip-address mask</i>	Sets a primary IP address for an interface.

## Configuring Access to a VPN

After you have completed the prerequisite configuration tasks on the Cisco 7200 platform, you can configure access to a VPN with a tunnel or without a tunnel.

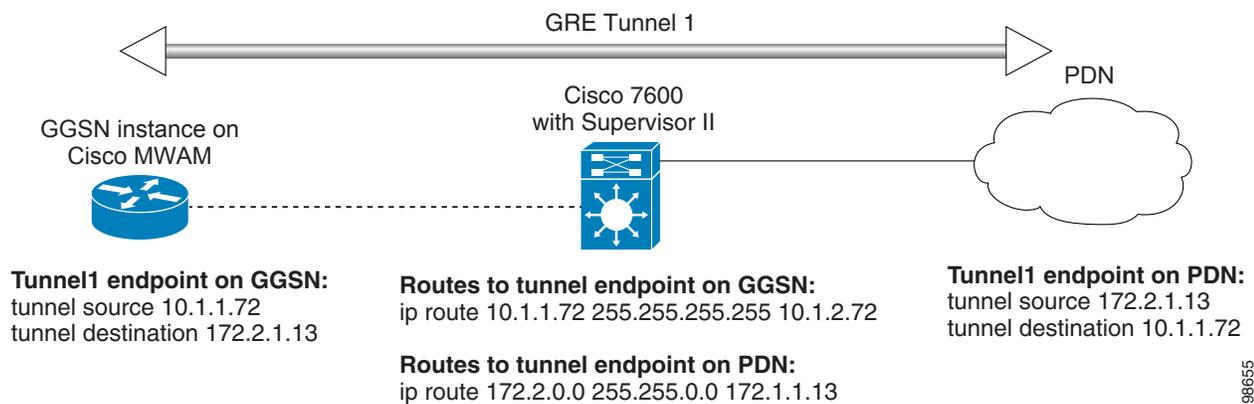

VRF is not supported on the Catalyst 6500 / Cisco 7600 Supervisor II / MSFC2; therefore, if using the Supervisor II, you must tunnel encapsulated VRF traffic through the Supervisor via a generic routing encapsulation (GRE) tunnel from the GGSN to the PDN.

**Note**

The Catalyst 6500 / Cisco 7600 Sup720 supports VRF.

Figure 7-1 is a logical view of a GRE tunnel configured between the VRF-aware GGSN and PDN, which tunnels the encapsulated VRF information through the “VRF-unaware” Supervisor II / MSFC2.

**Figure 7-1 Tunnel Configuration from the GGSN to PDN through the Catalyst 6500 / Cisco 7600 Supervisor II**

The following sections describe the different methods you can use to configure access to a VPN:

- [Configuring Access to a VPN Without a Tunnel](#)
- [Configuring Access to a VPN With a Tunnel](#)

**Note**

With GGSN Release 5.0 and later, you can assign multiple APNs to the same VRF.

### Configuring Access to a VPN Without a Tunnel

On the Cisco 7200 platform, if you configure more than one Gi interface to different PDNs, and need to access a VPN off one of those PDNs, then you can configure access to that VPN without configuring an IP tunnel. To configure access to the VPN in this case, you need to configure the `vrf` access point configuration command.

**Note**

The Catalyst 6500 / Cisco 7600 Supervisor II / MSFC2 does not support VRF; therefore, you must tunnel VRF traffic through the Supervisor via a GRE tunnel as described in the “[Configuring Access to a VPN With a Tunnel](#)” section on page 7-22.

To configure access to a VPN in the GPRS access point list, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>gprs access-point-list</b> <i>list-name</i>	Specifies a name for a new access point list, or references the name of the existing access point list, and enters access-point list configuration mode.
Step 2	Router(config-ap-list)# <b>access-point</b> <i>access-point-index</i>	Specifies an index number for a new access point definition, or references an existing access point definition, and enters access point configuration mode.
Step 3	Router(config-access-point)# <b>access-point-name</b> <i>apn-name</i>	Specifies the network (or domain) name for a PDN that users can access from the GGSN at a defined access point.  <b>Note</b> The <i>apn-name</i> must match the APN that has been provisioned at the MS, HLR, and Domain Name System (DNS) server.
Step 4	Router(config-access-point)# <b>access-type real</b>	Specifies an APN type that corresponds to an interface to an external network on the GGSN. This is the default value.
Step 5	Router(config-access-point)# <b>vrf</b> <i>vrf-name</i>	Configures VRF at a GGSN access point and associates the access point with a particular VRF instance.
Step 6	Router(config-access-point)# <b>exit</b>	Exits access point configuration mode.

For information about the other access point configuration options, see the “[Configuring Other Access Point Options](#)” section on page 7-25.

#### Configuring Access to a VPN With a Tunnel

If you have only a single Gi interface to a PDN from which you need to access one or more VPNs, or if you are configuring access to a VPN via VRF on the Catalyst 6500 / Cisco 7600 platform, you can configure an IP tunnel to access those private networks. On the Catalyst 6500 / Cisco 7600 platform, you configure the tunnel to tunnel the VRF traffic through the Supervisor/MSFC2, which does not support VRF.

To configure access to the VPN using a tunnel, perform the following tasks:

- [Configuring the VPN Access Point](#) (Required)
- [Configuring the IP Tunnel](#) (Required)

**Configuring the VPN Access Point**

To configure access to a VPN in the GPRS access point list, use the following commands, beginning in global configuration mode:

	<b>Command</b>	<b>Purpose</b>
<b>Step 1</b>	Router(config)# <b>gprs access-point-list</b> <i>list-name</i>	Specifies a name for a new access point list, or references the name of the existing access point list, and enters access-point list configuration mode.
<b>Step 2</b>	Router(config-ap-list)# <b>access-point</b> <i>access-point-index</i>	Specifies an index number for a new access point definition, or references an existing access point definition, and enters access point configuration mode.
<b>Step 3</b>	Router(config-access-point)# <b>access-point name</b> <i>apn-name</i>	Specifies the access point network ID, which is commonly an Internet domain name.  <b>Note</b> The <i>apn-name</i> must match the APN that has been provisioned at the MS, HLR, and DNS server.
<b>Step 4</b>	Router(config-access-point)# <b>access-mode</b> { <b>transparent</b>   <b>non-transparent</b> }	(Optional) Specifies whether the GGSN requests user authentication at the access point to a PDN. The available options are: <ul style="list-style-type: none"> <li>• <b>transparent</b>—No security authorization or authentication is requested by the GGSN for this access point. This is the default value.</li> <li>• <b>non-transparent</b>—GGSN acts as a proxy for authenticating.</li> </ul>
<b>Step 5</b>	Router(config-access-point)# <b>access-type real</b>	Specifies an APN type that corresponds to an interface to an external network on the GGSN. This is the default value.
<b>Step 6</b>	Router(config-access-point)# <b>ip-address-pool</b> { <b>dhcp-proxy-client</b>   <b>radius-client</b>   <b>local</b> <i>pool-name</i>   <b>disable</b> }	(Optional) Specifies a dynamic address allocation method using IP address pools for the current access point. The available options are: <ul style="list-style-type: none"> <li>• <b>dhcp-proxy-client</b>—DHCP server provides the IP address pool.</li> <li>• <b>radius-client</b>—RADIUS server provides the IP address pool.</li> <li>• <b>local</b>—Specifies that a local pool provides the IP address. This option requires configuration of a local pool using the <b>ip local pool</b> global configuration command.</li> <li>• <b>disable</b>—Turns off dynamic address allocation.</li> </ul> <b>Note</b> If you are using a dynamic address allocation method, then you must configure this command according to the appropriate IP address pool source.

	Command	Purpose
Step 7	Router(config-access-point)# <b>vrf</b> <i>vrf-name</i>	Configures VPN routing and forwarding at a GGSN access point and associates the access point with a particular VRF instance.
Step 8	Router(config-access-point)# <b>exit</b>	Exits access point configuration mode.

For information about the other access point configuration options, see the “[Configuring Other Access Point Options](#)” section on page 7-25.

### Configuring the IP Tunnel

When you configure a tunnel, you might consider using loopback interfaces as the tunnel endpoints instead of real interfaces because loopback interfaces are always up.

To configure an IP tunnel to a private network, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>interface</b> <b>tunnel</b> <i>number</i>	Configures a logical tunnel interface number.
Step 2	Router(config-if)# <b>ip vrf forwarding</b> <i>vrf-name</i>	Associates a VRF instance with the interface.
Step 3	Router(config-if)# <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]	Specifies an IP address for the tunnel interface. <b>Note</b> This IP address is not used in any other part of the GGSN configuration.
Step 4	Router(config-if)# <b>tunnel source</b> { <i>ip-address</i>   <i>type number</i> }	Specifies the IP address (or interface type and port or card number) of the Gi interface to the PDN or a loopback interface.
Step 5	Router(config-if)# <b>tunnel destination</b> { <i>hostname</i>   <i>ip-address</i> }	Specifies IP address (or host name) of the private network that you can access from this tunnel.

## Configuring Other Access Point Options

This section summarizes the configuration options that you can specify for a GGSN access point.

Some of these options are used in combination with other global router settings to configure the GGSN. Further details about configuring several of these options are discussed in other topics in this chapter and other chapters of this book.

### Note

Although the Cisco IOS software allows you to configure other access point options on a virtual access point, only the **access-point-name** and **access-type** commands are applicable to a virtual access point.

To configure options for a GGSN access point, use any of the following commands, beginning in access-point list configuration mode:

	Command	Purpose
Step 1	Router(config-ap-list)# <b>access-point</b> <i>access-point-index</i>	Specifies an index number for a new access point definition, or references an existing access point definition, and enters access point configuration mode.
Step 2	Router(config-access-point)# <b>access-point-name</b> <i>apn-name</i>	Specifies the network (or domain) name for a PDN that users can access from the GGSN at a defined access point.  <b>Note</b> The <i>apn-name</i> must match the APN that has been provisioned at the MS, HLR, and DNS server.
Step 3	Router(config-access-point)# <b>aaa-accounting</b> { <b>enable</b>   <b>disable</b> }	Enables or disables accounting for a particular access point on the GGSN.  <b>Note</b> If you have configured a transparent access APN and you want to provide accounting at that APN, you need to configure the <b>aaa-accounting enable</b> command at the APN.

	Command	Purpose
Step 4	Router(config-access-point)# <b>aaa-group</b> { <b>authentication</b>   <b>accounting</b> } <i>server-group</i>	Specifies a default authentication, authorization, and accounting (AAA) server group and assigns the type of AAA services to be supported by the server group for a particular access point on the GGSN, where: <ul style="list-style-type: none"> <li>• <b>authentication</b>—Assigns the selected server group for authentication services on the APN.</li> <li>• <b>accounting</b>—Assigns the selected server group for accounting services on the APN.</li> <li>• <i>server-group</i>—Specifies the name of an AAA server group to be used for AAA services on the APN.</li> </ul> <p><b>Note</b> The name of the AAA server group that you specify must correspond to a server group that you configure using the <b>aaa group server</b> command.</p>
Step 5	Router(config-access-point)# <b>access-type</b> { <b>virtual</b>   <b>real</b> }	(Optional) Specifies the type of access point. The available options are: <ul style="list-style-type: none"> <li>• <b>virtual</b>—APN type that is not associated with any specific physical target network.</li> <li>• <b>real</b>—APN type that corresponds to an interface to an external network on the GGSN. This is the default value.</li> </ul>
Step 6	Router(config-access-point)# <b>access-mode</b> { <b>transparent</b>   <b>non-transparent</b> }	(Optional) Specifies whether the GGSN requests user authentication at the access point to a PDN. The available options are: <ul style="list-style-type: none"> <li>• <b>transparent</b>—No security authorization or authentication is requested by the GGSN for this access point. This is the default value.</li> <li>• <b>non-transparent</b>—GGSN acts as a proxy for authenticating.</li> </ul>
Step 7	Router(config-access-point)# <b>access-violation</b> <b>deactivate-pdp-context</b> }	(Optional) Specifies that a user's session be ended and the user packets discarded when a user attempts unauthorized access to a PDN through an access point.
Step 8	Router(config-access-point)# <b>aggregate</b> { <b>auto</b>   <i>ip-network-prefix</i> {/ <i>mask-bit-length</i>   <i>ip-mask</i> }	(Optional) Configures the GGSN to create an aggregate route in its IP routing table when receiving PDP requests from MSs on the specified network through a particular access point on the GGSN. <p><b>Note</b> The <b>aggregate auto</b> command will not aggregate routes when using local IP address pools.</p>
Step 9	Router(config-access-point)# <b>anonymous user</b> <i>username</i> [ <i>password</i> ]	(Optional) Configures anonymous user access at an access point.

	Command	Purpose
Step 10	Router(config-access-point)# <b>block-foreign-ms</b>	(Optional) Restricts GGSN access at a particular access point based on the mobile user's home PLMN.
Step 11	Router(config-access-point)# <b>dhcp-gateway-address</b> <i>ip-address</i>	(Optional) Specifies a DHCP gateway to handle DHCP requests for mobile station (MS) users entering a particular PDN access point.
Step 12	Router(config-access-point)# <b>dhcp-server</b> { <i>ip-address</i> } [ <i>ip-address</i> ] [ <b>vrf</b> ]	(Optional) Specifies a primary (and backup) DHCP server to allocate IP addresses to MS users entering a particular PDN access point.
Step 13	Router(config-access-point)# <b>dns primary</b> <i>ip-address</i> <b>secondary</b> <i>ip-address</i>	(Optional) Specifies a primary (and backup) DNS to be sent in Create PDP Context responses at the access point.  For more information about configuring the DNS for an access point, see the <a href="#">“Configuring the NBNS and DNS Address for an APN”</a> section on page 11-15.
Step 14	Router(config-access-point)# <b>gtp pdp-context single</b> <b>pdp-session</b> [ <b>mandatory</b> ]	(Optional) Configures the GGSN to delete the primary PDP context, and any associated secondary PDP contexts, of a <i>hanging</i> PDP session upon receiving a new create request from the same MS that shares the same IP address of the hanging PDP context.  A hanging PDP context is a PDP context on the GGSN whose corresponding PDP context on the SGSN has already been deleted for some reason.  When a hanging PDP session occurs and the <b>gtp pdp-context single pdp-session</b> command is not configured, if the same MS (on the same APN) sends a new Create PDP Context request that has a different NSAPI but has been assigned the same IP address used by the hanging PDP session, the GGSN rejects the new Create PDP Context request.  When configure without the <b>mandatory</b> keyword specified, this feature applies only to those users for whom the Cisco vendor-specific attribute (VSA) “gtp-pdp-session=single-session” has been defined in their RADIUS user profile.  To enable this feature and apply it to all users on an APN regardless of their RADIUS user profiles, specify the <b>mandatory</b> keyword option.  <b>Note</b> This feature is supported on the Cisco 7200 series platform.
Step 15	Router(config-access-point)# <b>gtp response-message</b> <b>wait-accounting</b>	(Optional) Configures the GGSN to wait for a RADIUS accounting response before sending a Create PDP Context response to the SGSN.

Command	Purpose
<b>Step 16</b> Router(config-access-point)# <b>ip-access-group</b> <i>access-list-number</i> { <b>in</b>   <b>out</b> }	(Optional) Specifies access permissions between an MS and a PDN through the GGSN at a particular access point, where <i>access-list-number</i> specifies the IP access list definition to be used at the access point. The available options are: <ul style="list-style-type: none"> <li>• <b>in</b>—Applies the IP access list definition from the PDN to the MS.</li> <li>• <b>out</b>—Applies the IP access list definition from the MS to the PDN.</li> </ul> <b>Note</b> To disable the sending of ICMP messages, ensure that the <b>no ip unreachable</b> interface configuration command has been configured on the virtual template interface.
<b>Step 17</b> Router(config-access-point)# <b>ip-address-pool</b> { <b>dhcp-proxy-client</b>   <b>radius-client</b>   <b>local</b> <i>pool-name</i>   <b>disable</b> }	(Optional) Specifies a dynamic address allocation method using IP address pools for the current access point. The available options are: <ul style="list-style-type: none"> <li>• <b>dhcp-proxy-client</b>—DHCP server provides the IP address pool.</li> <li>• <b>radius-client</b>—RADIUS server provides the IP address pool.</li> <li>• <b>local</b>—Specifies that a local pool provides the IP address. This option requires that a local pool has been configured using the <b>ip local pool</b> global configuration command.</li> <li>• <b>disable</b>—Turns off dynamic address allocation.</li> </ul> <b>Note</b> If you are using a dynamic address allocation method, then you must configure this command according to the appropriate IP address pool source.
<b>Step 18</b> Router(config-access-point)# <b>ip probe path</b> <i>ip_address protocol udp</i> [ <b>port</b> <i>port</i> <b>t1</b> <i>t1</i> ]	(Optional) Enables the GGSN to send a probe packet to a specific destination for each PDP context that is successfully established on an APN.
<b>Step 19</b> Router(config-access-point)# <b>msisdn suppression</b> [ <i>value</i> ]	(Optional) Specifies that the GGSN overrides the mobile station ISDN (MSISDN) number with a pre-configured value in its authentication requests to a RADIUS server.
<b>Step 20</b> Router(config-access-point)# <b>nbns primary</b> <i>ip-address</i> <b>secondary</b> <i>ip-address</i>	(Optional) Specifies a primary (and backup) NetBIOS Name Service (NBNS) to be sent in the Create PDP Context responses to at the access-point.  For more information about configuring the NBNS for an access point, see the <a href="#">“Configuring the NBNS and DNS Address for an APN”</a> section on page 11-15.

	Command	Purpose
<b>Step 21</b>	Router(config-access-point)# <b>ppp-regeneration</b> [ <b>max-session</b> <i>number</i> ] [ <b>setup-time</b> <i>seconds</i> ]	(Optional) Enables an access point to support PPP regeneration, where: <ul style="list-style-type: none"> <li>• <b>max-session</b> <i>number</i>—Specifies the maximum number of PPP regenerated sessions allowed at the access point. The default value is device dependent and is determined by the maximum number of IDBs that can be supported by the router.</li> <li>• <b>setup-time</b> <i>seconds</i>—Specifies the maximum amount of time (between 1 and 65535 seconds) within which a PPP regenerated session must be established. The default value is 60 seconds.</li> </ul>
<b>Step 22</b>	Router(config-access-point)# <b>ppp-regeneration</b> <b>verify-domain</b>	(Optional) Configures the GGSN to verify the domain sent in the protocol configuration option (PCO) IE sent in a Create PDP Context request against the APN sent out by the user when PPP-regeneration is being used. <p><b>Note</b> If a mismatch occurs, the Create PDP Context request is rejected with the cause code “Service not supported.”</p> <p><b>Note</b> The <b>ppp-regeneration fix-domain</b> and <b>ppp-regeneration verify-domain</b> configurations are exclusive. When <b>ppp-regeneration fix-domain</b> is configured, domain verification cannot be performed.</p>
<b>Step 23</b>	Router(config-access-point)# <b>ppp-regeneration</b> <b>fix-domain</b>	(Optional) Configures the GGSN to use the access point name as the domain name with which it initiates an L2TP tunnel to the user when PPP-regeneration is being used. <p><b>Note</b> The <b>ppp-regeneration fix-domain</b> and <b>ppp-regeneration verify-domain</b> configurations are mutually exclusive. When <b>ppp-regeneration fix-domain</b> is configured, domain verification cannot be performed.</p>
<b>Step 24</b>	Router(config-access-point)# <b>radius attribute</b> <b>acct-session-id charging-id</b>	(Optional) Specifies that the charging ID in the Acct-Session-ID (attribute 44) is included in access requests.
<b>Step 25</b>	Router(config-access-point)# <b>radius attribute</b> <b>nas-id</b> <i>format</i>	(Optional) Specifies that the GGSN sends the NAS-Identifier in access requests at the APN where <i>format</i> is a string sent in attribute 32 containing an IP address (%i), a host name (%h), and a domain name (%d).
<b>Step 26</b>	Router(config-access-point)# <b>radius attribute</b> <b>suppress imsi</b>	(Optional) Specifies that the GGSN suppress the 3GPP-IMSI number in its authentication and accounting requests to a RADIUS server.
<b>Step 27</b>	Router(config-access-point)# <b>radius attribute</b> <b>suppress qos</b>	(Optional) Specifies that the GGSN suppress the 3GPP-GPRS-Qos Profile in its authentication and accounting requests to a RADIUS server.

	Command	Purpose
Step 28	Router(config-access-point)# <b>radius attribute suppress sgsn-address</b>	(Optional) Specifies that the GGSN suppress the 3GPP-GPRS-SGSN-Address in its authentication and accounting requests to a RADIUS server.
Step 29	Router(config-access-point)# <b>radius attribute user-name msisdn</b>	(Optional) Specifies that the MSISDN is included in the User-Name (attribute 1) field in access requests.
Step 30	Router(config-access-point) <b>redirect all ip ip address</b>	(Optional) Specifies that all traffic be redirected to a specific IP address.
Step 31	Router(config-access-point) <b>redirect intermobile ip ip address</b>	(Optional) Specifies that mobile-to-mobile traffic be redirected.
Step 32	Router(config-access-point) <b>security verify {source   destination}</b>	Specifies that the GGSN verify the source or destination address in Transport Protocol Data Units (TPDUs) received from a Gn interface.
Step 33	Router(config-access-point)# <b>session idle-time number</b>	(Optional) Specifies the time (between 1 and 168 hours) that the GGSN waits before purging idle mobile sessions for the current access point.
Step 34	Router(config-access-point) # <b>subscription-required</b>	(Optional) Specifies that the GGSN checks the value of the selection mode in a PDP context request to determine if a subscription is required to access a PDN through the access point.
Step 35	Router(config-access-point)# <b>vrf vrf-name</b>	(Optional) Configures VPN routing and forwarding at a GGSN access point and associates the access point with a particular VRF instance.

## Verifying the Access Point Configuration

This section describes how to verify that you have successfully configured access points on the GGSN, and includes the following tasks:

- [Verifying the GGSN Configuration, page 7-31](#)
- [Verifying Reachability of the Network Through the Access Point, page 7-34](#)

## Verifying the GGSN Configuration

To verify that you have properly configured access points on the GGSN, use the **show running-config** command and the **show gprs access-point** commands.

### Note

The **gprs access-point-list** command first appears in the output of the **show running-config** command under the virtual template interface, which indicates that the GPRS access point list has been configured and is associated with the virtual template. To verify your configuration of specific access points within the GPRS access point list, look further down in the **show** command output where the **gprs access-point-list** command appears again, followed by the individual access point configurations.

- Step 1** From global configuration mode, use the **show running-config** command as shown in the following example for the Cisco 7200 series platform. Verify that the **gprs access-point-list** command appears under the virtual template interface, and verify the individual access point configurations within the **gprs access-point-list** section of the output as shown in bold:

```
GGSN# show running-config

```

**Step 2** To view the configuration of a specific access point on the GGSN in further detail, use the **show gprs access-point** command and specify the index number of the access point, as shown in the following example:

```

GGSN# show gprs access-point 2
  apn_index 2          apn_name = gprt.cisco.com
  apn_mode: transparent
  apn-type: Real
  accounting: Disable
  wait_accounting: Disable
  dynamic_address_pool: not configured
  apn_dhcp_server: 0.0.0.0
  apn_dhcp_gateway_addr: 0.0.0.0
  apn_authentication_server_group:
  apn_accounting_server_group:
  apn_username: , apn_password:
  subscribe_required: No
  deactivate_pdp_context_on_violation: No
  network_activation_allowed: No
  Block Foreign-MS Mode: Disable
  VPN: Disable
  GPRS vaccess interface: Virtual-Access1
  number of ip_address_allocated 0

Total number of PDP in this APN :1

aggregate:
In APN:    Disable

In Global: Disable

```

**Step 3** To view a summary of every access point that is configured on the GGSN, use the **show gprs access-point all** command as shown in the following example:

```

GGSN# show gprs access-point all

There are 3 Access-Points configured

Index  Mode           Access-type  AccessPointName  VRF Name
-----
1      non-transparent Real         gprs.cisco.com
-----
2      transparent    Real         gprr.cisco.com
-----
3      non-transparent Real         gprr.cisco.com
-----

```

## Verifying Reachability of the Network Through the Access Point

The following procedure provides a basic methodology for verifying reachability from the MS to the destination network.

### Note

Many factors can affect whether you can successfully reach the destination network. Although this procedure does not attempt to fully address those factors, it is important for you to be aware that your particular configuration of the APN, IP routing, and physical connectivity of the GGSN, can affect end-to-end connectivity between a host and an MS.

To verify that you can reach the network from the MS, perform the following steps:

- Step 1** From the MS (for example, using a handset), create a PDP context with the GGSN by specifying the APN to which you want to connect. In this example, you specify the APN *gpirt.cisco.com*.
- Step 2** From global configuration mode on the GGSN, use the **show gprs access-point** command and verify the number of created network PDP contexts (in the Total number of PDP in this APN output field).

The following example shows one successful PDP context request:

```
GGSN# show gprs access-point 2
  apn_index 2          apn_name = gpirt.cisco.com
  apn_mode: transparent
  apn-type: Real
  accounting: Disable
  wait_accounting: Disable
  dynamic_address_pool: not configured
  apn_dhcp_server: 0.0.0.0
  apn_dhcp_gateway_addr: 0.0.0.0
  apn_authentication_server_group:
  apn_accounting_server_group:
  apn_username: , apn_password:
  subscribe_required: No
  deactivate_pdp_context_on_violation: Yes
  network_activation_allowed: No
  Block Foreign-MS Mode: Disable
  VPN: Disable
  GPRS vaccess interface: Virtual-Access1
  number of ip_address_allocated 0

Total number of PDP in this APN :1

aggregate:
In APN:      Disable

In Global: Disable
```

**Step 3** To test further, generate traffic to the network. To do this, use the **ping** command from a handset, or from a laptop connected to the handset, to a host on the destination network, as shown in the following example:

```
ping 192.168.12.5
```

**Note** To avoid possible DNS configuration issues, use the IP address (rather than the host name) of a host that you expect to be reachable within the destination network. For this test to work, the IP address of the host that you select must be able to be properly routed by the GGSN.

In addition, the APN configuration and physical connectivity to the destination network through a Gi interface must be established. For example, if the host to be reached is in a VPN, the APN must be properly configured to provide access to the VPN.

**Step 4** After you have begun to generate traffic over the PDP context, use the **show gprs gtp pdp-context** command to see detailed statistics including send and receive byte and packet counts.

**Tip**

To find the Terminal Identifier (TID) for a particular PDP context on an APN, use the **show gprs gtp pdp-context access-point** command.

The following example shows sample output for a PDP context for TID 81726354453647FA:

```
GGSN# show gprs gtp pdp-context tid 81726354453647FA
```

TID	MS Addr	Source	SGSN Addr	APN
81726354453647FA	10.2.2.1	Static	172.16.44.1	gprt.cisco.com

```

current time :Dec 06 2001 13:15:34
user_name (IMSI): 18273645546374      MS address: 10.2.2.1

```

# Configuring Access to External Support Servers

You can configure the GGSN to access external support servers to provide services for dynamic IP addressing of MSs using the Dynamic Host Configuration Protocol (DHCP) or using Remote Authentication Dial-In User Service (RADIUS). You can also configure RADIUS services on the GGSN to provide security, such as authentication of users accessing a network at an APN.

The GGSN allows you to configure access to DHCP and RADIUS servers globally for all access points, or to specific servers for a particular access point. For more information about configuring DHCP on the GGSN, see the “[Configuring Dynamic Addressing on the GGSN](#)” chapter. For more information about configuring RADIUS on the GGSN, see the “[Configuring Security on the GGSN](#)” chapter.

## Configuring Virtual APN Access on the GGSN

This section includes the following topics:

- [Overview of the Virtual APN Feature, page 7-36](#)
- [Virtual APN Configuration Task List, page 7-38](#)
- [Verifying the Virtual APN Configuration, page 7-39](#)

For a sample configuration, see the “[Virtual APN Configuration Example](#)” section on page 7-55.

## Overview of the Virtual APN Feature

GGSN Release 3.0 and later support virtual APN access from the PLMN using the virtual access point type on the GGSN. The virtual APN feature on the GGSN allows multiple users to access different physical target networks through a shared APN access point on the GGSN.

In a GPRS/UMTS network, the user APN information must be configured at several of the GPRS/UMTS network entities, such as the home location register (HLR) and DNS server. In the HLR, the user subscription data associates the IMSI (unique per user) with each APN that the IMSI is allowed to access. At the DNS server, APNs are correlated to the GGSN IP address. If DHCP or RADIUS servers are in use, the APN configuration can also extend to those servers.

The virtual APN feature reduces the amount of APN provisioning required by consolidating access to all real APNs through a single virtual APN at the GGSN. Therefore, only the virtual APN needs to be provisioned at the HLR and DNS server, instead of each of the real APNs to be reached. The GGSN also must be configured for the virtual APN.

**Note**

---

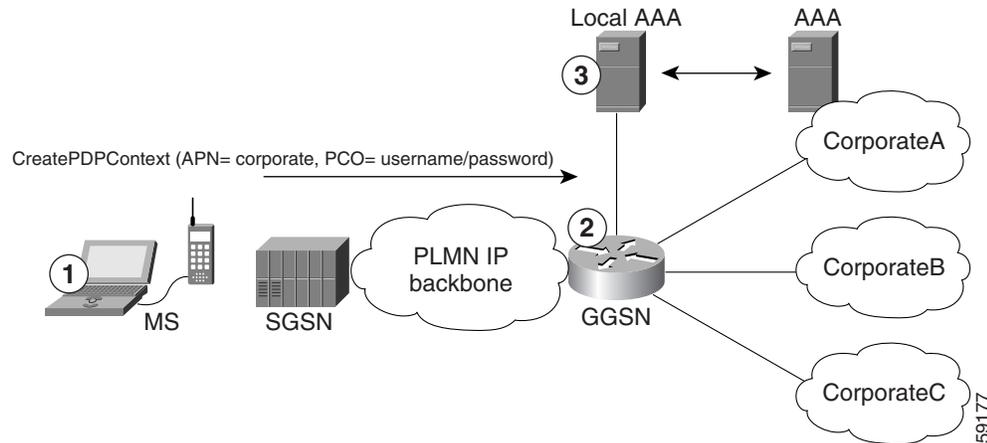

On the Catalyst 6500 / Cisco 7600 platform, identical virtual APN configurations must exist on each GGSN that is load-balanced by means of a virtual server.

---

The Cisco GGSN software determines the ultimate target network for the session by receiving the Create PDP Context request at the virtual access point and extracting the domain name to direct the packet to the appropriate real APN. The real APN is the actual destination network.

Figure 7-2 shows how the GGSN supports a Create PDP Context request from an MS processed through a virtual APN on the GGSN.

Figure 7-2 Virtual APN PDP Context Activation on the GGSN

1. At the MS, the user connects to the network with a username in the form of login@domain, such as ciscouser@CorporateA.com. The SGSN sends a Create PDP Context request to the GGSN, using the virtual APN of “corporate.” The Create PDP Context request also includes the username in login@domain format in the protocol configuration option (PCO) information element.
2. The GGSN extracts the domain from the information in the PCO, which corresponds to the real target network on the GGSN. In this example, the GGSN finds CorporateA.com as the domain and directs the session to the appropriate real APN for the target network. In this case, the real APN is corporateA.com. The GGSN uses the complete username to do authentication.
3. The local or corporate AAA server is selected based on the domain part of the username, which is CorporateA.com in this case.

### Benefits of the Virtual APN Feature

The virtual APN feature provides the following benefits:

- Simplifies provisioning of APN information at the HLR and DNS servers
- Improves scalability for support of large numbers of corporate networks, ISPs, and services
- Increases flexibility of access point selection
- Eases deployment of new APNs and services

### Restrictions of the Virtual APN Feature

The virtual APN feature has the following restrictions:

- CDRs do not include the domain information. For virtual APNs, the domain information is always removed from the username attribute. The associated real APN name is used in CDRs and authentication requests to a virtual APN.
- Although the Cisco IOS software allows you to configure other access point options on a virtual access point, no other access point options are applicable if they are configured.

## Virtual APN Configuration Task List

To configure the GGSN to support virtual APN access, you must configure one or more virtual access points. You also need to configure the real access points that provide the information required for connecting to the physical networks of the external PDNs or VPNs.

In addition to the configuring the GGSN, you must also ensure proper provisioning of other GPRS/UMTS network entities as appropriate to successfully implement the virtual APN feature on the GPRS/UMTS network.

To configure virtual APN access on the GGSN, perform the following tasks:

- [Configuring Virtual Access Points on the GGSN, page 7-38](#) (Required)
- [Configuring Real Access Points on the GGSN, page 7-14](#) (Required)
  - [PDN Access Configuration Task List, page 7-14](#)
  - [VPN Access Using VRF Configuration Task Lists, page 7-16](#)

For a sample configuration, see the “[Virtual APN Configuration Example](#)” section on page 7-55.

## Configuring Virtual Access Points on the GGSN

Use virtual access point types to consolidate access to multiple real target networks on the GGSN. Because the GGSN always uses real access points to reach an external network, virtual access points are used in combination with real access points on the GGSN.

You can configure multiple virtual access points on the GGSN. Multiple virtual access points can be used to access the same real networks. One virtual access point can be used to access different real networks.

### Note

Be sure that you provision the HLR and configure the DNS server to properly correspond to the virtual APN domains that you have configured on the GGSN. For more information, see the “[Configuring Other GPRS/UMTS Network Entities With the Virtual APN](#)” section on page 7-39.

To configure a virtual access point on the GGSN, use the following commands, beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# <b>gprs access-point-list</b> <i>list-name</i>	Specifies a name for a new access-point list, or references the name of the existing access-point list, and enters access-point list configuration mode.
Step 2	Router(config-ap-list)# <b>access-point</b> <i>access-point-index</i>	Specifies an index number for a new access point definition, or references an existing access point definition, and enters access point configuration mode.
Step 3	Router(config-access-point)# <b>access-point-name</b> <i>apn-name</i>	Specifies the network (or domain) name for a PDN that users can access from the GGSN at a defined access point.  <b>Note</b> The <i>apn-name</i> must match the APN that has been provisioned at the MS, HLR, and DNS server.
Step 4	Router (config-access-point)# <b>access-type virtual</b>	Specifies an APN type that is not associated with any specific physical target network on the GGSN. The default access type is real.

**Note**

Although the Cisco IOS software allows you to configure other access point options on a virtual access point, no other access point options are applicable if they are configured.

### Configuring Other GPRS/UMTS Network Entities With the Virtual APN

When you configure the GGSN to support virtual APN access, be sure that you also meet any necessary requirements for properly configuring other GPRS/UMTS network entities to support the virtual APN implementation.

The following GPRS/UMTS network entities might also require provisioning for proper implementation of virtual APN support:

- DHCP server—Requires configuration of the real APNs.
- DNS server—The DNS server that the SGSN uses to resolve the address of the GGSN must identify the virtual APN with the IP address of the GTP virtual template on the GGSN. If GTP SLB is implemented, then the virtual APN should be associated with the IP address of the GTP load balancing virtual server instance on the SLB router.
- HLR—Requires the name of the virtual APN in subscription data, as allowable for subscribed users.
- RADIUS server—Requires configuration of the real APNs.
- SGSN—Requires the name of the virtual APN as the default APN (as desired) when the APN is not provided in user subscription data.

### Verifying the Virtual APN Configuration

This section describes how to verify that you have successfully configured virtual APN support on the GGSN, and includes the following tasks:

- [Verifying the GGSN Configuration, page 7-39](#)
- [Verifying Reachability of the Network Through the Virtual Access Point, page 7-43](#)

### Verifying the GGSN Configuration

To verify that you have properly configured access points on the GGSN, use the **show running-config** command and the **show gprs access-point** commands.

**Note**

The **gprs access-point-list** command first appears in the output of the **show running-config** command under the virtual template interface, which indicates that the GPRS access point list has been configured and is associated with the virtual template. To verify your configuration of specific access points within the GPRS access point list, look further down in the **show** command output where the **gprs access-point-list** command appears again, followed by the individual access point configurations.

**Step 1**

From privileged EXEC mode, use the **show running-config** command as shown in the following example from the Cisco 7200 platform. Verify the interface configuration and virtual and real access points:

```
GGSN# show running-config
Building configuration...

Current configuration : 3521 bytes
!
```

```

```

**Step 2** To view the configuration of a specific access point on the GGSN in further detail, use the **show gprs access-point** command and specify the index number of the access point, as shown in the following examples.

The following output shows information about a real access point:

```
GGSN# show gprs access-point 2
  apn_index 2          apn_name = corporatea.com
  apn_mode: non-transparent
  apn-type: Real
  accounting: Disable
  wait_accounting: Disable
  dynamic_address_pool: not configured
  apn_dhcp_server: 0.0.0.0
  apn_dhcp_gateway_addr: 0.0.0.0
  apn_authentication_server_group: foo
  apn_accounting_server_group:
  apn_username: , apn_password:
  subscribe_required: No
  deactivate_pdp_context_on_violation: No
  network_activation_allowed: No
  Block Foreign-MS Mode: Disable
  VPN: Disable
  GPRS vaccess interface: Virtual-Access1
  number of ip_address_allocated 0

Total number of PDP in this APN :1

aggregate:
In APN:    Disable

In Global: Disable
```

The following output shows information about a virtual access point:

```
GGSN# show gprs access-point 1
  apn_index 1          apn_name = corporate
  apn_mode: transparent
  apn-type: Virtual
  accounting: Disable
  wait_accounting: Disable
  dynamic_address_pool: not configured
  apn_dhcp_server: 0.0.0.0
  apn_dhcp_gateway_addr: 0.0.0.0
  apn_authentication_server_group:
  apn_accounting_server_group:
  apn_username: , apn_password:
  subscribe_required: No
  deactivate_pdp_context_on_violation: No
  network_activation_allowed: No
  Block Foreign-MS Mode: Disable
  VPN: Disable
  GPRS vaccess interface: Virtual-Access2
  number of ip_address_allocated 0

Total number of PDP in this APN :0

aggregate:
In APN:    Disable

In Global: Disable
```

**Step 3** To view a summary of every access point that is configured on the GGSN, use the **show gprs access-point all** command as shown in the following example:

```
GGSN# show gprs access-point all
```

```
There are 4 Access-Points configured
```

Index	Mode	Access-type	AccessPointName	VRF Name
1	transparent	Virtual	corporate	
2	non-transparent	Real	corporatea.com	
3	transparent	Real	corporateb.com	
4	non-transparent	Real	corporatec.com	

### Verifying Reachability of the Network Through the Virtual Access Point

To verify reachability of the real destination network through the virtual access point, you can use the same procedure described in the [“Verifying Reachability of the Network Through the Access Point” section on page 7-34](#).

In addition, you should meet the following guidelines for virtual access point testing:

- When you initiate PDP context activation at the MS, be sure that the username that you specify (in the form of login@domain in the Create PDP Context request) corresponds to a real APN that you have configured on the GGSN.
- When you generate traffic to the network, be sure to select a host on one of the real destination networks that is configured for APN support on the GGSN.

## Blocking Access to the GGSN by Foreign Mobile Stations

This section describes how to restrict access to the GGSN from mobile stations outside their home PLMN. It includes the following topics:

- [Overview of Blocking Foreign Mobile Stations, page 7-43](#)
- [Blocking Foreign Mobile Stations Configuration Task List, page 7-44](#)

### Overview of Blocking Foreign Mobile Stations

The GGSN allows you to block access by mobile stations that are outside of the PLMN. When you enable blocking of foreign mobile stations, the GGSN determines whether an MS is inside or outside of the PLMN, based on the mobile country code (MCC) and mobile network code (MNC). You must specify the MCC and MNC codes on the GGSN to properly configure the home public land mobile network (HPLMN) values.

When you enable the blocking foreign MS access feature on the access point, then whenever the GGSN receives a Create PDP Context request, the GGSN compares the MCC and MNC in the TID against the home operator codes that you configure on the GGSN. If the MS mobile operator code fails the matching criteria on the GGSN, then the GGSN rejects the Create PDP Context request.

## Blocking Foreign Mobile Stations Configuration Task List

To implement blocking of foreign mobile stations on the GGSN, you must enable the function and specify the supporting criteria for determining whether an MS is outside its home PLMN.

To configure blocking of foreign mobile stations on the GGSN, perform the following tasks:

- [Configuring the MCC and MNC Values, page 7-44](#) (Required)
- [Enabling Blocking of Foreign Mobile Stations on the GGSN, page 7-45](#) (Required)
- [Verifying the Blocking of Foreign Mobile Stations Configuration, page 7-45](#)

### Configuring the MCC and MNC Values

The MCC and MNC together identify a public land mobile network (PLMN). The values that you configure using the **gprs mcc mnc** command without the **trusted** keyword option specified, are those of the home PLMN ID, which is the PLMN to which the GGSN belongs.

Only one home PLMN can be defined for a GGSN at a time. The GGSN compares the IMSI in Create PDP Context requests with the values configured using this command to determine if a request is from a foreign MS.

You can also configure up to 5 *trusted* PLMNs by specifying the **trusted** keyword when issuing the **gprs mcc mnc** command. A Create PDP Context request from an MS in a trusted PLMN is treated the same as a Create PDP Context request from an MS in the home PLMN.

To configure the MCC and MNC values that the GGSN uses to determine whether a request is from a roaming MS, use the following command in global configuration mode:

Command	Purpose
Router(config)# <b>gprs mcc</b> <i>mcc-num</i> <b>mnc</b> <i>mnc-num</i> [ <b>trusted</b> ]	<p>Configures the mobile country code and mobile network code that the GGSN uses to determine whether a Create PDP Context request is from a foreign MS. Optionally, use the <b>trusted</b> keyword to define up to 5 trusted PLMNs.</p> <p><b>Note</b> The Create PDP Context requests from a trusted PLMN are treated the same as those from the home PLMN.</p>

#### Note

The GGSN automatically specifies values of 000 for the MCC and MNC. However, you must configure non-zero values for both the MCC and MNC before you can enable the GGSN to create CDRs for roamers.

## Enabling Blocking of Foreign Mobile Stations on the GGSN

To enable the GGSN to block foreign mobile stations from establishing PDP contexts, use the following command in access-point configuration mode:

Command	Purpose
Router(config-access-point)# <b>block-foreign-ms</b>	Restricts GGSN access at a particular access point based on the mobile user's HPLMN.

### Note

The MCC and MNC values that are used to determine whether a request is from a roaming MS must be configured before the GGSN can be enabled to block foreign mobile stations.

## Verifying the Blocking of Foreign Mobile Stations Configuration

This section describes how to verify the blocking of foreign mobile stations configuration on the GGSN. It includes the following topics:

- [Verifying Blocking of Foreign Mobile Stations at an Access Point, page 7-45](#)
- [Verifying the MCC and MNC Configuration on the GGSN, page 7-46](#)

### Verifying Blocking of Foreign Mobile Stations at an Access Point

To verify whether the GGSN is configured to support blocking of foreign mobile stations at a particular access point, use the **show gprs access-point** command. Observe the value of the Block Foreign-MS Mode output field as shown in bold in the following example:

```
GGSN# show gprs access-point 1
  apn_index 1          apn_name = gprs.corporate.com
  apn_mode: transparent
  apn-type: Real
  accounting: Disable
  wait_accounting: Disable
  dynamic_address_pool: dhcp-proxy-client
  apn_dhcp_server: 10.99.100.5
  apn_dhcp_gateway_addr: 10.27.1.1
  apn_authentication_server_group: foo
  apn_accounting_server_group: fool
  apn_username: , apn_password:
  subscribe_required: No
  deactivate_pdp_context_on_violation: Yes
  network_activation_allowed: Yes
  Block Foreign-MS Mode: Enable
  VPN: Enable (VRF Name : vpn1)
  GPRS vaccess interface: Virtual-Access2
  number of ip_address_allocated 0

Total number of PDP in this APN :0

aggregate:
In APN:      auto

In Global: 30.30.0.0/16
           21.21.0.0/16
```

## Verifying the MCC and MNC Configuration on the GGSN

To verify the configuration elements that the GGSN uses as matching criteria to determine whether a request is coming from a foreign mobile station, use the **show gprs plmn** privileged EXEC command. Observe the values of the output fields shown in bold in the following example. The example shows that the GGSN is configured for the USA country code (310) and for the Bell South network code (15) and four trusted PLMNs have been configured:

```
GGSN# show gprs plmn
Home PLMN
  MCC = 302  MNC = 678
Trusted PLMN
  MCC = 346  MNC = 123
  MCC = 234  MNC = 67
  MCC = 123  MNC = 45
  MCC = 100  MNC = 35
```

### Note

For a reference table of some of the established MCC and MNC codes, refer to the “[Table of MCC and MNC Codes](#)” appendix.

# Controlling Access to the GGSN by MSs with Duplicate IP Addresses

An MS cannot have the same IP address as another GPRS/UMTS network entity. You can configure the GGSN to reserve certain IP address ranges for use by the GPRS/UMTS network, and to disallow them from use by an MS.

During a Create PDP Context request, the GGSN verifies whether the IP address of an MS falls within the specified excluded range. If there is an overlap of the MS IP address with an excluded range, then the Create PDP Context request is rejected. This measure prevents duplicate IP addressing in the network.

You can configure up to 100 IP address ranges. A range can be one or more addresses. However, you can configure only one IP address range per command entry. To exclude a single IP address, you can repeat the IP address in the start-ip and end-ip arguments. IP addresses are 32-bit values.

### Note

On the Catalyst 6500 / Cisco 7600 platform, identical configurations must exist on each GGSN that is load-balanced by means of a virtual server.

To reserve IP address ranges for use by the GPRS/UMTS network and block their use by an MS, use the following command in global configuration mode:

Command	Purpose
Router(config)# <b>gprs ms-address exclude-range</b> <i>start-ip end-ip</i>	Specifies the IP address ranges used by the GPRS/UMTS network, and thereby excluded from the MS IP address range.

## Configuring Routing Behind the Mobile Station on an APN

The routing behind the MS feature enables the routing of packets to IP addresses that do not belong to the PDP context (the MS), but exist behind it. The network address of the destination can be different than the MS address.

Before enabling routing behind the MS, the following requirements must be met:

- The MS must use RADIUS for authentication and authorization.
- At minimum, one Framed-Route, attribute 22 as defined in Internet Engineering Task Force (IETF) standard RFC 2865, must be configured in the RADIUS server for each MS that wants to use this feature.

When configured, the Framed-Route attribute is automatically downloaded to the GGSN during the authentication and authorization phase of the PDP context creation. If routing behind the MS is not enabled, the GGSN ignores the Framed-Route attribute. If multiple Framed-Route attributes have been configured for an MS, the GGSN uses the first attribute configured. When the MS session is no longer active, the route is deleted.

- For PDP Regen or PPP with L2TP sessions, the Framed-Route attribute must be configured in the RADIUS server of the LNS.
- For PPP Regen sessions, if the **security verify source** command is configured, the Framed-Route attribute must also be configured in the user profile in the GGSN RADIUS server.

## Enabling Routing Behind the Mobile Station

To enable routing behind an MS, use the following command in access-point configuration mode:

Command	Purpose
Router(config-access-point)# <b>network-behind-mobile</b>	Enables an access point to support routing behind an MS.

Use the **show ip route** privilege EXEC command to view the current state of the routing table. To display a list of currently active mobile sessions, use the **show pdp** command.

### Note

Packets routed behind the MS share the same 3GPP QoS settings of the MS.

## Verifying the Routing Behind the Mobile Station Configuration

To verify the routing behind the mobile station configuration, use the following **show** commands.

- Step 1** From privilege EXEC mode, use the **show gprs gtp pdp-context tid** and **show ip route** commands to view the framed route and the static route added for the framed route that uses the IP address of the PDP context as the gateway address:

```
GGSN#show gprs gtp pdp-context tid 1234567809000010

# Configuration Examples

This section includes the following configuration examples for configuring different types of network access to the GGSN:

- [Static Route to SGSN Example, page 7-50](#)
- [Access Point List Configuration Example, page 7-52](#)
- [VRF Tunnel Configuration Example, page 7-52](#)
- [Virtual APN Configuration Example, page 7-55](#)
- [Blocking Access by Foreign Mobile Stations Configuration Example, page 7-58](#)
- [Duplicate IP Address Protection Configuration Example, page 7-58](#)

## Static Route to SGSN Example

### Cisco 7200 Platform

The following example shows how to configure a static route from a physical interface on the GGSN to the SGSN.

Notice the following areas in the GGSN configuration shown in this example:

- Fast Ethernet 0/0 is the physical interface to the SGSN, which is known as the *Gn interface*.
- In this example, the SGSN is located at IP address 192.168.1.1. Using the **ip route** command, a static route is configured to the SGSN located at 192.168.1.1 from the Fast Ethernet 0/0 interface on the GGSN.

### GGSN Configuration

```
! Configure Gn interface on GGSN to communicate with SGSN
!
interface FastEthernet0/0
 ip address 10.0.0.2 255.0.0.0
 no ip directed-broadcast
 no ip mroute-cache
 no keepalive
!
ip route 192.168.1.1 255.255.255.255 FastEthernet0/0
```

#### Note

For the SGSN to successfully communicate with the GGSN, the SGSN must configure a static route or must be able to dynamically route to the IP address used by the GGSN virtual template.

### Catalyst 6500 / Cisco 7200 Platform

On the GGSN:

```
!
...
!
interface Loopback100
 description GPRS GTP V-TEMPLATE IP ADDRESS
 ip address 9.9.9.72 255.255.255.0
!
interface GigabitEthernet0/0.2
 description Ga/Gn Interface
```

```

encapsulation dot1Q 101
ip address 10.1.1.72 255.255.255.0
no cdp enable
!
interface Virtual-Template1
description GTP v-access
ip unnumbered Loopback100
encapsulation gtp
gprs access-point-list gprs
!
ip route 40.1.2.1 255.255.255.255 10.1.1.1
ip route 40.1.3.10 255.255.255.255 10.1.1.1
ip route 40.2.2.1 255.255.255.255 10.1.1.1
ip route 40.2.3.10 255.255.255.255 10.1.1.1
!
...
!

```

#### Related configuration on the Supervisor/MSFC2:

```

!
...
!
interface FastEthernet8/22
no ip address
switchport
switchport access vlan 302
!
interface FastEthernet9/41
no ip address
switchport
switchport access vlan 303
!
interface Vlan101
description Vlan to GGSN for GA/GN
ip address 10.1.1.1 255.255.255.0
!
interface Vlan302
ip address 40.0.2.1 255.255.255.0
!
interface Vlan303
ip address 40.0.3.1 255.255.255.0

ip route 9.9.9.72 255.255.255.255 10.1.1.72
ip route 9.9.9.73 255.255.255.255 10.1.1.73
ip route 9.9.9.74 255.255.255.255 10.1.1.74
ip route 9.9.9.75 255.255.255.255 10.1.1.75
ip route 9.9.9.76 255.255.255.255 10.1.1.76
ip route 40.1.2.1 255.255.255.255 40.0.2.11
ip route 40.1.3.10 255.255.255.255 40.0.3.10
ip route 40.2.2.1 255.255.255.255 40.0.2.11
ip route 40.2.3.10 255.255.255.255 40.0.3.10
!
...
!

```

## Access Point List Configuration Example

The following example (from the Cisco 7200 platform) shows a portion of the GGSN configuration for a GPRS access point list:

```
!
interface virtual-template 1
 ip unnumber loopback 1
 no ip directed-broadcast
 encapsulation gtp
 gprs access-point-list abc
!
! Defines a GPRS access point list named abc
! with 3 access points
!
gprs access-point-list abc
 access-point 1
  access-point-name gprs.pdn1.com
  ip-address-pool dhcp-proxy-client
  dhcp-server 10.102.100.3
  dhcp-gateway-address 10.30.30.30
  exit
!
 access-point 2
  access-point-name gprs.pdn2.com
  ip-address-pool dhcp-proxy-client
  dhcp-server 10.60.0.1
  dhcp-gateway-address 10.27.27.27
  exit
!
 access-point 3
  access-point-name www.pdn3.com
  access-mode non-transparent
  dhcp-gateway-address 10.25.25.25
  aaa-group authentication foo
  exit
!
. . .
```

## VRF Tunnel Configuration Example

### Cisco 7200 Platform

The following example shows a partial configuration for a virtual private network named “vpn1” using VRF:

```
! Configure a VRF routing table
! and define an identifier
!
ip vrf vpn1
 rd 100:1
!
! Enable CEF switching
!
ip cef
!
interface Loopback101
 ip address 10.14.101.1 255.255.255.255
!
! Configure a tunnel interface
! to a private network using VRF
```

```

!
interface Tunnel1
 ip vrf forwarding vpn1
 ip address 10.1.101.1 255.255.255.0
 tunnel source 10.14.101.1
 tunnel destination 10.13.101.1
!
! Configure OSPF routing using VRF
!
router ospf 101 vrf vpn1
log-adjacency-changes
 redistribute static subnets
 network 10.1.101.0 0.0.0.255 area 0
!
! Configure VRF at the access point
!
gprs access-point-list gprs
 access-point 1
 access-point-name gprs.cisco.com
 vrf vpn1
 exit

```

### Catalyst 6500 / Cisco 7600 Platform

The following examples show a partial configuration for two VPNs (vpn1 and vpn2) and their associated GRE tunnel configurations (Tunnel1 and Tunnel2).

On the GGSN:

```

service gprs ggsn
!
hostname 6500-7-2
!
ip cef
!
ip vrf vpn1
 description GRE Tunnel 1

ip route 167.2.0.0 255.255.0.0 167.1.1.12

```

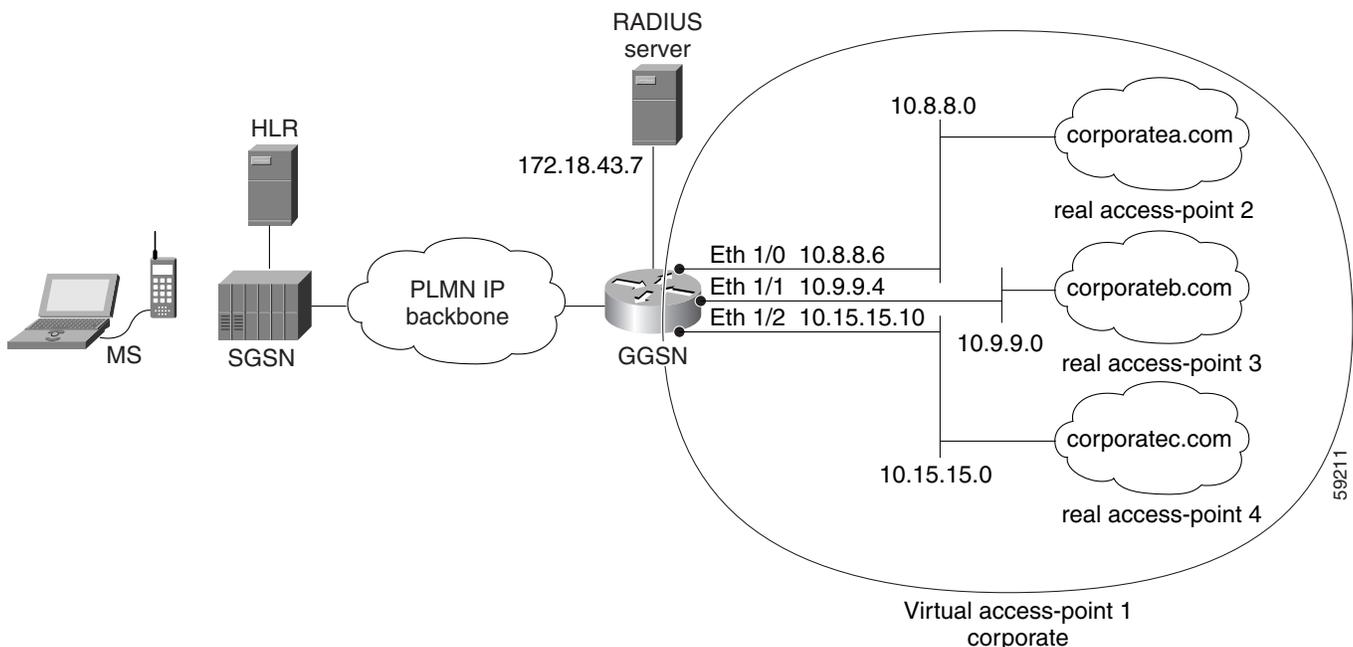

## Virtual APN Configuration Example

The following example shows a GGSN that is configured for a virtual APN access point that serves as the focal connection for three different real corporate networks.

Notice the following areas in the GGSN configuration shown in this example:

- Three physical interfaces (Gi interfaces) are defined to establish access to the real corporate networks: Ethernet 1/0, Ethernet 1/1, and Ethernet 1/2.
- Four access points are configured:
  - Access point 1 is configured as the virtual access point with an APN called *corporate*. No other configuration options are applicable at the virtual access point. The “corporate” virtual APN is the APN that is provisioned at the HLR and DNS server.
  - Access points 2, 3, and 4 are configured to the real network domains: *corporatea.com*, *corporateb.com*, and *corporatec.com*. The real network domains are indicated in the PCO of the PDP context request.

**Figure 7-3 Virtual APN Configuration Example**

## Blocking Access by Foreign Mobile Stations Configuration Example

The following example shows a partial configuration in which access point 100 blocks access by foreign mobile stations:

```

!
version 12.2
no service single-slot-reload-enable
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
! Enables the router for GGSN services
!
service gprs ggsn
!
hostname ggsn
!
ip cef
!
gprs access-point-list gprs
!
access-point 100
  access-point-name blocking
!
! Enables blocking of MS to APN 100
! that are outside ! of the PLMN
!
  block-foreign-ms
exit
!
. . .
!
! Configures the MCC and MNC codes
!
gprs mcc 123 mnc 456

```

## Duplicate IP Address Protection Configuration Example

The following example shows a partial configuration that specifies three different sets of IP address ranges used by the GPRS/UMTS network (which are thereby excluded from the MS IP address range):

```

gprs ms-address exclude-range 10.0.0.1 10.20.40.50
gprs ms-address exclude-range 172.16.150.200 172.30.200.255
gprs ms-address exclude-range 192.168.100.100 192.168.200.255

```
