

Configuring CMPC+

Cisco Multipath Channel+ (CMPC+) is Cisco's implementation of IBM's Multipath Channel+ (MPC+) feature. The CMPC+ feature in Cisco IOS Release 12.0(3)T and later supports the MPC+ features and protocols necessary to support IP. This chapter provides information about configuring CMPC+ support on the Channel Interface Processor (CIP) and Channel Port Adapter (CPA) types of Cisco Mainframe Channel Connection (CMCC) adapters on a Cisco router.

This information is described in the following sections:

- [Overview, page 1](#)
- [Benefits, page 7](#)
- [Preparing to Configure CMPC+, page 8](#)
- [Configuring CMPC+ Support, page 10](#)
- [Monitoring and Maintaining CMPC+, page 32](#)
- [CMPC+ Configuration Examples, page 33](#)

For a complete description of the CMPC+ commands in this chapter, refer to the “CSNA, CMPC, and CMPC+ Commands” chapter of the *Cisco IOS Bridging and IBM Networking Command Reference* (Volume 2 of 2). To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “[Identifying Platform Support for Cisco IOS Software Features](#)” section on [page li](#) in the “Using Cisco IOS Software” chapter.

Overview

CMPC+ enables High Performance Data Transfer (HPDT). It allows TCP/IP connections to the host through CMCC adapters, using either the TCP/IP stack or the High Speed Access Services (HSAS) IP stack. CMPC+ offers the following support:

- Support for TCP/IP and HSAS Transmission Group (TG)
- Support for one IP stack per MPC+ group

- Support for one read subchannel and one write subchannel per CMPC+ group. The read subchannel and write subchannel in an MPC+ group can be on different physical channels.
- Support for up to 64 KB per I/O block.
- Supports the CIP and the CPA

Up to 64 MPC+ groups can be configured on a CMCC, depending on memory configuration. CMPC+ can coexist with CMPC, TCP/IP Offload, CLAW, TN3270, and CSNA features.

Figure 1 shows an MVS host with a TCP/IP stack and a Cisco router configured with CMPC+ and IP.

Figure 1 *MVS Host with TCP/IP Stack and Cisco Router with CMPC+*

Figure 2 shows a scenario where a VTAM host is configured with both HSAS and TCP/IP stacks. Each stack on the host has a TG with a read and write subchannel. The CMCC adapter can be a CIP or CPA. On the outbound flow coming from the host, the Cisco router receives the MPC+ packets from the channel, removes the MPC+ headers, and transfers the packets as IP packets to the IP cloud. The router sends the packets to the appropriate interface, depending on the destination IP address in the packet.

Figure 2 CMPC+ IP Structure

On the inbound flow coming from the IP cloud via LAN or WAN interfaces, the IP packets are switched from the Cisco IOS software to the CMCC adapter and MPC+ headers are added to the packets. The MPC+ block of packets is then sent to the host.

IP communication from one IBM host to another can also be accomplished through the same CMCC adapter. [Figure 3](#) illustrates IP packets going from Host 1 to Host 2 and from Host 2 to Host 1. These packets are routed through the same Route Switch Processor (RSP) in the Cisco router.

Figure 3 *IP Communication Between IBM Hosts Through the Same CMCC*

Figure 4 illustrates IP packets flowing between host 1 and host 2. IP packets can also be sent from one host to another host using different CMCC adapters.

Figure 4 IP Communication Between IBM Hosts Using Different CMCC Adapters

Figure 5 illustrates IP communication flowing between Host 1 and Host 2. IP communication can occur between two different hosts connected through two different routers.

Figure 5 IP Communication Between Hosts Through Different Routers

Figure 6 illustrates IP communication between a host and different IP nodes.

Figure 6 *IP Communication from a Host to IP Nodes*

Benefits

CMPC+ provides the following benefits:

- HPDT support
- IP connections to hosts using MPC+
- Coexistence with CMPC, CSNA, TN3270, TCP/IP Offload, and CLAW features on a CMCC
- ESCON and Parallel Channel support
- ESCON Director support
- EMIF support

Preparing to Configure CMPC+

The following topics in this section provide information that is useful when you are planning to configure CMPC+ support:

- [Hardware and Software Requirements, page 8](#)
- [Mainframe Host Configuration Considerations, page 8](#)

Hardware and Software Requirements

This section provides information about the router and mainframe requirements to support CMPC+.

Router Requirements

The CMPC+ feature is supported on the following router platforms and requires the appropriate CMCC microcode and a minimum of 32 MB DRAM on the CMCC adapter:

- Cisco 7500 series—Supports CIP adapters
- Cisco 7200 series—Supports ECPA and PCPA adapters
- Cisco 7000 series with RSP7000—Supports CIP adapters

You must configure the CMPC+ feature on the physical interface of a CMCC adapter. For a CIP, the physical interface is either 0 or 1. For the CPA adapters, ECPA and PCPA, the physical interface is port 0.

Mainframe Requirements

CMPC+ establishes channel connectivity to a S/390 mainframe host using the Virtual Telecommunications Access Method (VTAM) and IP stacks. The following software versions of S/390, VTAM, and IP stacks are required to configure CMPC+ on a CMCC adapter:

Operating System and VTAM Requirements

- OS/390 1.3 and later
- ACF/VTAM 4.4 and later

IP Stack Requirements

CMPC+ requires one of the following IP stacks on the mainframe:

- TCP/IP 3.3 and later
- HSAS

Mainframe Host Configuration Considerations

Configuring CMPC+ support requires that you perform tasks for configuration of the mainframe and the router sides of the network environment.

Often in the mixed network environment of mainframes and LANs, an MVS systems programmer installs and maintains the mainframe side of the network, while a network engineer manages the routers on the LAN side of the network. In such an environment, the successful configuration of CMPC+ support requires the close coordination between these job functions at a customer site.

This chapter contains information for both the network engineer and the MVS systems programmer to properly configure the network devices for CMPC+ support. The tasks for configuring CMPC+ support are organized by whether they are host-related configuration tasks or router-related configuration tasks. In addition, a topic for correlating the mainframe and router configuration is provided so that you can identify the dependencies between the host and router configuration elements and be sure that they are set up correctly.

Defining the Channel Subsystem for the Router

To establish the path and allocate the range of subchannel addresses that the CMCC adapter can use for the CMPC+ feature, you need to specify the channel subsystem definitions in the Input/Output Control Program (IOCP) or Hardware Configuration Definition (HCD).

For more information about the statements that might be defined in an IOCP file for parallel channels and ESCON channels on the CIP or CPA, see the “Defining the Channel Subsystem for the Router” section in the “Configuring Cisco Mainframe Channel Connection Adapters” chapter of this publication.

Disabling the Missing Interrupt Handler

Because the appropriate configuration of the missing interrupt handler (MIH) varies according to the protocols and software releases used, Cisco offers the following guidance:

- For OS/390 releases Version 2 Release 4 and earlier, set the MIH to zero.
- For OS/390 releases later than Version 2 Release 4 and z/OS releases, refer to the following section of the z/OS Communications Server IP Configuration Reference:
<http://publibfp.boulder.ibm.com/cgi-bin/bookmgr/BOOKS/f1a1b420/1.2.13?SHELF=f1a1bk31&DT=20020604120755#HDRMOLLY>

For information about how to disable the MIH for the unit addresses being used for your CMCC adapter configuration, see the section “Disabling the Missing Interrupt Handler” section in the “Configuring Cisco Mainframe Channel Connection Adapters” chapter of this publication.

Related Publications

The following mainframe-related publications might be useful when configuring the mainframe to support CMPC+ on a CMCC adapter in the router:

Configuring CMPC+ Support

This section describes the configuration tasks that are required to install CMPC+ support on the mainframe and router and includes the following topics:

- [CMPC+ Configuration Guidelines, page 10](#)
- [CMPC+ Host Configuration Task List, page 11](#)
- [CMPC+ Router Configuration Task List, page 13](#)
- [Correlating the Mainframe and Router Configuration Elements, page 16](#)
- [Verifying a CMPC+ Configuration Using TCP/IP, page 17](#)
- [Verifying a CMPC+ Configuration Using HSAS, page 25](#)

See the “[CMPC+ Configuration Examples](#)” section on [page 33](#) for examples.

CMPC+ Configuration Guidelines

To configure the CMPC+ feature, you must configure the host VTAM parameters, the TCP/IP or HSAS stacks on the host, and the CMCC adapter. Consider the following guidelines as you prepare to configure CMPC+ support:

- A CMPC+ link uses two subchannels: one read and one write. Some IBM implementations of MPC+ allow multiple read and multiple write subchannels within a link. CMPC+ does not support multiple read and write subchannels. Only one read subchannel and one write subchannel can be configured for each CMPC+ link. A CMPC+ link is also referred to as a CMPC+ TG.
- On the router a CMPC+ TG consists of one read subchannel definition, one write subchannel definition, and a TG definition, associated by a unique *tg-name*.
- A CMCC adapter can have multiple CMPC+ links (TGs), up to a maximum of 64.
- To configure the TCP/IP or HSAS interface for the CMCC adapter, use the **tg** (CMPC+) command.
- To define the host subchannel (or path) and device, use the **cmnpc** command on the router. One **cmnpc** command defines the read subchannel, and one **cmnpc** command defines the write subchannel. The **cmnpc** command is configured on the CMCC adapter’s physical interface (port 0 or 1 on a CIP; port 0 on a CPA).
- The two subchannels in a CMPC+ link do not need to be adjacent devices. Either channel can be the read subchannel or the write subchannel. The two subchannels can be on separate channel process IDs (CHPIDs) in the host.
- The two subchannels must be connected to the same CMCC adapter, however they do not have to be connected to the same physical channel interface on a CIP. On a CIP it is possible to connect a read subchannel to channel interface 0, while the write subchannel is connected to channel interface 1.
- The host IOCP or HCD parameters must coordinate with the **cmnpc** command parameters on the router and the transport resource list major node definition to specify the subchannel path, device, and subchannel address.
- To configure MPC+ on the host, define the Transport Resource List (TRL). If you do not plan to support HPR, then you need to disable support in the TRL major node by configuring HPR=NO.
- CMPC+ can coexist with CLAW, TCP/IP offload, IP host backup, CSNA, CMPC, and TN3270 server features on the router.

CMPC+ Host Configuration Task List

This section contains the following host configuration tasks:

- [Configuring the VTAM Transport Resource List Major Node, page 11](#)
- [Configuring the Stacks, page 12](#)

Configuring the VTAM Transport Resource List Major Node

The CMPC+ feature supports standard Transport Resource List (TRL) major node configurations, standard TCP Profiles and OE configuration statements. The host configuration must be coordinated with the CMPC+ configuration for IP connectivity to be successful.

To define the TRL, you must have two valid subchannel addresses configured in the IOCP or HCD on the host that can be used for the read and write subchannels. The read/write subchannels that you configure in the TRL should correlate with the unit addresses configured in the *device* argument of the **cmpc** commands. CMPC+ requires a unique TRLE for each CMPC+ TG.

The following sample configuration shows an example of a typical TRL major node configuration:

```
JECTR LG VBUILD TYPE=TRL
JCTR LG74 TRLE LNCTL=MPC, X
          MAXBF RU=16, X
          REPLYTO=25.5, X
          MPCLEVEL=NOHPDT, X
          READ=(274), X
          WRITE=(275)
```

In this example, device 274 has been configured for read and 275 has been configured for write. Devices 274 and 275 must be available subchannels in the IOCP or HCD definition for the CMCC adapter connection.

You should activate the TRL before activating the corresponding local major node. The following example shows the command to activate a TRL, where the ID parameter specifies the name of the TRL:

```
v net,act,id=jectrlg,update=add
```

Note

The argument “update=add” is preferred and is the default for later versions of VTAM. The argument “update=all” can cause inactive TRLEs to be deleted unexpectedly from ISTTRL. However, “update=all” must be used if you change an active TRL data set and want the changes to become active.

The following commands are useful for displaying the current list of TRLEs:

- **d net,trl**
- **d net,id=isttrl,e**
- **d net,trl,trle=trle_name**

For details on how to configure the TRL major node, see the following IBM documents:

- *VTAM Resource Definition Samples*, SC31-6554
- *VTAM Operation*, SC31-6549
- *VTAM Network Implementation Guide*, SC31-6548

Configuring the Stacks

This section provides samples for the following tasks:

- [Configuring the IBM TCP/IP Stack, page 12](#)
- [Configuring the HSAS Stack, page 13](#)

Configuring the IBM TCP/IP Stack

Following is an excerpt of a sample TCP/IP profile. The most important configuration commands are in bold:

```

START JCTRLG74

```

For the CMCC adapter, the MTU size on the DEFAULTNET statement must be 4468 or less to ensure that the CMCC adapter does not receive packets larger than the CMCC adapter's MTU.

Configuring the HSAS Stack

Following are the sample OE configuration commands for configuring and activating the HSAS stack:

```

oeifconfig trle host-ip-addr router-ip-addr [mtu size] [netmask netmask]
oeifconfig trle [up|down|detach]
oeroute [flags] [add|delete] [default|dest-ip-addr gateway-ip-addr [metric]]
oenetopts [+a [config-file-name]]

```

For HSAS, the MTU size must be set to 4468.

CMPC+ Router Configuration Task List

This section describes the configuration tasks associated with the CMPC+ feature.

- [Assigning an IP Address to the Network Interface, page 13](#)
- [Configuring the CMPC+ Subchannels, page 14](#)
- [Configuring the CMPC+ TGs, page 15](#)

Assigning an IP Address to the Network Interface

To assign an IP address to the network interface, use the following command in interface configuration mode:

| Command | Purpose |
|---|---|
| Router(config-if)# ip address <i>ip-address mask</i> secondary | Assigns an IP address to the network interface. |

Configuring the CMPC+ Subchannels

Configuring the CMPC+ subchannels establishes the physical path between the CMCC interface and the mainframe channel.

To define a CMPC+ read subchannel and CMPC+ write subchannel, use the following commands beginning in global configuration mode:

| | Command | Purpose |
|--------|--|---|
| Step 1 | Router(config)# interface channel slot/port | Selects the interface on which to configure CMPC. The <i>port</i> value differs by the type of CMCC adapter: <ul style="list-style-type: none"> • CIP—<i>port</i> value corresponds to the physical interface, which is port 0 or 1. • CPA—<i>port</i> value corresponds to port 0. |
| Step 2 | Router(config-if)# cmpc path device tg-name read | Defines the CMPC+ read subchannel device with the following arguments: <ul style="list-style-type: none"> • <i>path</i>—Four-digit value that represents the channel path for the device. The path value is always 0100 for parallel channels. • <i>device</i>—Unit address for the device on the subchannel. • <i>tg-name</i>—Name of the CMPC+ TG, up to 8 characters. |
| Step 3 | Router(config-if)# cmpc path device tg-name write | Defines the CMPC+ write subchannel device with the following arguments: <ul style="list-style-type: none"> • <i>path</i>—Four-digit value that represents the channel path for the device. The path value is always 0100 for parallel channels. • <i>device</i>—Unit address for the device on the subchannel. This unit address must be a different address than the unit address for the CMPC+ read subchannel. • <i>tg-name</i>—Name of the CMPC+ TG, up to eight characters. |

Use the **no cmpc path device** command to remove the definition of a subchannel.

Mainframe Configuration Tips

- Configuring the subchannel information in the router requires that you correlate the *path* and *device* information from the IOCP or HCD file on the host.
 - The *path* argument is a four-digit hexadecimal value that concatenates the path value (two digits), EMIF partition number (one digit), and control unit logical address (one digit).
 - The *device* argument is a valid number in the UNITADD range of the IOCP CNTLUNIT statement for the CMPC internal LAN adapter.

For detailed information about how to determine the *path* and *device* values for the **cmpc** command, see the “Correlating Channel Configuration Parameters” section in the “Configuring Cisco Mainframe Channel Connection Adapters” chapter in this guide.

- The **cmpc** commands on the router define the subchannel addresses that CMPC+ will use to connect to the host, and correspond to the definitions in the TRL major node on the host. Normally, the last two hexadecimal digits in the READ parameter of the TRL match the value of the *device* argument in the corresponding **cmpc read** command. Similarly, the last two hexadecimal digits in the WRITE parameter of the TRL match the value of the *device* argument in the **cmpc write** command.

Configuring the CMPC+ TGs

To define a CMPC+ TG by name, use the following command in interface configuration mode on a CIP virtual interface or a CPA physical interface:

| | Command | Purpose |
|--------|--|--|
| Step 1 | Router(config)# interface channel <i>slot/port</i> | Selects the interface on which to configure the CMPC+ TG. The <i>port</i> value differs by the type of CMCC adapter: <ul style="list-style-type: none"> • CIP—<i>port</i> value corresponds to the virtual interface, which is port 2. • CPA—<i>port</i> value corresponds to port 0. |
| Step 2 | Router(config-if)# tg <i>tg-name</i> [ip hsas-ip] <i>host-ip-addr</i> <i>local-ip-addr</i> broadcast | Defines the type of IP stack and the IP addresses for the CMPC+ connection with the following arguments: <ul style="list-style-type: none"> • <i>tg-name</i>—Name (up to 8 characters) of the TG. This name must match the name specified in the cmpc commands. • ip—TCP/IP stack connection for the TG. • hsas-ip—HSAS IP stack connection for the TG. • <i>host-ip-addr</i>—IP address of the channel-attached host using this TG. This address must match the IP address in the HOME statement of the host's TCP/IP profile, or the host address in the <i>source-IP-address</i> argument of the oeifconfig command for HSAS on the host. • <i>local-ip-addr</i>—IP address configured on the virtual interface of the CMCC adapter. This address must match the IP address for the router in the DEFAULTNET statement of the host's TCP/IP profile, or the router address in the <i>destination-IP-address</i> argument of the oeifconfig command for HSAS on the host. • broadcast—Routing updates enabled to the host. |

Use the **no tg** command to remove a CMPC+ TG from the configuration, which will deactivate the named CMPC+ TG. To change any parameter of the **tg** statement, the statement must be removed by using the **no tg** *tg-name* command.

Router Configuration Tip

The *name* that you specify for the TG must match the name that you specify in the *tg-name* argument of the **cmpc** commands on the physical interface of the same CMCC adapter.

Mainframe Configuration Tips

- The IP address that you specify for the *host-ip-addr* argument must match one of the following host configuration parameters:
 - For TCP/IP profile configurations, the *host-ip-addr* address must match the IP address specified in the HOME statement at the host.
 - For HSAS stack configurations, the *host-ip-addr* address must match the IP address specified in the *source-IP-address* argument of the **oeifconfig** command at the host.
- The IP address that you specify for the *local-ip-addr* argument must match one of the following host configuration parameters:
 - For TCP/IP profile configurations, the *local-ip-addr* address must match the IP address specified in the DEFAULTNET statement at the host.
 - For HSAS stack configurations, the *local-ip-addr* address must match the IP address specified in the destination-IP-address argument of the **oeifconfig** command at the host.

Correlating the Mainframe and Router Configuration Elements

Table 1 shows a summary of the configuration elements on the router and host that must be correlated for proper operation of CMPC+. The column labeled “Configuration Element” identifies the type of entity to be configured. The columns labeled “Router Configuration” and “Mainframe Configuration” identify the related parameters on the router and the mainframe whose values must be compatible or match.

Table 1 Relationship of Configuration Elements for CMPC+

| Configuration Element | Router Configuration | Mainframe Configuration |
|------------------------|---|---|
| Subchannels | <i>path</i> and <i>device</i> arguments of the cmpc command | RESOURCE PARTITION, CHPID, and CNTLUNIT statements of the IOCP definition defining the following parameters for the CMPC+ channel path: <ul style="list-style-type: none"> • LPAR number (if defined) in the RESOURCE PARTITION and CHPID statements—Specify in the 3rd digit of the <i>path</i> argument in the router cmpc command. • CUADD value (if defined) in the CNTLUNIT statement—Specify in the 4th digit of the <i>path</i> argument in the router cmpc command. • Available device address in the UNITADD parameter of the CNTLUNIT statement—Specify in the <i>device</i> argument of the router cmpc command. |
| Read/write subchannels | <i>device</i> argument for the cmpc read command <i>device</i> argument for the cmpc write command | Subchannel for the READ parameter of the TRL major node Subchannel for the WRITE parameter of the TRL major node |

Table 1 Relationship of Configuration Elements for CMPC+ (continued)

| Configuration Element | Router Configuration | Mainframe Configuration |
|-----------------------|---|---|
| Host IP address | <i>host-ip-addr</i> argument for the tg (CMPC+) command | <ul style="list-style-type: none"> For TCP/IP profile configuration—HOME statement For HSAS configuration—<i>source-IP-address</i> argument of the oeifconfig command |
| Router IP address | <i>local-ip-addr</i> argument for the tg (CMPC+) command | <ul style="list-style-type: none"> For TCP/IP profile configuration—DEFAULTNET statement For HSAS configuration—<i>destination-IP-address</i> argument of the oeifconfig command |

Verifying a CMPC+ Configuration Using TCP/IP

Configuring CMPC+ includes tasks for both the mainframe and the router. This section describes the steps to verify that you have successfully configured CMPC+ on a CIP. It provides procedures to verify connectivity from the router perspective and from the host perspective, and includes troubleshooting tips as a guide when the configuration verification fails.

This section includes the following topics:

- [Initial Host and Router Configuration Using the TCP/IP Stack, page 17](#)
- [Verifying CMPC+ Channel Connectivity, page 19](#)
- [Verifying Communication Between the Host and Router Using TCP/IP, page 22](#)

Initial Host and Router Configuration Using the TCP/IP Stack

When using the TCP/IP stack, consider that you begin verification with the following configurations on the host and router:

- [TRL Major Node Definition, page 17](#)
- [Host TCP/IP Stack Configuration in PROFILE.TCPIP, page 18](#)
- [Initial Router Configuration on a CIP, page 18](#)

TRL Major Node Definition

```
JECTR LG VBUILD TYPE=TRL
JCTR LG74 TRLE LNCTL=MPC, X
          MAXBFRU=16, X
          REPLYTO=25.5, X
          MPCLEVEL=NOHPDT, X
          READ=(274), X
          WRITE=(275) X
```

Note

The verification procedures assume that the VTAM major node is defined, but not yet activated.

Host TCP/IP Stack Configuration in PROFILE.TCPIP

Initial Router Configuration on a CIP

```

interface channel 2/1
no ip address
no ip directed-broadcast
no keepalive

```

```
!  
interface channel 2/2  
 ip address 172.18.20.49 255.255.255.248  
 no ip redirects  
 no ip directed-broadcast  
 no keepalive  
 tx-queue-limit 100
```

**Note**

The initial router configuration shows the configuration prior to configuring the CMPC+ feature.

Verifying CMPC+ Channel Connectivity

If you have defined the channel paths for the router at the mainframe host in the IOCP or HCD, you can begin to configure the router for CMPC+ support and verify connectivity at the channel level first. Isolating this level of verification is useful when the VTAM configuration is not completed, but you want to establish that the router can successfully communicate with the host.

Verifying channel connectivity confirms the following aspects of the router configuration:

- Microcode is loaded on the CMCC
- CMCC adapter is functional
- CMCC can communicate with the host over the channel path

This section includes the following tasks:

- [Verifying CMPC+ Channel Connectivity From the Router, page 19](#)
- [Verifying CMPC+ Channel Connectivity From the Host, page 21](#)
- [Troubleshooting Tips for Channel Connectivity, page 21](#)

Verifying CMPC+ Channel Connectivity From the Router

The steps in this section show how to verify the CMPC+ channel configuration beginning with configuring the **cmpc** commands on the router's physical interface. The following assumptions are made for the procedure described in this section:

- The router's virtual interface is already configured with the statements as shown in the initial router configuration for a CIP shown in [Figure 6](#).
- The router has the recommended CMCC hardware and microcode versions to support the CMPC feature. You can use the **show version**, **show controllers cbus**, and **show controllers channel** commands to verify the Cisco IOS software and CMCC microcode versions.

**Note**

Before you begin on the router, run the **debug channel events** command so that you can verify the messages on the router console.

To verify CMPC+ channel connectivity, perform the following steps:

- Step 1** From the router, configure the **cmpc** commands on the physical interface according to your site's requirements as shown in the following example:

```
interface channel 2/1
cmpc C190 74 MVSG-TCP READ
cmpc C190 75 MVSG-TCP WRITE
```

Confirm that you receive messages stating "Device Initialized," similar to the following displays:

```
PA1 MPC C190-74 Device initialized
PA1 MPC C190-75 Device initialized
```

- Step 2** Configure the CMPC+ TG according to your site's requirements as shown in the following example:

```
interface channel 2/2
tg MVSG-TCP ip 172.18.20.51 172.18.20.49
```

Confirm that you receive a message stating that the CMPC+ TG is "Initialized," similar to the following display:

```
CMPC-TG MVSG-TCP initialized
```

- Step 3** To verify that the channel is up and the line protocol is up, go to EXEC command mode and run the **show interfaces channel** command as shown in the following example:

```
show interfaces channel 2/1
```

- Step 4** To verify that the physical channel is up, run the **show extended channel statistics** command as shown in the following example:

```
show extended channel 2/1 statistics
```

Verify that the path field in the output for the CMPC+ devices shows "ESTABLISHED," which means that the physical channel is up.

- Step 5** If your **show** command output matches the values described in [Step 3](#) and [Step 4](#), then the channel connection between the mainframe and the router is established. If you cannot confirm the values, see the ["Troubleshooting Tips for Channel Connectivity"](#) section on page 21.

Verifying CMPC+ Channel Connectivity From the Host

After CMPC+ has been configured on the router, you can also verify channel connectivity from the host by performing the following steps:

- Step 1** From the host, verify that the devices are online using the following sample command to display the device 274 for a range of two (or 274-275):

```
du,,,274,2
```

- Step 2** If the devices are offline, then vary the devices online according to your site's configuration as shown in the following sample commands:

```
v 274,online
v 275,online
```

Note The CHPID for the device should already be active on the host.

- Step 3** If the devices come online, then the channel connection between the mainframe and the router is established. If the device does not come online, or you receive the message “No paths physically available,” see the [“Troubleshooting Tips for Channel Connectivity”](#) section on page 21.

Troubleshooting Tips for Channel Connectivity

There are several indicators on the router and the mainframe that indicate that the channel connection is not available.

- From the router, you might see the following things:
 - The output from the **show interfaces channel** command shows that the channel or line protocol is down.
 - The output from the **show interface channel statistics** command shows that the path is not established (the physical channel is not up).
- From the host, you might see the following things:
 - The device is not online.
 - When you vary the device online, you receive the message “No paths physically available.”

Recommended Actions

If you determine that the channel connection is not available, review the following tasks to be sure that you have performed them correctly:

- Be sure that you enabled the CMPC+ router configuration using the **no shut** command to restart the interface. If you configured both the physical and virtual interface on a CIP, be sure to run the **no shut** command on both interfaces.
- Be sure that the CMPC+ devices (and paths) are online at the host.
- Verify that the *path* and *device* arguments that you specified in your **cmpe** configuration command correlate properly to the host IOCP or HCD configuration.

If none of these recommended actions allow you to establish the channel connection, check your CMCC LED indicators and the physical channel connection.

Verifying Communication Between the Host and Router Using TCP/IP

After the VTAM TRLE major node definition is installed, the TCP/IP stack is configured, and the router is configured, you can verify communication between the host and router.

This section includes the following verification procedures:

- [Verifying Communication From the Host Using TCP/IP, page 22](#)
- [Verifying Communication From the Router Using TCP/IP, page 23](#)
- [Troubleshooting Tips from the Host Using TCP/IP, page 24](#)
- [Troubleshooting Tips from the Router Using TCP/IP, page 24](#)

Verifying Communication From the Host Using TCP/IP

This procedure describes how to verify from the host that the VTAM TRLE major node definition is configured and activated.

To verify communication with VTAM using CMPC+, perform the following steps:

Step 1 Activate the TRLE using the following sample command:

```
v net,act,id=JCTRLG74,update=add
```

Verify that you receive the following console messages:

```
IST097I VARY ACCEPTED
IST093I ISTTRL ACTIVE
```

Step 2 Display the TRLE status using the following command:

```
d net,trl
```

Verify that the TRLE is present but not active, as shown in the following console message:

```
IST1314I TRLE=JCTRLG74 STATUS=NEVAC CONTROL=MPC
```

Step 3 Start the TCP/IP task using the following sample command:

```
s TCPMVSG4
```

Verify that the TCP/IP task starts, the TRLE device and HSAS stack initializes and the interfaces are active as shown in the following console messages:

```
$HASP100 TCPMVSG4 ON STCINRDR
IEF695I START TCPMVSG4 WITH JOBNAME TCPMVSG4 IS ASSIGNED TO USER
OMVSKERN, GROUP OMVSGRP
$HASP373 TCPMVSG4 STARTED
IEF403I TCPMVSG4 - STARTED - TIME=11.33.21
IEE252I MEMBER CTIEZB00 FOUND IN SYS1.OS390R7.PARMLIB

EZAIN11I ALL TCPIP INTERFACES FOR PROC TCPMSG4 ARE ACTIVE.
```

Verifying Communication From the Router Using TCP/IP

This procedure describes how to verify communication with the VTAM TRL major node and the TCP/IP stack from the router.

To verify communication with VTAM from the router, perform the following steps:

Step 1 Run the **show extended channel statistics** command as shown in the following example:

```
show extended channel 2/1 statistics
```

Verify that the following is displayed in these fields of the output for the CMPC+ devices:

- Path—The CMPC+ path is “ESTABLISHED,” which means that the physical channel is up.
- Con—The connection value is “Y,” which means that the subchannel is up and the CMPC+ connection is established between the router and the mainframe.

Step 2 To verify that the CMPC+ subchannels are active, run the **show extended channel cmpc** command as shown in the following example:

```
show extended channel 2/0 cmpc
```

Step 3 To verify the operational status and configuration of the CMPC+ TGs, run the **show extended channel tg** command as shown in the following example:

```
show extended channel 2/2 tg detailed MVSG-TCP
```

Step 4 When the TCP/IP task has been started at the host, verify that you receive a message stating that the connection is activated as shown in the following example:

```
MVSG-TCP: Tcp/Ip Connection Activated
```

Step 5 To confirm that you can establish a connection to the host, run the following **ping** command at the router console and specify the IP address that is configured in the HOME statement of the TCP/IP profile (Figure 6):

```
router# ping 172.18.20.51
```

Verify that you receive a successful response to the **ping** command as shown in the following example:

```
Sending 5, 100-byte ICMP Echos to 172.18.20.51, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 12/12/12 ms
```

For information about other commands that are useful when diagnosing or monitoring your CMPC+ connection, see the “[Monitoring and Maintaining CMPC+](#)” section on page 32.

Troubleshooting Tips from the Host Using TCP/IP

This section describes recommended actions for the following problems that might occur during verification of communication between the host and router.

From the host, you receive the following messages when you start the TCP/IP task:

```
$HASP100 TCPMVSG4 ON STCINRDR
IEF695I START TCPMVSG4 WITH JOBNAME TCPMVSG4 IS ASSIGNED TO USER
OMVSKERN, GROUP OMVSGRP
$HASP373 TCPMVSG4 STARTED
IEF403I TCPMVSG4 - STARTED - TIME=11.40.57
IEE252I MEMBER CTIEZB00 FOUND IN SYS1.OS390R7.PARMLIB
EPW0250I EPWPITSK: FFST INITIALIZATION FOR TCP COMPLETE
EZZ0300I OPENED PROFILE FILE DD:PROFILE
EZZ0309I PROFILE PROCESSING BEGINNING FOR DD:PROFILE
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE DD:PROFILE
EZZ0334I IP FORWARDING IS DISABLED
EZZ0335I ICMP WILL NOT IGNORE REDIRECTS
EZZ4308I ERROR: CODE=80103016 DURING ACTIVATION OF DEVICE JCTRLG74.
DIAGNOSTIC CODE: 02
EZZ0337I CLAWUSEDDOUBLENOP IS CLEARED
EZZ0345I STOPONCLAWERROR IS DISABLED
EZZ4202I OPENEDITION-TCP/IP CONNECTION ESTABLISHED FOR TCPMVSG4
BPXF206I ROUTING INFORMATION FOR TRANSPORT DRIVER TCPMVSG4 HAS BEEN
INITIALIZED OR UPDATED.
EZB6473I TCP/IP STACK FUNCTIONS INITIALIZATION COMPLETE.

EZZ6027I TELNET TRANSFORM INITIALIZATION FAILED, RC: FFFF
EZZ6028I TELNET TRANSFORM HAS ENDED
```

Recommended Action

Verify that the TRL major node is active at the host.

Troubleshooting Tips from the Router Using TCP/IP

This section describes recommended actions for the following problems that might occur during verification of communication between the host and router.

Problem

From the router, the **ping** command to the host fails as shown in the following example:

```
Sending 5, 100-byte ICMP Echos to 172.18.20.51, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)
```

Recommended Actions

- Verify that the TRL major node is active at the host.
- Verify that the IP address for the router in the TCP/IP profile matches the local IP address that you specified in the router's **tg** configuration command.

Problem

From the router, you receive the following messages when the TCP/IP task is started at the host:

```
%CIP2-6-MSG: slot2 %MPC-6-CMPCP_CV_LOG: MVSG-TCP: Event/State
PRE_VcActInd/PRS_Reset
%CIP2-3-MSG: slot2 %MPC-3-CMPCP_CV_ERR2: Possible Config error:
  Rcvd Host Local IP: 172.18.20.51, Expected: 172.18.20.52
```

**Note**

Ignore any other error messages that might follow these errors on the router console until you follow the recommended action to resolve the problem.

Recommended Action

Verify that the IP address for the host in the TCP/IP profile matches the remote IP address that you specified in the router's **tg** configuration command.

Problem

From the router, you receive the following messages when the TCP/IP task is started at the host:

```
%CIP2-6-MSG: slot2 %MPC-6-CMPCP_CV_LOG: MVSG-TCP: Event/State
PRE_VcActInd/PRS_Reset
%CIP2-3-MSG: slot2 %MPC-3-CMPCP_CV_ERR2: Possible Config error:
  Rcvd protocol: TCP/IP, Expected: HSAS/IP
```

**Note**

Ignore any other error messages that might follow these errors on the router console until you follow the recommended action to resolve the problem.

Recommended Action

Verify that the router's **tg** configuration command specifies the **ip** protocol keyword and not **hsas-ip**.

Verifying a CMPC+ Configuration Using HSAS

Configuring CMPC+ includes tasks for both the mainframe and the router. This section describes the steps to verify that you have successfully configured CMPC+ on a CIP. It provides procedures to verify connectivity from the router perspective and from the host perspective, and includes troubleshooting tips as a guide when the configuration verification fails.

This section includes the following topics:

- [Initial Host and Router Configuration Using the HSAS Stack, page 26](#)
- [Verifying CMPC+ Channel Connectivity, page 26](#)
- [Verifying Communication Between the Host and Router Using HSAS, page 29](#)

Initial Host and Router Configuration Using the HSAS Stack

When using the HSAS stack, consider that you begin verification with the following configurations on the host and router:

- [TRL Major Node Definition, page 26](#)
- [Initial Router Configuration on a CIP, page 26](#)

Note

The verification procedures assume that the VTAM major node is defined, but not yet activated.

TRL Major Node Definition

```

HSASTRLG VBUILD TYPE=TRL
HSASTR72 TRLE LNCTL=MPC,MAXBFRU=16,          X
              READ=(272),                    X
              WRITE=(273)

```

Initial Router Configuration on a CIP

```

interface Channel2/1
  no ip address
  no ip directed-broadcast
  no keepalive
!
interface Channel2/2
  ip address 172.18.20.49 255.255.255.248
  no ip redirects
  no ip directed-broadcast
  no keepalive
  tx-queue-limit 100

```

Note

The initial router configuration shows the configuration prior to configuring the CMPC+ feature.

Verifying CMPC+ Channel Connectivity

If you have defined the channel paths for the router at the mainframe host in the IOCP or HCD, you can begin to configure the router for CMPC+ support and verify connectivity at the channel level first. Isolating this level of verification is useful when the VTAM configuration is not completed, but you want to establish that the router can successfully communicate with the host.

Verifying channel connectivity confirms the following aspects of the router configuration:

- Microcode is loaded on the CMCC
- CMCC adapter is functional
- CMCC can communicate with the host over the channel path

Verifying CMPC+ Channel Connectivity From the Router

The steps in this section show how to verify the CMPC+ channel configuration beginning with running the **cmpc** command on the router's physical interface. The following assumptions are made for the procedure described in this section:

- The router's virtual interface is already configured with the statements as shown in the initial router configuration for a CIP shown in [Figure 6](#).
- The router has the recommended CMCC hardware and microcode versions to support the CMPC feature. You can use the **show version**, **show controllers cbus**, and **show controllers channel** commands to verify the Cisco IOS software and CMCC microcode versions.

Note

Before you begin on the router, run the **debug channel events** command so that you can verify the messages on the router console.

To verify CMPC+ channel connectivity, perform the following steps:

-
- Step 1** From the router, configure the **cmpc** commands on the physical interface according to your site's requirements as shown in the following example:
- ```
interface channel 2/1
cmPC C190 72 MVSG-HSA READ
cmPC C190 73 MVSG-HSA WRITE
```
- Confirm that you receive messages stating "Device Initialized," similar to the following displays:
- ```
PA1 MPC C190-72 Device initialized
PA1 MPC C190-73 Device initialized
```
- Step 2** Configure the CMPC+ TG according to your site's requirements as shown in the following example:
- ```
interface channel 2/2
tg MVSG-HSA ip 172.18.20.50 172.18.20.49
```
- Confirm that you receive a message stating that the CMPC+ TG is "Initialized," similar to the following display:
- ```
CMPC-TG MVSG-HSA initialized
```
- Step 3** To verify that the channel is up and the line protocol is up, go to EXEC command mode and run the **show interfaces channel** command as shown in the following example:
- ```
show interfaces channel 2/1
```
- Step 4** To verify that the physical channel is up, run the **show extended channel statistics** command as shown in the following example:
- ```
show extended channel 2/1 statistics
```
- Verify that the path field in the output for the CMPC+ devices shows "ESTABLISHED," which means that the physical channel is up.
- Step 5** If your **show** command output matches the values described in [Step 3](#) and [Step 4](#), then the channel connection between the mainframe and the router is established. If you cannot confirm the values, see the "[Troubleshooting Tips for Channel Connectivity](#)" section on [page 28](#).
-

Verifying CMPC+ Channel Connectivity From the Host

After CMPC+ has been configured on the router, you can also verify channel connectivity from the host by performing the following steps:

- Step 1** From the host, verify that the devices are online using the following sample command to display the device 272 for a range of two (or 272-273):

```
d u, , 272, 2
```

- Step 2** If the devices are offline, then vary the devices online according to your site's configuration as shown in the following sample commands:

```
v 272,online
v 273,online
```

Note The CHPID for the device should already be active on the host.

- Step 3** If the devices come online, then the channel connection between the mainframe and the router is established. If the device does not come online, or you receive the message “No paths physically available,” see the [“Troubleshooting Tips for Channel Connectivity” section on page 28](#).

Troubleshooting Tips for Channel Connectivity

There are several indicators on the router and the mainframe that indicate that the channel connection is not available.

- From the router, you might see the following things:
 - The output from the **show interfaces channel** command shows that the channel or line protocol is down.
 - The output from the **show interface channel statistics** command shows that the path is not established (the physical channel is not up).
- From the host, you might see the following things:
 - The device is not online.
 - When you vary the device online, you receive the message “No paths physically available.”

Recommended Actions

If you determine that the channel connection is not available, review the following tasks to be sure that you have performed them correctly:

- Be sure that you enabled the CMPC+ router configuration using the **no shut** command to restart the interface. If you configured both the physical and virtual interface on a CIP, be sure to run the **no shut** command on both interfaces.
- Be sure that the CMPC+ devices (and paths) are online at the host.
- Verify that the *path* and *device* arguments that you specified in your **cmpe** configuration command correlate properly to the host IOCP or HCD configuration.

If none of these recommended actions allow you to establish the channel connection, check your CMCC LED indicators and the physical channel connection.

Verifying Communication Between the Host and Router Using HSAS

After the VTAM TRLE major node definition is installed and the router is configured, you can configure the HSAS stack on the host and verify communication between the host and router.

This section includes the following verification procedures:

- [Verifying Communication From the Host Using HSAS, page 29](#)
- [Verifying Communication From the Router Using HSAS, page 30](#)
- [Troubleshooting Tips From the Router Using HSAS, page 31](#)

Verifying Communication From the Host Using HSAS

This procedure describes how to verify from the host that the VTAM TRLE major node definition is configured and activated.

To verify communication with VTAM using CMPC+, perform the following steps:

Step 1 Activate the TRLE using the following sample command:

```
v net,act,id=HSASTR72,update=add
```

Verify that you receive the following console messages:

```
IST097I VARY ACCEPTED
IST093I ISTTRL ACTIVE
```

Step 2 Display the TRLE status using the following command:

```
d net,trl
```

Verify that the TRLE is present but not active, as shown in the following console message:

```
IST1314I TRLE=HSASTR72 STATUS=NEVAC CONTROL=MPC
```

Step 3 From the TSO/ISPF menu at the host, enter Open Edition by typing **L8.4**.

Step 4 To configure the HSAS stack on the host, type the **oeifconfig** command as shown in the following example:

```
oeifconfig hsastr72 172.18.20.50 172.18.20.49 mtu 4468
```

Step 5 Display the HSAS configuration using the following command:

```
oenetstat -r
```

Verify that you receive a display similar to the following messages:

| Destination | Gateway | Flags | Refs | Use | Unreach | Interface |
|--------------|--------------|-------|------|-----|---------|-----------|
| 172.18.20.49 | 172.18.20.49 | UH | 0 | 0 | 0 | HSASTR72 |
| 172.18.20.50 | * | UHL | 0 | 0 | 0 | HSASTR72 |
| 127.0.0.0 | * | UL | 0 | 0 | 0 | LO0 |

Verifying Communication From the Router Using HSAS

This procedure describes how to verify communication with the VTAM TRL major node and the HSAS stack from the router.

To verify communication with VTAM from the router, perform the following steps:

Step 1 Run the **show extended channel statistics** command as shown in the following example:

```
show extended channel 2/1 statistics
```

Verify that the following is displayed in these fields of the output for the CMPC+ devices:

- Path—The CMPC+ path is “ESTABLISHED,” which means that the physical channel is up.
- Con—The connection value is “Y,” which means that the subchannel is up and the CMPC+ connection is established between the router and the mainframe.

Step 2 To verify that the CMPC+ subchannels are active, run the **show extended channel cmpc** command as shown in the following example:

```
show extended channel 2/0 cmpc
```

Step 3 To verify the operational status and configuration of the CMPC+ TGs, run the **show extended channel tg** command as shown in the following example:

```
show extended channel 2/2 tg detailed MVSG-HSA
```

Step 4 When the HSAS task is configured at the host, verify that you receive a message stating that the connection is activated as shown in the following example:

```
MVSG-HSA: Hsas/Ip Connection Activated
```

Step 5 To confirm that you can establish a connection to the host, run the following **ping** command at the router console and specify the IP address that is configured in the `oeifconfig` command at the host:

```
router# ping 172.18.20.50
```

Verify that you receive a successful response to the **ping** command as shown in the following example:

```
Sending 5, 100-byte ICMP Echos to 172.18.20.50, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 12/12/16 ms
```

For information about other commands that are useful when diagnosing or monitoring your CMPC+ connection, see the [“Monitoring and Maintaining CMPC+” section on page 32](#).

Troubleshooting Tips From the Router Using HSAS

This section describes recommended actions for the following problems that might occur during verification of communication between the host and router.

Problem

From the router, the `Hsas/Ip Connection Activated` message does not appear and the `ping` command times out.

Recommended Action

- Verify that the IP address for the host in the `oeifconfig` command at the host matches the remote IP address that you specified in the router's `tg` configuration command.
- Verify that the TRL activated successfully at the host.

Problem

From the router, you receive the following messages when the `oeifconfig` command is run at the host:

```
%CIP2-6-MSG: slot2 %MPC-6-CMPCP_CV_LOG: MVSG-HSA: Event/State
PRE_VcActInd/PRS_Reset
%CIP2-3-MSG: slot2 %MPC-3-CMPCP_CV_ERR2: Possible Config error:
  Rcvd Local Addr: 172.18.20.49, Expected: 172.18.20.51
```

Note

Ignore any other error messages that might follow these errors on the router console until you follow the recommended action to resolve the problem.

Recommended Action

Verify that the IP address for the router in the `oeifconfig` command matches the local IP address that you specified in the router's `tg` configuration command.

Problem

From the router, you receive the following messages when the `oeifconfig` command is run at the host:

```
%CIP2-6-MSG: slot2 %MPC-6-CMPCP_CV_LOG: MVSG-HSA: Event/State
PRE_VcActInd/PRS_Reset
%CIP2-3-MSG: slot2 %MPC-3-CMPCP_CV_ERR2: Possible Config error:
  Rcvd protocol: HSAS/IP, Expected: TCP/IP
```

Note

Ignore any other error messages that might follow these errors on the router console until you follow the recommended action to resolve the problem.

Recommended Action

Verify that the router's `tg` configuration command specifies the `hsas-ip` protocol keyword and not `ip`.

Monitoring and Maintaining CMPC+

The following topics in this section provide information about the different commands that you can use to monitor and maintain the CMCC interfaces that are configured for CMPC+:

- [Monitoring Interface Status, page 32](#)
- [Clearing Counters for CMPC+, page 32](#)

Monitoring Interface Status

To monitor CMCC adapter interface status, you can display information about the interface, including the version of the software and the hardware, the controller status, and statistics about the interfaces. In addition, you can display information about feature-related statistics on the CMCC adapter. This section lists some additional commands that are useful when monitoring CMCC adapter interfaces that are configured for CMPC+.

For a complete list of the **show** commands that are related to monitoring CMCC adapter interfaces, see the “Configuring Cisco Mainframe Channel Connection Adapters” chapter in this guide. To display the full list of **show** commands, enter **show ?** at the EXEC prompt.

To display information related to CMPC+ configurations, use the following commands in EXEC mode:

| Command | Purpose |
|--|---|
| Router# show extended channel slot/port cmgr [<i>tg-name</i>] | Displays information about the MPC+ TG connection manager. |
| Router# show extended channel slot/port cmpc [<i>path</i> [<i>device</i>]] | Displays information about each CMPC+ (and CMPC) subchannel configured on the specified CMCC adapter interface. |
| Router# show extended channel slot/port tg [oper stats] [detailed] [<i>tg-name</i>] | Displays configuration, operational, and statistics information for CMPC+ (and CMPC) TGs configured on a specified CMCC adapter internal LAN interface. |

Clearing Counters for CMPC+

You can reset the statistics counters that are displayed in the output of the **show extended channel** commands. You can reset the counters associated with an interface or a particular feature on the interface. If you are monitoring a particular threshold or statistic for a CMPC+ TG and need to reset a related counter, you can clear all those counters related to the TG.

For information about clearing other counters on the CMCC adapter interface, see the “Configuring Cisco Mainframe Channel Connection Adapters” chapter in this guide.

To clear the TG counters associated with CMPC+ on the CMCC adapters, use the following command in privileged EXEC mode:

| Command | Purpose |
|---|---|
| Router# <code>clear extended counters channel slot/port tg</code> | <p>Clears counters for statistics associated with TGs in the CMPC+ (and CMPC) features on the specified <i>slot/port</i>. The port value differs by the type of CMCC adapter:</p> <ul style="list-style-type: none"> • CIP—<i>port</i> value corresponds to the virtual interface, which is port 2. • CPA—<i>port</i> value corresponds to the physical interface, which is port 0. |

**Note**

This command will not clear counters retrieved using Simple Network Management Protocol (SNMP), but only those seen with the EXEC `show extended channel tg` command.

CMPC+ Configuration Examples

Following are the CMPC+ configuration examples shown in this section:

- [CMPC+ with TCP/IP Stack Example, page 33](#)
- [CMPC+ with HSAS Stack Example, page 35](#)
- [CMPC+ with TCP/IP and HSAS Stacks Example, page 36](#)
- [CMPC+ TG Using Two Interfaces Example, page 39](#)

CMPC+ with TCP/IP Stack Example

Figure 7 illustrates TCP/IP link for CMPC+ between a host and a Cisco router with a CMCC adapter. The configurations for this example follow.

Figure 7 CMPC+ IP with TCP/IP

**Router**

The following configuration is for the CIP in the Cisco 7500 router:

```

hostname ipclust1
!
microcode CIP flash slot0:cip27-4
microcode reload
!

```

```

interface Channel0/1
  no ip address
  no keepalive
  cmpc 0170 00 TG00 READ
  cmpc 0170 01 TG00 WRITE
!
interface Channel0/2
  ip address 80.12.165.1 255.255.255.0
  no ip redirects
  no ip directed-broadcast
  ip route-cache same-interface
  no ip mroute-cache
  load-interval 30
  no keepalive

  tg TG00      ip 80.12.165.2 80.12.165.1

```

In this configuration, the CMPC+ configuration is for the TCP/IP stack on the host. The host IP address of 80.12.165.2 in the TG statement corresponds to the IP address for the TCP/IP stack in the TCP/IP profile on the host. The IP address for the CIP is 80.12.165.2.

TCP/IP Profile

The following sample shows the TCP/IP Profile on the host:

```

ARPAGE 5
telnetparms timemark 600 port 23 dbcstransform endtelnetparms
ASSORTEDPARMS NOFWD ENDASSORTEDPARMS
;
DEVICE mpc4b00 MPCPTP
LINK MPCPLNK2 MPCPTP mpc4b00
;
AUTOLOG
  OEFTPE3
ENDAUTOLOG
INCLUDE TODD.MPCP.TCPIP.PROFILES(PORTS)
HOME
  80.12.165.2 MPCPLNK2
GATEWAY
; NETWORK      FIRST      DRIVER      PACKET      SUBNet mask  subnet value
;              HOP              SIZE
  80.12.165.1  =      mpcplnk2  4468      host
DEFAULTNET 80.12.165.1 mpcplnk2 4468      0
BEGINVTAM

      ; Define logon mode tables to be the defaults shipped with the latest
      ; level of VTAM
3278-3-E NSX32703 ; 32 line screen - default of NSX32702 is 24 line screen
3279-3-E NSX32703 ; 32 line screen - default of NSX32702 is 24 line screen
3278-4-E NSX32704 ; 48 line screen - default of NSX32702 is 24 line screen
3279-4-E NSX32704 ; 48 line screen - default of NSX32702 is 24 line screen
3278-5-E NSX32705 ; 132 column screen - default of NSX32702 is 80 columns
3279-5-E NSX32705 ; 132 column screen - default of NSX32702 is 80 columns
      ; Define the LUs to be used for general users
DEFAULTAPPL ECHOMVSE
; DEFAULTAPPL ECHOMVSE 10.10.1.188
; DEFAULTAPPL NETTMVSE
DEFAULTLUS
  TCPE0000..TCPE9999
ENDEFAULTLUS
ALLOWAPPL * ; Allow all applications that have not been previously
            ; specified to be accessed
ENDVTAM

```

```
DATASETPREFIX TODD.MPCP
start mpc4b00
```

In this TCP/IP profile, the DEVICE specifies the VTAM TRLE mpc4b00 and LINK specifies the link name (MPCPLNK2) associated with the IP address (80.12.165.2) for that link. The host IP address 80.12.165.2 that is specified for the TG in the router configuration must be identical to the IP address specified for the TG in the router configuration.

TRL Major Node

The following sample shows the TRL major node example:

```
TRL4B00 VBUILD TYPE=TRL
MPC4B00 TRLE LNCTL=MPC,MAXBFPU=16, X
          READ=(4B00), X
          WRITE=(4B01)
```

In this TRL major node example, the parameter *MPC4B00* must be identical to the LINK parameter in the TCP/IP profile.

CMPC+ with HSAS Stack Example

Figure 8 illustrates HSAS for CMPC+ between a host and a Cisco router with a CMCC adapter. The configurations for this example follow.

Figure 8 CMPC+ IP with HSAS

Router

The following sample shows the configuration for the CIP in the Cisco 7500 router:

```
hostname ipclust1
!
microcode CIP flash slot0:cip27-4
microcode reload
!
interface Channel0/1
 no ip address
 no keepalive
 cmpc 0170 02 TG00 READ
 cmpc 0170 03 TG00 WRITE
!

interface Channel0/2
 ip address 80.12.165.1 255.255.255.0
 no ip redirects
 no ip directed-broadcast
 ip route-cache same-interface
 no ip mroute-cache
 load-interval 30
 no keepalive
 tg TG00 hsas-ip 80.12.165.2 80.12.165.1
```

In this configuration, the CMPC + configuration is for the HSAS stack on the host. The IP address of 80.12.165.2 on the CIP corresponds to the HSAS IP address for the HSAS stack on the host.

Stack Definition in the OE Parmlib Member for HSAS

The following example shows the HSAS communications stack defined through the BPXPRMxy member in SYS1.PARMLIB. The most important configuration statement is shown in bold.

```
SYS1.PARMLIB(BPXPRMxy)
.
.
.
FILESYSTYPE      ENTRYPOINT(BPXCINT)  TYPE(CINET)
NETWORK DOMAINNAME(AF_INET) DOMAINNUMBER(2) MAXSOCKETS(11000)
                  TYPE(CINET) INADDRANYPORT(5000) INADDRANYCOUNT(4000)
SUBFILESYSTYPE NAME(TCPMVSE1) ENTRYPOINT(EZBPFINI) TYPE(CINET)
                  DEFAULT
SUBFILESYSTYPE NAME(TCPMVSE2) ENTRYPOINT(EZBPFINI) TYPE(CINET)
SUBFILESYSTYPE NAME(TCPMVSE3) ENTRYPOINT(EZBPFINI) TYPE(CINET)
SUBFILESYSTYPE NAME(TCPMVSE4) ENTRYPOINT(EZBPFINI) TYPE(CINET)
SUBFILESYSTYPE NAME(TCPMVSE5) ENTRYPOINT(EZBPFINI) TYPE(CINET)
SUBFILESYSTYPE NAME(TCPMVSE6) ENTRYPOINT(EZBPFINI) TYPE(CINET)
SUBFILESYSTYPE NAME(TCPMVSE7) ENTRYPOINT(EZBPFINI) TYPE(CINET)
SUBFILESYSTYPE NAME(TCPMVSE8) ENTRYPOINT(EZBPFINI) TYPE(CINET)
SUBFILESYSTYPE NAME(OESTACK) ENTRYPOINT(BPXUIINT) TYPE(CINET)
```

The OpenEdition Common INET physical file system must be defined to include the HSAS communications stack (OESTACK). Whereas other IP communications stacks require a separate address space, the HSAS communications stack resides within the OpenEdition kernel.

The SUBFILESYSTYPE NAME(OESTACK) statement defines the HSAS stack. This statement must be coded exactly as shown in the example and only one such statement must be coded.

HSAS Configuration

The following sample is the HSAS configuration on the MVS host:

```
oeifconfig mpc4b02 80.80.165.2 80.12.165.1 mtu 4468
oeroute add default 80.12.165.1
```

TRL Major Node

The following sample is the TRL major node configuration:

```
TRL4B02 VBUILD TYPE=TRL
MPC4B02 TRLE LNCTL=MPC,MAXBFRU=16, X
                READ=(4B02), X
                WRITE=(4B03)
```

In this TRL major node configuration, the parameter *MPC4B02* must be identical to the TRLE parameter in the *oeifconfig* configuration.

CMPC+ with TCP/IP and HSAS Stacks Example

Figure 9 illustrates CMPC+ used between a Cisco router with a CMCC adapter and a host with both TCP/IP and HSAS stacks.

Figure 9 CMPC+ with TCP/IP and HSAS Stacks**Router**

The following is the CMPC+ configuration for TCP/IP and HSAS in the CPA:

```
hostname ipclust2
!
enable secret 5 $1$2Py5$GmguUvRGwLdOj2UCi6cv71
enable password lab
!
microcode ecpa slot0:xcpa216-0.plus110698
microcode reload
ip subnet-zero
ip host bizarre 171.69.160.37
ip domain-name cisco.com
ip name-server 171.69.161.21
!

interface Channel5/0
 ip address 80.80.2.1 255.255.255.0
 no ip directed-broadcast
 ip route-cache same-interface
 no ip mroute-cache
 load-interval 30
 no keepalive
 cmpc 0180 00 TG00 READ
 cmpc 0180 01 TG00 WRITE
 cmpc 0180 02 TG02 READ
 cmpc 0180 03 TG02 WRITE
 tg TG00      ip 80.80.2.2 80.80.2.1
 tg TG02     hsas-ip 80.80.2.3 80.80.2.1
```

In this configuration, the `cmpc` configuration is for the TCP/IP and HSAS stacks on the host. The IP address of 80.80.2.2 corresponds to the IP address for the TCP/IP stack in the TCP/IP profile on the host. The IP address of 80.80.2.3 corresponds to the IP address in the HSAS stack on the host.

TRL Major Node for TCP/IP Stack

The following sample shows the TRL major node configuration for the TCP/IP stack:

```
TRL4900 VBUILD TYPE=TRL
MPC4900 TRLE LNCTL=MPC,MAXBFRU=6,REPLYTO=3,                                x
          READ=(4900),WRITE=(4901)
```

In this TRL major node example, the parameter `MPC4900` must be identical to the `TRLE` parameter in the `LINK` statement in the TCP/IP profile.

TRL Major Node for HSAS Stack

The following sample shows the TRL major node configuration for the HSAS stack:

```
TRL4902 VBUILD TYPE=TRL
MPC4902 TRLE LNCTL=MPC,MAXBFRU=9,REPLYTO=3,                                X
          READ=(4902),                                                    X
```

```
WRITE=(4903)
```

In this TRL major node example, the parameter *MPC4B02* must be identical to the *oeifconfig* statement in the TCP/IP profile.

TCP/IP Profile

The following example shows the TCP/IP profile on the host:

```
ARPAGE 5
telnetparms timemark 600 port 23 dbcstransform endtelnetparms
ASSORTEDPARMS NOFWD ENDASSORTEDPARMS
;
DEVICE mpc4900 MPCPTP
LINK MPCPLNK2 MPCPTP mpc4900
;
INCLUDE TODD.MPCP.TCPIP.PROFILES(PORTS)
HOME
    80.80.2.2      MPCPLNK2
GATEWAY
; NETWORK      FIRST      DRIVER      PACKET      SUBNet mask      subnet value
;              HOP              SIZE
    80.80.2.1      =      mpcplnk2      4468      host
DEFAULTNET 80.80.2.1      mpcplnk2      4468      0

BEGINVTAM
    ; Define logon mode tables to be the defaults shipped with the latest
    ; level of VTAM
3278-3-E NSX32703 ; 32 line screen - default of NSX32702 is 24 line screen
3279-3-E NSX32703 ; 32 line screen - default of NSX32702 is 24 line screen
3278-4-E NSX32704 ; 48 line screen - default of NSX32702 is 24 line screen
3279-4-E NSX32704 ; 48 line screen - default of NSX32702 is 24 line screen
3278-5-E NSX32705 ; 132 column screen - default of NSX32702 is 80 columns
3279-5-E NSX32705 ; 132 column screen - default of NSX32702 is 80 columns
    ; Define the LUs to be used for general users
DEFAULTAPPL ECHOMVSF
; DEFAULTAPPL NETTMVSE
DEFAULTLUS
    TCPF0000..TCPF9999
ENDDEFAULTLUS
ALLOWAPPL * ; Allow access to all applications not previously specified
ENDVTAM
DATASETPREFIX TODD.MPCP
START mpc4900
```

In this TCP/IP profile, the *DEVICE* specifies the VTAM TRLE *mpc4900* and *LINK* specifies the link name (*MPCPLNK2*) associated with the IP address (*80.8.2.2*) for that link. The IP address *80.80.2.1* must be identical to the IP address specified for the TG in the router configuration.

HSAS Stack Configuration

The following example shows the OE commands for the HSAS stack configuration:

```
oeifconfig mpc4902 80.80.2.3 80.80.2.1 mtu 4468
oeroute add default 80.80.2.1
```

In this configuration, *mpc4902* must be identical to the TRLE parameter in the *oeifconfig* configuration.

CMPC+ TG Using Two Interfaces Example

Figure 10 illustrates CMPC+ used between a Cisco router with a CIP and a host with split TGs.

Note

The split TG configuration is only supported on a CIP with two physical interfaces.

Figure 10 CMPC+ with Split TG

Router

The following example shows the CMPC+ router configuration for a split TG:

```
interface Channel0/0
  no ip address
  no ip directed-broadcast
  no keepalive
  cmpc 0170 00 TG00 READ
!
interface Channel0/1
  no ip address
  no ip directed-broadcast
  no keepalive
  cmpc 0170 00 TG00 WRITE
!
interface Channel0/2
  ip address 80.12.165.1 255.255.255.0
  no ip redirects
  no ip directed-broadcast
  ip route-cache same-interface
  no ip mroute-cache
  load-interval 30
  no keepalive
  tg TG00      hsas-ip 80.12.165.2 80.12.165.1
```

HSAS Configuration

The following example shows the HSAS configuration on the host:

```
oeifconfig mpcsplit 80.12.165.2 80.12.165.1 mtu 4468
oeroute add default 80.12.165.1
```

TRL Major Node for HSAS Stack

The following example shows the TRL major node configuration for the HSAS stack:

```
TRLSPLIT VBUILD TYPE=TRL
MPCSPPLIT TRLE LNCTL=MPC,MAXBFRU=16,REPLYTO=3, X
READ=(5200), X
WRITE=(4B00)
```

In this TRL major node example, the parameter *mpcsplit* must be identical to the TRLE parameter in the LINK statement within the *oeifconfig* statement.
