PPP-Max-Payload and IWF PPPoE Tag Support

First Published: December 5, 2006
Last Updated: March 2, 2009

The PPP-Max-Payload and IWF PPPoE Tag Support feature enables the PPP over Ethernet (PPPoE) component to process the PPP-Max-Payload and Interworking Functionality (IWF) PPPoE tags in the PPPoE discovery frame:

- The tag **ppp-max-payload** command allows PPPoE peers to negotiate PPP maximum receive units (MRUs) greater than 1492 octets if the underlying network supports a maximum transmission unit (MTU) size greater than 1500 octets.
- The IWF PPPoE tag allows the Broadband Remote Access Server (BRAS) to distinguish the IWF PPPoE from the regular PPPoE sessions to overcome the per-MAC session limit put on the BRAS as a protection from denial of service (DOS) attacks sourced from the same MAC address.

Finding Feature Information

For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for PPP-Max-Payload and IWF PPPoE Tag Support” section on page 9.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Information About PPP-Max-Payload and IWF PPPoE Tag Support

To implement this feature, you should be familiar with the following concepts:

- Accommodating an MTU/MRU Greater than 1492 in PPPoE
- Interworking Functionality

Accommodating an MTU/MRU Greater than 1492 in PPPoE

Per the RFC, “Accommodating an MTU/MRU Greater than 1492 in PPPoE,” PPPoE peers can negotiate only MRUs with a maximum of 1492 octets so that the PPPoE header and PPP protocol ID can be inserted in the PPPoE session data packet. The maximum for an Ethernet payload is 1500 octets. RFC 2516 defines a new tag to allow PPPoE peers to negotiate PPP MRU greater than 1492 if the underlying networks can support an Ethernet payload of greater than 1500 bytes. To enable processing of this new tag, a command has been defined in the Cisco IOS command-line interface as tag ppp-max-payload. The PPP-Max-Payload and IWF PPPoE Tag Support feature enhances the PPPoE component so the tag ppp-max-payload command can process the new tag to influence the Link Control Protocol (LCP) MRU negotiations for the PPP session based on the MRU value specified in the tag from the PPPoE client.

Interworking Functionality

The DSL Forum defined IWF to define the process for conversion of PPP over ATM (PPPoA) sessions to PPPoE sessions at the digital subscriber line access multiplexer (DSLAM) to the BRAS. This functionality was defined to help the migration of DSLAM networks from ATM to Ethernet media. So, essentially, the PPPoA session comes in to the DSLAM over ATM and is converted to a PPPoE session at the DSLAM, which is then connected to the BRAS as a PPPoE session. Each PPPoA session is mapped to a corresponding PPPoE session.

Typically, the BRAS is configured to limit PPPoE sessions originating from the same MAC address to protect itself from a DOS attack. This presents a problem for IWF PPPoE sessions because all PPPoE sessions originate from the same MAC address DSLAM. To overcome this issue, the IWF PPPoE tag is inserted at the DSLAM and read by the BRAS to distinguish the IWF PPPoE session from the regular PPPoE session during the PPPoE discovery frames.

For more information about this subject, refer to the DSL Forum Technical Report 101, “Migration to Ethernet-Based DSL Aggregation.”

How to Configure PPP-Max-Payload and IWF PPPoE Tag Support

This section contains the following tasks:

- Enabling PPP-Max-Payload and IWF PPPoE Tag Support
- Disabling PPP-Max-Payload and IWF PPPoE Tag Support
Enabling PPP-Max-Payload and IWF PPPoE Tag Support

To enable the PPP-Max-Payload and IWF PPPoE Tag Support feature, perform this task.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. bba-group pppoe {group-name | global}
4. virtual-template template-name
5. tag ppp-max-payload [minimum value maximum value] [deny]
6. sessions per-mac iwf limit per-mac-limit
7. interface {fastethernet | gigabitethernet | tengigabitethernet} slot/subslot/port/.subinterface
8. pppoe enable [group group-name]
9. virtual-template template-number
10. ppp lcp echo mru verify [minimum value]
11. end
12. show pppoe session [all | packets]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Example: | Router> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: | Router# configure terminal |
| **Step 3** bba-group pppoe {group-name | global} | Enters BBA group configuration mode and defines a PPPoE profile. |
| Example: | Router(config)# bba-group pppoe pppoe-group |
| **Step 4** virtual-template template-number | Configures a PPPoE profile with a virtual template to be used for cloning virtual access interfaces.  
• The template-number argument is an identifying number of the virtual template that will be used to clone virtual-access interfaces. |
<p>| Example: | Router(config-bba-group)# virtual-template 1 |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 5**
**tag ppp-max-payload** [**minimum** value **maximum** value] [deny] | Specifies a range for the ppp-max payload tag value that will be accepted by the BRAS.
- Default values are 1492 for the minimum and 1500 for the maximum.
- The ppp-max-payload tag value accepted from the client cannot exceed the physical interface value for MTU minus 8. |
| **Example:**
Router(config-bba-group)# tag ppp-max-payload minimum 1200 maximum 3000 | |
| **Step 6**
**sessions per-mac iwf limit** per-mac-limit | Specifies a limit for IWF-specific sessions per MAC address (separate from session limits that are not IWF-specific).
- If this command is not entered, the normal MAC-address session limit is applied to IWF sessions.
- The **per-mac-limit** argument specifies the allowable number of IWF sessions. The default is 100. |
| **Example:**
Router(config-bba-group)# sessions per-mac iwf limit 200 | |
| **Step 7**
**interface** (fastethernet | gigabitethernet | tengigabitethernet)
slot/subslot/port/subinterface | Enters interface configuration mode for a Gigabit Ethernet interface. |
| **Example:**
Router(config-bba-group)# interface gigabitethernet 0/0/0 | |
| **Step 8**
**pppoe enable** [**group** group-name] | Enables PPPoE sessions on an Ethernet interface or subinterface. |
| **Example:**
Router(config-if)# pppoe enable group 1 | |
| **Step 9**
**virtual-template** template-number | Configures a PPPoE profile with a virtual template to be used for cloning virtual access interfaces.
- The **template-number** argument is an identifying number of the virtual template that will be used to clone virtual-access interfaces. |
| **Example:**
Router(config-if)# virtual-template 1 | |
| **Step 10**
**ppp lcp echo mru verify** [**minimum** value] | Verifies the negotiated MRU and adjusts the PPP virtual access interface MTU for troubleshooting purposes.
- If the optional **minimum** keyword is entered, the **value** can be from 64 to 1500.
- If the verification of minimum MTU succeeds, the PPP connection’s interface MTU is set to that value. This reset is useful when you troubleshoot and need to adjust the sessions according to underlying physical network capability. After this command is configured, IP Control Protocol (IPCP) is delayed until verification of the MTU is completed at the LCP. |
| **Example:**
Router(config-if)# ppp lcp echo mru verify minimum 1304 | |
Disabling PPP-Max-Payload and IWF PPPoE Tag Support

The **tag ppp-max-payload** command adjusts PPP MTU of the PPPoE session above the default maximum limit of 1492 bytes. But MTU values greater than 1492 can only be supported (with PPPoE) if the underlying Ethernet network supports these larger frames. Not all Ethernet networks support higher values. If your network does not support values higher than the default maximum, you should disable the PPP-Max-Payload and IWF PPPoE Tag Support feature by performing this task.

**SUMMARY STEPS**

1.  enable
2.  configure terminal
3.  bba-group pppoe \{group-name | global\}
4.  tag ppp-max-payload deny

**DETAILED STEPS**

Configuration Examples for PPP-Max Payload and IWF PPPoE Tag Support

This section provides a sample configuration showing the PPP-Max-Payload and IWF PPPoE Tag Support feature enabled and a configuration in which the effects of this feature are disabled:

- **PPP-Max-Payload and IWF PPPoE Tag Support Enabled: Example, page 6**
- **PPP-Max-Payload and IWF PPPoE Tag Support Disabled: Example, page 6**

### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>bba-group pppoe (group-name</td>
<td>global)</td>
</tr>
</tbody>
</table>

**Example:**
```
Router(config-if)# bba-group pppoe pppoe-group
```

| Step 4 | tag ppp-max-payload deny | Disables the processing of the ppp-max-payload tag value higher than the default of 1492 bytes. |

**Example:**
```
Router(config-bba-group)# tag ppp-max-payload deny
```

### PPP-Max-Payload and IWF PPPoE Tag Support Enabled: Example

The following configuration example shows the PPP-Max-Payload and IWF PPPoE Tag Support enabled to accept PPP-Max-Payload tag values from 1492 to 1892, limits the number of sessions per MAC address to 2000 when the IWF is present, and verifies that the PPP session can accept 1500-byte packets in both directions:
```
bba-group pppoe global
  virtual-template 1
  tag ppp-max-payload minimum 1492 maximum 1892
  sessions per-mac limit 1
  sessions per-mac iwf limit 2000
  ppp lcp echo mrU verify
  interface Virtual-Template 1
```

### PPP-Max-Payload and IWF PPPoE Tag Support Disabled: Example

The following configuration example disables the effect of the `tag ppp-max-payload` command:
```
bba-group pppoe global
  virtual-template 1
  tag ppp-max-payload deny
```
Additional References

The following sections provide references related to the PPP-Max-Payload and IWF PPPoE Tag Support feature.

Feature Information for PPP-Max-Payload and IWF PPPoE Tag Support

Table 1 lists the features in this module and provides links to specific configuration information. Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note
Table 1 lists only the Cisco IOS XE software release that introduced support for a given feature in a given Cisco IOS XE software release train. Unless noted otherwise, subsequent releases of that Cisco IOS XE software release train also support that feature.
