Remote Access MPLS-VPNs

First Published: August 12, 2002
Last Updated: May 4, 2009

The Remote Access MPLS-VPNs feature allows the service provider to offer a scalable end-to-end Virtual Private Network (VPN) service to remote users. This feature integrates the Multiprotocol Label Switching (MPLS)-enabled backbone with broadband access capabilities.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for Remote Access MPLS-VPNs” section on page 13.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Remote Access MPLS-VPNs

The Remote Access MPLS-VPNs feature has the following prerequisites:

- Your network must be running the following Cisco IOS XE services before you configure VPN operation:
  - MPLS in the service provider backbone routers
  - Tag Distribution Protocol (TDP) or the Label Distribution Protocol (LDP)
  - Border Gateway Protocol (BGP) in all routers providing a VPN service
  - Cisco Express Forwarding switching in each MPLS-enabled router
- The provider edge (PE) routers that belong to the same VPN must be configured with the same VPN ID. The VPN ID must be unique to the service provider network.

Restrictions for Remote Access MPLS-VPNs

The Remote Access MPLS-VPNs feature has the following restrictions:

- The VPN ID is not used to control the distribution of routing information or to associate IP addresses.

Information About Remote Access MPLS-VPNs

- Introduction to Remote Access MPLS-VPNs, page 2
- MPLS VPN Architecture, page 3
- PPP over Ethernet to MPLS VPN, page 3

Introduction to Remote Access MPLS-VPNs

MPLS-based VPNs allow service providers to deploy a scalable and cost-effective VPN service that provides a stable and secure path through the network. An enterprise connects to geographically dispersed sites in the Internet service provider’s (ISPs) network through use of an MPLS backbone. Sites are interconnected to create an MPLS VPN.

The Remote Access MPLS-VPNs feature allows the service provider to offer a scalable end-to-end VPN service to remote users. The Remote Access MPLS-VPNs feature integrates the MPLS-enabled backbone with broadband access capabilities. By integrating access VPNs with MPLS VPNs, a service provider can:

- Enable remote users and offices to seamlessly access their corporate networks
- Offer equal access to a set of different ISPs or retail service providers
- Integrate their broadband access networks with the MPLS-enabled backbone
- Provide end-to-end VPN service to enterprise customers with remote access (RA) users and offices
- Separate network access and connectivity functions from ISP functions
MPLS VPN Architecture

MPLS VPN architecture enables the service provider to build the MPLS VPN network one time and add VPNs for new customers as needed, including them in the already established network. The elements that comprise the MPLS VPN are:

- **Customer edge (CE) routers**—The routers to which subscribers in a customer’s network connect. The CE router connects to a service provider’s edge router (PE router). The CE router initiates the remote access session to the PE router.

- **Provider edge (PE) routers**—The routers located at the edge of the service provider’s MPLS core network. The PE router connects to one or more CE routers and has full knowledge of the routes to the VPNs associated with those CE routers. The PE router does not have knowledge of the routes to VPNs whose associated CE routers are not connected to it.

- **Provider (P) routers**—The service provider routers that comprise the provider’s core network. The P routers do not assign VPN information and they do not have any knowledge of CE routers. Instead, the main focus of the P router is on label switching.

Figure 1 shows an example of MPLS VPN network architecture.

**Figure 1  MPLS VPN Network—Example**

PPP over Ethernet to MPLS VPN

Figure 2 shows the topology of integrated PPP over Ethernet (PPPoE) access to an MPLS VPN.
In Figure 2, the service provider operates an MPLS VPN that interconnects all customer sites. The service provider’s core network is an MPLS backbone with VPN service capability. The service provider provides all remote access operations to its customer. The network-side interfaces are tagged interfaces, logically separated into multiple VPNs.

Remote access is provided using a PPPoE connection. In this model, when a remote user attempts to establish a connection with a corporate network, a PPPoE session is initiated and is terminated on the service provider’s virtual home gateway (VHG) or PE router. All remote hosts connected to a particular CE router must be part of the VPN to which the CE router is connected.

The PPPoE to MPLS VPN architecture is a flexible architecture with the following characteristics:

- A remote host can create multiple concurrent PPPoE sessions, each to a different VPN.
- If multiple remote hosts exist behind the same CE router, each remote host can log in to a different VPN.
- Any remote host can log in to any VPN at any time because each VHG or PE router has the VRFs for all possible VPNs preinstantiated on it. This configuration requires that the VRF be applied through the RADIUS server, which can cause scalability issues.

The following events occur as the VHG or PE router processes the incoming PPPoE session:

1. A PPPoE session is initiated over the broadband access network.
2. The VHG/PE router accepts and terminates the PPPoE session.
3. The VHG/PE router obtains virtual access interface (VAI) configuration information:
   - The VHG/PE obtains a virtual template interface configuration information, which typically includes VRF mapping for sessions.
   - The VHG/PE sends a separate request to either the customer’s or service provider’s RADIUS server for the VPN to authenticate the remote user.
   - The VPN’s VRF instance is instantiated on the VHG or PE. The VPN’s VRF contains a routing table and other information associated with a specific VPN.

Typically, the customer RADIUS server is located within the customer VPN. To ensure that transactions between the VHG/PE router and the customer RADIUS server occur over routes within the customer VPN, the VHG/PE router is assigned at least one IP address that is valid within the VPN.
4. The VHG/PE router forwards accounting records to the service provider’s proxy RADIUS server, which in turn logs the accounting records and forwards them to the appropriate customer RADIUS server.

5. The VHG/PE obtains an IP address for the CPE. The address is allocated from one of the following:
   - Local address pool
   - Service provider’s RADIUS server, which either specifies the address pool or directly provides the address
   - Service provider’s DHCP server

6. The CPE is now connected to the customer VPN. Packets can flow to and from the remote user.

---

**How to Configure Remote Access MPLS-VPNs**

To configure the RA to MPLS VPN feature, perform the following configuration tasks:

- Configuring the MPLS Core Network, page 5 (required)
- Configuring PPPoE, page 5 (required)
- Configuring and Associating Virtual Private Networks, page 8 (required)

---

**Configuring the MPLS Core Network**

The MPLS core network is configured by enabling label switching of IP packets on interfaces, configuring virtual routing and forwarding instances, associating VRFs and configuring Multiprotocol BGP PE-to-PE routing sessions. For details relating to these activities, see the appropriate section of the *Cisco IOS XE Multiprotocol Label Switching Configuration Guide*.

---

**Configuring PPPoE**

To configure PPPoE, perform the following configuration tasks:

- Configuring a Virtual Template Interface, page 5 (required)
- Configuring PPPoE in a Broadband Aggregation Group, page 6 (required)

---

**Configuring a Virtual Template Interface**

To create and configure a virtual template interface that can be configured and applied dynamically in creating virtual access interfaces, perform the steps in the following task.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface virtual-template number`
4. `ip unnumbered ethernet number`
5. ppp authentication chap
6. ppp ipcp address required

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 3 interface virtual-template number</td>
<td>Creates a virtual template interface and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# interface virtual-template 1</td>
</tr>
<tr>
<td>Step 4 ip unnumbered ethernet number</td>
<td>Enables IP without assigning a specific IP address on the LAN.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-if)# ip unnumbered ethernet 1</td>
</tr>
<tr>
<td>Step 5 ppp authentication chap</td>
<td>Enables PPP authentication on the virtual template interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-if)# ppp authentication chap</td>
</tr>
<tr>
<td>Step 6 ppp ipcp address required</td>
<td>(Required for legacy dialup and DSL networks.) Prevents a PPP session from being configured with 0.0.0.0 remote ip address.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-if)# ppp ipcp address required</td>

**Configuring PPPoE in a Broadband Aggregation Group**

To configure a broadband aggregation (BBA) group for PPPoE and to link it to the appropriate virtual template interface, perform the steps in the following task.

SUMMARY STEPS

1. enable
2. configure terminal
3. bba-group pppoe (name | global)
4. virtual-template template-number
5. sessions per-mac limit per-mac-limit
6. sessions max limit global pppoe session limit
7. exit
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:**  
  Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**  
  Router# configure terminal | |
| **Step 3** bba-group pppoe (name | Configures a BBA group to be used to establish PPPoE sessions and enters BBA configuration mode  
  name |  
  global)  
  - The name argument identifies the BBA group. You can have multiple BBA groups.  
  - The global keyword is the default BBA group used when a BBA group name is not specified. |
| **Example:**  
  Router(config)# bba-group pppoe bbal | |
| **Step 4** virtual-template template-number | Specifies the virtual template interface to use to clone virtual access interfaces (VAIs). |
| **Example:**  
  Router(config-bba)# virtual-template 20 | |
| **Step 5** sessions per-mac limit per-mac-limit | (Optional) Specifies the maximum number of PPP over Ethernet (PPPoE) sessions allowed per MAC address in a PPPoE profile. |
| **Example:**  
  Router(config-bba)# sessions per-mac limit 32000 | |
| **Step 6** sessions max limit global pppoe session limit | (Optional) Specifies the maximum number of PPPoE sessions that will be permitted on a router and sets the PPPoE session-count threshold |
| **Example:**  
  Router(config-bba)# sessions max limit 32000 | |
| **Step 7** exit | Returns to global configuration mode. |
| **Example:**  
  Router(config-bba)# exit | |
| **Step 8** interface gigabitethernet slot/subslot/port.[subinterface] | Specifies the interface to which you want to attach the BBA group. |
| **Example:**  
  Router(config)# interface gigabitethernet 2/0/0.2 | |
Configuring and Associating Virtual Private Networks

A Virtual Private Network (VPN) service can be added to your MPLS configuration by configuring VPNs and associating the VPNs with a virtual template interface. For details relating to these activities, see the Configuring MPLS Layer 3 VPNs module.

Configuration Examples for Remote Access MPLS-VPNs

This section provides the following configuration example:

- Example: Configuring Remote Access MPLS-VPNs with One VRF for PPPoE Sessions, page 8

Example: Configuring Remote Access MPLS-VPNs with One VRF for PPPoE Sessions

The following example shows how to configure the RA to MPLS VPN feature with one VRF for PPPoE sessions:
