IGMP Static Group Range Support

First Published: July 10, 2006
Last Updated: November 20, 2009

The IGMP Static Group Range Support feature introduces the capability to configure group ranges in class maps and attach class maps to the `ip igmp static-group` command. This feature is an enhancement that simplifies the administration of networks with devices that require many interfaces to be configured with many different `ip igmp static-group` command configurations.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for IGMP Static Group Range Support” section on page 13.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IGMP Static Group Range Support

To configure the IGMP Static Group Range Support feature, you should understand the following concepts:

- IGMP Static Group Range Support Overview, page 2
- Class Maps for IGMP Static Group Range Support, page 2
- Benefits of IGMP Static Group Range Support, page 4

IGMP Static Group Range Support Overview

Prior to the introduction of the IGMP Static Group Range Support feature in Cisco IOS software, the `ip igmp static-group` command did not provide an option to specify group ranges. Administering devices that required many `ip igmp static-group` command configurations was challenging in some network environments, because each static group had to be configured individually with the `ip igmp static-group` command, which resulted in configurations that were excessively long and difficult to manage.

The IGMP Static Group Range Support feature introduces the capability to configure group ranges in class maps and attach class maps to the `ip igmp static-group` command. This feature is an enhancement that simplifies the administration of networks with devices that require many interfaces to be configured with many different `ip igmp static-group` command configurations.

Class Maps for IGMP Static Group Range Support

A class is a way of identifying a set of packets based on its contents. A class is designated through class maps. Typically, class maps are used to create traffic policies. Traffic policies are configured using the modular quality of service (QoS) command-line interface (CLI) (MQC). The normal procedure for creating traffic policies entails defining a traffic class (using the `class-map` command), creating a traffic policy (using the `policy-map` command), and attaching the policy to an interface (using the `service-policy` command).

Note

Although this feature uses the MQC to define class maps, the procedure for configuring Internet Group Management Protocol (IGMP) static group class maps is different from the normal procedure used to create class maps for configuring QoS traffic policies. See the “General Procedure for Configuring IGMP Group Range Support” section for more information.

The IGMP Static Group Range Support feature introduces a type of class map that is used to define group ranges, group addresses, SSM channels, and SSM channel ranges. Once created, the class map can be attached to interfaces.
General Procedure for Configuring IGMP Group Range Support

To configure the IGMP Static Group Range Support feature, you would complete the following procedure:

1. Create an IGMP static group class map (using the `class-map type multicast-flows` command).
2. Define the group entries associated with the class map (using the `group` command).
3. Attach the class map to an interface (using the `ip igmp static-group` command).

The `class-map type multicast-flows` command is used to enter multicast-flows class-map configuration mode to create or modify an IGMP static group class map.

Unlike QoS class maps, which are defined by specifying numerous match criteria, IGMP static group class maps are defined by specifying multicast groups entries (group addresses, group ranges, Source Specific Multicast (SSM) channels, and SSM channel ranges). The following forms of the `group` command are entered from multicast-flows class-map configuration mode to define group entries to associate with the class map:

- `group group-address`  
  Defines a group address to be associated with an IGMP static group class map.

- `group group-address to group-address`  
  Defines a range of group addresses to be associated with an IGMP static group class map.

- `group group-address source source-address`  
  Defines an SSM channel to be associated with an IGMP static group class map.

- `group group-address to group-address source source-address`  
  Defines a range of SSM channels to be associated with an IGMP static group class map.

Unlike QoS class maps, IGMP static group range class maps are not configured in traffic policies. Rather, the `ip igmp static-group` command has been extended to support IGMP static group ranges. After creating an IGMP static group class map, you can attach the class map to interfaces using the `ip igmp static-group` command with the `class-map` keyword and `class-map-name` argument. Once a class map is attached to an interface, all group entries defined in the class map become statically connected members on the interface and are added to the IGMP cache and IP multicast route (mroute) table.

Additional Guidelines for Configuring IGMP Static Group Range Support

- Only one IGMP static group class map can be attached to an interface.
- If an IGMP static group class map is modified (that is, if group entries are added to or removed from the class map using the `group` command), the group entries that are added to or removed from the IGMP static group class map are added to or deleted from the IGMP cache and the mroute table, respectively.
- If an IGMP static group class map is replaced on an interface by another class map using the `ip igmp static-group` command, the group entries associated with old class map are removed, and the group entries defined in the new class map are added to the IGMP cache and mroute table.
The `ip igmp static-group` command accepts an IGMP static group class map for the `class-map-name` argument, regardless of whether the class map configuration exists. If a class map attached to an interface does not exist, the class map remains inactive. Once the class map is configured, all group entries associated with the class map are added to the IGMP cache and mroute table.

If a class map is removed from an interface using the `no` form of the `ip igmp static-group` command, all group entries defined in the class map are removed from the IGMP cache and mroute tables.

**Benefits of IGMP Static Group Range Support**

The IGMP Static Group Range Support feature provides the following benefits:

- Simplifies the administration of devices that require many interfaces to be configured with many different `ip igmp static-group` command configurations by introducing the capability to configure group ranges in class maps and attach class maps to the `ip igmp static-group` command.
- Reduces the number of commands required to administer devices that require many `ip igmp static-group` command configurations.

**How to Configure IGMP Static Group Range Support**

This procedure contains the following tasks:

- Configuring IGMP Static Group Range Support, page 4 (required)
- Verifying IGMP Static Group Range Support, page 6 (optional)

**Configuring IGMP Static Group Range Support**

The IGMP Static Group Range Support feature is an enhancement that simplifies the administration of devices that require many interfaces to be configured with many different `ip igmp static-group` command configurations by introducing the capability to configure group ranges in class maps and attach class maps to the `ip igmp static-group` command.

Perform this task to configure IGMP static group class maps and attach class maps to the `ip igmp static-group` command.

---

**Note**

Although the IGMP Static Group Range Support feature uses the MQC to define class maps, the procedure for configuring IGMP static group class maps is different from the normal procedure used to create class maps for configuring QoS traffic policies. For more information about IGMP static group class maps, including configuration guidelines, see the “Class Maps for IGMP Static Group Range Support” section.
**SUMMARY STEPS**

1. enable
2. configure terminal
3. class-map type multicast-flows class-map-name
4. group group-address [to group-address] [source source-address]
5. Repeat Step 4 to add group entries to the class map in Step 3.
6. Repeat Step 3 to Step 5, if you want to create additional class maps.
7. exit
8. interface type number
9. ip igmp static-group class-map class-map-name
10. Repeat Step 8 and 9, if you want to attach class maps to additional interfaces.
11. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
                     | • Enter your password if prompted. |
| Example:          | Router> enable |
| Step 2 configure terminal | Enters global configuration mode. |
| Example:          | Router# configure terminal |
| Step 3 class-map type multicast-flows class-map-name | Enters multicast-flows class map configuration mode to create or modify an IGMP static group class map. |
| Example:          | Router(config)# class-map type multicast-flows static1 |
| Step 4 group group-address [to group-address] [source source-address] | Defines the group entries to be associated with the class map.  
                     | • Specify the optional to keyword and group-address argument to define a range of multicast groups.  
                     | • Specify the optional source keyword and source-address argument to define a (S, G) channel or a range of (S, G) channels. |
| Example:          | Router(config-mcast-flows-cmap)# group 232.1.1.7 to 232.1.1.20 |
| Step 5 Repeat Step 4 to add group entries to the class map in Step 3. | — |
| Step 6 Repeat Step 3 to Step 5, if you want to create additional class maps. | — |
Verifying IGMP Static Group Range Support

Perform this optional task to verify the contents of IGMP static group class maps configurations, and to confirm that all group entries defined in class maps were added to the IGMP cache and the mroute table after you attach class maps to interfaces.

**SUMMARY STEPS**

1. `show ip igmp static-group class-map [interface [type number]]`
2. `show ip igmp groups [group-name | group-address | interface-type interface-number] [detail]`
3. `show ip mroute`

**DETAILED STEPS**

**Step 1**

`show ip igmp static-group class-map [interface [type number]]`

Use this command to display the contents of IGMP static group class maps and the interfaces using class maps:

- Specify the `interface` keyword to filter the output to display only the interfaces using class maps.
- Specify the `interface` keyword and the `type number` arguments to filter the output to display only the class map attached to a particular interface.
The following is sample output from the `show ip igmp static-group class-map` command:

```
Router# show ip igmp static-group class-map

Class-map static1
  Group address range 228.8.8.7 to 228.8.8.9
  Group address 232.8.8.7, source address 10.1.1.10
  Interfaces using the classmap:
    Loopback0

Class-map static
  Group address range 232.7.7.7 to 232.7.7.9, source address 10.1.1.10
  Group address 227.7.7.7
  Group address range 227.7.7.7 to 227.7.7.9
  Group address 232.7.7.7, source address 10.1.1.10
  Interfaces using the classmap:
    Ethernet3/1
```

The following is sample output from the `show ip igmp static-group class-map` command with the `interface` keyword:

```
Router# show ip igmp static-group class-map interface

Loopback0
  Class-map attached: static1

Ethernet3/1
  Class-map attached: static
```

The following is sample output from the `show ip igmp static-group class-map` command with the `interface` keyword and `type number` arguments:

```
Router# show ip igmp static-group class-map interface Ethernet 3/1

Ethernet3/1
  Class-map attached: static
```

### Step 2

**show ip igmp groups [group-name | group-address | interface-type interface-number] [detail]**

Use this command to display the multicast groups with receivers that are directly connected to the router and that are learned through IGMP.

When verifying an IGMP static group range configuration, use this command after attaching a class map to confirm that the group entries defined in the class map were added to the IGMP cache.

The following is sample output from the `show ip igmp groups` command:

```
Router# show ip igmp groups

IGMP Connected Group Membership
Group Address Interface Uptime Expires Last Reporter
232.7.7.7   Ethernet3/1 00:00:09 stopped 0.0.0.0
232.7.7.9   Ethernet3/1 00:00:09 stopped 0.0.0.0
232.7.7.8   Ethernet3/1 00:00:09 stopped 0.0.0.0
227.7.7.7   Ethernet3/1 00:00:09 stopped 0.0.0.0
227.7.7.9   Ethernet3/1 00:00:09 stopped 0.0.0.0
227.7.7.8   Ethernet3/1 00:00:09 stopped 0.0.0.0
224.0.1.40  Ethernet3/2 01:44:50 00:02:09 10.2.2.5
224.0.1.40  Loopback0  01:45:22 00:02:32 10.3.3.4
```

### Step 3

**show ip mroute**

Use this command to display the contents of the mroute table.

When verifying an IGMP static group range configuration, use this command after attaching a class map to confirm that group entries defined in the class map were added to the mroute table.
The following is sample output from the **show ip mroute** command:

```
Router# show ip mroute

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,

Configuration Examples for IGMP Static Group Range Support

This section provides the following configuration examples:

- Configuring IGMP Static Group Support: Example, page 9
- Verifying IGMP Static Group Support: Example, page 9

Configuring IGMP Static Group Support: Example

The following example shows how to configure a class map and attach the class map to an interface. In this example, a class map named static is configured and attached to Ethernet interface 3/1.

class-map type multicast-flows static
group 227.7.7.7
group 232.7.7.7 to 232.7.7.9 source 10.1.1.10
group 232.7.7.7 source 10.1.1.10
group 227.7.7.7 to 227.7.7.9
.
.
!
interface Ethernet3/1
ip address 192.168.1.2 255.255.255.0
ip pim sparse-dense-mode
ip igmp static-group class-map static
!

Verifying IGMP Static Group Support: Example

The following is sample output from the `show ip igmp static-group class-map` command. In this example, the output displays the contents of the IGMP static group class map named static (the class map configured in the “Configuring IGMP Static Group Support: Example” section).

Router# show ip igmp static-group class-map
Class-map static
  Group address range 227.7.7.7 to 227.7.7.9
  Group address 232.7.7.7, source address 10.1.1.10
  Group address range 232.7.7.7 to 232.7.7.9, source address 10.1.1.10
  Group address 227.7.7.7
  Interfaces using the classmap:
    Ethernet3/1

The following is sample output from the `show ip igmp groups` command. In this example, the command is issued to confirm that the group entries defined in the class map named static (the class map configured in the “Configuring IGMP Static Group Support: Example” section) were added to the IGMP cache.

Router# show ip igmp groups
IGMP Connected Group Membership
Group Address       Interface            Uptime    Expires  Last Reporter
232.7.7.7           Ethernet3/1         00:00:09  stopped  0.0.0.0
232.7.7.9           Ethernet3/1         00:00:09  stopped  0.0.0.0
232.7.7.8           Ethernet3/1         00:00:09  stopped  0.0.0.0
227.7.7.7           Ethernet3/1         00:00:09  stopped  0.0.0.0
227.7.7.9           Ethernet3/1         00:00:09  stopped  0.0.0.0
227.7.7.8           Ethernet3/1         00:00:09  stopped  0.0.0.0
224.0.1.40          Ethernet3/2         01:44:50  00:02:09  10.2.2.5
The following is sample output from the `show ip mroute` command. In this example, the command is issued to confirm that the group entries defined in the class map named static (the class map configured in the “Configuring IGMP Static Group Support: Example” section) were added to the mroute table.

```
Router# show ip mroute

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,

Feature Information for IGMP Static Group Range Support

Table 1 lists the release history for this feature.

For information on a feature in this technology that is not documented here, see the “IP Multicast Features Roadmap.”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.
