show vlan

To display VLAN information, use the show vlan command in privileged EXEC mode.

    show vlan [brief | id vlan-id | name name [ifindex] | ifindex]

**Syntax Description**

- **brief** (Optional) Displays only a single line for each VLAN, naming the VLAN, status, and ports.
- **id vlan-id** (Optional) Displays information about a single VLAN that is identified by a VLAN ID number; valid values are from 1 to 4094.
- **name name** (Optional) Displays information about a single VLAN that is identified by VLAN name; valid values are an ASCII string from 1 to 32 characters.
- **ifindex** (Optional) Displays the VLAN’s ifIndex number.

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each Ethernet switch port and Ethernet repeater group belong to only one VLAN. Trunk ports can be on multiple VLANs.

If you shut down a VLAN using the **state suspend** or the **state active** command, these values appear in the Status field:

- **suspended**—VLAN is suspended.
- **active**—VLAN is active.

If you shut down a VLAN using the **shutdown** command, these values appear in the Status field:

- **act/lshut**—VLAN status is active but shut down locally.
- **sus/lshut**—VLAN status is suspended but shut down locally.

This is an example of the output for a VLAN (VLAN0002) that is active but shut down locally:

```
Router# show vlan

<table>
<thead>
<tr>
<th>VLAN Name</th>
<th>Status</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 default</td>
<td>active</td>
<td>Fa5/9</td>
</tr>
<tr>
<td>2 VLAN0002</td>
<td>act/lshut</td>
<td>Fa5/9</td>
</tr>
<tr>
<td>(...Output truncated...)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
If a VLAN is shut down internally, these values appear in the Status field:

- act/ishut—VLAN status is active but shut down internally.
- sus/ishut—VLAN status is suspended but shut down internally.

This is an example of the output for a VLAN (VLAN0002) that is active but shut down internally:

```
Router# show vlan

VLAN Name     Status   Ports
----          -------   -------
1  default    active   Fa5/9
2  VLAN0002   act/ishut Fa5/9
```

If a VLAN is shut down locally and internally, the value that is displayed in the Status field is act/ishut or sus/ishut. If a VLAN is shut down locally only, the value that is displayed in the Status field is act/lshut or sus/lshut.

Separate VLAN ranges with a hyphen, and separate VLANs with a comma and no spaces in between. For example, you can enter the following:

```
Router# show vlan id 1-4,3,7,5-20
```

### Examples

This example shows how to display the VLAN parameters for all VLANs within the administrative domain:

```
Router# show vlan

VLAN Name     Status   Ports
----          -------   -------
1  default    active   Fa5/9
2  VLAN0002   active   Fa5/9
3  VLAN0003   active   Fa5/9
4  VLAN0004   active   Fa5/9
5  VLAN0005   active   Fa5/9
6  VLAN0006   active   Fa5/9
<...Output truncated...>
```

```

</table>
show vlan access-log config

To display VLAN access control list (VACL) logging configuration properties, use the **show vlan access-log config** command in privileged EXEC mode.

```
show vlan access-log config
```

**Syntax Description**
This command has no arguments or keywords.

**Command Modes**
Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>This command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>This command was modified. Support for this command on the Supervisor Engine 2 was extended to Cisco IOS Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Syslog messages are generated when the device reaches the set threshold, or five minutes after the previous message is displayed, whichever occurs first. The threshold controls the rate of the syslog message only and does not affect the log table entries. Packets exceeding the specified rate limit will not be logged.

**Examples**
The following example shows how to display the configured VACL logging properties. The fields are self-explanatory.

```
Router# show vlan access-log config

VACL Logging Configuration:
 max log table size :500
 log threshold      :4000
 rate limiter       :3000
```

**Related Commands**

</tr>
</tbody>
</table>
show vlan access-log flow

To display VLAN access control list (VACL) flow table contents, use the `show vlan access-log flow` command in privileged EXEC mode.

```
show vlan access-log flow protocol { src-addr src-mask | any | host {hostname | host-ip} } { dst-addr dst-mask | any | host {hostname | host-ip} } [vlan vlan-id]
```

**Syntax Description**

- `protocol`: Protocol name or number; valid values are `icmp`, `igmp`, `ip`, `tcp`, `udp`, or numbers from 0 to 255 to designate a protocol.
- `src-addr src-mask`: Source address and mask.
- `any`: Displays information for any host.
- `host hostname`: Displays information for a hostname.
- `host host-ip`: Displays information for a host IP address.
- `dst-addr dst-mask`: Destination address and mask.
- `vlan vlan-id`: (Optional) Displays information for a specific VLAN valid value. Range is from 1 to 4094.

**Command Modes**
Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>This command was introduced on the Supervisor Engine 720.</td>

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Entries for the standard protocols or any protocol can be displayed by specifying the protocol name or protocol number. Entries are removed from the table, if there is no increment in the packet counter after the last syslog message.

**Examples**
The following example shows how to display the VACL flow table contents.
Router# `show vlan access-log flow 17 172.20.10.110 255.255.0.0 172.20.10.105 255.255.0.0`

</table>
show vlan access-log statistics

To display VLAN access control list (VACL) packet counts, messages, and other statistics, use the `show vlan access-log statistics` command in privileged EXEC mode.

```
show vlan access-log statistics
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>This command was introduced on the Supervisor Engine 720.</td>

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

All platforms do not display VACL logging index. Packets that are dropped do not generate any syslog messages.

**Examples**

The following example shows how to display the VACL statistics. The fields are self-explanatory.

```
Router# show vlan access-log statistics

VACL Logging Statistics:
total packets    :0
logged           :0
dropped          :0

Dropped Packets Statistics:
unsupported protocol :0
no packet buffer    :0
hash queue full     :0
flow table full     :0

Misc Information:
VACL Logging LTL Index :0x7E02
free packet buffers  :8192
log messages sent    :0
log table size       :0
```

<td>Status of the backup Concentrator relay function (CRF).</td>
</tr>
<tr>
<td>primary</td>
<td>Primary VLAN.</td>
</tr>
<tr>
<td>secondary</td>
<td>Secondary VLAN.</td>
</tr>
</tbody>
</table>

*Note* The term "VLAN translation" is also used in Cisco configuration guides for mapping specific VLANs in a given trunk to another VLAN that is of the same media type. In this context the term "VLAN translation" refers to a form of VLAN mapping that is using the term "VLAN translation" to describe it.
show vlan counters

To display the software-cached counter values, use the `show vlan counters` command in privileged EXEC mode.

```
show vlan [id vlanid] counters
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>id vlanid</code></td>
<td>(Optional) Displays the software-cached counter values for a specific VLAN; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SX</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SX.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(50)SY</td>
<td>This command was introduced. Command output was updated to count broadcast packets with Unicast counters.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show vlan id counters` command is not supported on switch virtual interfaces (SVIs).

For Layer 2 and Layer 3 VLAN interfaces and router ports, per-interface switching statistics and VLAN-counter information to the Multilayer Switching Feature Card 2 (MSFC2) are exported approximately every 3 minutes.

If you enter the `show vlan counters` command with no arguments, the software-cached counter values for all VLANs are displayed.

**Examples**

This example shows how to display the software-cached counter values for a specific VLAN. The fields shown in the display are self-explanatory.

```
Router# show vlan id 205 counters
VLAN vlanid 205
L2-Unicast-Pkts  10
L3-In-Unicast-Pkts  0
L3-Out-Unicast-Pkts  0
L2-NonUnicast-Pkts + L3-In-NonUnicast-Pkts  5
L3-Out-NonUnicast-Pkts  6
L2-Unicast-Octets   6
L3-In-Unicast-Octets  6
L3-Out-Unicast-Octets  6
L2-NonUnicast-Octets + L3-In-NonUnicast-Octets  6
L3-Out-NonUnicast-Octets  6
Router#
```

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show vlan filter map-name interface` command accepts only ATM, packet over SONET/SDH (POS), or serial interface types. If your system is not configured with any of these interface types, the `interface interface interface-number` keyword and arguments are not provided.

The `interface-number` argument designates the module and port number. Valid values for `interface-number` depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 2 to 13 and valid values for the port number are from 1 to 48.

If you do not specify an optional keyword and argument, all mappings are displayed. If you enter `access-map map_name`, all the VLANs and interfaces that are associated with the specified map are shown. If you enter `vlan vlan-id` or `interface interface-number`, its associated access map, if existing, is shown.

In the output for VLAN access control lists (VACLs) on VLANs, the following applies:

- Configured on VLANs—User configured
- Active on VLANs—VLAN list on which the VACL is active

In the WAN-interface outputs, the following applies:

- Configured on interfaces—User configured
- Active on Interfaces—Interfaces on which the VACL is active
This example shows how to display mappings between the VACLs and the VLANs and the VACLs and the interfaces. The fields shown in the display are self-explanatory.

Router# show vlan filter

VLAN Map mordred:
   Configured on VLANs: 2,4-6
   Active on VLANs: 2,4-6
Router#

</tr>
</tbody>
</table>
show vlan free

To display the total number of free VLANs on a router, use the `show vlan free` command in privileged EXEC mode.

```
show vlan free
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
All free VLANs are displayed.

**Command Modes**
Privileged EXEC (#)

**Usage Guidelines**
The `show vlan free` command displays the total number of free VLANs on a router.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SRE</td>
<td>This command was introduced on the Cisco 7600 series routers.</td>
</tr>
</tbody>
</table>

**Examples**
The following is sample output from the `show vlan free` command. This example lists the number of free VLANs on a router. The fields shown in the display are self-explanatory.

```
Router# show vlan free
Free VLANs
---------
  2
  3
  4
  5
  6
  7
  8
  9
 10
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vlan</td>
<td>Displays the VLAN information in the system.</td>
</tr>
</tbody>
</table>
show vlan free summary

To display the usage summary information for VLANs, use the show free vlan summary command in privileged EXEC mode.

```
show vlan free summary
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Usage summary information for all of the free VLANs is displayed.

**Command Modes**

Privileged EXEC (#)

**Usage Guidelines**

The `show vlan free summary` command displays the following VLAN information:

- Total number of available VLANs
- Total number of free VLANs
- Total number of used VLANs.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SRE</td>
<td>This command was introduced on the Cisco 7600 series routers.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to view the summary information for the existing VLANs in the system. The field descriptions shown in the display are self-explanatory.

```
Router# show vlan free summary

======= vlan free/usage Summary =======
Total number of available vlans = 4094
Total number of free vlans = 4074
Total number of used vlans = 20

Router#
```

**Related Commands**

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In some cases, the output displays the following:

```
workaround vlan
```

A workaround VLAN is used to enable the Policy Feature Card (PFC)-based policing on the PWAN1 main interface. Without the workaround VLAN, the packets hit the PFC policer twice for PWAN1 because the same VLAN is used when packets traverse the local bus before and after Parallel eXpress Forwarding (PXF) processing.

Entering the `show vlan internal usage` command displays the Optical Services Module (OSM) interfaces and subinterfaces in addition to the regular Ethernet interfaces.

To display the associated subinterfaces, enter the `show cwan vlan` command. The `show cwan vlan` command displays the mapping between the WAN subinterface and the internal VLANs in use.

**Examples**

This example shows how to display the current internal VLAN allocation. The fields shown in the displays are self-explanatory.

```
Router# show vlan internal usage

VLAN Usage
     ----------------------
  1025 -
  1026 -
  1027 -
  1028 -
  1029 Port-channel6
  1030 GigabitEthernet1/2
  1032 FastEthernet3/20
  1033 FastEthernet3/21
  1129 -
```
This example shows how to display the internal VLAN allocation for a specific VLAN:

Router# show vlan id 1030 internal usage

VLAN Usage
---- -----------------------
1030 GigabitEthernet1/2
show vlan mapping

To register a mapping of an 802.1Q VLAN to an Inter-Switch Link (ISL) VLAN, use the `show vlan mapping` command in privileged EXEC mode.

```
show vlan mapping
```

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

<table>

------------------------------------------------------
vlan port provisioning    Enables or disables VLAN port provisioning.
```
show vlan private-vlan

To display private VLAN (PVLAN) information, use the **show vlan private-vlan** command in privileged EXEC mode.

`show vlan private-vlan [type]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>(Optional) Displays the PVLAN type (isolated, community, or primary).</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the **show vlan private-vlan type** command output display, “normal” displayed as a type indicates a regular VLAN that is configured in a PVLAN. A display of “normal” means that two VLANs have been associated before the type was set and that the PVLAN is not operational. This information is useful for debugging purposes.

**Examples**

This example shows how to display information about all currently configured PVLANs:

```
Router# show vlan private-vlan

Primary Secondary Type              Ports
------- --------- ----------------- ------------------------------------------
 2       301       community         Fa5/3, Fa5/25
 2       302       community
 100     101       isolated
 150     151       non-operational
 202     203       community
 303     304       community
 401     402       non-operational

Router#
```

This example shows how to display information about all currently configured PVLAN types:

```
Router# show vlan private-vlan type

Vlan Type
------- ------------------
 202  primary
 303  community
 304  community
 305  community
 306  community
```
Table 34 describes the fields that are shown in the example.

<table>
<thead>

Fa1/40                4
Total virtual ports: 82
Router#
```
This example shows how to display the number of logical virtual ports that are required for all slots. The fields shown in the display are self-explanatory.

Router# show vlan virtual-port

Slot 1
-------
Total slot virtual ports 1
Slot 3
-------
Total slot virtual ports 82
Slot 4
-------
Total slot virtual ports 4
Total chassis virtual ports 87
Router#
**show vlan-range**

To display the VLAN range, use the `show vlan-range` command in privileged EXEC mode.

```
show vlan-range
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC (#)

**Command History**

</table>

**Usage Guidelines**

On the Catalyst 6500 series switches and Cisco 7600 series routers, the EXEC `show vlan` command displays information about the Layer 2 VLAN. The privileged EXEC `show vlans` command displays information about the VLAN subinterface in Layer 3.

When entering the `show vlans` command, you cannot shorten the `vlans` keyword.

If you want to view the Layer 3 statistics, do not use the `show vlans` command, instead use the `show interface vlan vlan-num stats` command or the `show interface vlan vlan-num accounting` command.

**Examples**

The following is sample output from the `show vlans` command:

```
Router# show vlans

Virtual LAN ID:  2 (IEEE 802.1Q Encapsulation)
  VLAN Trunk Interface:  FastEthernet5/0.1
  Protocols Configured:  Address:  Received:  Transmitted:
                         IP         10.0.0.3     16          92129

Virtual LAN ID:  3 (IEEE 802.1Q Encapsulation)
  VLAN Trunk Interface:  Ethernet6/0/1.1
```
The following is sample output from the `show vlans` command indicating a native VLAN and a bridged group:

Virtual LAN ID: 1 (IEEE 802.1Q Encapsulation)

VLAN Trunk Interface: FastEthernet1/0/2

This example shows how to display information about the Cisco IOS VLAN subinterfaces:

Router# show vlans

This VLAN is configured as a native VLAN for the following interfaces:

FastEthernet1/0/2

The following is sample output from the `show vlans` command that shows the traffic count on Fast Ethernet subinterfaces:

Router# show vlans

Virtual LAN ID: 2 (IEEE 802.1Q Encapsulation)
VLAN Trunk Interface: FastEthernet5/0.1
Protocols Configured: Address: Received: Transmitted:
IP 172.16.0.3 16 92129

Virtual LAN ID: 3 (IEEE 802.1Q Encapsulation)

VLAN Trunk Interface: Ethernet6/0/1.1
Protocols Configured: Address: Received: Transmitted:
IP 172.20.0.3 1558 1521

Virtual LAN ID: 4 (Inter Switch Link Encapsulation)

VLAN Trunk Interface: FastEthernet5/0.2
Protocols Configured: Address: Received: Transmitted:
IP 172.30.0.3 0 7

Table 35 describes the significant fields shown in the display.

</tr>
</tbody>
</table>

### Usage Guidelines

If no arguments or keywords are entered, statistics for all of the 802.1Q VLAN IDs are displayed.

The `any` keyword is not supported for IPoQinQ because IP routing is not supported on ambiguous subinterfaces. However, the `second-dot1q inner-id` keyword and argument can be used on IPoQinQ for a specific inner VLAN ID that is not an ambiguous subinterface.
Note

On the Cisco 10000 series router, the following is an implementation limitation—when a service policy is applied to a PPPoEoQinQ or IPoQinQ subinterface and the service policy drops some packets, the packets dropped are still displayed in the outgoing packet counters as output.

Note

For the Cisco ASR 1000 Series Aggregation Services Router only, the command output includes the total number of packets dropped from the shared port adapter (SPA) because of ingress oversubscription on the VLAN. An example of the output is included in the “Cisco ASR 1000 Series Router: Example” section below.

Examples

802.1Q VLAN Statistics: Example

The output from the `show vlans dot1q` command displays the statistics for all the 802.1Q VLAN IDs. Only the outer VLAN IDs are displayed here.

```
Router# show vlans dot1q
```

```
Total statistics for 802.1Q VLAN 1:
  441 packets, 85825 bytes input
  1028 packets, 69082 bytes output
Total statistics for 802.1Q VLAN 101:
  5173 packets, 510384 bytes input
  3042 packets, 369567 bytes output
Total statistics for 802.1Q VLAN 201:
  1012 packets, 119254 bytes input
  1018 packets, 120393 bytes output
Total statistics for 802.1Q VLAN 301:
  3163 packets, 265272 bytes input
  1011 packets, 120750 bytes output
Total statistics for 802.1Q VLAN 401:
  1012 packets, 119254 bytes input
  1010 packets, 119108 bytes output
```

Table 36 describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total statistics for 802.1Q VLAN 1</td>
<td>Statistics are shown for the VLAN ID with the specified outer ID.</td>
</tr>
<tr>
<td>packets</td>
<td>Number of packets encapsulated by the 802.1Q QinQ VLAN.</td>
</tr>
<tr>
<td>bytes input</td>
<td>Number of bytes input.</td>
</tr>
<tr>
<td>bytes output</td>
<td>Number of bytes output.</td>
</tr>
</tbody>
</table>

The following sample output from the `show vlans dot1q` command displays the statistics for the 802.1Q VLAN subinterface configured on Gigabit Ethernet interface 5/0:

```
Router# show vlans dot1q GigabitEthernet 5/0.1011001
```

```
GigabitEthernet5/0.1011001 (101/1001)
  1005 packets, 122556 bytes input
  1023 packets, 125136 bytes output
```
Table 37 describes the significant fields shown in the display.

Table 37  show vlans dot1q (subinterface) Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet5/0.1011001 (101/1001)</td>
<td>Statistics are shown for subinterface Gigabit Ethernet 5/0.1011001 with an outer VLAN ID of 101 and an inner VLAN ID of 1001.</td>
</tr>
<tr>
<td>packets</td>
<td>Number of packets encapsulated by the 802.1Q QinQ VLAN.</td>
</tr>
<tr>
<td>bytes input</td>
<td>Number of bytes input.</td>
</tr>
<tr>
<td>bytes output</td>
<td>Number of bytes output.</td>
</tr>
</tbody>
</table>

The following sample output from the show vlans dot1q command displays the summary statistics for all of the VLAN subinterfaces under the physical interface Gigabit Ethernet 5/0 that have an outer VLAN ID of 101:

Router# show vlans dot1q 101 GigabitEthernet 5/0

Total statistics for 802.1Q VLAN 101 on GigabitEthernet5/0:
5218 packets, 513444 bytes input
3042 packets, 369567 bytes output

The following sample output from the show vlans dot1q command displays the individual subinterface statistics and summary statistics for all the VLAN subinterfaces under the physical interface Gigabit Ethernet 5/0 that have an outer VLAN ID of 101:

Router# show vlans dot1q 101 GigabitEthernet 5/0 detail

GigabitEthernet5/0.101 (0)
3220 packets, 269148 bytes input
1008 packets, 119622 bytes output
GigabitEthernet5/0.1019999 (101/1-1000,1003-2000)
0 packets, 0 bytes input
3 packets, 1143 bytes output
GigabitEthernet5/0.1011001 (101/1001)
1005 packets, 122556 bytes input
1023 packets, 125136 bytes output
GigabitEthernet5/0.1011002 (101/1002)
1005 packets, 122556 bytes input
1008 packets, 123666 bytes output
Total statistics for 802.1Q VLAN 101 on GigabitEthernet5/0:
5230 packets, 514260 bytes input
3042 packets, 369567 bytes output

The following sample output from the show vlans dot1q command displays the statistics for an outer VLAN and inner VLAN ID combination. This is a summary that displays the total for all the subinterfaces on the router that are configured with the specified IDs.

When multiple inner VLANs are used, the statistics displayed are at subinterface-level granularity, not VLAN-ID granularity. For example, when a range of inner VLAN IDs is assigned to a subinterface, the statistics are reported only at the subinterface level. Statistics are not available for each inner VLAN ID.
show vlans dot1q

Router# `show vlans dot1q 101 second-dot1q 1001 detail`

GigabitEthernet5/0.1011001 (101/1001)
1005 packets, 122556 bytes input
1023 packets, 125136 bytes output
Total statistics for Outer/Inner VLAN 101/1001:
1005 packets, 122556 bytes input
1023 packets, 125136 bytes output

The following sample output from the `show vlans dot1q` command displays the statistics for a specific outer VLAN ID of 301 and an inner VLAN ID of any. This is a summary that displays the total for all of the subinterfaces on the router that are configured with the specified IDs.

Router# `show vlans dot1q 301 second-dot1q any`

GigabitEthernet5/0.301999 (301/any)
0 packets, 0 bytes input
3 packets, 1128 bytes output
Total statistics for Outer/Inner VLAN 301/"any":
0 packets, 0 bytes input
3 packets, 1128 bytes output

QinQ Subsystem Information: Example

The following sample output from the `show vlans dot1q` command displays some internal information about the QinQ subsystem and is used for troubleshooting purposes (typically by Cisco engineers):

Router# `show vlans dot1q internal`

Internal VLAN representation on FastEthernet0/0:
VLAN Id: 1 (.1Q, Fa0/0)
VLAN Id: 201 (.1Q-in-.1Q tree, 3 elements)
  Inner VLAN Id: (0 -0 ) Fa0/0.201
dot1q software subblock bitlist missing
  Inner VLAN Id: (2001-2001) Fa0/0.2012001
  2001
  Inner VLAN Id: (2002-2002) Fa0/0.2012002
  2002
"any" Fa0/0.201999
VLAN Id: 401 (.1Q-in-.1Q tree, 3 elements)
  Inner VLAN Id: (0 -0 ) Fa0/0.401
dot1q software subblock bitlist missing
  Inner VLAN Id: (100-900 ) Fa0/0.4019999
  100-900,1001-2000
  Inner VLAN Id: (1001-2000) Fa0/0.4019999
  100-900,1001-2000
Internal VLAN representation on GigabitEthernet5/0:
VLAN Id: 1 (.1Q, Gi5/0)
VLAN Id: 101 (.1Q-in-.1Q tree, 5 elements)
  Inner VLAN Id: (0 -0 ) Gi5/0.101
dot1q software subblock bitlist missing
  Inner VLAN Id: (1 -1000) Gi5/0.1019999
  1-1000,1003-2000
  Inner VLAN Id: (1001-1001) Gi5/0.1011001
  1001
  Inner VLAN Id: (1002-1002) Gi5/0.1011002
  1002
  Inner VLAN Id: (1003-2000) Gi5/0.1019999
  1-1000,1003-2000
VLAN Id: 301 (.1Q-in-.1Q tree, 1 elements)
  Inner VLAN Id: (0 -0 ) Gi5/0.301
dot1q software subblock bitlist missing
"any" Gi5/0.301999
Cisco ASR 1000 Series Router: Example

The following is an example of the output displayed on the Cisco ASR 1000 series router only. For the Cisco ASR 1000 series router only, the command output includes the total number of packets dropped from the SPA due to ingress over subscription on the VLAN.

Router# show vlans dot1q gigabitEthernet 0/0/3.1

GigabitEthernet0/0/3.1 (0)
133279760 packets, 8529904640 bytes input
0 packets, 0 bytes output
121997683 oversub packet drops

Table 38 describes the significant fields shown in the display.

</tbody>
</table>
show vlan-switch

To display VLAN information, use the `show vlan-switch` command in user EXEC or privileged EXEC mode.

```
show vlan-switch [brief | id vlan | internal usage | name name | summary]
```

**Syntax Description**

- **brief**
  
  (Optional) Displays only a single line for each VLAN, identifying the VLAN, status, and ports.

- **id vlan**
  
  (Optional) Displays information about a single VLAN identified by VLAN ID number. The range is from 1 to 1005.

- **internal usage**
  
  (Optional) Displays VLAN internal usage information.

- **name name**
  
  (Optional) Displays information about a single VLAN identified by VLAN name. Valid values are ASCII strings from 1 to 32 characters.

- **summary**
  
  (Optional) Displays VLAN summary information.

**Command Modes**

- User EXEC (>)
- Privileged EXEC (#)

**Command History**

- **Release**
- **Modification**
- 12.2(2)XT
  
  This command was introduced.
- 12.2(8)T
  
  This command was integrated into Cisco IOS Release 12.2(8)T.

**Usage Guidelines**

Each Ethernet switch port and Ethernet repeater group belongs to only one VLAN. Trunk ports can be on multiple VLANs.

**Examples**

The following is sample output from the example `show vlan-switch` command, which displays the VLAN parameters for all VLANs within the administrative domain:

```
Router# show vlan-switch

VLAN Name                             Status    Ports
---- -------------------------------- --------- -------------------------------
2    VLAN0002                         active
3    VLAN0003                         active
5    VLAN0005                         active
1002 fddi-default                    active
```
Table 39 describes the significant fields shown in the display.

**show vtp**

To display general information about the VLAN Trunking Protocol (VTP) management domain, status, and counters, use the `show vtp` command in privileged EXEC mode.

```plaintext
show vtp [counters | interface [type/number] | status | password | devices [conflicts]]
```

### Syntax Description

- **counters**: Displays the VTP counters for the switch.
- **interface**: Displays information for all interfaces.
- **type/number** *(Optional)*: A specific interface.
- **status**: Displays general information about the VTP management domain.
- **password**: Displays VTP password in VTP version 3 domain.
- **devices**: Displays VTP version 3 domain information.
- **conflicts** *(Optional)*: Displays only devices that have conflicting servers in a VTP version 3 domain.

<td>The output for counters and status were updated to include VTPv3 information.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

In the output of the `show vtp status` command, the last modified time is of the modifier itself. For example, the time displayed in the line “Configuration last modified by 7.0.22.11 at 5-5-06 05:51:49”, is the time that the modifier (7.0.22.11) last modified the VLAN configuration.
Examples

The following is sample output from the `show vtp counters` command:

```
Router# show vtp counters

VTP statistics:
Summary advertisements received : 0
Subset advertisements received : 0
Request advertisements received : 0
Summary advertisements transmitted : 6970
Subset advertisements transmitted : 0
Request advertisements transmitted : 0
Number of config revision errors : 0
Number of config digest errors : 0
Number of V1 summary errors : 0

VTP pruning statistics:

<table>
<thead>
<tr>
<th>Trunk</th>
<th>Join</th>
<th>Transmitted</th>
<th>Received</th>
<th>Summary advts received from non-pruning-capable device</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/11</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Gi18/10</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Gi18/15</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Gi18/16</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Fa3/1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>

<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Router#
```

This example shows how to display only those lines in the `show vtp` output that contain the word `Summary`:

```
Router# show vtp counters | include Summary

Summary advertisements received : 1
Summary advertisements transmitted : 32

Router#
```

This example shows how to display general information about the VTP management domain:

```
Router# show vtp status

VTP Version capable : 1 to 3
VTP version running : 2
VTP Domain Name : cisco
VTP Pruning Mode : Disabled
VTP Traps Generation : Disabled
Device ID : 0012.44dc.b800
MD5 digest : 0x61 0x98 0xD0 0xAD 0xA4 0x8C 0x53 0x35
Configuration last modified by 10.10.0.0 at 8-7-06 06:56:27
Local updater ID is 10.10.0.0 on interface Lo0 (first layer3 interface found)

Feature VLAN:
----------------------
VTP Mode : Server
Maximum VLANs supported locally : 1005
Number if existing VLANs : 53
Revision : 1

Router#
```

Table 40 describes the significant fields shown in the display.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary advertisements received</td>
<td>Number of summary advertisements received by this switch on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update time stamp and identity, the authentication checksum, and the number of subset advertisements to follow.</td>
</tr>
<tr>
<td>Subset advertisements received</td>
<td>Number of subset advertisements received by this switch on its trunk ports. Subset advertisements contain all the VTP information for one or more VLANs.</td>
</tr>
<tr>
<td>Request advertisements received</td>
<td>Number of advertisement requests received by this switch on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.</td>
</tr>
<tr>
<td>Summary advertisements transmitted</td>
<td>Number of summary advertisements sent by this switch on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update time stamp and identity, the authentication checksum, and the number of subset advertisements to follow.</td>
</tr>
<tr>
<td>Subset advertisements transmitted</td>
<td>Number of subset advertisements sent by this switch on its trunk ports. Subset advertisements contain all the VTP information for one or more VLANs.</td>
</tr>
<tr>
<td>Request advertisements transmitted</td>
<td>Number of advertisement requests sent by this switch on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.</td>
</tr>
<tr>
<td>Number of config revision errors</td>
<td>Number of revision errors. Whenever you define a new VLAN, delete an existing VLAN, suspend or resume an existing VLAN, or modify the parameters on an existing VLAN, the configuration revision number of the switch increments.</td>
</tr>
<tr>
<td></td>
<td>Revision errors increment whenever the switch receives an advertisement whose revision number matches the revision number of the switch, but the message digest algorithm 5 (MD5) values do not match. This error indicates that the VTP password in the two switches is different, or the switches have different configurations.</td>
</tr>
<tr>
<td></td>
<td>These errors indicate that the switch is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.</td>
</tr>
</tbody>
</table>
The following is sample output from the `show vtp status` command for VTP version 1 and VTP version 2:

```
Router# show vtp status

VTP Version                        : 3 (capable)
Configuration Revision             : 1

</tbody>
</table>
VTP Operating Mode Displays the VTP operating mode, which can be server, client, or transparent.

- Server—A switch in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on it. The switch guarantees that it can recover all VLAN information in the current VTP database from nonvolatile storage after reboot. By default, every switch is a VTP server.

- Client—A switch in VTP client mode is enabled for VTP, can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on it. When a VTP client starts up, it does not transmit VTP advertisements until it receives advertisements to initialize its VLAN database.

- Transparent—A switch in VTP transparent mode is disabled for VTP, does not transmit advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The switch receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received. The configuration of multi-VLAN ports causes the switch to automatically enter transparent mode.

- Off—When VTP is disabled using off mode, the switch behaves the same as in VTP transparent mode except that VTP advertisements are not forwarded.

Note Catalyst 2912MF, 2924M, and 3500 XL switches support up to 250 VLANs. All other Catalyst 2900 XL switches support up to 64 VLANs.

For Catalyst 2912MF, 2924M, and 3500 XL switches, if you define more than 250 VLANs or if the switch receives an advertisement that contains more than 250 VLANs, the switch automatically enters VTP transparent mode and operates with the VLAN configuration preceding the one that sent it into transparent mode.

For all other Catalyst 2900 XL switches, if you define more than 64 VLANs or if the switch receives an advertisement that contains more than 64 VLANs, the switch automatically enters VTP transparent mode and operates with the VLAN configuration preceding the one that sent it into transparent mode.

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>
The following is sample output from the `show vtp status` command for all three VTP versions on the Cisco 7600 series routers running Release 12.2(33)SRC and later.

This example shows how to verify the configuration when the device is running VTP version 1:

```
Router# show vtp status
VTP Version capable : 1 to 3
VTP version running  : 1
VTP Domain Name      : Lab_Network
VTP Pruning Mode     : Enabled
VTP Traps Generation : Disabled
Device ID            : 0016.9c6d.5300
Configuration last modified by 127.0.0.12 at 10-18-07 10:12:42
Local updater ID is 127.00.12 at 10-18-07 10:2:42
Feature VLAN:
-----------------
VTP Operating Mode   : Server
Maximum number of existing VLANs : 5
Configuration Revision : 1
MD5 digest           : 0x92 0xF1 0xE8 0x52 0x2E 0x5C 0x36 0x10 0x70 0x61 0xB8
                       0x24 0xB6 0x93 0x21 0x09
Router#
```

This example shows how to verify the configuration when the device is running VTP version 2:

```
Router# show vtp status
VTP Version capable : 1 to 3
VTP V2 Mode         : Displays if VTP version 2 mode is enabled. All VTP version 2 switches operate in version 1 mode by default. Each VTP switch automatically detects the capabilities of all other VTP devices. A network of VTP devices should be configured to version 2 only if all VTP switches in the network can operate in version 2 mode.
VTP Traps Generation: Displays whether VTP traps are transmitted to a network management station.
MD5 digest          : 16-byte checksum of the VTP configuration.
Configuration last modified : Displays the date and time of the last configuration modification. Displays the IP address of the switch that caused the configuration change to the database.
```

Table 43 describes the significant fields shown in the display.
To shut down local traffic on a specified VLAN, use the `shutdown vlan` command in global configuration mode. To restart local traffic on the VLAN, use the `no` form of this command.

```
shutdown vlan vlan-id
no shutdown vlan vlan-id
```

**Syntax Description**

- `vlan-id` VLAN number of the VLAN to be locally shut down; valid values are from 2 to 1001.

**Command Default**

Local traffic on a specified VLAN is not shut down.

**Command Modes**

Global configuration (config)

**Command History**

- **Release**
  - `12.2(14)SX` Support for this command was introduced on the Supervisor Engine 720.

---

**Table 43**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP Database</td>
<td>Displays the feature (database) type (VLAN or MST) of each server.</td>
</tr>
<tr>
<td>Conflict</td>
<td>Yes is displayed in this column if the server is in conflict with the local server for the feature. A conflict is detected when two devices in the same domain do not have the same primary server for the given database.</td>
</tr>
<tr>
<td>Switch ID</td>
<td>The MAC address of the server.</td>
</tr>
<tr>
<td>Primary Server</td>
<td>The MAC address of the primary server for the device identified in the Switch ID column. If a device is configured with a database that it originated, and equal sign (=) appears between the Primary Server field and the Switch ID field.</td>
</tr>
<tr>
<td>Revision</td>
<td>Revision number of the VTP database.</td>
</tr>
<tr>
<td>System Name</td>
<td>String provided to more easily identify the system.</td>
</tr>
</tbody>
</table>

</table>
12.2(17d)SXB  Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.

12.2(33)SRA  This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines
This command does not support extended-range VLANs.

Examples
This example shows how to shut down traffic on VLAN 2:

Router(config)# shutdown vlan 2
To enable the Simple Network Management Protocol (SNMP) trap notification on a LAN port when MAC addresses are added to or removed from the address table, use the `snmp trap mac-notification change` command in interface configuration mode. To disable the SNMP trap notification on a LAN port when MAC addresses are added to or removed from the address table, use the `no` form of this command.

```
snmp trap mac-notification change [added | removed]

no snmp trap mac-notification change
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>added</td>
<td>(Optional) Sends notification only when a MAC address is added to the table.</td>
</tr>
<tr>
<td>removed</td>
<td>(Optional) Sends notification only when a MAC address is removed from the table.</td>
</tr>
</tbody>
</table>

### Command Default

The SNMP trap notification is disabled.

### Command Modes

Interface configuration (config-if)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SXH</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to enable the SNMP trap notification on a LAN port when MAC addresses are added to the address table:

```
Router(config-if)# snmp trap mac-notification change added
```

The following example shows how to enable the SNMP trap notification on a LAN port when MAC addresses are removed from the address table:

```
Router(config-if)# snmp trap mac-notification change removed
```

The following example shows how to disable the SNMP trap notification on a LAN port:

```
Router(config-if)# no snmp trap mac-notification change
```

</table>
spanning-tree backbonefast

To enable BackboneFast to allow a blocked port on a switch to change immediately to a listening mode, use the `spanning-tree backbonefast` command in global configuration mode. To return to the default setting, use the `no` form of this command.

```
spanning-tree backbonefast
no spanning-tree backbonefast
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
BackboneFast is disabled.

**Command Modes**
Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(6)EA2</td>

<td>This command was integrated into Cisco IOS Release 12.3(4)T on the following platforms: Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
BackboneFast should be enabled on all of the Cisco routers containing an Ethernet switch network module. BackboneFast provides for fast convergence in the network backbone after a spanning-tree topology change. It enables the switch to detect an indirect link failure and to start the spanning-tree reconfiguration sooner than it would under normal spanning-tree rules.

Use the `show spanning-tree` privileged EXEC command to verify your settings.

**Examples**
The following example shows how to enable BackboneFast on the switch:

```
Router(config)# spanning-tree backbonefast
```

**Related Commands**

<tbody>
<tr>
<td><code>show spanning-tree</code></td>
<td>Displays information about the spanning-tree state.</td>
</tr>
</tbody>
</table>
spanning-tree bpdufilter

To enable bridge protocol data unit (BPDU) filtering on the interface, use the `spanning-tree bpdufilter` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
spanning-tree bpdufilter { enable | disable }

no spanning-tree bpdufilter
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BPDU filtering on this interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BPDU filtering on this interface.</td>
</tr>
</tbody>
</table>

**Command Default**
The setting that is already configured when you enter the `spanning-tree portfast bpdufilter default` command.

**Command Modes**
Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

Be careful when you enter the `spanning-tree bpdufilter enable` command. Enabling BPDU filtering on an interface is similar to disabling the spanning tree for this interface. If you do not use this command correctly, you might create bridging loops.

Entering the `spanning-tree bpdufilter enable` command to enable BPDU filtering overrides the PortFast configuration.

When configuring Layer 2-protocol tunneling on all the service-provider edge switches, you must enable spanning-tree BPDU filtering on the 802.1Q tunnel ports by entering the `spanning-tree bpdufilter enable` command.
BPDU filtering prevents a port from sending and receiving BPDUs. The configuration is applicable to the whole interface, whether it is trunking or not. This command has three states:

- **spanning-tree bpdufilter enable**—Unconditionally enables BPDU filtering on the interface.
- **spanning-tree bpdufilter disable**—Unconditionally disables BPDU filtering on the interface.
- **no spanning-tree bpdufilter**—Enables BPDU filtering on the interface if the interface is in operational PortFast state and if you configure the **spanning-tree portfast bpdufilter default** command.

Use the **spanning-tree portfast bpdufilter default** command to enable BPDU filtering on all ports that are already configured for PortFast.

### Examples

This example shows how to enable BPDU filtering on this interface:

```
Router(config-if)# spanning-tree bpdufilter enable
```

```
Router(config-if)#
```

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show spanning-tree</td>
<td>Displays information about the spanning-tree state.</td>
</tr>
<tr>
<td></td>
<td>spanning-tree portfast bpdufilter default</td>
<td>Enables BPDU filtering by default on all PortFast ports.</td>
</tr>
</tbody>
</table>
spanning-tree bpduguard

To enable bridge protocol data unit (BPDU) guard on the interface, use the `spanning-tree bpduguard` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
  spanning-tree bpduguard {enable | disable}
  no spanning-tree bpduguard
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>Enables BPDU guard on this interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disable</td>
<td>Disables BPDU guard on this interface.</td>
</tr>
</tbody>

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

BPDU guard prevents a port from receiving BPDUs. Typically, this feature is used in a service-provider environment where the network administrator wants to prevent an access port from participating in the spanning tree. If the port still receives a BPDU, it is put in the error-disabled state as a protective measure. This command has three states:

- `spanning-tree bpduguard enable`—Unconditionally enables BPDU guard on the interface.
- `spanning-tree bpduguard disable`—Unconditionally disables BPDU guard on the interface.
- `no spanning-tree bpduguard`—Enables BPDU guard on the interface if it is in the operational PortFast state and if the `spanning-tree portfast bpduguard default` command is configured.

**Examples**

This example shows how to enable BPDU guard on this interface:

```
Router(config-if)# spanning-tree bpduguard enable
Router(config-if)#
```

spanning-tree bridge assurance

To enable Bridge Assurance on all network ports on the switch, use the `spanning-tree bridge assurance` command in global configuration mode. To disable Bridge Assurance, use the `no` form of this command.

```plaintext
spanning-tree bridge assurance

no spanning-tree bridge assurance
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Bridge Assurance is enabled.

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SXI</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Bridge Assurance protects against a unidirectional link failure or other software failure and a device that continues to forward data traffic when it is no longer running the spanning tree algorithm.

Bridge Assurance is enabled only on spanning tree network ports that are point-to-point links. Both ends of the link must have Bridge Assurance enabled. If the device on one side of the link has Bridge Assurance enabled and the device on the other side either does not support Bridge Assurance or does not have this feature enabled, the connecting port is blocked.

Disabling Bridge Assurance causes all configured network ports to behave as normal spanning tree ports.

**Examples**

This example shows how to enable Bridge Assurance on all network ports on the switch:

```plaintext
Router(config)# spanning-tree bridge assurance
Router(config)#
```

This example shows how to disable Bridge Assurance on all network ports on the switch:

```plaintext
Router(config)# no spanning-tree bridge assurance
Router(config)#
```

Cisco IOS LAN Switching Command Reference

LSW-352

November 2010
spanning-tree cost

To set the path cost of the interface for Spanning Tree Protocol (STP) calculations, use the `spanning-tree cost` command in interface configuration mode. To revert to the default value, use the `no` form of this command.

```
spanning-tree cost  cost

no spanning-tree cost
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cost</code></td>
<td>Path cost; valid values are from 1 to 200000000 for Cisco IOS Releases 12.1(3a)E and later releases and from 1 to 65535 for Cisco IOS releases prior to Cisco IOS Release 12.1(3a)E.</td>
</tr>
</tbody>
</table>

**Command Default**

The default path cost is computed from the bandwidth setting of the interface; default path costs are:

- Ethernet: 100
- 16-Mb Token Ring: 62
- FDDI: 10
- FastEthernet: 10
- ATM 155: 6
- GigabitEthernet: 1
- HSSI: 647

**Command Modes**

Interface configuration (config-if)

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you specify a value for the cost argument, higher values indicate higher costs. This range applies regardless of the protocol type specified.
The following example shows how to access an interface and set a path cost value of 250 for the spanning tree VLAN associated with that interface:

Router(config)# interface ethernet 2/0
Router(config-if)# spanning-tree cost 250

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

Usage Guidelines
EtherChannel uses either Port Aggregation Protocol (PAgP) or Link Aggregation Control Protocol (LACP) and does not work if the EtherChannel mode of the interface is enabled using the channel-group group-number mode on command.

The spanning-tree etherchannel guard misconfig command detects two types of errors: misconfiguration and misconnection errors. A misconfiguration error is an error between the port-channel and an individual port. A misconnection error is an error between a switch that is channeling more ports and a switch that is not using enough Spanning Tree Protocol (STP) Bridge Protocol Data Units (BPDUs) to detect the error. In this case, the switch will only error disable an EtherChannel if the switch is a nonroot switch.

When an EtherChannel-guard misconfiguration is detected, this error message displays:

    msgdef(CHNL_MISCFG, SPANTREE, LOG_CRIT, 0, "Detected loop due to etherchannel misconfiguration of %s %s")

To determine which local ports are involved in the misconfiguration, enter the show interfaces status err-disabled command. To check the EtherChannel configuration on the remote device, enter the show etherchannel summary command on the remote device.

After you correct the configuration, enter the shutdown and the no shutdown commands on the associated port-channel interface.
Examples

This example shows how to enable the EtherChannel-guard misconfiguration:

Router(config)# spanning-tree etherchannel guard misconfig
Router(config)#

</tr>
<tr>
<td></td>
<td>Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The Catalyst 6500 series switch can support 64 or up to 1024 MAC addresses. For a Catalyst 6500 series switch with 64 MAC addresses, STP uses the extended-system ID and a MAC address to make the bridge ID unique for each VLAN.

You cannot disable the extended-system ID on a Catalyst 6500 series switch that supports 64 MAC addresses.

Enabling or disabling the extended-system ID updates the bridge IDs of all active Spanning Tree Protocol (STP) instances, which might change the spanning-tree topology.

**Examples**
This example shows how to enable the extended-system ID:

```
Router(config)# spanning-tree extend system-id
Router(config)#
```

**Related Commands**

</tbody>
</table>
spanning-tree link-type

To configure a link type for a port, use the `spanning-tree link-type` command in the interface configuration mode. To return to the default settings, use the `no` form of this command.

```
spanning-tree link-type {point-to-point | shared}
```

```
o spanning-tree link-type
```

**Syntax Description**

- **point-to-point**: Specifies that the interface is a point-to-point link.
- **shared**: Specifies that the interface is a shared medium.

**Command Default**

Link type is automatically derived from the duplex setting unless you explicitly configure the link type.

**Command Modes**

Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Rapid Spanning Tree Protocol Plus (RSTP+) fast transition works only on point-to-point links between two bridges.

By default, the switch derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link.

If you designate a port as a shared link, RSTP+ fast transition is forbidden, regardless of the duplex setting.

**Examples**

This example shows how to configure the port as a shared link:

```
Router(config-if)# spanning-tree link-type shared
Router(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

spanning-tree loopguard default

To enable loop guard as a default on all ports of a given bridge, use the `spanning-tree loopguard default` command in global configuration mode. To disable loop guard, use the `no` form of this command.

```nolog
spanning-tree loopguard default

no spanning-tree loopguard default
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Loop guard is disabled.

**Command Modes**
Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>

<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to</td>
</tr>
<tr>
<td></td>
<td>Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Loop guard provides additional security in the bridge network. Loop guard prevents alternate or root ports from becoming the designated port due to a failure that could lead to a unidirectional link.

Loop guard operates only on ports that are considered point to point by the spanning tree.

The individual loop-guard port configuration overrides this command.

**Examples**
This example shows how to enable loop guard:

```nolog
Router(config)# spanning-tree loopguard default
```

**Related Commands**

<table>
<thead>
<tr>

<td>Enables or disables the guard mode.</td>
</tr>
</tbody>
</table>
**spanning-tree mode**

To switch between Per-VLAN Spanning Tree+ (PVST+), Rapid-PVST+, and Multiple Spanning Tree (MST) modes, use the `spanning-tree mode` command in global configuration mode. To return to the default settings, use the `no` form of this command.

```
spanning-tree mode [pvst | mst | rapid-pvst]
```

```
no spanning-tree mode
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pvst</td>
<td>(Optional) PVST+ mode.</td>
</tr>
<tr>
<td>mst</td>
<td>(Optional) MST mode.</td>
</tr>
<tr>
<td>rapid-pvst</td>
<td>(Optional) Rapid-PVST+ mode.</td>
</tr>
</tbody>
</table>

**Command Default**

pvst

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

Be careful when using the `spanning-tree mode` command to switch between PVST+, Rapid-PVST+, and MST modes. When you enter the command, all spanning-tree instances are stopped for the previous mode and are restarted in the new mode. Using this command may cause disruption of user traffic.

**Examples**

This example shows how to switch to MST mode:

```
Router(config)# spanning-tree mode mst
Router(config)#
```

This example shows how to return to the default mode (PVST+):

```
Router(config)# no spanning-tree mode
Router(config)#
```
### Related Commands

</tbody>
</table>
spanning-tree mst

To set the path cost and port-priority parameters for any Multiple Spanning Tree (MST) instance (including the Common and Internal Spanning Tree [CIST] with instance ID 0), use the `spanning-tree mst` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst instance-id { { cost cost | port-priority priority } | pre-standard }
no spanning-tree mst instance-id { { cost | port-priority } | pre-standard }
```

### Syntax Description
- **instance-id**: Instance ID number; valid values are from 0 to 15.
- **cost**: Path cost for an instance; valid values are from 1 to 200000000.
- **port-priority**: Port priority for an instance; valid values are from 0 to 240 in increments of 16.
- **pre-standard**: Configures prestandard MST BPDU transmission on the interface.

### Command Default
The defaults are as follows:
- **cost**: depends on the port speed; the faster interface speeds indicate smaller costs. MST always uses long path costs.
- **priority**: is 128.

### Command Modes
Interface configuration (config-if)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
Higher **cost** values indicate higher costs. When entering the **cost**, do not include a comma in the entry; for example, enter **1000**, not **1,000**.

Higher **port-priority** values indicate smaller priorities.

### Examples
This example shows how to set the interface path cost:
```
Router(config-if)# spanning-tree mst 0 cost 17031970
Router(config-if)#
```

This example shows how to set the interface priority:
```
Router(config-if)# spanning-tree mst 0 port-priority 64
Router(config-if)#
```
Related Commands | Command | Description
--- | --- | ---
 | show spanning-tree mst | Displays the information about the MST protocol. |
 | spanning-tree port-priority | Sets an interface priority when two bridges vie for position as the root bridge. |
spanning-tree mst configuration

To enter MST-configuration submode, use the **spanning-tree mst configuration** command in global configuration mode. To return to the default settings, use the **no** form of this command.

```
spanning-tree mst configuration
no spanning-tree mst configuration
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
The default value for the Multiple Spanning Tree (MST) configuration is the default value for all its parameters:
- No VLANs are mapped to any MST instance (all VLANs are mapped to the Common and Internal Spanning Tree [CIST] instance).
- The region name is an empty string.
- The revision number is 0.

**Command Modes**
Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The MST configuration consists of three main parameters:
- Instance VLAN mapping—See the **instance** command
- Region name—See the **name (MST configuration submode)** command
- Configuration revision number—See the **revision** command

The **abort** and **exit** commands allow you to exit MST configuration submode. The difference between the two commands depends on whether you want to save your changes or not.

The **exit** command commits all the changes before leaving MST configuration submode. If you do not map secondary VLANs to the same instance as the associated primary VLAN, when you exit MST-configuration submode, a warning message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The warning message is as follows:

```
These secondary vlans are not mapped to the same instance as their primary:
-> 3
```

The **abort** command leaves MST-configuration submode without committing any changes.
Changing an MST-configuration submode parameter can cause connectivity loss. To reduce service disruptions, when you enter MST-configuration submode, make changes to a copy of the current MST configuration. When you are done editing the configuration, you can apply all the changes at once by using the `exit` keyword, or you can exit the submode without committing any change to the configuration by using the `abort` keyword.

In the unlikely event that two users commit a new configuration at exactly the same time, this warning message displays:

```
% MST CFG:Configuration change lost because of concurrent access
```

### Examples

This example shows how to enter MST-configuration submode:

```
Router(config)# spanning-tree mst configuration
Router(config-mst)#
```

This example shows how to reset the MST configuration to the default settings:

```
Router(config)# no spanning-tree mst configuration
Router(config)#
```

</table>

**Usage Guidelines**

If you do not specify the `hello-time` value, the value is calculated from the network diameter.

**Examples**

This example shows how to set the hello-time delay timer:

```
Router(config)# spanning-tree mst hello-time 3
Router(config)#
```

spanning-tree mst pre-standard

To configure a port to transmit only prestandard bridge protocol data units (BPDUs), use the `spanning-tree mst pre-standard` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst pre-standard

no spanning-tree mst pre-standard
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

The default is to automatically detect prestandard neighbors.

**Command Modes**

Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Even with the default configuration, the port can receive both prestandard and standard BPDUs. Prestandard BPDUs are based on the Cisco IOS Multiple Spanning Tree (MST) implementation that was created before the IEEE standard was finalized. Standard BPDUs are based on the finalized IEEE standard.

If you configure a port to transmit prestandard BPDUs only, the prestandard flag displays in the `show spanning-tree` commands. The variations of the prestandard flag are as follows:

- **Pre-STD** (or **pre-standard** in long format)—This flag displays if the port is configured to transmit prestandard BPDUs and if a prestandard neighbor bridge has been detected on this interface.
- **Pre-STD-Cf** (or **pre-standard (config)** in long format)—This flag displays if the port is configured to transmit prestandard BPDUs but a prestandard BPDU has not been received on the port, the autodetection mechanism has failed, or a misconfiguration, if there is no prestandard neighbor, has occurred.
- **Pre-STD-Rx** (or **pre-standard (rcvd)** in long format)—This flag displays when a prestandard BPDU has been received on the port but it has not been configured to send prestandard BPDUs. The port will send prestandard BPDUs, but we recommend that you change the port configuration so that the interaction with the prestandard neighbor does not rely only on the autodetection mechanism.

If the MST configuration is not compatible with the prestandard (if it includes an instance ID greater than 15), only standard MST BPDUs are transmitted, regardless of the STP configuration on the port.
spanning-tree mst pre-standard

Examples

This example shows how to configure a port to transmit only prestandard BPDUs:

Router(config-if)# spanning-tree mst pre-standard
Router(config-if)#

<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can set the bridge priority in increments of 4096 only. When you set the priority, valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

You can set the `priority` to 0 to make the switch root.

You can enter `instance` as a single instance or a range of instances, for example, 0-3, 5, 7-9.

**Examples**

This example shows how to set the bridge priority:

```
Router(config)# spanning-tree mst 0 priority 4096
Router(config)#
```

</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
</tbody>
</table>
```

Usage Guidelines

You can enter `instance` as a single instance or a range of instances, for example, 0-3,5,7-9.

The `spanning-tree mst root secondary` value is 16384.

The `diameter diameter` and `hello-time seconds` keywords and arguments are available for instance 0 only.

If you do not specify the `seconds` argument, the value for it is calculated from the network diameter.

Examples

```
This example shows how to designate the primary root switch and timer values for an instance:

Router(config)# spanning-tree mst 0 root primary diameter 7 hello-time 2
Router(config)# spanning-tree mst 5 root primary
Router(config)#
```

spanning-tree mst simulate pvst (interface)

To override the global Per-VLAN Spanning Tree (PVST) simulation setting for a port, use the `spanning-tree mst simulate pvst` interface command in interface configuration mode. To return to the default PVST simulation setting, use the `no` form of this command.

```
spanning-tree mst simulate pvst [disable]

no spanning-tree mst simulate pvst
```

**Syntax Description**
- `disable` Disables PVST simulation on the interface.

**Command Default**
PVST simulation is enabled.

**Command Modes**
Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(33)SXI</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
PVST simulation is enabled by default so that an interface can interoperate between Multiple Spanning Tree (MST) and Rapid Per-VLAN Spanning Tree Plus (PVST+). To prevent an accidental connection to a device that does not run MST as the default Spanning Tree Protocol (STP) mode, you can disable PVST simulation. If you disable PVST simulation, the MST-enabled port moves to the blocking state once it detects it is connected to a Rapid PVST+-enabled port. This port remains in the inconsistent state until the port stops receiving Bridge Protocol Data Units (BPDUs), and then the port resumes the normal STP transition process.

**Examples**
This example shows how to prevent a port from automatically interoperating with a connecting device that is running Rapid PVST+:

```
Router(config)# interface gi3/13
Router(config-if)# spanning-tree mst simulate pvst disable
Router(config-if)#
```

</table>
spanning-tree mst simulate pvst global

To enable Per-VLAN Spanning Tree (PVST) simulation globally, enter the `spanning-tree mst simulate pvst global` command in global configuration mode. To disable PVST simulation globally, enter the `no` form of this command.

```
spanning-tree mst simulate pvst global
no spanning-tree mst simulate pvst global
```

Syntax Description
This command has no arguments or keywords.

Command Default
PVST simulation is enabled.

Command Modes
Global configuration (config)

Command History
Release Modification
12.2(33)SXI Support for this command was introduced.

Usage Guidelines
PVST simulation is enabled by default so that all interfaces on the device interoperate between Multiple Spanning Tree (MST) and Rapid Per-VLAN Spanning Tree Plus (PVST+). To prevent an accidental connection to a device that does not run MST as the default Spanning Tree Protocol (STP) mode, you can disable PVST simulation. If you disable PVST simulation, the MST-enabled port moves to the blocking state once it detects it is connected to a Rapid PVST+-enabled port. This port remains in the inconsistent state until the port stops receiving Bridge Protocol Data Units (BPDUs), and then the port resumes the normal STP transition process.

To override the global PVST simulation setting for a port, enter the `spanning-tree mst simulate pvst` interface command in the interface command mode.

Examples
This example shows how to prevent the switch from automatically interoperating with a connecting device that is running Rapid PVST+:

```
Router(config)# no spanning-tree mst simulate pvst global
Router(config)#
```

<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command applies to all the spanning-tree instances on the Catalyst 6500 series switch.

The `long` path-cost calculation method utilizes all 32 bits for path-cost calculation and yields values in the range of 1 through 200,000,000.

The `short` path-cost calculation method (16 bits) yields values in the range of 1 through 65535.

### Examples

This example shows how to set the default path-cost calculation method to long:

```
Router(config#) spanning-tree pathcost method long
Router(config#)
```

This example shows how to set the default path-cost calculation method to short:

```
Router(config#) spanning-tree pathcost method short
Router(config#)
```

</tr>
<tr>
<td>12.2(33)SXI</td>
<td>Added edge [trunk] and network keywords.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You should use this command only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data-packet loop and disrupt the Catalyst 6500 series switch and network operation.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

Be careful when using the `no spanning-tree portfast` command. This command does not disable PortFast if the `spanning-tree portfast default` command is enabled.

This command has these states:

- **spanning-tree portfast**—This command enables PortFast unconditionally on the given port.
- **spanning-tree portfast disable**—This command explicitly disables PortFast for the given port. The configuration line shows up in the running configuration because it is not the default.
- **spanning-tree portfast edge**—This command allows you to configure PortFast edge mode on the given port.
- **spanning-tree portfast network**—This command allows you to configure PortFast network mode on the given port.

- **spanning-tree portfast [edge] trunk**—This command allows you to configure PortFast on trunk ports. The `edge` keyword is required with `trunk` in Cisco IOS Release 12.2(33)SXI and later releases.

**Note** If you enter the `spanning-tree portfast trunk` command, the port is configured for PortFast even in the access mode.

- **no spanning-tree portfast**—This command implicitly enables PortFast if you define the `spanning-tree portfast default` command in global configuration mode and if the port is not a trunk port. If you do not configure PortFast globally, the `no spanning-tree portfast` command is equivalent to the `spanning-tree portfast disable` command.

**Examples**

This example shows how to enable PortFast mode in releases earlier than Cisco IOS Release 12.2(33)SXI:

```
Router(config-if)# spanning-tree portfast
Router(config-if)#
```

This example shows how to enable PortFast edge mode in Cisco IOS Release 12.2(33)SXI and later releases:

```
Router(config-if)# spanning-tree portfast edge
Router(config-if)#
```

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The `spanning-tree portfast bpdufilter` command enables BPDU filtering globally on PortFast ports. BPDU filtering prevents a port from sending or receiving any BPDU.

You can override the effects of the `portfast bpdufilter default` command by configuring BPDU filtering at the interface level.

Note

Be careful when enabling BPDU filtering. The feature’s functionality is different when you enable it on a per-port basis or globally. When enabled globally, BPDU filtering is applied only on ports that are in an operational PortFast state. Ports send a few BPDU at linkup before they effectively filter outbound BPDU. If a BPDU is received on an edge port, it immediately loses its operational PortFast status and BPDU filtering is disabled.

When enabled locally on a port, BPDU filtering prevents the Catalyst 6500 series switch from receiving or sending BPDU on this port.

Caution

Be careful when using this command. Using this command incorrectly can cause bridging loops.
spanning-tree portfast bpdufilter default

**Examples**

This example shows how to enable BPDU filtering by default:

```markdown
Router(config)# spanning-tree portfast bpdufilter default
Router(config)#
```

</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**
Be careful when using this command. You should use this command only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data-packet loop and disrupt the Catalyst 6500 series switch and network operation.

BPDU guard disables a port if it receives a BPDU. BPDU guard is applied only on ports that are PortFast enabled and are in an operational PortFast state.

**Examples**

This example shows how to enable BPDU guard by default:

```
Router(config)# spanning-tree portfast bpduguard default
Router(config)#
```

**Related Commands**

</tbody>
</table>

### Usage Guidelines

**Caution**

Be careful when using this command. You should use this command only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data-packet loop and disrupt the operation of the router or switch and the network.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.
You can enable PortFast mode on individual interfaces using the `spanning-tree portfast` (interface) command.

**Examples**

This example shows how to enable PortFast by default on all access ports in releases earlier than Cisco IOS Release 12.2(33)SXI:

```
Router(config)# spanning-tree portfast default
Router(config)#
```

This example shows how to enable PortFast edge mode with BPDU Guard by default on all access ports in Cisco IOS Release 12.2(33)SXI and later releases:

```
Router(config)# spanning-tree portfast edge bpduguard default
Router(config)#
```

spanning-tree port-priority

To set an interface priority when two bridges tie for position as the root bridge, use the `spanning-tree port-priority` command in interface configuration mode. To revert to the default value, use the `no` form of this command.

```
spanning-tree port-priority port-priority

no spanning-tree port-priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>port-priority</code></th>
<th>Port priority; valid values are from 2 to 255. The default is 128.</th>
</tr>
</thead>
</table>

**Command Default**

The port priority is 128.

**Command Modes**

Interface configuration (config-if)

**Command History**

- **Release**: 12.0(7)XE
  - **Modification**: This command was introduced on the Catalyst 6000 series switches.
- **Release**: 12.2(2)XT
  - **Modification**: This command was implemented on the Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers.
- **Release**: 12.2(8)T
  - **Modification**: This command was integrated into Cisco IOS Release 12.2(8)T on the Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers.
- **Release**: 12.2(14)SX
  - **Modification**: Support for this command was introduced on the Supervisor Engine 720.
- **Release**: 12.2(17d)SXB
  - **Modification**: Support for this command on the Supervisor Engine 2 was extended to 12.2(17d)SXB.
- **Release**: 12.2(33)SRA
  - **Modification**: This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines**

The priority you set breaks the tie.

**Examples**

The following example shows how to increase the likelihood that spanning-tree instance 20 is chosen as the root-bridge on interface Ethernet 2/0:

```
Router(config)# interface ethernet 2/0
Router(config-if)# spanning-tree port-priority 20
Router(config-if)#
```

spanning-tree transmit hold-count

To specify the transmit hold count, use the **spanning-tree transmit hold-count** command in global configuration mode. To return to the default settings, use the **no** form of this command.

```
spanning-tree transmit hold-count value

no spanning-tree transmit hold-count
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Number of bridge protocol data units (BPDUs) that can be sent before pausing for 1 second; valid values are from 1 to 20.</td>
</tr>
</tbody>
</table>

**Command Default**

value is 6.

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)SXF</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported on all spanning-tree modes.

The transmit hold count determines the number of BPDUs that can be sent before pausing for 1 second.

**Note**

Changing this parameter to a higher value may have a significant impact on CPU utilization, especially in rapid-Per-VLAN Spanning Tree (PVST) mode. Lowering this parameter could slow convergence in some scenarios. We recommend that you do not change the value from the default setting.

If you change the `value` setting, enter the `show running-config` command to verify the change.

If you delete the command, use the `show spanning-tree mst` command to verify the deletion.

**Examples**

This example shows how to specify the transmit hold count:

```
Router(config)# spanning-tree transmit hold-count 8
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td>show running-config</td>
<td>Displays the status and configuration of the module or Layer 2 VLAN.</td>
</tr>
<tr>
<td>show spanning-tree mst</td>
<td>Display the information about the MST protocol.</td>
</tr>
</tbody>
</table>
spanning-tree uplinkfast

To enable UplinkFast, use the `spanning-tree uplinkfast` command in global configuration mode. To disable UplinkFast, use the `no` form of this command.

```
spanning-tree uplinkfast [max-update-rate packets-per-second]
no spanning-tree uplinkfast [max-update-rate]
```

**Syntax Description**

| max-update-rate | packets-per-second | (Optional) Specifies the maximum rate (in packets per second) at which update packets are sent; valid values are from 0 to 65535. |

**Command Default**

The defaults are as follows:

- UplinkFast is disabled.
- `packets-per-second` is 150 packets per second.

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(14)SX</td>
<td>Support for this command was introduced on the Supervisor Engine 720.</td>
</tr>
<tr>
<td>12.2(17d)SXB</td>
<td>Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command only on access switches.

When you configure UplinkFast, the bridge priority is changed to 49152 so that this switch is not selected as root. All interface path costs of all spanning-tree interfaces that belong to the specified spanning-tree instances also increase by 3000.

When spanning tree detects that the root interface has failed, UplinkFast causes an immediate switchover to an alternate root interface, transitioning the new root interface directly to the forwarding state. During this time, a topology change notification is sent. To minimize the disruption that is caused by the topology change, a multicast packet is sent to 01-00-0C-CD-CD-CD for each station address in the forwarding bridge except for those associated with the old root interface.

Use the `spanning-tree uplinkfast max-update-rate` command to enable UplinkFast (if it is not already enabled) and change the rate at which update packets are sent. Use the `no` form of this command to return to the default rate.

**Examples**

This example shows how to enable UplinkFast and set the maximum rate to 200 packets per second:

```
Router(config)# spanning-tree uplinkfast max-update-rate 200
Router(config)#
```
Related Commands

</tr>
</tbody>
</table>
spanning-tree vlan

To configure Spanning Tree Protocol (STP) on a per-virtual LAN (VLAN) basis, use the `spanning-tree vlan` command in global configuration mode. To return to the default settings, use the `no` form of this command.

```
spanning-tree vlan vlan-id [forward-time seconds | hello-time seconds | max-age seconds | priority priority | protocol protocol | root {primary | secondary} | diameter net-diameter [hello-time seconds]]]

no spanning-tree vlan vlan-id [forward-time | hello-time | max-age | priority | protocol | root]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>VLAN identification number; valid values are from 1 to 1005. Beginning with Cisco IOS Release 12.4(15)T, the valid VLAN ID range is from 1 to 4094.</td>
</tr>
<tr>
<td><code>forward-time</code></td>
<td>(Optional) Sets the STP forward delay time; valid values are from 4 to 30 seconds.</td>
</tr>
<tr>
<td><code>hello-time</code></td>
<td>(Optional) Specifies the duration, in seconds, between the generation of configuration messages by the root switch; valid values are from 1 to 10 seconds.</td>
</tr>
<tr>
<td><code>max-age</code></td>
<td>(Optional) Sets the maximum number of seconds the information in a bridge packet data unit (BPDU) is valid; valid values are from 6 to 40 seconds.</td>
</tr>
<tr>
<td><code>priority</code></td>
<td>(Optional) Sets the STP bridge priority; valid values are from 0 to 65535.</td>
</tr>
<tr>
<td><code>protocol</code></td>
<td>(Optional) Sets the STP. See the “Usage Guidelines” section for a list of valid values.</td>
</tr>
<tr>
<td><code>root primary</code></td>
<td>(Optional) Forces this switch to be the root bridge.</td>
</tr>
<tr>
<td><code>root secondary</code></td>
<td>(Optional) Specifies this switch to act as the root switch should the primary root fail.</td>
</tr>
<tr>
<td><code>diameter</code></td>
<td>(Optional) Specifies the maximum number of bridges between any two points of attachment of end stations; valid values are from 2 through 7.</td>
</tr>
</tbody>
</table>

**Command Default**

The defaults are:

- `forward-time`—15 seconds
- `hello-time`—2 seconds
- `max-age`—20 seconds
- `priority`—The default with IEEE STP enabled is 32768; the default with STP enabled is 128.
- `protocol`—IEEE
- `root`—No STP root

When you issue the `no spanning-tree vlan xx root` command the following parameters are reset to their defaults:

- `priority`—The default with IEEE STP enabled is 32768; the default with STP enabled is 128.
- `hello-time`—2 seconds
- **forward-time**—15 seconds
- **max-age**—20 seconds

</table>

**Usage Guidelines**

⚠️ **Caution**
When disabling spanning tree on a VLAN using the `no spanning-tree vlan vlan-id` command, ensure that all switches and bridges in the VLAN have spanning tree disabled. You cannot disable spanning tree on some switches and bridges in a VLAN and leave it enabled on other switches and bridges in the same VLAN because switches and bridges with spanning tree enabled have incomplete information about the physical topology of the network.

⚠️ **Caution**
We do not recommend disabling spanning tree, even in a topology that is free of physical loops. Spanning tree is a safeguard against misconfigurations and cabling errors. Do not disable spanning tree in a VLAN without ensuring that there are no physical loops present in the VLAN.

When you set the **max-age seconds** parameter, if a bridge does not hear bridge protocol data units (BPDUs) from the root bridge within the specified interval, it assumes that the network has changed and recomputes the spanning-tree topology.

Valid values for `protocol` are **dec** (Digital STP), **ibm** (IBM STP), **ieee** (IEEE Ethernet STP), and **vlan-bridge** (VLAN Bridge STP).

The **spanning-tree root primary** command alters this switch’s bridge priority to 8192. If you enter the **spanning-tree root primary** command and the switch does not become the root switch, then the bridge priority is changed to 100 less than the bridge priority of the current bridge. If the switch still does not become the root, an error results.
The **spanning-tree root secondary** command alters this switch’s bridge priority to 16384. If the root switch should fail, this switch becomes the next root switch.

Use the **spanning-tree root** commands on backbone switches only.

The **spanning-tree etherchannel guard misconfig** command detects two types of errors: misconfiguration and misconnection errors. A misconfiguration error is an error between the port-channel and an individual port. A misconnection error is an error between a switch that is channeling more ports and a switch that is not using enough Spanning Tree Protocol (STP) Bridge Protocol Data Units (BPDUs) to detect the error. In this case, the switch will only error disable an EtherChannel if the switch is a nonroot switch.

**Examples**

The following example shows how to enable spanning tree on VLAN 200:

```
Router(config)# spanning-tree vlan 200
```

The following example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:

```
Router(config)# spanning-tree vlan 10 root primary diameter 4
```

The following example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:

```
Router(config)# spanning-tree vlan 10 root secondary diameter 4
```
