

# MPLS Traffic Engineering: BFD-triggered Fast Reroute

---

**First Published: January 8, 2008**  
**Last Updated: February 18, 2009**

The MPLS Traffic Engineering: BFD-triggered Fast Reroute feature allows you to obtain link and node protection by using the Bidirectional Forwarding Detection (BFD) protocol to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. In addition to fast forwarding path failure detection, BFD provides a consistent failure detection method for network administrators.

To obtain link and node protection by using the Resource Reservation Protocol (RSVP) with Hellos support, refer to the [MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#) process module. RSVP Hellos enable a router to detect when a neighboring node has gone down but its interface to that neighbor is still operational.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering: BFD-triggered Fast Reroute”](#) section on page 24.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Glossary](#), page 25

## Prerequisites for MPLS Traffic Engineering: BFD-triggered Fast Reroute

- Configure BFD. Refer to the *Bidirectional Forwarding Detection* process module.
- Enable MPLS TE on all relevant routers and interfaces.
- Configure MPLS TE tunnels.
- For additional prerequisites, refer to the *MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)* process module.

## Restrictions for MPLS Traffic Engineering: BFD-triggered Fast Reroute

- You cannot configure BFD and RSVP Hellos on the same interface.
- BFD may not be supported on some interfaces.
- For additional restrictions, refer to the *MPLS TE: Link and Node protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)* process module.

## BFD

BFD is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. In addition to fast forwarding path failure detection, BFD provides a consistent failure detection method for network administrators. Because the

network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol Hello mechanisms, network profiling and planning will be easier, and convergence time will be consistent and predictable.

## Fast Reroute

Fast Reroute (FRR) is a mechanism for protecting Multiprotocol Label Switching (MPLS) traffic engineering (TE) label switched paths (LSPs) from link and node failures by locally repairing the LSPs at the point of failure, allowing data to continue to flow on them while their headend routers attempt to establish new end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

## Link Protection

Backup tunnels that bypass only a single link of the LSP's path provide link protection. They protect LSPs if a link along their path fails by rerouting the LSP's traffic to the next hop (bypassing the failed link). These are referred to as next-hop (NHOP) backup tunnels because they terminate at the LSP's next hop beyond the point of failure.

## Node Protection

FRR provides node protection for LSPs. Backup tunnels that bypass next-hop nodes along LSP paths are called next-next-hop (NNHOP) backup tunnels because they terminate at the node following the next-hop node of the LSP paths, thereby bypassing the next-hop node. They protect LSPs if a node along their path fails by enabling the node upstream of the failure to reroute the LSPs and their traffic around the failed node to the next-next hop. FRR supports the use of RSVP Hellos to accelerate the detection of node failures. NNHOP backup tunnels also provide protection from link failures, because they bypass the failed link as well as the node.

## Bandwidth Protection

NHOP and NNHOP backup tunnels can be used to provide bandwidth protection for rerouted LSPs. This is referred to as backup bandwidth. You can associate backup bandwidth with NHOP or NNHOP backup tunnels. This informs the router of the amount of backup bandwidth a particular backup tunnel can protect. When a router maps LSPs to backup tunnels, bandwidth protection ensures that an LSP uses a given backup tunnel only if there is sufficient backup bandwidth. The router selects which LSPs use which backup tunnels in order to provide maximum bandwidth protection. That is, the router determines the best way to map LSPs onto backup tunnels in order to maximize the number of LSPs that can be protected.

# How to Configure MPLS Traffic Engineering: BFD-triggered Fast Reroute

This section assumes that you want to add FRR protection to a network in which MPLS TE LSPs are configured.

To review how to configure MPLS TE tunnels, see the [MPLS Traffic Engineering: Interarea Tunnels](#) process module.

The following sections describe how to use FRR to protect LSPs in your network from link or node failures. Each task is identified as either required or optional.

**Note**

You can perform the configuration tasks in any order.

**Note**

An NNHOP backup tunnel must *not* go via the NHOP backup tunnel.

## Enabling BFD Support on the Router

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip rsvp signalling hello bfd**

### DETAILED STEPS

|        | Command  | Purpose  |
|--------|--|--|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                             | Enters global configuration mode.  |
| Step 3 | <b>ip rsvp signalling hello bfd</b><br><br><b>Example:</b><br>Router(config)# ip rsvp signalling hello bfd | Enables the BFD protocol on the router for MPLS TE link and node protection.                                       |

## Enabling Fast Reroute on LSPs

LSPs can use backup tunnels only if the LSPs have been configured as fast reroutable. To enable FRR on the LSP, enter the following commands at the headend of each LSP.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **tunnel mpls traffic-eng fast-reroute [bw-protect] [node-protect]**

### DETAILED STEPS

|        | Command   | Purpose  |
|--------|---|--|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal  | Enters global configuration mode.  |
| Step 3 | <b>interface tunnel <i>number</i></b><br><br><b>Example:</b><br>Router(config)# interface tunnel 1000   | Enters interface configuration mode for the specified tunnel.  |
| Step 4 | <b>tunnel mpls traffic-eng fast-reroute [bw-protect] [node-protect]</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect node-protect | Enables an MPLS TE tunnel to use an established backup tunnel if there is a link or node failure.                  |

## Creating a Backup Tunnel to the Next Hop or to the Next-Next Hop

To create a backup tunnel to the next hop or to the next-next hop, enter the following commands on the node that will be the headend of the backup tunnel (that is, the node whose downstream link or node may fail). The node on which you enter these commands must be a supported platform. See the [“Finding Feature Information” section on page 1](#).

Creating a backup tunnel is basically no different from creating any other tunnel.

#### Note

When using the **exclude-address** command to specify the path for a backup tunnel, you must exclude an interface address to avoid a link (for creating an NHOP backup tunnel), or a router-ID address to avoid a node (for creating an NNHOP backup tunnel).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **ip unnumbered** *type number*
5. **tunnel destination** *A.B.C.D*
6. **tunnel mode mpls traffic-eng**
7. **tunnel mpls traffic-eng path-option** *number* { **dynamic** | **explicit** { **name** *path-name* | *path-number* } } [**lockdown**]
8. **exit**
9. **ip explicit-path name** *name*
10. **exclude-address** *address*

## DETAILED STEPS

|        | Command   | Purpose  |
|--------|---|--|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                    | Enters global configuration mode.  |
| Step 3 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                | Creates a new tunnel interface and enters interface configuration mode.  |
| Step 4 | <b>ip unnumbered</b> <i>type number</i><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered loopback 0     | Gives the tunnel interface an IP address that is the same as that of interface loopback 0.<br><br><b>Note</b> This command is not effective until loopback 0 has been configured with an IP address. |
| Step 5 | <b>tunnel destination</b> <i>A.B.C.D</i><br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.3.3.3 | Specifies the IP address of the device where the tunnel will terminate. That address should be the router ID of the device that is the NHOP or NNHOP of LSPs to be protected.                        |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng     | Sets encapsulation mode of the tunnel to MPLS TE.  |

|         | Command   | Purpose   |
|---------|---|---|
| Step 7  | <pre>tunnel mpls traffic-eng path-option number {dynamic   explicit {name path-name   path-number}}[lockdown]</pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng path-option 10 explicit name avoid-protected-link</p> | Configures a path option for an MPLS TE tunnel  |
| Step 8  | <pre>exit</pre> <p><b>Example:</b><br/>Router(config-if)# exit</p>  | Exits interface configuration mode.   |
| Step 9  | <pre>ip explicit-path name name</pre> <p><b>Example:</b><br/>Router(config)# ip explicit-path name avoid-protected-link</p>   | Enters IP explicit path mode for IP explicit paths to create the named path.  |
| Step 10 | <pre>exclude-address address</pre> <p><b>Example:</b><br/>Router(cfg-ip-expl-path)# exclude-address 10.3.3.3</p>  | <p>For link protection, specifies the IP address of the link to be protected. For node protection, specifies the router ID of the node to be protected.</p> <p><b>Note</b> Backup tunnel paths can be dynamic or explicit and they do not have to use an excluded address. Because backup tunnels must avoid the protected link or node, it is convenient to use an excluded address.</p> |

## Assigning Backup Tunnels to a Protected Interface

To assign one or more backup tunnels to a protected interface, enter the following commands on the node that will be the headend of the backup tunnel (that is, the node whose downstream link or node may fail). The node on which you enter these commands must be a supported platform. See the [“Finding Feature Information”](#) section on page 1.

### Note

You must configure the interface to have an IP address and to enable the MPLS TE tunnel feature.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mpls traffic-eng backup-path tunnel** *tunnel-id*

## DETAILED STEPS

|        | Command   | Purpose  |
|--------|---|--|
| Step 1 | <p><b>enable</b></p> <p><b>Example:</b><br/>Router&gt; enable</p>   | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>  |
| Step 2 | <p><b>configure terminal</b></p> <p><b>Example:</b><br/>Router# configure terminal</p>  | <p>Enters global configuration mode.</p>   |
| Step 3 | <p><b>interface</b> <i>type slot/port</i></p> <p><b>Example:</b><br/>Router(config)# interface Gi 9/1</p>   | <p>Moves configuration to the physical interface level, directing subsequent configuration commands to the specific physical interface identified by the <i>type</i> value, and enters interface configuration mode. The <i>slot</i> and <i>port</i> values identify the slot and port being configured. The interface must be a supported interface. See the <a href="#">“Finding Feature Information”</a> section on page 1.</p> |
| Step 4 | <p><b>mpls traffic-eng backup-path tunnel</b> <i>tunnel-id</i></p> <p><b>Example:</b><br/>Router(config-if)# mpls traffic-eng backup-path tunnel2</p> | <p>Allows LSPs going out this interface to use this backup tunnel if there is a link or node failure.</p> <p><b>Note</b> You can enter this command multiple times to associate multiple backup tunnels with the same protected interface.</p>   |

## Enabling BFD on the Protected Interface

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip rsvp signalling hello bfd**
5. **bfd interval** *milliseconds* **min\_rx** *milliseconds* **multiplier** *interval-multiplier*

### DETAILED STEPS

|        | Command  | Purpose  |
|--------|--|--|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal   | Enters global configuration mode.  |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Gi9/1  | Enters interface configuration mode.   |
| Step 4 | <b>ip rsvp signalling hello bfd</b><br><br><b>Example:</b><br>Router(config-if)# ip rsvp signalling hello bfd  | Enables the BFD protocol on the interface for MPLS TE link and node protection.                                    |
| Step 5 | <b>bfd interval</b> <i>milliseconds</i> <b>min_rx</b> <i>milliseconds</i><br><b>multiplier</b> <i>interval-multiplier</i><br><br><b>Example:</b><br>Router(config-if)# bfd interval 100 min_rx 100<br>multiplier 4 | Sets the BFD interval.   |

## Associating Backup Bandwidth and Pool Type with a Backup Tunnel

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*

4. **tunnel mpls traffic-eng backup-bw** {*bandwidth* | [**sub-pool** {*bandwidth* | **Unlimited**}] [**global-pool** {*bandwidth* | **Unlimited**}] [**any** {*bandwidth* | **Unlimited**}]}

## DETAILED STEPS

|        | Command  | Purpose   |
|--------|--|---|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal   | Enters global configuration mode.   |
| Step 3 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 2   | Enters interface configuration mode for the specified tunnel.   |
| Step 4 | <b>tunnel mpls traffic-eng backup-bw</b> { <i>bandwidth</i>   [ <b>sub-pool</b> { <i>bandwidth</i>   <b>Unlimited</b> }] [ <b>global-pool</b> { <i>bandwidth</i>   <b>Unlimited</b> }] [ <b>any</b> { <i>bandwidth</i>   <b>Unlimited</b> }]}<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng backup-bw sub-pool 1000 | Associates bandwidth with a backup tunnel and designates whether LSPs that allocate bandwidth from the specified pool can use the tunnel. |

## Configuring Backup Bandwidth Protection

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **tunnel mpls traffic-eng fast-reroute** [**bw-protect**]
5. **exit**
6. **mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw**

## DETAILED STEPS

|               |  |   |
|---------------|--|---|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>   |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal   | Enters global configuration mode.   |
| <b>Step 3</b> | <b>interface tunnel <i>number</i></b><br><br><b>Example:</b><br>Router(config)# interface tunnel 2   | Enters interface configuration mode for the specified tunnel.   |
| <b>Step 4</b> | <b>tunnel mpls traffic-eng fast-reroute [bw-protect]</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect                              | Enables an MPLS TE tunnel to use an established backup tunnel in the event of a link or node failure. The <b>bw-protect</b> keyword gives an LSP priority for using backup tunnels with bandwidth protection. |
| <b>Step 5</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit  | Exits interface configuration mode.   |
| <b>Step 6</b> | <b>mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw | Changes the backup protection preemption algorithm from minimize the number of LSPs that are demoted to minimize the amount of bandwidth that is wasted.  |

## Verifying That Fast Reroute Is Operational

**Note**

To determine if FRR has been configured correctly, perform Steps 1 and 2.

**Note**

If you created LSPs and performed the required configuration tasks but do not have operational backup tunnels (that is, the backup tunnels are not up or the LSPs are not associated with those backup tunnels), perform Step 3.

**Note**

To determine the status of BFD, perform Steps 9 through 11.

## SUMMARY STEPS

1. show mpls traffic-eng tunnels brief

2. **show ip rsvp sender detail**
3. **show mpls traffic-eng fast-reroute database**
4. **show mpls traffic-eng tunnels backup**
5. **show mpls traffic-eng fast-reroute database**
6. **show ip rsvp reservation**
7. **show ip rsvp hello**
8. **show ip rsvp interface detail**
9. **show ip rsvp hello bfd nbr**
10. **show ip rsvp hello bfd nbr detail**
11. **show ip rsvp hello bfd nbr summary**

## DETAILED STEPS

### Step 1 show mpls traffic-eng tunnels brief

Use this command to verify that backup tunnels are up:

```
Router# show mpls traffic-eng tunnels brief

Signalling Summary:
  LSP Tunnels Process:      running
  RSVP Process:            running
  Forwarding:              enabled
  Periodic reoptimization: every 3600 seconds, next in 1706 seconds
TUNNEL NAME                DESTINATION    UP IF    DOWN IF    STATE/PROT
Router_t1                  10.112.0.12   -       Gi4/0/1   up/up
Router_t2                  10.112.0.12   -       unknown   up/down
Router_t3                  10.112.0.12   -       unknown   admin-down
Router_t1000               10.110.0.10   -       unknown   up/down
Router_t2000               10.110.0.10   -       Gi4/0/1   up/up
Displayed 5 (of 5) heads, 0 (of 0) midpoints, 0 (of 0) tails
```

### Step 2 show ip rsvp sender detail

Use this command to verify that LSPs are protected by the appropriate backup tunnels.

Following is sample output from the **show ip rsvp sender detail** command when the command is entered at the router acting as the point of local repair (PLR) before a failure:

```
Router# show ip rsvp sender detail

PATH:
Tun Dest:  10.10.0.6  Tun ID: 100  Ext Tun ID: 10.10.0.1
Tun Sender: 10.10.0.1  LSP ID: 31
Path refreshes:
  arriving: from PHOP 10.10.7.1 on Et0/0 every 30000 msecs
Session Attr:
  Setup Prio: 7, Holding Prio: 7
  Flags: (0x7) Local Prot desired, Label Recording, SE Style
  session Name: R1_t100
ERO: (incoming)
  10.10.7.2 (Strict IPv4 Prefix, 8 bytes, /32)
  10.10.0.6 (Strict IPv4 Prefix, 8 bytes, /32)
RRO:
  10.10.7.1/32, Flags:0x0 (No Local Protection)
  10.10.4.1/32, Flags:0x9 (Local Prot Avail/to NNHOP) !Available to NNHOP
  10.10.1.1/32, Flags:0x0 (No Local Protection)
```

```
Traffic params - Rate: 10K bits/sec, Max. burst: 1K bytes
Min Policed Unit: 0 bytes, Max Pkt Size 4294967295 bytes
Fast-Reroute Backup info:
  Inbound FRR: Not active
  Outbound FRR: No backup tunnel selected
Path ID handle: 50000416.
Incoming policy: Accepted. Policy source(s): MPLS/TE
Status: Proxy-terminated
```

### Step 3 show mpls traffic-eng fast-reroute database

Enter the **clear ip rsvp hello instance counters** command to verify the following:

- MPLS TE FRR Node Protection has been enabled.
- A certain type of LSP can use a backup tunnel.

The following command output displays the LSPs that are protected:

```
Router# show mpls traffic-eng fast-reroute database

Tunnel head end item frr information:
Protected tunnel          In-label Out intf/label   FRR intf/label   Status
Tunnel500                Tun hd   AT4/0.100:Untagg Tu501:20         ready

Prefix item frr information:
Prefix                    Tunnel   In-label Out intf/label   FRR intf/label   Status
10.0.0.8/32              Tu500   18       AT4/0.100:Pop ta Tu501:20         ready
10.0.8.8/32              Tu500   19       AT4/0.100:Untagg Tu501:20         ready
10.8.9.0/24              Tu500   22       AT4/0.100:Untagg Tu501:20         ready

LSP midpoint item frr information:
LSP identifier           In-label Out   intf/label   FRR intf/label   Status
```

If Label Distribution Protocol (LDP) is not enabled, separate prefix items are not shown because all prefixes then use a single rewrite. To confirm that a particular IP prefix is FRR protected, even though it is not shown in this display, enter it within the **show mpls forwarding-table ip-address detail** command. The final line of the display will tell whether that prefix is protected:

```
Router# show mpls forwarding-table 10.0.0.11 32 detail

Local   Outgoing   Prefix           Bytes tag   Outgoing           Next Hop
tag     tag or VC  or Tunnel Id    switched   interface
Tun hd  Untagged  10.0.0.11/32    48 5/0      Gi5/0             point2point
MAC/Encaps=4/8, MTU=1520, Tag Stack{22}
48D18847 00016000
No output feature configured
Fast Reroute Protection via (Tu0, outgoing label 12304)
```

The following command output displays the LSPs that are protected when the FRR primary tunnel is over a Gigabit Ethernet interface and the backup tunnel is over a Gigabit Ethernet interface. As shown in [Figure 1](#), interface Gigabit Ethernet 9/1 is protected by backup tunnel 501.

Figure 1 Protected LSPs

Figure 1 shows the following:

- Primary tunnel 500—Path is R1 via Gigabit Ethernet9/1 to R2 to R3 to R4.
- FRR backup tunnel 501—Path is R1 via Gigabit Ethernet7/1 to R2.
- Interface Gigabit Ethernet9/1—Protected by backup tunnel 501.

```
Router# show mpls traffic-eng fast-reroute database
```

```
Tunnel head end item frr information:
Protected tunnel In-label Out intf/label FRR intf/label Status
Tunnel500 Tun hd AT4/0.100:Untagg Tu501:20 ready
Prefix item frr information:
```

```
Prefix Tunnel In-label Out intf/label FRR intf/label Status
10.0.0.8/32 Tu500 18 AT4/0.100:Pop ta Tu501:20 ready
10.0.8.8/32 Tu500 19 AT4/0.100:Untagg Tu501:20 ready
10.8.9.0/24 Tu500 22 AT4/0.100:Untagg Tu501:20 ready
```

```
LSP midpoint item frr information:
LSP identifier In-label Out intf/label FRR intf/label Status
```

The following command output displays the LSPs that are protected when the FRR backup tunnel is over a Gigabit Ethernet interface.

```
Router# show mpls traffic-eng fast-reroute database
```

```
Tunnel head end item frr information:
Protected tunnel In-label Out intf/label FRR intf/label Status
Tunnel500 Tun hd PO2/0:Untagged Tu501:20 ready
```

```
Prefix item frr information:
Prefix Tunnel In-label Out intf/label FRR intf/label Status
10.0.0.8/32 Tu500 18 PO2/0:Pop tag Tu501:20 ready
10.0.8.8/32 Tu500 19 PO2/0:Untagged Tu501:20 ready
10.8.9.0/24 Tu500 22 PO2/0:Untagged Tu501:20 ready
```

```
LSP midpoint item frr information:
LSP identifier In-label Out intf/label FRR intf/label Status
```

#### Step 4 show mpls traffic-eng tunnels backup

For backup tunnels to be operational, the LSP must be reroutable. At the headend of the LSP, enter the **show run interface tunnel *tunnel-number*** command. The output should include the **tunnel mpls traffic-eng fast-reroute** command. If it does not, enter this command for the tunnel.

On the router where the backup tunnels originate, enter the **show mpls traffic-eng tunnels backup** command. Following is sample command output:

```
Router# show mpls traffic-eng tunnels backup

Router_t578
LSP Head, Tunnel578, Admin: up, Oper: up
Src 10.55.55.55, Dest 10.88.88.88, Instance 1
Fast Reroute Backup Provided:
  Protected i/fs: PO1/0, PO1/1, PO3/3
  Protected lsp: 1
  Backup BW: any pool unlimited; inuse: 100 kbps
Router_t5710
LSP Head, Tunnel5710, Admin: admin-down, Oper: down
Src 10.55.55.55, Dest 10.7.7.7, Instance 0
Fast Reroute Backup Provided:
  Protected i/fs: PO1/1
  Protected lsp: 0
  Backup BW: any pool unlimited; inuse: 0 kbps
Router_t5711
LSP Head, Tunnel5711, Admin: up, Oper: up
Src 10.55.55.55, Dest 10.7.7.7, Instance 1
Fast Reroute Backup Provided:
  Protected i/fs: PO1/0
  Protected lsp: 2
  Backup BW: any pool unlimited; inuse: 6010 kbps
```

The command output will allow you to verify the following:

- Backup tunnel exists—Verify that there is a backup tunnel that terminates at this LSP’s NHOP or NNHOP. Look for the LSP’s NHOP or NNHOP in the Dest field.
- Backup tunnel is up—To verify that the backup tunnel is up, look for “Up” in the Oper field.
- Backup tunnel is associated with the LSP’s interface—Verify that the interface for the LSP is allowed to use this backup tunnel. Look for the LSP’s output interface in the protected *i/fs* field list.
- Backup tunnel has sufficient bandwidth—If you restricted the amount of bandwidth a backup tunnel can hold, verify that the backup tunnel has sufficient bandwidth to hold the LSPs that would use this backup tunnel if there is a failure. The bandwidth of an LSP is defined by the line **tunnel mpls traffic-eng bandwidth** at the headend of the LSP. To determine the available bandwidth on a backup tunnel, look at the “cfg” and “inuse” fields. If there is insufficient backup bandwidth to accommodate the LSPs that would use this backup tunnel in the event of a failure, create an additional backup tunnel or increase the backup bandwidth of the existing tunnel by using the **tunnel mpls traffic-eng bandwidth** command.

#### Note

In order to determine how much bandwidth is sufficient, offline capacity planning may be required.

Backup tunnel has appropriate bandwidth type—If you restricted the type of LSPs (subpool or global pool) that can use this backup tunnel, verify that the LSP is the appropriate type for the backup tunnel. The type of the LSP is defined by the line **tunnel mpls traffic-eng bandwidth** at the headend of this LSP. If this line contains the word “sub pool”, then it uses subpool bandwidth; otherwise, it uses global pool bandwidth. Verify that the type matches the type the backup tunnel can hold by looking in the output of the **tunnel mpls traffic-eng bandwidth** command.

If none of the verification actions described succeed, enable debug by entering the **debug ip rsvp fast-reroute** command and the **debug mpls traffic-eng fast-reroute** command on the router that is the headend of the backup tunnel. Then do the following:

1. Enter the **shutdown** command for the primary tunnel.

2. Enter the **no shutdown** command for the primary tunnel.
3. View the debug output.

#### Step 5 show mpls traffic-eng fast-reroute database

Enter the **clear ip rsvp hello instance counters** command to verify the following:

- MPLS TE FRR node protection has been enabled.
- A certain type of LSP can use a backup tunnel.

The following command output displays the LSPs that are protected:

```
Router# show mpls traffic-eng fast-reroute database

Tunnel head end item frr information:
Protected Tunnel   In-label   intf/label   FRR intf/label   Status
Tunnell0          Tun        Gi5/0:Untagged Tu0:12304        ready

Prefix item frr information:
Prefix            Tunnel   In-label   Out intf/label   FRR intf/label   Status
10.0.0.11/32     Tu110   Tun hd     Gi5/0:Untagged   Tu0:12304        ready

LSP midpoint frr information:
LSP identifier    In-label   Out intf/label   FRR intf/label   Status
10.0.0.12 1 [459] 16         Gi0/1:17        Tu2000:19        ready
```

#### Note

If Label Distribution Protocol (LDP) is not enabled, separate prefix items are not shown because all prefixes then use a single rewrite. To confirm that a particular IP prefix is FRR protected, even though it is not shown in this display, enter it within the **show mpls forwarding-table ip-address detail** command. The final line of the display will tell whether that prefix is protected.

```
Router# show mpls forwarding-table 10.0.0.11 32 detail

Local   Outgoing   Prefix           Bytes tag   Outgoing   Next Hop
tag     tag or VC  or Tunnel Id    switched   interface
Tun hd  Untagged  10.0.0.11/32    48 Gi5/0    point2point
MAC/Encaps=4/8, MTU=1520, Tag Stack{22}
48D18847 00016000
No output feature configured
Fast Reroute Protection via (Tu0, outgoing label 12304)
```

#### Step 6 show ip rsvp reservation detail

Following is sample output from the **show ip rsvp reservation detail** command entered at the headend of a primary LSP. Entering the command at the headend of the primary LSP shows, among other things, the status of FRR (that is, local protection) at each hop this LSP traverses. The per-hop information is collected in the Record Route Object (RRO) that travels with the Resv message from the tail to the head.

```
Router# show ip rsvp reservation detail

Reservation:
Tun Dest: 10.1.1.1 Tun ID: 1 Ext Tun ID: 10.1.1.1
Tun Sender: 10.1.1.1 LSP ID: 104
Next Hop: 10.1.1.2 on Gi1/0
Label: 18 (outgoing)
Reservation Style is Shared-Explicit, QoS Service is Controlled-Load
Average Bitrate is 0 bits/sec, Maximum Burst is 1K bytes
Min Policed Unit: 0 bytes, Max Pkt Size: 0 bytes
RRO:
10.1.1.1/32, Flags:0x1 (Local Prot Avail/to NHOP)
```

```

Label subobject: Flags 0x1, C-Type 1, Label 18
10.1.1.1/32, Flags:0x0 (Local Prot Avail/In Use/Has BW/to NHOP)
Label subobject: Flags 0x1, C-Type 1, Label 16
10.1.1.2/32, Flags:0x0 (No Local Protection)
Label subobject: Flags 0x1, C-Type 1, Label 0
Resv ID handle: CD000404.
Policy: Accepted. Policy source(s): MPLS/TE

```

Notice the following about the primary LSP:

- It has protection that uses an NHOP backup tunnel at its first hop.
- It has protection and is actively using an NHOP backup tunnel at its second hop.
- It has no local protection at its third hop.

The RRO display shows the following information for each hop:

- Whether local protection is available (that is, whether the LSP has selected a backup tunnel)
- Whether local protection is in use (that is, whether the LSP is using its selected backup tunnel)
- Whether the selected backup tunnel is an NHOP or NNHOP backup tunnel
- Whether the backup tunnel used at this hop provides bandwidth protection

#### Step 7 show ip rsvp hello

Use this command to display hello status and statistics for FRR, reroute (hello state timer), and graceful restart. Following is sample output:

```

Router# show ip rsvp hello

Hello:
  RSVP Hello for Fast-Reroute/Reroute: Enabled
  Statistics: Disabled
  BFD for Fast-Reroute/Reroute: Enabled
  RSVP Hello for Graceful Restart: Disabled

```

#### Step 8 show ip rsvp interface detail

Use this command to display the interface configuration for Hello. Following is sample output:

```

Router# show ip rsv interface detail

Gi9/47:
  RSVP: Enabled
  Interface State: Up
  Bandwidth:
    Curr allocated: 0 bits/sec
    Max. allowed (total): 0 bits/sec
    Max. allowed (per flow): 0 bits/sec
    Max. allowed for LSP tunnels using sub-pools (pool 1): 0 bits/sec
    Set aside by policy (total): 0 bits/sec
  Signalling:
    DSCP value used in RSVP msgs: 0x3F
    Number of refresh intervals to enforce blockade state: 4
  Authentication: disabled
  Key chain: <none>
  Type: md5
  Window size: 1
  Challenge: disabled
  FRR Extension:
    Backup Path: Configured (or "Not Configured")
  BFD Extension:
    State: Disabled

```

```

Interval: Not Configured
RSVP Hello Extension:
State: Disabled
Refresh Interval: FRR: 200 , Reroute: 2000
Missed Acks:      FRR: 4 , Reroute: 4
DSCP in HELLOs:  FRR: 0x30 , Reroute: 0x30

```

**Step 9 show ip rsvp hello bfd nbr**

Use this command to display information about all MPLS traffic engineering link and node protected neighbors that use the BFD protocol. Following is sample output. The command output is the same as the **show ip rsvp hello bfd nbr summary** command output.

```

Router# show ip rsvp hello bfd nbr

Client Neighbor I/F State LostCnt LSPs
FRR 10.0.0.6 Gi9/47 Up 0 1

```

**Step 10 show ip rsvp hello bfd nbr detail**

Use this command to display detailed information about all MPLS traffic engineering link and node protected neighbors that use the BFD protocol:

```

Router# show ip rsvp hello bfd nbr detail

Hello Client Neighbors

Remote addr 10.0.0.6, Local addr 10.0.0.7
Type: Active
I/F: Gi9/47
State: Up (for 00:09:41)
Clients: FRR
LSPs protecting: 1 (frr: 1, hst upstream: 0 hst downstream: 0)
Communication with neighbor lost: 0

```

**Step 11 show ip rsvp hello bfd nbr summary**

Use this command to display summarized information about all MPLS traffic engineering link and node protected neighbors that use the BFD protocol. The command output is the same as the **show ip rsvp hello bfd nbr summary** command output.

```

Router# show ip rsvp hello bfd nbr summary

Client Neighbor I/F State LostCnt LSPs
FRR 10.0.0.6 Gi9/47 Up 0 1

```

## Configuration Examples for MPLS Traffic Engineering: BFD-triggered Fast Reroute

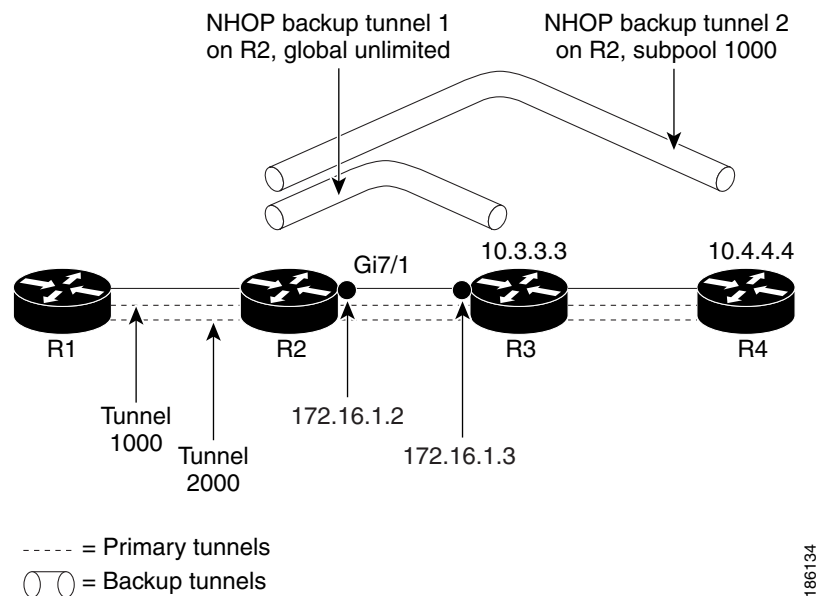

This section provides the following configuration examples:

- [Enabling BFD Support on the Router: Example, page 19](#)
- [Enabling Fast Reroute on LSPs: Example, page 19](#)
- [Creating a Backup Tunnel to the Next Hop: Example, page 20](#)
- [Assigning Backup Tunnels to a Protected Interface: Example, page 20](#)

- [Enabling BFD on the Protected Interface: Example, page 20](#)
- [Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example, page 20](#)
- [Configuring Backup Bandwidth Protection: Example, page 21](#)

The examples relate to the illustration shown in [Figure 2](#).

**Figure 2 Backup Tunnels**

## Enabling BFD Support on the Router: Example

The following example enables the BFD protocol on the router:

```
Router(config)# ip rsvp signalling hello bfd
```

## Enabling Fast Reroute on LSPs: Example

On router R1, enter interface configuration mode for each tunnel to be protected (Tunnel 1000 and Tunnel 2000). Enable these tunnels to use a backup tunnel in case of a link or node failure along their paths.

Tunnel 1000 will use ten units of bandwidth from the subpool.

Tunnel 2000 will use five units of bandwidth from the global pool. The “bandwidth protection desired” bit and the “node protection desired bit” have been set by specifying **bw-prot** and **node-prot**, respectively, in the **tunnel mpls traffic-eng fast-reroute** command.

```
Router(config)# interface tunnel 1000
Router(config-if)# tunnel mpls traffic-eng fast-reroute
Router(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 10
```

```
Router(config)# interface tunnel 2000
Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect node-protect
Router(config-if)# tunnel mpls traffic-eng bandwidth 5
```

## Creating a Backup Tunnel to the Next Hop: Example

On router R2, create an NHOP backup tunnel to R3. This backup tunnel should avoid using the link 10.1.1.2.

```
Router(config)# ip explicit-path name avoid-protected-link
Router(cfg-ip-expl-path)# exclude-address 10.1.1.2
Explicit Path name avoid-protected-link:
___1: exclude-address 10.1.1.2
Router(cfg-ip_expl-path)# end
```

```
Router(config)# interface tunnel 1
Router(config-if)# ip unnumbered loopback 0
Router(config-if)# tunnel destination 10.3.3.3
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng path-option 1 explicit avoid-protected-link
```

## Creating an NNHOP Backup Tunnel: Example

On router R2, create an NNHOP backup tunnel to R4. This backup tunnel should avoid R3.

```
Router(config)# ip explicit-path name avoid-protected-node
Router(cfg-ip-expl-path)# exclude-address 10.3.3.3
Explicit Path name avoid-protected-node:
___1: exclude-address 10.3.3.3
Router(cfg-ip_expl-path)# end
```

```
Router(config)# interface tunnel2
Router(config-if)# ip unnumbered loopback0
Router(config-if)# tunnel destination 10.4.4.4
Router(config-if)# tunnel mode mpls traffic-eng0
Router(config-if)# tunnel mpls traffic-eng path-option 1 explicit avoid-protected-node
```

## Assigning Backup Tunnels to a Protected Interface: Example

On router R2, associate both backup tunnels with interface Gigabit Ethernet 5/0:

```
Router(config)# interface Gi5/0
Router(config-if)# mpls traffic-eng backup-path tunnel 1
Router(config-if)# mpls traffic-eng backup-path tunnel 2
```

## Enabling BFD on the Protected Interface: Example

BFD is enabled on interface Gigabit Ethernet 9/47:

```
Router(config)# interface Gi9/47
Router(config-if)# ip rsvp signalling hello bfd
Router(config-if)# bfd interval 100 min_rx 100 multiplier 4
```

## Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example

Backup tunnel 1 is to be used only by LSPs that take their bandwidth from the global pool. It does not provide bandwidth protection. Backup tunnel 2 is to be used only by LSPs that take their bandwidth from the subpool. Backup tunnel 2 provides bandwidth protection for up to 1000 units.

```
Router(config)# interface tunnel 1
Router(config-if)# tunnel mpls traffic-eng backup-bw global-pool Unlimited

Router(config)# interface tunnel 2
Router(config-if)# tunnel mpls traffic-eng backup-bw sub-pool 1000
```

## Configuring Backup Bandwidth Protection: Example

In the following example, backup bandwidth protection is configured:

**Note**

---

This global configuration is required only to change the backup protection preemption algorithm from minimize the number of LSPs that are demoted to minimize the amount of bandwidth that is wasted.

---

```
Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect
Router(config)# mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw
```

# Feature Information for MPLS Traffic Engineering: BFD-triggered Fast Reroute

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS, Catalyst OS, and Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

# Glossary

**backup bandwidth**—The usage of NHOP and NNHOP backup tunnels to provide bandwidth protection for rerouted LSPs.

**backup tunnel**—An MPLS TE tunnel used to protect other (primary) tunnels' traffic when a link or node failure occurs.

**bandwidth**—The available traffic capacity of a link.

**fast reroute**—Procedures that enable temporary routing around a failed link or node while a new LSP is being established at the headend.

**global pool**—The total bandwidth allocated to an MPLS traffic engineering link or node.

**headend**—The router that originates and maintains a given LSP. This is the first router in the LSP's path.

**hop**—Passage of a data packet between two network nodes (for example, between two routers).

**instance**—A Hello instance implements the RSVP Hello extensions for a given router interface address and remote IP address. Active Hello instances periodically send Hello Request messages, expecting Hello ACK messages in response. If the expected Ack message is not received, the active Hello instance declares that the neighbor (remote IP address) is unreachable (that is, it is lost). This can cause LSPs crossing this neighbor to be fast rerouted.

**interface**—A network connection.

**link**—A point-to-point connection between adjacent nodes. There can be more than one link between adjacent nodes. A network communications channel consisting of a circuit or transmission path and all related equipment between a sender and a receiver. Sometimes referred to as a line or a transmission link.

**LSP**—label-switched path. A configured connection between two routers, in which label switching is used to carry the packets. The purpose of an LSP is to carry data packets.

**MPLS**—Multiprotocol Label Switching. Packet-forwarding technology, used in the network core, that applies data link layer labels to tell switching nodes how to forward data, resulting in faster and more scalable forwarding than network layer routing normally can do.

**NHOP**—next hop. The next downstream node along an LSP's path.

**NHOP backup tunnel**—next-hop backup tunnel. Backup tunnel terminating at the LSP's next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link, and is used to protect primary LSPs that were using this link before the failure.

**NNHOP**—next-next hop. The node after the next downstream node along an LSP's path.

**NNHOP backup tunnel**—next-next-hop backup tunnel. Backup tunnel terminating at the LSP's next-next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link or node, and is used to protect primary LSPs that were using this link or node before the failure.

**node**—Endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be interconnected by links, and serve as control points in the network. Computers on a network, or any endpoint or a junction common to two or more lines in a network. Nodes can be processors, controllers, or workstations.

**primary LSP**—The last LSP originally signaled over the protected interface before the failure. The LSP before the failure.

**primary tunnel**—Tunnel whose LSP may be fast rerouted if there is a failure. Backup tunnels cannot be primary tunnels.

**protected interface**—An interface that has one or more backup tunnels associated with it.

**redundancy**—The duplication of devices, services, or connections so that, in the event of a failure, the redundant devices, services, or connections can perform the work of those that failed.

**RSVP**—Resource Reservation Protocol. An IETF protocol used for signaling requests (setting up reservations) for Internet services by a customer before that customer is permitted to transmit data over that portion of the network.

**state**—Information that a router must maintain about each LSP. The information is used for rerouting tunnels.

**subpool**—The more restrictive bandwidth in an MPLS traffic engineering link or node. The subpool is a portion of the link or node's overall global pool bandwidth.

**tailend**—The router upon which an LSP is terminated. This is the last router in the LSP's path.

**tunnel**—Secure communications path between two peers, such as two routers.

**unlimited backup bandwidth**—Backup tunnels that provide no bandwidth (best-effort) protection (that is, they provide best-effort protection).
