

# L2VPN Multisegment Pseudowires

---

**First Published: February 27, 2009**

**Last Updated: November 20, 2010**

The L2VPN Multisegment Pseudowires feature enables you to configure two or more Layer 2 pseudowire segments that function as a single pseudowire. Layer 2 Virtual Private Network (L2VPN) multisegment pseudowires span multiple cores or autonomous systems of the same or different carrier networks. L2VPN multisegment pseudowires are also used in L2VPN Virtual Private LAN Services (VPLS) Inter-AS Option B networks.

This document explains Multiprotocol Label Switching (MPLS) Operations, Administration, and Maintenance (OAM) Support for L2VPN Multisegment Pseudowires and the MPLS OAM Support for the L2VPN VPLS Inter-AS Option B feature. These features allow you to use **ping mpls** and **trace mpls** commands to ensure pseudowire connectivity.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for L2VPN Multisegment Pseudowires](#)” section on page 17.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for L2VPN Multisegment Pseudowires

Before configuring this feature, see the following documents:

- [Any Transport over MPLS](#)
- [L2VPN Pseudowire Switching](#)
- [MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV](#)
- [Pseudowire Setup and Maintenance Using the Label Distribution Protocol \(LDP\) \(RFC 4447\)](#)

## Restrictions for L2VPN Multisegment Pseudowires

- Only Multiprotocol Label Switching (MPLS) Layer 2 pseudowires are supported.
- In Cisco IOS Release 12.3(33)SRE, only static configuration of the pseudowires is supported for the L2VPN Multisegment Pseudowires feature.
- In Cisco IOS Release 15.1(1)S, dynamic configuration of the pseudowires is supported and required for the L2VPN VPLS Inter-AS Option B feature.
- In Cisco IOS Release 12.3(33)SRE, only pseudowires advertised with forwarding equivalence class (FEC) 128 are supported for the L2VPN Multisegment Pseudowires feature. FEC 129 is not supported.
- In Cisco IOS Release 15.1(1)S, FEC 129 is supported and used to exchange information about the pseudowires for the L2VPN VPLS Inter-AS Option B feature.
- The S-PE router is limited to 1600 pseudowires.

## Information About L2VPN Multisegment Pseudowires

- [L2VPN Pseudowire Defined, page 2](#)
- [L2VPN Multisegment Pseudowire Defined, page 3](#)
- [MPLS OAM Support for Multisegment Pseudowires, page 4](#)
- [MPLS OAM Support for L2VPN VPLS Inter-AS Option B, page 4](#)

## L2VPN Pseudowire Defined

An L2VPN pseudowire (PW) is a tunnel established between two provider edge (PE) routers across the core carrying the Layer 2 payload encapsulated as MPLS data, as shown in [Figure 1](#). This helps carriers migrate from traditional Layer 2 networks such as Frame Relay and ATM to an MPLS core. The PWs between two PE routers are located within the same autonomous system (AS). Routers PE1 and PE2 are called terminating PE routers (T-PEs). Attachment circuits are bounded to the PW on these PE routers.

## L2VPN Multisegment Pseudowire Defined

An L2VPN multisegment pseudowire (MS-PW) is a set of two or more PW segments that function as a single PW, as shown in [Figure 2](#). It is also known as switched PW. MS-PWs span multiple cores or autonomous systems of the same or different carrier networks. An L2VPN MS-PW can include up to 254 PW segments.

The end routers are called terminating PE routers (T-PEs), and the switching routers are called S-PE routers. The S-PE router terminates the tunnels of the preceding and succeeding PW segments in an MS-PW. The S-PE router can switch the control and data planes of the preceding and succeeding PW segments of the MS-PW. An MS-PW is declared to be up when all the single-segment PWs are up. For more information, see the [L2VPN Pseudowire Switching](#) document.

With the L2VPN Multisegment Pseudowire feature introduced in Cisco IOS Release 12.2(33)SRE, the pseudowires are created statically, and FEC 128 information is used to exchange the information about each AS.

## MPLS OAM Support for Multisegment Pseudowires

You can use the **ping mpls** and **trace mpls** commands to verify that all the segments of the MPLS multisegment pseudowire are operating.

You can use the **ping mpls** command to verify connectivity at the following pseudowire points:

- From one end of the pseudowire to the other
- From one of the pseudowires to a specific segment
- The segment between two adjacent S-PE routers

You can use the **trace mpls** command to verify connectivity at the following pseudowire points:

- From one end of the pseudowire to the other
- From one of the pseudowires to a specific segment
- The segment between two adjacent S-PE routers
- A range of segments

## MPLS OAM Support for L2VPN VPLS Inter-AS Option B

The L2VPN VPLS Inter-AS Option B feature introduced in Cisco IOS Release 15.1(1)S uses multisegment pseudowires to connect Autonomous System Border Routers (ASBRs) in different autonomous systems. With this feature, the pseudowires are created dynamically, and FEC 129 information is used to exchange the information about each ASBR.

The differences between static multisegment pseudowires and dynamic multisegment pseudowires are listed in [Table 1](#).

**Table 1** Comparison of Static and Dynamic Multisegment Pseudowires

Static Multisegment Pseudowires	Dynamic Multisegment Pseudowires
Are statically stitched and dynamically signalled.	Are dynamically stitched and dynamically signalled.
Label Distribution Protocol (LDP) exchanges the type length value (TLV) and FEC 128 information is exchanged between segments.	Border Gateway Protocol (BGP) exchanges the TLV and FEC 129 information is exchanged between ASBRs.

For more information about the L2VPN VPLS Inter-AS Option B feature, see [L2VPN VPLS Inter-AS Option B](#).

## How to Configure L2VPN Multisegment Pseudowires

The following sections outline the tasks for configuring and verifying L2VPN multisegment pseudowires:

- [Configuring L2VPN Multisegment Pseudowires, page 5](#) (required)
- [Displaying Information About the L2VPN Multisegment Pseudowires, page 6](#) (optional)
- [Verifying Multisegment Pseudowires with ping mpls and trace mpls Commands, page 8](#) (optional)

# Configuring L2VPN Multisegment Pseudowires

Perform the following steps on the S-PE routers to create L2VPN multisegment pseudowires.

## Cisco 7600 Router-Specific Instructions

If the Cisco 7600 router is the penultimate hop router connected to the S-PE or T-PE router, issue the following commands on the S-PE or T-PE routers:

- **mpls ldp explicit-null**
- **no mls mpls explicit-null propagate-ttl**

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls label protocol ldp**
4. **mpls ldp router-id *interface* force**
5. **pseudowire-class *name***
6. **encapsulation mpls**
7. **switching tlv**
8. **exit**
9. **l2 vfi *name* point-to-point**
10. **description *string***
11. **neighbor *ip-address* *vcid* {encapsulation mpls | pw-class *pw-class-name*}**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls label protocol ldp</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Configures the use of Label Distribution Protocol (LDP) on all interfaces.

	Command or Action	Purpose
Step 4	<b>mpls ldp router-id interface force</b>  <b>Example:</b> Router(config)# mpls ldp router-id loopback0 force	Specifies the preferred interface for determining the LDP router ID.
Step 5	<b>pseudowire-class name</b>  <b>Example:</b> Router(config)# pseudowire-class atom	Establishes a pseudowire class with a name that you specify, and enters pseudowire class configuration mode.
Step 6	<b>encapsulation mpls</b>  <b>Example:</b> Router(config-pw-class)# encapsulation mpls	Specifies the tunneling encapsulation. <ul style="list-style-type: none"> <li>For MPLS L2VPNs, the encapsulation type is <b>mpls</b>.</li> </ul>
Step 7	<b>switching tlv</b>  <b>Example:</b> Router(config-pw-class)# switching tlv	(Optional) Enables the advertisement of the switching point type-length variable (TLV) in the label binding. <ul style="list-style-type: none"> <li>This command is enabled by default.</li> </ul>
Step 8	<b>exit</b>  <b>Example:</b> Router(config-pw-class)# exit	Exits pseudowire class configuration mode.
Step 9	<b>l2 vfi name point-to-point</b>  <b>Example:</b> Router(config)# l2 vfi atomtunnel point-to-point	Creates a point-to-point Layer 2 virtual forwarding interface (VFI) and enters VFI configuration mode.
Step 10	<b>description string</b>  <b>Example:</b> Router(config-vfi)# description segment1	Provides a description of the switching provider edge router for a multisegment pseudowire.
Step 11	<b>neighbor ip-address vcid</b> { <b>encapsulation mpls</b>   <b>pw-class pw-class-name</b> }	Sets up an emulated VC. <ul style="list-style-type: none"> <li>Specify the IP address and the VC ID of the peer router. Also specify the pseudowire class to use for the emulated VC.</li> </ul> <p><b>Note</b> Only two <b>neighbor</b> commands are allowed for each <b>l2 vfi point-to-point</b> command.</p>
	<b>Example:</b> Router(config-vfi)# neighbor 10.0.0.1 100 pw-class mpls	

## Displaying Information About the L2VPN Multisegment Pseudowires

Perform the following task to display the status of L2VPN multisegment pseudowires.

## SUMMARY STEPS

1. **show mpls l2transport binding**
2. **show mpls l2transport vc detail**

## DETAILED STEPS

**Step 1 show mpls l2transport binding**

Use the **show mpls l2transport binding** command to display information about the pseudowire switching point, as shown in bold in the output. (In the following examples PE1 and PE4 are the T-PE routers.)

```
Router# show mpls l2transport binding
```

```

Destination Address: 10.1.1.1, VC ID: 102
Local Label: 17
  Cbit: 1, VC Type: Ethernet, GroupID: 0
  MTU: 1500, Interface Desc: n/a
  VCCV: CC Type: CW [1], RA [2], TTL [3]
    CV Type: LSPV [2]
Remote Label: 16
  Cbit: 1, VC Type: Ethernet, GroupID: 0
  MTU: 1500, Interface Desc: n/a
  VCCV: CC Type: CW [1], RA [2], TTL [3]
    CV Type: LSPV [2]
PW Switching Point:
  Vcid local IP addr remote IP addr Description
  101 10.11.11.11 10.20.20.20 PW Switching Point PE3
  100 10.20.20.20 10.11.11.11 PW Switching Point PE2
```

**Step 2 show mpls l2transport vc detail**

Use the **show mpls l2transport vc detail** command to display status of the pseudowire switching point. In the following example, the output (shown in bold) displays the segment that is the source of the fault of the multisegment pseudowire:

```
Router# show mpls l2transport vc detail
```

```

Local interface: Se3/0 up, line protocol up, HDLC up
Destination address: 12.1.1.1, VC ID: 100, VC status: down
Output interface: Se2/0, imposed label stack {23}
Preferred path: not configured
Default path: active
Next hop: point2point
Create time: 00:03:02, last status change time: 00:01:41
Signaling protocol: LDP, peer 10.1.1.1:0 up
Targeted Hello: 10.1.1.4(LDP Id) -> 10.1.1.1, LDP is UP
Status TLV support (local/remote) : enabled/supported
  LDP route watch : enabled
  Label/status state machine : established, LruRrd
Last local dataplane status rcvd: No fault
Last local SSS circuit status rcvd: No fault
Last local SSS circuit status sent: DOWN(PW-tx-fault)
Last local LDP TLV status sent: No fault
Last remote LDP TLV status rcvd: DOWN(PW-tx-fault)
PW Switching Point:

PW-tx-fault 101 10.1.1.1 10.1.1.1 S-PE2
Last remote LDP ADJ status rcvd: No fault
MPLS VC labels: local 19, remote 23
```

```

Group ID: local 0, remote 0
MTU: local 1500, remote 1500
Remote interface description:
Sequencing: receive disabled, send disabled
VC statistics:
  packet totals: receive 16, send 27
  byte totals:   receive 2506, send 3098
  packet drops:  receive 0, seq error 0, send 0

```

---

## Verifying Multisegment Pseudowires with ping mpls and trace mpls Commands

You can use **ping mpls** and **trace mpls** commands to verify connectivity in multisegment pseudowires.

### Restrictions

Some **ping mpls** and **trace mpls** keywords that are available with IPv4 LDP or traffic engineering (TE) are not available with pseudowire.

The following keywords are not available with the **ping mpls pseudowire** command:

- **dsmap**
- **flags**
- **force-explicit-null**
- **output**
- **revision**
- **ttl**

The following keywords are not available with the **trace mpls pseudowire** command:

- **flags**
- **force-explicit-null**
- **output**
- **revision**
- **ttl**

### SUMMARY STEPS

1. **ping mpls pseudowire** *destination-address* *vc-id* [**segment** *segment-number*]
2. **trace mpls pseudowire** *destination-address* *vc-id* **segment** *segment-number* [*segment-number*]

### DETAILED STEPS

---

**Step 1** **ping mpls pseudowire** *destination-address* *vc-id* [**segment** *segment-number*]

Where:

- *destination-address* is the address of the S-PE router, which is the end of the segment from the direction of the source.

- *vc-id* is the VC ID of the segment from the source to the next PE router.
- **segment** *segment-number* is optional and specifies the segment you want to ping.

The following examples use the topology shown in [Figure 2](#):

- To perform an end-to-end ping operation from T-PE1 to T-PE2, enter the following command. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

```
ping mpls pseudowire destination-address vc-id
```

- To perform a ping operation from T-PE1 to segment 2, enter the following command. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

```
ping mpls pseudowire destination-address vc-id segment 2
```

**Step 2** **trace mpls pseudowire destination-address vc-id segment segment-number [segment-number]**

Where:

- *destination-address* is the address of the next S-PE router from the origin of the trace.
- *vc-id* is the VC ID of the segment from which the **trace** command is issued.
- *segment-number* indicates the segment upon which the trace operation will act. If you enter two segment numbers, the traceroute operation will perform a trace on that range of routers.

The following examples use the topology shown in [Figure 2](#):

- To perform a trace operation from T-PE1 to segment 2 of the multisegment pseudowire, enter the following command. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

```
trace mpls pseudowire destination-address vc-id segment 2
```

This example performs a trace from T-PE1 to S-PE2.

- To perform a trace operation on a range of segments, enter the following command. This example performs a trace from S-PE2 to T-PE2. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

```
trace mpls pseudowire destination-address vc-id segment 2 4
```

The following commands perform trace operations on S-PE router 10.10.10.9, first on segment 1, then on segment 2.

Segment 1 trace:

```
Router# trace mpls pseudowire 10.10.10.9 220 segment 1
```

```
Tracing MS-PW segments within range [1-1] peer address 10.10.10.9 and timeout 2 seconds
```

```
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'I' - unknown upstream index,
'X' - unknown return code, 'x' - return code 0
```

```
Type escape sequence to abort.
```

```
L 1 10.10.9.9 0 ms [Labels: 18 Exp: 0]
    local 10.10.10.22 remote 10.10.10.9 vc id 220
```

Segment 2 trace:

```
Router# trace mpls pseudowire 10.10.10.9 220 segment 2
```

```

Tracing MS-PW segments within range [1-2] peer address 10.10.10.9 and timeout 2 seconds

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
       'L' - labeled output interface, 'B' - unlabeled output interface,
       'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
       'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
       'P' - no rx intf label prot, 'p' - premature termination of LSP,
       'R' - transit router, 'I' - unknown upstream index,
       'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.

---

## Verifying L2VPN VPLS Inter-AS Option B with ping mpls and trace mpls Commands

You can use **ping mpls** and **trace mpls** commands to verify connectivity in configurations using the L2VPN VPLS Inter-AS Option B feature. For end-to-end ping and trace operations, you enter the destination address of the T-PE router at the other end of the pseudowire.

### Restrictions

Some **ping mpls** and **trace mpls** keywords that are available with IPv4 LDP or traffic engineering (TE) are not available with pseudowire.

The following keywords are not available with the **ping mpls pseudowire** command:

- **dsmap**
- **flags**
- **force-explicit-null**
- **output**
- **revision**
- **tfl**

The following keywords are not available with the **trace mpls pseudowire** command:

- **flags**
- **force-explicit-null**
- **output**
- **revision**
- **tfl**

### SUMMARY STEPS

1. **ping mpls pseudowire** *destination-address* *vc-id* [**segment** *segment-number*]

2. **trace mpls pseudowire** *destination-address vc-id segment segment-number* [*segment-number*]

## DETAILED STEPS

**Step 1** **ping mpls pseudowire** *destination-address vc-id* [**segment** *segment-number*]

Where:

- *destination-address* is the address of the T-PE2 router at the other end of the pseudowire.
- *vc-id* is the VC ID between T-PE1 and S-PE1.
- **segment** *segment-number* is optional and specifies the segment you want to ping.

The following examples use the topology shown in [Figure 2](#):

- To perform an end-to-end ping operation from T-PE1 to T-PE2, enter the following command. *destination-address* is T-PE2 and *vc-id* is the VC between T-PE1 and S-PE1.

```
ping mpls pseudowire destination-address vc-id
```

**Step 2** **trace mpls pseudowire** *destination-address vc-id segment segment-number* [*segment-number*]

Where:

- *destination-address* is the address of the T-PE2 router at the other end of the pseudowire.
- *vc-id* is the VC ID between T-PE1 and S-PE1.
- *segment-number* indicates the segment upon which the trace operation will act. If you enter two segment numbers, the traceroute operation will perform a trace on that range of routers.

The following examples use the topology shown in [Figure 2](#):

- To perform a trace operation from T-PE1 to T-PE2, enter the following command. *destination-address* is T-PE2 and *vc-id* is the VC between T-PE1 and S-PE1.

```
trace mpls pseudowire destination-address vc-id segment 2
```

This example performs a trace from T-PE1 to T-PE2.

- To perform a trace operation on a range of segments, enter the following command. This example performs a trace from S-PE2 to T-PE2. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

```
trace mpls pseudowire destination-address vc-id segment 2 4
```

## Configuration Examples for L2VPN Multisegment Pseudowires

This section contains a configuration example for a network similar to the one shown in [Figure 2](#).

- [Example: Configuring an L2VPN Multisegment Pseudowire, page 11](#)

### Example: Configuring an L2VPN Multisegment Pseudowire

The following example does not include all the commands. Unconfigured interfaces are not shown. Portions of the example relevant to L2VPN Multisegment Pseudowires are shown in bold.

**T-PE1 Configuration**

## Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	<a href="http://www.cisco.com/cisco/web/support/index.html">http://www.cisco.com/cisco/web/support/index.html</a>

# Feature Information for L2VPN Multisegment Pseudowires

Table 2 lists the release history for this feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 2 lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 2** Feature Information for L2VPN Multisegment Pseudowires

Feature Name	Releases	Feature Information
L2VPN Multisegment Pseudowires	12.2(33)SRE	This feature enables you to configure two or more Layer 2 pseudowire segments that function as a single pseudowire. The feature spans multiple cores or autonomous systems of the same or different carrier networks.
MPLS OAM Support for Multisegment Pseudowires	12.2(33)SRE	This feature enables you to use the <b>ping mpls</b> and <b>trace mpls</b> commands to verify that all the segments of the MPLS multisegment pseudowire are operating.
MPLS OAM Support for L2VPN VPLS Inter-AS Option B	15.1(1)S	This feature is an enhancement to the MPLS OAM Support for Multisegment Pseudowires feature. This feature allows you to use the <b>ping mpls</b> and <b>trace mpls</b> commands to verify the pseudowire used in a L2VPN VPLS Inter-AS Option B configuration.
