Using Multilink PPP over Serial Interface Links

First Published: May 2, 2005
Last Updated: March 22, 2011

This module contains conceptual information and configuration tasks for using Multilink PPP over serial interface links. Multilink PPP is a method used to reduce latency and jitter for real-time traffic.

Finding Feature Information in This Module

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for Using Multilink PPP over Serial Interface Links” section on page 11.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Using Multilink PPP over Serial Interface Links

Knowledge

- Be familiar with the concepts in the “Reducing Latency and Jitter for Real-Time Traffic Using Multilink PPP” module.

Enable Queueing Mechanism

- Multilink uses first-in first out (FIFO) queuing for queueing and interleaving packets. Other queueing mechanisms such as low latency queueing (LLQ), weighted fair queueing (WFQ), and class-based weighted fair queueing (CBWFQ) can be used. If you want to use one of these alternative mechanisms, enable it before configuring multilink.

Restrictions for Using Multilink PPP over Serial Interface Links

**Number of Links per Multilink Bundle**

If a multilink bundle has one link or packet order is not important for interleaved packets, use Link Fragmentation and Interleaving (LFI) without multiclass. Use LFI with multiclass if a multilink bundle has multiple links.

**VoIP Support**

Only Voice over IP (VoIP) is supported.

**Queueing Mechanisms Not Supported**

Many of the legacy queueing mechanisms are not supported by multilink. These mechanisms include:

- Fair queueing on a virtual template interface
- Weighted random early detection (WRED) on a virtual template interface
- Custom queueing
- Priority queueing

**Note**

Fair queueing, WRED, and priority queueing can be configured in a traffic policy using the Modular Quality of Service (QoS) Command-Line Interface (CLI) (MQC).

Information About Using Multilink PPP over Serial Interface Links

To use Multilink PPP over serial interface links, you should understand the following concept:

- MQC and Multilink PPP over Serial Interface Links, page 3
- Multilink Group Interfaces, page 3
MQC and Multilink PPP over Serial Interface Links

Before using Multilink PPP over serial interface links, a traffic policy (also known as a policy map) must be created. (See the “Prerequisites” section on page 3.) Policy maps are created using the Modular Quality of Service (QoS) Command-Line Interface (CLI) (MQC).

The MQC is a CLI structure that allows users to create traffic polices (policy maps) and attach these policy maps to interfaces. A policy map contains a traffic class and one or more QoS features. A traffic class is used to classify traffic. The QoS features in the traffic policy determine how to treat the classified traffic.

Multilink Group Interfaces

A multilink group interface is a collection of interfaces bundled together in the multilink PPP configuration. With a multilink group interface, you can bundle interfaces into logical multilink groups.

How to Configure Multilink PPP over Serial Interface Links

This section contains the following procedures:

- Configuring Multilink PPP over Serial Interface Links on a Multilink Group Interface, page 3 (required)
- Associating the Serial Interface with the Multilink Group, page 5 (required)
- Verifying the Multilink PPP over Serial Interface Link Configuration, page 6 (optional)

Configuring Multilink PPP over Serial Interface Links on a Multilink Group Interface

Prerequisites

Before proceeding with this task, you must create a policy map. The policy map contains the configuration parameters used to apply the specific quality of service feature to the network traffic. To create a policy map, use the MQC. See the “MQC and Multilink PPP over Serial Interface Links” section on page 3.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface multilink multilink-bundle-number
4. ip address ip-address mask [secondary]
5. service-policy output policy-map-name
6. service-policy input policy-map-name
7. ppp multilink fragment delay milliseconds [microseconds]
8. ppp multilink interleave
9. `ppp multilink multiclass`

10. `end`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Router&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>interface multilink multilink-bundle-number</code></td>
<td>Creates a multilink bundle and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Router(config)# interface multilink 1</code></td>
<td>• Enter the multilink bundle number.</td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>ip address ip-address mask [secondary]</code></td>
<td>Sets a primary IP address for an interface. This command can also set the optional secondary IP address for an interface.</td>
</tr>
<tr>
<td>Example: <code>Router(config-if)# ip address 10.10.100.1 255.255.255.0</code></td>
<td>• Enter the primary IP address (and, optionally, the secondary IP address).</td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>service-policy output policy-map-name</code></td>
<td>Attaches the previously created QoS traffic policy (policy map). See the “Prerequisites” section on page 3. The policy map evaluates and applies QoS features for traffic leaving the interface.</td>
</tr>
<tr>
<td>Example: <code>Router(config-if)# service-policy output policy1</code></td>
<td>• Enter the policy map name.</td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>service-policy input policy-map-name</code></td>
<td>Attaches the previously created QoS traffic policy (policy map). See the “Prerequisites” section on page 3. The policy map evaluates and applies QoS features for traffic entering the interface.</td>
</tr>
<tr>
<td>Example: <code>Router(config-if)# service-policy input policy1</code></td>
<td>• Enter the policy map name.</td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>ppp multilink fragment delay milliseconds [microseconds]</code></td>
<td>Specifies a maximum size in units of time for packet fragments on a Multilink PPP (MLP) bundle.</td>
</tr>
<tr>
<td>Example: <code>Router(config-if)# ppp multilink fragment delay 20</code></td>
<td>• Enter the maximum amount of time, in milliseconds.</td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>ppp multilink interleave</code></td>
<td>Enables interleaving of packets among the fragments of larger packets on a multilink bundle.</td>
</tr>
</tbody>
</table>
# Using Multilink PPP over Serial Interface Links

## How to Configure Multilink PPP over Serial Interface Links

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface serial slot/port:timeslot`
4. `no fair-queue`
5. `encapsulation ppp`
6. `ppp multilink`
7. `ppp multilink group group-number`
8. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>ppp multilink multiclass</code></td>
<td>(Optional) Enables Multiclass Multilink PPP (MCMP) on an interface.</td>
</tr>
<tr>
<td>Example: <code>Router(config-if)# ppp multilink multiclass</code></td>
<td>Note Use this command only if there are multiple links in the multilink bundle.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>end</code></td>
<td>(Optional) Exits interface configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Router(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

## Associating the Serial Interface with the Multilink Group

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface serial slot/port:timeslot`
4. `no fair-queue`
5. `encapsulation ppp`
6. `ppp multilink`
7. `ppp multilink group group-number`
8. `end`

### DETAILED STEPS

Configuration Examples for Using Multilink PPP over Serial Interface Links

This section contains the following examples:

- Configuring Multilink PPP over Serial Interface Links on a Multilink Group Interface: Example, page 7
- Associating the Serial Interface with the Multilink Group: Example, page 8
- Verifying the Multilink PPP over Serial Interface Link Configuration: Example, page 8

Configuring Multilink PPP over Serial Interface Links on a Multilink Group Interface: Example

The following is an example of configuring Multilink PPP over serial interface links on a multilink group interface:

```
Router> enable
Router# configure terminal
Router(config)# interface multilink 1
Router(config-if)# ip address 10.10.100.1 255.255.255.0
Router(config-if)# service-policy output policy1
Router(config-if)# service-policy input policy1
Router(config-if)# ppp multilink fragment delay 20
Router(config-if)# ppp multilink interleave
Router(config-if)# ppp multilink multiclass
Router(config-if)# end
```
Associating the Serial Interface with the Multilink Group: Example

The following is an example of associating the serial interface serial4/1 with the multilink group:

Router> enable
Router# configure terminal
Router(config)# interface serial 4/1:23
Router(config-if)# no fair-queue
Router(config-if)# encapsulation ppp
Router(config-if)# ppp multilink
Router(config-if)# ppp multilink group 1
Router(config-if)# end

Verifying the Multilink PPP over Serial Interface Link Configuration: Example

You can verify the Multilink PPP over serial interface links configuration by using one or more of the following show commands:

- show interfaces
- show ppp multilink
- show policy-map interface

The following section provides sample output of the show ppp multilink command only. For sample output of the other commands, see the appropriate Cisco IOS Release 12.3 T command reference publication.

show ppp multilink Command Output Example

The following is an example of the show ppp multilink command output. In this example, one multilink bundle called 7206-2 is on the system. This bundle has two member links: one active link and one inactive link.

Router# show ppp multilink
Multilink2, bundle name is 7206-2
Endpoint discriminator is 7206-2
Bundle up for 00:00:09, 1/255 load
Receive buffer limit 12000 bytes, frag timeout 1500 ms
0/0 fragments/bytes in reassembly list
0 lost fragments, 0 reordered
0/0 discarded fragments/bytes, 0 lost received
0x0 received sequence, 0x3 sent sequence
Member links:1 active, 1 inactive (max not set, min not set)
Se3/2, since 00:00:10, 240 weight, 232 frag size
Se3/3 (inactive)

Where to Go Next

To use Multilink PPP over ATM links, see the “Using Multilink PPP over ATM Links” module.
To use Multilink PPP over Frame Relay, see the “Using Multilink PPP over Frame Relay” module.
To use Multilink PPP over dialer interface links, see the “Using Multilink PPP over Dialer Interface Links” module.

Feature Information for Using Multilink PPP over Serial Interface Links

Table 1 lists the release history for this feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.
