TCP Out-of-Order Packet Support for Cisco IOS Firewall and Cisco IOS IPS

First Published: November 17, 2006
Last Updated: November 17, 2006

This feature allows out-of-order packets in TCP streams to be cached and reassembled before they are inspected by Cisco IOS Intrusion Prevention System (IPS) or Cisco IOS Firewall.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for TCP Out-of-Order Packet Support for Cisco IOS Firewall and IPS” section on page 6.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for TCP Out-of-Order Packet Support for Cisco IOS Firewall and Cisco IOS IPS

Cisco IOS IPS or Cisco IOS Firewall must be configured on your router.

Restrictions for TCP Out-of-Order Packet Support for Cisco IOS Firewall and Cisco IOS IPS

- The feature is enabled by default. The user must explicitly disable it. To disable TCP out-of-order packet buffering and reassembly, issue the `ip inspect tcp reassembly queue length 0` command.
- Zone-based policy firewall is not supported. Only Cisco IOS IPS and Cisco IOS Firewall application inspection can support out-of-order TCP packets.

Information About TCP Out-of-Order Packet Support for Cisco IOS Firewall and Cisco IOS IPS

How TCP Out-of-Order Packet Support Works

Cisco IOS Firewall and IPS track packets in TCP connections. If configured to look into the application data of the packets, Cisco IOS Firewall and IPS expect the TCP packets to arrive in the correct order because some data items are split across segments. When packets arrive out of order, they are dropped by the firewall or IPS. Dropping out-of-order packets can cause significant delays in end applications because packets are dropped only after the retransmission timer expires (on behalf of the sender).

Out-of-order TCP packet support enables Cisco IOS Firewall and IPS to hold a copy of the out-of-order packet in a buffer (whose size is configurable with a maximum of 1024 packets per session). The original packet passes through the router and reaches its destination, but the firewall or IPS do not execute on the packet. When the next packet arrives, the firewall or IPS look for that packet to “fill the hole,” providing a consecutive sequence of segments. If this packet does not fulfill that requirement, it is processed as an out-of-order packet; when another packet arrives and provides a consecutive sequence of segments, it is processed by the firewall or IPS.

How to Configure Cisco IOS Firewall or IPS to Handle TCP Out-of-Order Packets

- Changing Default TCP Out-of-Order Packet Parameters, page 3
Changing Default TCP Out-of-Order Packet Parameters

Use this task to change any of the predefined parameters that instruct Cisco IOS Firewall application inspection or Cisco IOS IPS how to handle out-of-order TCP packets.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip inspect tcp reassembly**
   - **queue length** `packet-number`
   - **timeout** `seconds`
   - **memory limit** `size-in-kb`
   - **alarm** `{on | off}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip inspect tcp reassembly</td>
<td>Sets parameters that define how a Cisco IOS IPS handles out-of-order TCP packets.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# ip inspect tcp reassembly queue length 10 timeout 8</td>
<td></td>
</tr>
</tbody>
</table>

- **queue length** `packet-number`—Maximum number of out-of-order packets that can be held per queue (buffer). Note that there are 2 queues per session. Available value range: 0 to 1024. Default value: 16.
- **timeout** `seconds`—Number of seconds the TCP reassembly module will hold out-of-order segments waiting for the first segment missing in the sequence.

If the queue length is set to 0, all out-of-order packets are dropped.

- **memory limit** `size-in-kb`—Maximum allowed memory use by the TCP reassembly module.

After the timeout timer has expired, a retry timer is started. The value for the retry timer is four times the configured timeout value.

- **alarm** `{on | off}`—If enabled, a syslog message is generated when an out-of-order packet is dropped. Default value: **on**
Configuration Examples for TCP Out-of-Order Packet Parameters

- Example: Verifying TCP Out-of-Order Packets, page 4

Example: Verifying TCP Out-of-Order Packets

The following example shows how to instruct Cisco IOS IPS how to handle out of order packets for TCP connections:

```
Router(config)# ip inspect tcp reassembly queue length 18
Router(config)# ip inspect tcp reassembly memory limit 200
```

The following sample output displays the configured out-of-order packet parameters:

```
Router# show ip ips statistics

Signature Statistics [process switch: fast switch]
Signature 1000: 324 packets checked: [124:200]
Signature 1024: 100 packets checked: [0:100]
Interfaces configured for ips 0
Session creations since subsystem startup or last reset 0
Current session counts (estab/half-open/terminating) [0:0:0]
Maxever session counts (estab/half-open/terminating) [0:0:0]
Last session created never
Last statistic reset never
TCP reassembly statistics
received 200 packets out-of-order; dropped 25
peak memory usage: 200 KB; current usage: 154 KB
peak queue length 18
```

Feature Information for TCP Out-of-Order Packet Support for Cisco IOS Firewall and IPS

Table 1 lists the features in this module and provides links to specific configuration information. Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1 lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
