- `debug ip auth-proxy ezvpn`
- `icmp-echo`
- `ip http ezvpn`
- `show crypto ipsec client ezvpn`
- `show tech-support`
- `type echo protocol ipIcmpEcho`
- `xauth userid mode`
Feature Information for Easy VPN Remote

Table 4 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Note Table 4 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Glossary

AAA—authentication, authorization, and accounting. Framework of security services that provide the method for identifying users (authentication); for remote access control (authorization); and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

aggressive mode—Mode that eliminates several steps during Internet Key Exchange (IKE) authentication negotiation between two or more IPsec peers. Aggressive mode is faster than main mode but is not as secure.

authorization—Method for remote access control, including one-time authorization or authorization for each service; per-user account list and profile; user group support; and support of IP, IPX, ARA, and Telnet. AAA authorization works by assembling a set of attributes that describe what the user is authorized to perform. These attributes are compared to the information contained in a database for a given user and the result is returned to AAA to determine the actual capabilities and restrictions of the user. The database can be located locally on the access server or router, or it can be hosted remotely on a RADIUS or TACACS+ security server. Remote security servers, such as RADIUS and TACACS+, authorize users for specific rights by associating attribute-value (AV) pairs, which define those rights, with the appropriate user. All authorization methods must be defined through AAA.

CA—certificate authority. An entity in a network that issues and manages security credentials and public keys (in the form of X509v3 certificates) for message encryption. As part of a public key infrastructure (PKI), a CA checks with a registration authority (RA) to verify information provided by the requestor of a digital certificate. If the RA verifies the information of the requestor, the CA can then issue a certificate. Certificates generally include the public key of the owner, the expiration date of the certificate, the name of the owner, and other information about the public key owner.

CRWS—Cisco Router Web Setup Tool. Tool that provides web interface capabilities.

cTCP—Cisco Tunneling Control Protocol. When cTCP is enabled on a remote device (client) and headend device, IKE and ESP (Protocol 50) traffic is encapsulated in the TCP header so that the firewalls in between the client and the headend device permits this traffic (considering it the same as TCP traffic).

DPD—dead peer detection. Queries the liveness of the Internet Key Exchange (IKE) peer of a router at regular intervals.

DSLAM—digital subscriber line access multiplexer. A device that connects many digital subscriber lines to a network by multiplexing the DSL traffic onto one or more network trunk lines.

IKE—Internet Key Exchange. Key management protocol standard that is used in conjunction with the IP Security (IPsec) standard. IPsec is an IP security feature that provides robust authentication and encryption of IP packets. IPsec can be configured without IKE, but IKE enhances IPsec by providing additional features, flexibility, and ease of configuration for the IPsec standard. IKE is a hybrid protocol that implements the Oakley key exchange and Skeme key exchange inside the Internet Security Association and Key Management Protocol (ISAKMP) framework. ISAKMP, Oakley, and Skeme are security protocols implemented by IKE.

IPsec—IP Security Protocol. Framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPsec provides these security services at the IP layer. IPsec uses IKE to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPsec. IPsec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

main mode—Mode that ensures the highest level of security when two or more IPsec peers are negotiating IKE authentication. It requires more processing time than aggressive mode.
MIB—Management Information Base. Database of network management information that is used and maintained by a network management protocol, such as Simple Network Management Protocol (SNMP) or Common Management Information Protocol (CMIP). The value of a MIB object can be changed or retrieved using SNMP or CMIP commands, usually through a graphical user interface (GUI) network management system (NMS). MIB objects are organized in a tree structure that includes public (standard) and private (proprietary) branches.

peer—Router or device that participates as an endpoint in IPsec and IKE.

preshared key—Shared, secret key that uses IKE for authentication.

QoS—quality of service. Capability of a network to provide better service to selected network traffic over various technologies, including Frame Relay; Asynchronous Transfer Mode (ATM); Ethernet; and 802.1 networks, SONET, and IP-routed networks that may use any or all of these underlying technologies.

RADIUS—Remote Authentication Dial-In User Service. Distributed client or server system that secures networks against unauthorized access. RADIUS clients run on Cisco routers and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

SA—security association. Instance of security policy and keying material applied to a data flow. Both IKE and IPsec use SAs, although SAs are independent of one another. IPsec SAs are unidirectional, and they are unique in each security protocol. An IKE SA is used by IKE only, and unlike the IPsec SA, it is bi-directional. IKE negotiates and establishes SAs on behalf of IPsec. A user can also establish IPsec SAs manually.

A set of SAs are needed for a protected data pipe, one per direction per protocol. For example, if you have a pipe that supports encapsulating security payload (ESP) between peers, one ESP SA is required for each direction. SAs are uniquely identified by destination (IPsec endpoint) address, security protocol (AH or ESP), and security parameter index (SPI).

SDM—Security Device Manager. Web interface manager that enables you to connect or disconnect a VPN tunnel and that provides a web interface for extended authentication (Xauth).

SNMP—Simple Network Management Protocol. Application-layer protocol that provides a message format for communication between SNMP managers and agents.

trap—Message sent by an SNMP agent to a network management system, console, or terminal to indicate the occurrence of a significant event, such as a specifically defined condition or a threshold that was reached.

VPN—virtual private network. Enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another. A VPN uses tunnels to encrypt all information at the IP level.

See *Internetworking Terms and Acronyms* for terms not included in this glossary.
Crypto Access Check on Clear-Text Packets

The Crypto Access Check on Clear-Text Packets feature removes the checking of clear-text packets that go through the IP Security (IPSec) tunnel just prior to encryption or just after decryption. The clear-text packets were checked against the outside physical interface access control lists (ACLs). This checking was often referred to as a double ACL check. This feature enables easier configuration of ACLs and eliminates the security risks that are associated with a double check when using dynamic crypto maps.

Prerequisites for Crypto Access Check on Clear-Text Packets

Restrictions for Crypto Access Check on Clear-Text Packets

- This feature does not apply to IPSec configurations on the Virtual Private Network (VPN) service module (card) on Cisco Catalyst 6500 series switches and Cisco 7600 series router platforms.
  - This feature supports only extended ACLs.

Information About Crypto Access Check on Clear-Text Packets

- ACL Checking Behavior After Upgrading to This Feature, page 4
  - Backward Compatibility, page 6

Crypto Access Check on Clear-Text Packets Overview

Configuration Changes That Are Required for This Feature
Prior to Upgrading

Check all outside interfaces for outbound ACLs that contain ACEs that permit outbound clear-text packets that would be encrypted. These ACEs need to be removed if dynamic crypto maps are being used because when the IPSec tunnel is not up, these ACEs will allow the clear-text packets out of the network. If dynamic crypto maps are not being used, these ACEs can still be removed to simplify the outside interface ACLs.

Add an outbound crypto map access ACL under the crypto map to deny to-be-encrypted, outbound clear-text packets that should be dropped. Be sure that you also permit all other packets in this ACL.

Add an inbound crypto map access ACL under the crypto map to deny just-decrypted, inbound clear-text packets that should be dropped. Be sure to also permit all other packets in this ACL.

The last two configuration changes are needed only in the rare cases in which the crypto map ACL (that selects packets to be encrypted) is more general than the packet flows that you want to encrypt. Adding outbound or inbound crypto map ACLs is usually done to keep the crypto map ACL small and simple, which saves CPU utilization and memory. The set ip access-group

DF Bit Override Functionality with IPSec Tunnels

Feature History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS</td>
<td>For information about feature support in Cisco IOS software, use Cisco Feature Navigator.</td>
</tr>
<tr>
<td>Cisco IOS XE</td>
<td>This feature was introduced on Cisco ASR 1000 Series Routers.</td>
</tr>
</tbody>
</table>

This feature module describes the DF Bit Override Functionality with IPSec Tunnels feature and contains the following sections:

- Feature Overview, page 1
- Supported Platforms, page 2
- Supported Standards, MIBs, and RFCs, page 3
- Prerequisites, page 3
- Configuration Tasks, page 4
- Configuration Examples, page 4
- Command Reference, page 5

Feature Overview

The DF Bit Override Functionality with IPSec Tunnels feature allows customers to specify whether their router can clear, set, or copy the Don't Fragment (DF) bit from the encapsulated header. A DF bit is a bit within the IP header that determines whether a router is allowed to fragment a packet.

Some customer configurations have hosts that perform the following functions:

- Set the DF bit in packets they send
- Use firewalls that block Internet Control Message Protocol (ICMP) errors from outside the firewall, preventing hosts from learning about the maximum transmission unit (MTU) size outside the firewall
- Use IP Security (IPSec) to encapsulate packets, reducing the available MTU size
Customers whose configurations have hosts that prevent them from learning about their available MTU size can configure their router to clear the DF bit and fragment the packet.

**Note**

In compliance with RFC 2401, this feature can be configured globally or per interface. If both levels are configured, the interface configuration will override the global configuration.

**Benefits**

The DF Bit Override Functionality with IPSec Tunnels feature allows customers to configure the setting of the DF bit when encapsulating tunnel mode IPSec traffic on a global or per-interface level. Thus, if the DF bit is set to clear, routers can fragment packets regardless of the original DF bit setting.

**Restrictions**

**Performance Impact**

Because each packet is reassembled at the process level, a significant performance impact occurs at a high data rate. Two major caveats are as follows:

- The reassemble queue can fill up and force fragments to be dropped.
- The traffic is slower because of the process switching.

**DF Bit Setting Requirement**

If several interfaces share the same crypto map using the local address feature, these interfaces must share the same DF bit setting.

**Feature Availability**

This feature is available only for IPSec tunnel mode. (IPSec transport mode is not affected because it does not provide an encapsulating IP header.)

**Related Documents**

The following documents provide information related to the DF Bit Override Functionality with IPSec Tunnels feature:

**Supported Platforms**

This feature is supported on the following platforms:

- Cisco 800
- Cisco 827
DF Bit Override Functionality with IPSec Tunnels

Supported Standards, MIBs, and RFCs

- Cisco 1600
- Cisco 1600R
- Cisco 1700
- Cisco 2600
- Cisco 3620
- Cisco 3640
- Cisco 3660
- Cisco 4000
- Cisco 4500
- Cisco 5200

- Cisco 7100
- Cisco 7200
- Cisco 7500
- Cisco uBR7200
- Cisco uBR900
- Cisco uBR905
- Cisco uBR910

This feature runs on all platforms that support IPSec.

**Supported Standards, MIBs, and RFCs**

**Standards**
No new or modified standards are supported by this feature.

**MIBs**
No new or modified MIBs are supported by this feature.

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.

**RFCs**
- RFC 2401, *Security Architecture for the Internet Protocol*

**Prerequisites**

IPSec must be enabled on your router.
Configuration Tasks

See the following section for configuration tasks for the DF-Bit Override Functionality with IPSec Tunnels feature:

- Configuring the DF Bit for the Encapsulating Header in Tunnel Mode

Configuring the DF Bit for the Encapsulating Header in Tunnel Mode

To set the DF bit for the encapsulating header in tunnel mode, use the following command in global configuration mode:

```
Router(config)# crypto ipsec df-bit [clear | set | copy]
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# crypto ipsec df-bit [clear</td>
<td>set</td>
</tr>
</tbody>
</table>

Verifying DF Bit Setting

To verify the current DF Bit settings on your router, use the `show running-config` command in EXEC mode.

Configuration Examples

This section provides the following configuration example:

- DF Bit Setting Configuration Example

DF Bit Setting Configuration Example

In following example, the router is configured to globally clear the setting for the DF bit and copy the DF bit on the interface named Ethernet0. Thus, all interfaces except Ethernet0 will allow the router to send packets larger than the available MTU size; Ethernet0 will allow the router to fragment the packet.

Command Reference

The following new commands are pertinent to this feature. To see the command pages for these commands and other commands used with this feature, go to the Cisco IOS Master Commands List, Release 12.4, at http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124mindx/124index.htm.

- crypto ipsec df-bit (global configuration)
- crypto ipsec df-bit (interface configuration)

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Distinguished Name Based Crypto Maps

Feature History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(4)T</td>
<td>This feature was introduced.</td>
</tr>
<tr>
<td>Cisco IOS XE</td>
<td>This feature was introduced on Cisco ASR 1000 Series Routers.</td>
</tr>
<tr>
<td>Release 2.1</td>
<td></td>
</tr>
</tbody>
</table>

This feature module describes the Distinguished Name Based Crypto Map feature in Cisco IOS Release 12.2(4)T. It includes the following sections:

- Feature Overview, page 1
- Supported Platforms, page 2
- Supported Standards, MIBs, and RFCs, page 3
- Prerequisites, page 3
- Configuration Tasks, page 3
- Configuration Examples, page 5
- Command Reference, page 6

Feature Overview

The Distinguished Name Based Crypto Maps feature allows you to configure the router to restrict access to selected encrypted interfaces for those peers with specific certificates, especially certificates with particular Distinguished Names (DNs).

Previously, if the router accepted a certificate or a shared secret from the encrypting peer, Cisco IOS did not have a method of preventing the peer from communicating with any encrypted interface other than the restrictions on the IP address of the encrypting peer. This feature allows you to configure which crypto maps are usable to a peer based on the DN that a peer used to authenticate itself, thereby, enabling you to control which encrypted interfaces a peer with a specified DN can access.
Benefits

The Distinguished Name Based Crypto Maps feature allows you to set restrictions in the router configuration that prevent peers with specific certificates—especially certificates with particular DNs—from having access to selected encrypted interfaces.

Restrictions

**System Requirements**
To configure this feature, your router must support IP Security.

**Performance Impact**
If you restrict access to a large number of DNs, it is recommended that you specify a few number of crypto maps referring to large identity sections instead of specifying a large number of crypto maps referring to small identity sections.

Related Documents

The following documents provide information related to the Distinguished Name Based Crypto Maps feature:
- *Cisco IOS Security Command Reference*, Release 12.2

Supported Platforms

This feature is supported on the following platforms:
- Cisco 1700 series
- Cisco 2600 series
- Cisco 3620
- Cisco 3640
- Cisco 3660
- Cisco 7100 series
- Cisco 7200 series
- Cisco uBR905 Cable Access Router
- Cisco uBR925 Cable Access Router

**Determining Platform Support Through Feature Navigator**
Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Feature Navigator. Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Feature Navigator is a web-based tool that enables you to quickly determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image.
To access Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions at http://www.cisco.com/register.

Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Feature Navigator home page at the following URL: http://www.cisco.com/go/fn

**Supported Standards, MIBs, and RFCs**

**Standards**
None

**MIBs**
None

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at the following URL:

**RFCs**
None

**Prerequisites**

Before configuring a DN based crypto map, you must perform the following tasks:

- Create an Internet Key Exchange (IKE) policy at each peer.
  - For more information on creating IKE policies, refer to the chapter “Configuring Internet Key Exchange Security Protocol” of the *Cisco IOS Security Configuration Guide*.
- Create crypto map entries for IPSec.
  - For more information on creating crypto map entries, refer to the chapter “Configuring IPSec Network Security” of the *Cisco IOS Security Configuration Guide*.

**Configuration Tasks**

See the following sections for configuration tasks for the Distinguished Name Based Crypto Maps feature. Each task in the list is identified as either required or optional.

- **Configuring DN Based Crypto Maps (authenticated by DN)** (required)
- **Configuring DN Based Crypto Maps (authenticated by hostname)** (required)
- **Applying Identity to DN Based Crypto Maps** (required)
- **Verifying DN Based Crypto Maps** (optional)
## Configuring DN Based Crypto Maps (authenticated by DN)

To configure a DN based crypto map that can be used only by peers that have been authenticated by a DN, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config)# crypto identity name</td>
</tr>
<tr>
<td></td>
<td>Configures the identity of a router with the given list of DNs in the certificate of the router and enters crypto identity configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(crypto-identity)# dn name=string [,name=string]</td>
</tr>
<tr>
<td></td>
<td>Associates the identity of the router with the DN in the certificate of the router.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The identity of the peer must match the identity in the exchanged certificate.</td>
</tr>
</tbody>
</table>

## Configuring DN Based Crypto Maps (authenticated by hostname)

To configure a DN based crypto map that can be used only by peers that have been authenticated by a hostname, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config)# crypto identity name</td>
</tr>
<tr>
<td></td>
<td>Configures the identity of a router with the given list of DNs in the certificate of the router and enters crypto identity configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(crypto-identity)# fqdn name</td>
</tr>
<tr>
<td></td>
<td>Associates the identity of the router with the hostname that the peer used to authenticate itself.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The identity of the peer must match the identity in the exchanged certificate.</td>
</tr>
</tbody>
</table>

## Applying Identity to DN Based Crypto Maps

To apply the identity (within the crypto map context), use the following commands beginning in global configuration mode:
Distinguished Name Based Crypto Maps

Configuration Examples

Verifying DN Based Crypto Maps

To verify that this functionality is properly configured, use the following command in EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td><code>crypto map map-name seq-num ipsec-isakmp</code></td>
<td><code>identity name</code></td>
</tr>
<tr>
<td></td>
<td>Creates or modifies a crypto map entry and enters the crypto map configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Note: If the identity command does not appear within the crypto map, the encrypted connection does not have any restrictions other than the IP address of the encrypting peer.</td>
</tr>
</tbody>
</table>

Troubleshooting Tips

If an encrypting peer attempts to establish a connection that is blocked by the DN based crypto map configuration, the following error message will be logged:

```
<time>: %CRYPTO-4-IKE_QUICKMODE_BAD_CERT: encrypted connection attempted with a peer without the configured certificate attributes.
```

Configuration Examples

This section provides the following configuration example:

- DN Based Crypto Map Configuration Example

DN Based Crypto Map Configuration Example

The following example shows how to configure DN based crypto maps that have been authenticated by DN and hostname. Comments are included inline to explain various commands.

```
! DN based crypto maps require you to configure an IKE policy at each peer.
crypto isakmp policy 15
  encryption 3des
  hash md5
  authentication rsa-sig
  group 2
  lifetime 5000

crypto isakmp policy 20
```

Verifying DN Based Crypto Maps

To verify that this functionality is properly configured, use the following command in EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td><code>crypto map map-name seq-num ipsec-isakmp</code></td>
<td><code>identity name</code></td>
</tr>
<tr>
<td></td>
<td>Creates or modifies a crypto map entry and enters the crypto map configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Note: If the identity command does not appear within the crypto map, the encrypted connection does not have any restrictions other than the IP address of the encrypting peer.</td>
</tr>
</tbody>
</table>

Troubleshooting Tips

If an encrypting peer attempts to establish a connection that is blocked by the DN based crypto map configuration, the following error message will be logged:

```
<time>: %CRYPTO-4-IKE_QUICKMODE_BAD_CERT: encrypted connection attempted with a peer without the configured certificate attributes.
```

Configuration Examples

This section provides the following configuration example:

- DN Based Crypto Map Configuration Example

DN Based Crypto Map Configuration Example

The following example shows how to configure DN based crypto maps that have been authenticated by DN and hostname. Comments are included inline to explain various commands.

```
! DN based crypto maps require you to configure an IKE policy at each peer.
crypto isakmp policy 15
  encryption 3des
  hash md5
  authentication rsa-sig
  group 2
  lifetime 5000

crypto isakmp policy 20
```
authentication pre-share
lifetime 10000
crypto isakmp key 1234567890 address 171.69.224.33

! The following is an IPSec crypto map (part of IPSec configuration). It can be used only
! by peers that have been authenticated by DN and if the certificate belongs to BigBiz.
crypto map map-to-bigbiz 10 ipsec-isakmp
set peer 172.21.114.196
set transform-set my-transformset
match address 124
identity to-bigbiz

crypto identity to-bigbiz
  dn ou=BigBiz
  
! This crypto map can be used only by peers that have been authenticated by hostname
! and if the certificate belongs to little.com.
crypto map map-to-little-com 10 ipsec-isakmp
set peer 172.21.115.119
set transform-set my-transformset
match address 125
identity to-little-com

crypto identity to-little-com
  fqdn little.com

Command Reference

The following new commands are pertinent to this feature. To see the command pages for these
commands and other commands used with this feature, go to the Cisco IOS Master Commands List,

- crypto identity
- dn
- fqdn
- identity

For information about these commands, see the Cisco IOS Security Command Reference at
For information about all Cisco IOS commands, see the Command Lookup Tool at
http://tools.cisco.com/Support/CLILookup or the Master Command List.
Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

Dynamic Multipoint VPN (DMVPN)

First Published: November 25, 2002
Last Updated: December 11, 2006

The Dynamic Multipoint VPN (DMVPN) feature allows users to better scale large and small IP Security (IPsec) Virtual Private Networks (VPNs) by combining generic routing encapsulation (GRE) tunnels, IPsec encryption, and Next Hop Resolution Protocol (NHRP).

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Dynamic Multipoint VPN (DMVPN)” section on page 53.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

- Command Reference, page 52
- Feature Information for Dynamic Multipoint VPN (DMVPN), page 53
- Glossary, page 54
Prerequisites for Dynamic Multipoint VPN (DMVPN)

- Before a multipoint GRE (mGRE) and IPsec tunnel can be established, you must define an Internet Key Exchange (IKE) policy by using the `crypto isakmp policy` command.
- For the NAT-Transparency Aware enhancement to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency can support two peers (IKE and IPsec) being translated to the same IP address (using the User Datagram Protocol [UDP] ports to differentiate them [that is, Peer Address Translation (PAT)]), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.
- To enable 2547oDMPVN—Traffic Segmentation Within DMVPN you must configure multiprotocol label switching (MPLS) by using the `mpls ip` command.

Restrictions for Dynamic Multipoint VPN (DMVPN)

- If you use the Dynamic Creation for Spoke-to-Spoke Tunnels benefit of this feature, you must use IKE certificates or wildcard preshared keys for Internet Security Association Key Management Protocol (ISAKMP) authentication.

  **Note**  
  It is highly recommended that you do not use wildcard preshared keys because the attacker will have access to the VPN if one spoke router is compromised.

- GRE tunnel keepalives (that is, the `keepalive` command under a GRE interface) are not supported on point-to-point or multipoint GRE tunnels in a DMVPN Network.
- For best DMVPN functionality, it is recommended that you run the latest Cisco IOS software Release 12.4 mainline, 12.4T, or 12.2(18)SXF.

DMVPN Support on the Cisco 6500 and Cisco 7600

**Blade-to-Blade Switchover on the Cisco 6500 and Cisco 7600**

- DMVPN does not support blade-to-blade switchover on the Cisco 6500 and Cisco 7600.

**Cisco 6500 or Cisco 7600 As a DMVPN Hub**

- A Cisco 6500 or Cisco 7600 that is functioning as a DMVPN hub cannot be located behind a NAT router.
- If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN hub, the spoke behind NAT must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS software Release 12.3(11)T02 or a later release.

**Cisco 6500 or Cisco 7600 As a DMVPN Spoke**

- If a Cisco 6500 or Cisco 7600 is functioning as a spoke, the hub cannot be behind NAT.
- If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN spoke behind NAT, the hub must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS Release 12.3(11)T02 or a later release.
DMVPN Hub or Spoke Supervisor Engine
- Only a Supervisor Engine 720 can be used as a DMVPN hub or spoke. A Supervisor Engine 2 cannot be used.

Encrypted Multicast with GRE
- Encrypted Multicast with GRE is not supported on the Cisco 6500 nor on the Cisco 7600.

mGRE Interfaces
- If there are two mGRE interfaces on the same DMVPN node and they both do not have a tunnel key, the two mGRE interfaces must each have a unique tunnel source address (or interface) configured.
- On the Cisco 6500 and Cisco 7600, each GRE interface (multipoint or point-to-point) must have a unique tunnel source address (or interface).
- The following commands are not supported under mGRE with DMVPN: `ip tcp adjust-mss`, `qos pre-classify tunnel vrf`, `tunnel path-mtu-discovery`, and `tunnel vrf`.

Quality of Service (QoS)
- You cannot use QoS for DMVPN packets on a Cisco 6500 or Cisco 7600.

Tunnel Key
- The use of a tunnel key on a GRE (multipoint or point-to-point) interface is not supported in the hardware switching ASICs on the Cisco 6500 and Cisco 7600 platforms. If a tunnel key is configured, throughput performance is greatly reduced.
- In Cisco IOS Release 12.3(11)T3 and Release 12.3(14)T, the requirement that a mGRE interface must have a tunnel key was removed. Therefore, in a DMVPN network that includes a Cisco 6500 or Cisco 7600 as a DMVPN node, you should remove the tunnel key from all DMVPN nodes in the DMVPN network, thus preserving the throughput performance on the Cisco 6500 and Cisco 7600 platforms.
- If the tunnel key is not configured on any DMVPN node within a DMVPN network, it must not be configured on all DMVPN nodes with the DMVPN network.

VRF-Aware DMVPN Scenarios
- The `mls mpls tunnel-recir` command must be configured on the provider equipment (PE) DMVPN hub if customer equipment (CE) DMVPN spokes need to “talk” to other CEs across the MPLS cloud.
- The mGRE interface should be configured with a large enough IP maximum transmission unit (1400 packets to avoid having the route processor doing fragmentation.
- Enhanced Interior Gateway Routing Protocol (EIGRP) should be avoided.

Information About Dynamic Multipoint VPN (DMVPN)

To configure the Dynamic Multipoint VPN (DMVPN) feature, you must understand the following concepts:
- Benefits of Dynamic Multipoint VPN (DMVPN), page 4
- Feature Design of Dynamic Multipoint VPN (DMVPN), page 5
- IPsec Profiles, page 6
Benefits of Dynamic Multipoint VPN (DMVPN)

**Hub Router Configuration Reduction**
- Currently, for each spoke router, there is a separate block of configuration lines on the hub router that define the crypto map characteristics, the crypto access list, and the GRE tunnel interface. This feature allows users to configure a single mGRE tunnel interface, a single IPsec profile, and no crypto access lists on the hub router to handle all spoke routers. Thus, the size of the configuration on the hub router remains constant even if spoke routers are added to the network.
- DMVPN architecture can group many spokes into a single multipoint GRE interface, removing the need for a distinct physical or logical interface for each spoke in a native IPsec installation.

**Automatic IPsec Encryption Initiation**
- GRE has the peer source and destination address configured or resolved with NHRP. Thus, this feature allows IPsec to be immediately triggered for the point-to-point GRE tunneling or when the GRE peer address is resolved via NHRP for the multipoint GRE tunnel.

**Support for Dynamically Addressed Spoke Routers**
- When using point-to-point GRE and IPsec hub-and-spoke VPN networks, the physical interface IP address of the spoke routers must be known when configuring the hub router because IP address must be configured as the GRE tunnel destination address. This feature allows spoke routers to have dynamic physical interface IP addresses (common for cable and DSL connections). When the spoke router comes online, it will send registration packets to the hub router: within these registration packets, is the current physical interface IP address of this spoke.

**Dynamic Creation for Spoke-to-Spoke Tunnels**
- This feature eliminates the need for spoke-to-spoke configuration for direct tunnels. When a spoke router wants to transmit a packet to another spoke router, it can now use NHRP to dynamically determine the required destination address of the target spoke router. (The hub router acts as the NHRP server, handling the request for the source spoke router.) The two spoke routers dynamically create an IPsec tunnel between them so data can be directly transferred.

**VRF Integrated DMVPN**
- DMVPN can be used to extend the Multiprotocol Label Switching (MPLS) networks that are deployed by service providers to take advantage of the ease of configuration of hub and spokes, to provide support for dynamically addressed customer premises equipment (CPEs), and to provide zero-touch provisioning for adding new spokes into a DMVPN.
Feature Design of Dynamic Multipoint VPN (DMVPN)

The Dynamic Multipoint VPN (DMVPN) feature combines GRE tunnels, IPsec encryption, and NHRP routing to provide users an ease of configuration via crypto profiles—which override the requirement for defining static crypto maps—and dynamic discovery of tunnel endpoints.

This feature relies on the following two Cisco enhanced standard technologies:

- **NHRP**—A client and server protocol where the hub is the server and the spokes are the clients. The hub maintains an NHRP database of the public interface addresses of the each spoke. Each spoke registers its real address when it boots and queries the NHRP database for real addresses of the destination spokes to build direct tunnels.

- **mGRE Tunnel Interface**—Allows a single GRE interface to support multiple IPsec tunnels and simplifies the size and complexity of the configuration.

The topology shown in Figure 1 and the corresponding bullets explain how this feature works.

- Each spoke has a permanent IPsec tunnel to the hub, not to the other spokes within the network. Each spoke registers as clients of the NHRP server.

- When a spoke needs to send a packet to a destination (private) subnet on another spoke, it queries the NHRP server for the real (outside) address of the destination (target) spoke.

- After the originating spoke “learns” the peer address of the target spoke, it can initiate a dynamic IPsec tunnel to the target spoke.

- The spoke-to-spoke tunnel is built over the multipoint GRE interface.

- The spoke-to-spoke links are established on demand whenever there is traffic between the spokes. Thereafter, packets can bypass the hub and use the spoke-to-spoke tunnel.

**Note** After a preconfigured amount of inactivity on the spoke-to-spoke tunnels, the router will tear down those tunnels to save resources (IPsec security associations [SAs]).
**IPsec Profiles**

IPsec profiles abstract IPsec policy information into a single configuration entity, which can be referenced by name from other parts of the configuration. Therefore, users can configure functionality such as GRE tunnel protection with a single line of configuration. By referencing an IPsec profile, the user does not have to configure an entire crypto map configuration. An IPsec profile contains only IPsec information; that is, it does not contain any access list information or peering information.

**VRF Integrated DMVPN**

VPN Routing and Forwarding (VRF) Integrated DMVPN enables users to map DMVPN multipoint interfaces into MPLS VPNs. This mapping allows Internet service providers (ISPs) to extend their existing MPLS VPN services by mapping off-network sites (typically a branch office) to their respective MPLS VPNs. Customer equipment (CE) routers are terminated on the DMVPN PE router, and traffic is placed in the VRF instance of an MPLS VPN.

DMVPN can interact with MPLS VPNs in two ways:

1. The `ip vrf forwarding` command is used to inject the data IP packets (those packets inside the mGRE+IPsec tunnel) into the MPLS VPN. The `ip vrf forwarding` command is supported for DMVPN in Cisco IOS Release 12.3(6) and Release 12.3(7)T.
2. The `tunnel vrf` command is used to transport (route) the mGRE+IPsec tunnel packet itself within an MPLS VPN. The `tunnel vrf` command is supported in Cisco IOS Release 12.3(11)T but not in Cisco IOS Release 12.2(18)SXE.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear-text data IP packets are forwarded in a VRF using the <code>ip vrf forwarding</code> command, and encrypted tunnel IP packets are forwarded in a VRF using the <code>tunnel vrf</code> command.</td>
</tr>
</tbody>
</table>

The `ip vrf forwarding` and `tunnel vrf` commands may be used at the same time. If they are used at the same time, the VRF name of each command may be the same or different.

For information about configuring the forwarding of clear-text data IP packets into a VRF, see the section “Configuring the Forwarding of Clear-Text Data IP Packets into a VRF.” For information about configuring the forwarding of encrypted tunnel packets into a VRF, see the section “Configuring the Forwarding of Encrypted Tunnel Packets into a VRF.”

For more information about configuring VRF, see reference in the “Related Documents” section.

**Figure 2** illustrates a typical VRF Integrated DMVPN scenario.
DMVPN—Enabling Traffic Segmentation Within DMVPN

Cisco IOS Release 12.4(11)T provides an enhancement that allows you to segment VPN traffic within a DMVPN tunnel. VRF instances are labeled, using MPLS, to indicate their source and destination. The diagram in Figure 3 and the corresponding bullets explain how traffic segmentation within DMVPN works.
The hub shown in the diagram is a WAN-PE and a route reflector, and the spokes (PE routers) are clients.

There are three VRFs, designated “red,” “green,” and “blue.”

Each spoke has both a neighbor relationship with the hub (multiprotocol Border Gateway Protocol [MP-iBGP] peering) and a GRE tunnel to the hub.

Each spoke advertises its routes and VPNv4 prefixes to the hub.

The hub sets its own IP address as the next-hop route for all the VPNv4 addresses it learns from the spokes and assigns a local MPLS label for each VPN when it advertises routes back to the spokes. As a result, traffic from Spoke A to Spoke B is routed via the hub.

An example illustrates the process:
1. Spoke A advertises a VPNv4 route to the hub, and applies the label X to the VPN.
2. The hub changes the label to Y when the hub advertises the route to Spoke B.
3. When Spoke B has traffic to send to Spoke A, it applies the Y label, and the traffic goes to the hub.
4. The hub swaps the VPN label, by removing the Y label and applying an X label, and sends the traffic to Spoke A.
NAT-Transparency Aware DMVPN

DMVPN spokes are often situated behind a NAT router (which is often controlled by the ISP for the spoke site) with the outside interface address of the spoke router being dynamically assigned by the ISP using a private IP address (per Internet Engineering Task Force [IETF] RFC 1918).

Prior to Cisco IOS Release 12.3(6) and 12.3(7)T, these spoke routers had to use IPsec tunnel mode to participate in a DMVPN network. In addition, their assigned outside interface private IP address had to be unique across the DMVPN network. Even though ISAKMP and IPsec would negotiate NAT-T and “learn” the correct NAT public address for the private IP address of this spoke, NHRP could only “see” and use the private IP address of the spoke for its mapping entries. Effective with the NAT-Transparency Aware DMVPN enhancement, NHRP can now learn and use the NAT public address for its mappings as long as IPsec transport mode is used (which is the recommend IPsec mode for DMVPN networks). The restriction that the private interface IP address of the spoke must be unique across the DMVPN network has been removed. It is recommended that all DMVPN routers be upgraded to the new code before you try to use the new functionality even though spoke routers that are not behind NAT do not need to be upgraded. In addition, you cannot convert upgraded spoke routers that are behind NAT to the new configuration (IPsec transport mode) until the hub routers have been upgraded.

Also added in Cisco IOS Releases 12.3(9a) and 12.3(11)T is the capability to have the hub DMVPN router behind static NAT. This was a change in the ISAKMP NAT-T support. For this functionality to be used, all the DMVPN spoke routers and hub routers must be upgraded, and IPsec must use transport mode.

For these NAT-Transparency Aware enhancements to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency (IKE and IPsec) can support two peers (IKE and IPsec) being translated to the same IP address (using the UDP ports to differentiate them), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.

Figure 4 illustrates a NAT-Transparency Aware DMVPN scenario.

Note

In Cisco IOS Release 12.4(6)T or earlier, DMVPN spokes behind NAT will not participate in dynamic direct spoke-to-spoke tunnels. Any traffic to or from a spoke that is behind NAT will be forwarded using the DMVPN hub routers. DMVPN spokes that are not behind NAT in the same DMVPN network may create dynamic direct spoke-to-spoke tunnels between each other.

In Cisco IOS Release 12.4(6)T or later releases, DMVPN spokes behind NAT will participate in dynamic direct spoke-to-spoke tunnels. The spokes must be behind NAT boxes that are preforming NAT, not PAT. The NAT box must translate the spoke to the same outside NAT IP address for the spoke-spoke connections as the NAT box does for the spoke-hub connection. If there is more than one DMVPN spoke behind the same NAT box, then the NAT box must translate the DMVPN spokes to different outside NAT IP addresses. It is also likely that you may not be able to build a direct spoke-spoke tunnel between these spokes. If a spoke-spoke tunnel fails to form, then the spoke-spoke packets will continue to be forwarded via the spoke-hub-spoke path.
Call Admission Control with DMVPN

In a DMVPN network, it is easy for a DMVPN router to become “overwhelmed” with the number of tunnels it is trying to build. Call Admission Control can be used to limit the number of tunnels that can be built at any one time, thus protecting the memory of the router and CPU resources.

It is most likely that Call Admission Control will be used on a DMVPN spoke to limit the total number of ISAKMP sessions (DMVPN tunnels) that a spoke router will attempt to initiate or accept. This limiting is accomplished by configuring an IKE SA limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (inbound and outbound) if the current number of ISAKMP SAs exceeds the limit.

It is most likely that Call Admission Control will be used on a DMVPN hub to rate limit the number of DMVPN tunnels that are attempting to be built at the same time. The rate limiting is accomplished by configuring a system resource limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (new DMVPN tunnels) when the system utilization is above a specified percentage. The dropped session requests allow the DMVPN hub router to complete the current ISAKMP session requests, and when the system utilization drops, it can process the previously dropped sessions when they are reattempted.

No special configuration is required to use Call Admission Control with DMVPN. For information about configuring Call Admission Control, see the reference in the section “Related Documents.”

NHRP Rate-Limiting Mechanism

NHRP has a rate-limiting mechanism that restricts the total number of NHRP packets from any given interface. The default values, which are set using the `ip nhrp max-send` command, are 100 packets every 10 seconds per interface. If the limit is exceeded, you will get the following system message:

%NHRP-4-QUOTA: Max-send quota of [int]pkts/[int]Sec. exceeded on [chars]

For more information about this system message, see the document 12.4T System Message Guide.
How to Configure Dynamic Multipoint VPN (DMVPN)

To enable mGRE and IPsec tunneling for hub and spoke routers, you must configure an IPsec profile that uses a global IPsec policy template and configure your mGRE tunnel for IPsec encryption. This section contains the following procedures:

- Configuring an IPsec Profile, page 11 (required)
- Configuring the Hub for DMVPN, page 13 (required)
- Configuring the Spoke for DMVPN, page 17 (required)
- Configuring the Forwarding of Clear-Text Data IP Packets into a VRF, page 20 (optional)
- Configuring the Forwarding of Encrypted Tunnel Packets into a VRF, page 21 (optional)
- Configuring DMVPN—Traffic Segmentation Within DMVPN, page 22
- Troubleshooting Dynamic Multipoint VPN (DMVPN), page 27 (optional)

Configuring an IPsec Profile

The IPsec profile shares most of the same commands with the crypto map configuration, but only a subset of the commands are valid in an IPsec profile. Only commands that pertain to an IPsec policy can be issued under an IPsec profile; you cannot specify the IPsec peer address or the access control list (ACL) to match the packets that are to be encrypted.

Prerequisites

Before configuring an IPsec profile, you must define a transform set by using the `crypto ipsec transform-set` command.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto ipsec profile name
4. set transform-set transform-set-name
5. set identity
6. set security association lifetime [seconds seconds | kilobytes kilobytes]
7. set pfs [group1 | group2]
# Dynamic Multipoint VPN (DMVPN)

## How to Configure Dynamic Multipoint VPN (DMVPN)

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td>3</td>
<td><code>crypto ipsec profile name</code></td>
<td>Defines the IPsec parameters that are to be used for IPsec encryption between “spoke and hub” and “spoke and spoke” routers. This command enters crypto map configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Router(config)# crypto ipsec profile vpnprof</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The <em>name</em> argument specifies the name of the IPsec profile.</td>
</tr>
<tr>
<td>4</td>
<td><code>set transform-set transform-set-name</code></td>
<td>Specifies which transform sets can be used with the IPsec profile.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Router(config-crypto-map)# set transform-set trans2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The <em>transform-set-name</em> argument specifies the name of the transform set.</td>
</tr>
<tr>
<td>5</td>
<td><code>set identity</code></td>
<td>(Optional) Specifies identity restrictions to be used with the IPsec profile.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Router(config-crypto-map)# set identity</td>
</tr>
<tr>
<td>6</td>
<td>`set security association lifetime (seconds seconds</td>
<td>kilobytes kilobytes)`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Router(config-crypto-map)# set security association lifetime seconds 1800</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The <em>seconds seconds</em> option specifies the number of seconds a security association will live before expiring; the <em>kilobytes kilobytes</em> option specifies the volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before that security association expires.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The default for the <em>seconds</em> argument is 3600 seconds.</td>
</tr>
<tr>
<td>7</td>
<td>`set pfs [group1</td>
<td>group2]`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Router(config-crypto-map)# set pfs group2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The <em>group1</em> keyword specifies that IPsec should use the 768-bit Diffie-Hellman (DH) prime modulus group when performing the new DH exchange; the <em>group2</em> keyword specifies the 1024-bit DH prime modulus group.</td>
</tr>
</tbody>
</table>
What to Do Next

Proceed to the following sections “Configuring the Hub for DMVPN” and “Configuring the Spoke for DMVPN.”

Configuring the Hub for DMVPN

To configure the hub router for mGRE and IPsec integration (that is, associate the tunnel with the IPsec profile configured in the previous procedure), use the following commands:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>enable</code></td>
</tr>
<tr>
<td>2.</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>3.</td>
<td><code>interface tunnel number</code></td>
</tr>
<tr>
<td>4.</td>
<td><code>ip address ip-address mask [secondary]</code></td>
</tr>
<tr>
<td>5.</td>
<td><code>ip mtu bytes</code></td>
</tr>
<tr>
<td>6.</td>
<td><code>ip nhrp authentication string</code></td>
</tr>
<tr>
<td>7.</td>
<td><code>ip nhrp map multicast dynamic</code></td>
</tr>
<tr>
<td>8.</td>
<td><code>ip nhrp network-id number</code></td>
</tr>
<tr>
<td>9.</td>
<td>`tunnel source {ip-address</td>
</tr>
<tr>
<td>10.</td>
<td><code>tunnel key key-number</code></td>
</tr>
<tr>
<td>11.</td>
<td><code>tunnel mode gre multipoint</code></td>
</tr>
<tr>
<td>12.</td>
<td><code>tunnel protection ipsec profile name</code></td>
</tr>
<tr>
<td>13.</td>
<td><code>bandwidth kbps</code></td>
</tr>
<tr>
<td>14.</td>
<td><code>ip tcp adjust-mss max-segment-size</code></td>
</tr>
<tr>
<td>15.</td>
<td><code>ip nhrp holdtime seconds</code></td>
</tr>
<tr>
<td>16.</td>
<td><code>delay number</code></td>
</tr>
</tbody>
</table>

Note: NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique network ID numbers (using the `ip nhrp network-id` command) across all routers in a DMVPN network, but it is not necessary that they be the same.
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface tunnel number</td>
<td>Configures a tunnel interface and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# interface tunnel 5</td>
<td>- The <code>number</code> argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip address ip-address mask [secondary]</td>
<td>Sets a primary or secondary IP address for the tunnel interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip address 10.0.0.1 255.255.255.0</td>
<td><strong>Note</strong> All hubs and spokes that are in the same DMVPN network must be addressed in the same IP subnet.</td>
</tr>
<tr>
<td><strong>Step 5</strong> ip mtu bytes</td>
<td>Sets the maximum transmission unit (MTU) size, in bytes, of IP packets sent on an interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip mtu 1400</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ip nhrp authentication string</td>
<td>Configures the authentication string for an interface using NHRP.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip nhrp authentication donttell</td>
<td><strong>Note</strong> The NHRP authentication string must be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td><strong>Step 7</strong> ip nhrp map multicast dynamic</td>
<td>Allows NHRP to automatically add spoke routers to the multicast NHRP mappings.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip nhrp map multicast dynamic</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> ip nhrp network-id number</td>
<td>Enables NHRP on an interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip nhrp network-id 99</td>
<td>- The <code>number</code> argument specifies a globally unique 32-bit network identifier from a nonbroadcast multiaccess (NBMA) network. The range is from 1 to 4294967295.</td>
</tr>
<tr>
<td><strong>Step 9</strong> tunnel source {ip-address</td>
<td>type number}</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-if)# tunnel source Ethernet0</td>
<td></td>
</tr>
</tbody>
</table>
## How to Configure Dynamic Multipoint VPN (DMVPN)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 10** \(\texttt{tunnel key key-number}\) | (Optional) Enables an ID key for a tunnel interface.  
- The `key-number` argument specifies a number from 0 to 4,294,967,295 that identifies the tunnel key.  
  **Note** The key number must be set to the same value on all hubs and spokes that are in the same DMVPN network.  
  **Note** This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform. |
| **Example:** Router (config-if)# \(\texttt{tunnel key 100000}\) | |
| **Step 11** \(\texttt{tunnel mode gre multipoint}\) | Sets the encapsulation mode to mGRE for the tunnel interface. |
| **Example:** Router(config-if)# \(\texttt{tunnel mode gre multipoint}\) | |
| **Step 12** \(\texttt{tunnel protection ipsec profile name}\) | Associates a tunnel interface with an IPsec profile.  
- The `name` argument specifies the name of the IPsec profile; this value must match the `name` specified in the `crypto ipsec profile name` command. |
| **Example:** Router(config-if)# \(\texttt{tunnel protection ipsec profile vpnprof}\) | |
| **Step 13** \(\texttt{bandwidth kbps}\) | Sets the current bandwidth value for an interface to higher-level protocols.  
- The `kbps` argument specifies the bandwidth in kilobits per second. The default value is 9. The recommend bandwidth value is 1000 or greater.  
  Setting the bandwidth value to at least 1000 is critical if EIGRP is used over the tunnel interface. Higher bandwidth values may be necessary depending on the number of spokes supported by a hub. |
| **Example:** Router(config-if)# \(\texttt{bandwidth 1000}\) | |
| **Step 14** \(\texttt{ip tcp adjust-mss max-segment-size}\) | Adjusts the maximum segment size (MSS) value of TCP packets going through a router.  
- The `max-segment-size` argument specifies the maximum segment size, in bytes. The range is from 500 to 1460.  
  The recommended value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will “fit” in the tunnel. |
| **Example:** Router(config-if)# \(\texttt{ip tcp adjust-mss 1360}\) | |
## Dynamic Multipoint VPN (DMVPN)

### How to Configure Dynamic Multipoint VPN (DMVPN)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 15</strong> ip nhrp holdtime <em>seconds</em></td>
<td>Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip nhrp holdtime 450</td>
<td>- The <em>seconds</em> argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds.</td>
</tr>
</tbody>
</table>

| **Step 16** delay *number* | (Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface. |
| **Example:** Router(config-if)# delay 1000 | - The *number* argument specifies the delay time in seconds. The recommend value is 1000. |
Dynamic Multipoint VPN (DMVPN)

How to Configure Dynamic Multipoint VPN (DMVPN)

Configuring the Spoke for DMVPN

To configure spoke routers for mGRE and IPsec integration, use the following commands.

**Note**

NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique network ID numbers (using the `ip nhrp network-id` command) across all routers in a DMVPN network, but it is not necessary that they be the same.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip address ip-address mask [secondary]`
5. `ip mtu bytes`
6. `ip nhrp authentication string`
7. `ip nhrp map hub-tunnel-ip-address hub-physical-ip-address`
8. `ip nhrp map multicast hub-physical-ip-address`
9. `ip nhrp nhs hub-tunnel-ip-address`
10. `ip nhrp network-id number`
11. `tunnel source {ip-address | type number}`
12. `tunnel key key-number`
13. `tunnel mode gre multipoint`
   or
   `tunnel destination hub-physical-ip-address`
14. `tunnel protection ipsec profile name`
15. `bandwidth kbps`
16. `ip tcp adjust-mss max-segment-size`
17. `ip nhrp holdtime seconds`
18. `delay number`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

</tbody>
</table>

**Note:** This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform.
Configuring the Forwarding of Clear-Text Data IP Packets into a VRF

To configure the forwarding of clear-text data IP packets into a VRF, perform the following steps. This configuration assumes that the VRF BLUE has already been configured.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `ip vrf forwarding vrf-name`

**Step 16**

`ip tcp adjust-mss max-segment-size`

**Example:**

```bash
Router(config-if)# ip tcp adjust-mss 1360
```

Adjusts the maximum segment size (MSS) value of TCP packets going through a router.

- The `max-segment-size` argument specifies the maximum segment size, in bytes. The range is from 500 to 1460.

The recommended number value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will “fit” in the tunnel.

**Step 17**

`ip nhrp holdtime seconds`

**Example:**

```bash
Router(config-if)# ip nhrp holdtime 450
```

Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses.

- The `seconds` argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds.

**Step 18**

`delay number`

**Example:**

```bash
Router(config-if)# delay 1000
```

(Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface.

- The `number` argument specifies the delay time in seconds. The recommend value is 1000.
DETAILED STEPS

Router> enable

Step 2 configure terminal
Router# configure terminal

Example:
### Configuring DMVPN—Traffic Segmentation Within DMVPN

There are no new commands to use for configuring traffic segmentation, but there are tasks you must complete in order to segment traffic within a DMVPN tunnel:

- Enabling MPLS on the VPN Tunnel, page 22
- Configuring Multiprotocol BGP on the Hub Router, page 23
- Configuring Multiprotocol BGP on the Spoke Routers, page 25

#### Prerequisites

The tasks that follow assume that the DMVPN tunnel and the VRFs “red” and “blue” have already been configured.

For information on configuring a DMVPN tunnel, see the “Configuring the Hub for DMVPN” section on page 13 and the “Configuring the Spoke for DMVPN” section on page 17. For details about VRF configuration, see the “Configuring the Forwarding of Clear-Text Data IP Packets into a VRF” section on page 20 and the “Configuring the Forwarding of Encrypted Tunnel Packets into a VRF” section on page 21.

#### Enabling MPLS on the VPN Tunnel

Because traffic segmentation within a DMVPN tunnel depends upon MPLS, you must configure MPLS for each VRF instance in which traffic will be segmented. For detailed information about configuring MPLS, see *Cisco IOS Multiprotocol Label Switching Configuration Guide*, Release 12.4.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `mpls ip`

#### Command or Action | Purpose
--- | ---
Step 3 | **interface type number**
**Example:**
Router (config)# interface tunnel0

Step 4 | **tunnel vrf vrf-name**
**Example:**
Router (config-if)# tunnel vrf RED

Associates a VPN VRF instance with a specific tunnel destination, interface, or subinterface.

Configures an interface type and enters interface configuration mode.
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
<tr>
<td>Step 3  interface type number</td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 4  mpls ip</td>
<td>Enables MPLS tagging of packets on the specified tunnel interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Multiprotocol BGP on the Hub Router

You must configure multiprotocol iBGP (MP-iBGP) to enable advertisement of VPNv4 prefixes and labels to be applied to the VPN traffic. Use BGP to configure the hub as a route reflector. To force all traffic to be routed via the hub, configure the BGP route reflector to change the next hop to itself when it advertises VPNv4 prefixes to the route reflector clients (spokes).

For more information about the BGP routing protocol, see the “BGP” chapter in the *Cisco IOS IP Routing Protocols Configuration Guide*, Release 12.4.

SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp
4. neighbor ipaddress remote-as as-number
5. neighbor ipaddress update-source interface
6. address-family vpnv4
7. neighbor ipaddress activate
8. neighbor ipaddress send-community extended
9. neighbor ipaddress route-reflector-client
10. neighbor ipaddress route-map nexthop out
11. exit-address family
12. address-family ipv4 vrf-name

Troubleshooting Dynamic Multipoint VPN (DMVPN)

After configuring DMVPN, to verify that DMVPN is operating correctly, to clear DMVPN statistics or sessions, or to debug DMVPN, you may perform the following optional steps:

SUMMARY STEPS

1. clear dmvpn session [peer {nbma | tunnel} ip-address] [interface {tunnel number}] [vrf vrf-name] [static]
2. clear dmvpn statistics [peer {nbma | tunnel} ip-address] [interface {tunnel number}] [vrf vrf-name]
3. debug dmvpn {[[condition unmatched] | [peer {nbma | tunnel} ip-address]] | [vrf vrf-name]} [[interface {tunnel number}]] | [[error | detail | packet | all] {nhrp | crypto | tunnel | socket | all}]
4. debug nhrp condition
5. debug nhrp error
6. logging dmvpn [rate-limit seconds]
7. show crypto ipsec sa [active | standby]
8. show crypto isakmp sa
9. show crypto map
10. show dmvpn [peer {nbma | tunnel} ip-address] [network ip-address] [mask] [vrf vrf-name] [interface {tunnel number}] [detail] [static] [debug-condition]
11. show ip nhrp traffic [interface {tunnel number}]

Example:
Router (config)# exit-address-family
Exits the address family configuration mode.

Example:
Router (config)# address-family ipv4 vrf red
Enters address family configuration mode to configure a routing session using standard IP Version 4 address prefixes.

Example:
Router (config)# redistribute connected
Redistributes routes that are established automatically by virtue of having enabled IP on an interface from one routing domain into another routing domain.

Example:
Router (config)# exit-address-family
Exits the address family configuration mode.

Note: Repeat Steps 10–12 for each VRF.
DETAILED STEPS

Step 1
The `clear dmvpn session` command is used to clear DMVPN sessions.

The following example clears only dynamic DMVPN sessions:

```
Router# clear dmvpn session peer nbma
```

The following example clears all DMVPN sessions, both static and dynamic, for the specified tunnel:

```
Router# clear dmvpn session interface tunnel 100 static
```

Step 2
The `clear dmvpn statistics` command is used to clear DMVPN related counters. The following example shows how to clear DMVPN related session counters for the specified tunnel interface:

```
Router# clear dmvpn statistics peer tunnel 192.0.2.3
```

Step 3
The `debug dmvpn` command is used to debug DMVPN sessions. You can enable or disable DMVPN debugging based on a specific condition. There are three levels of DMVPN debugging, listed in the order of details from lowest to highest:

- Error level
- Detail level
- Packet level

The following example shows how to enable conditional DMVPN debugging that displays all error debugs for next hop routing protocol (NHRP), sockets, tunnel protection and crypto information:

```
Router# debug dmvpn error all
```

Step 4
The `debug nhrp condition` command enables or disables debugging based on a specific condition. The following example shows how to enable conditional NHRP debugging:

```
Router# debug nhrp condition
```

Step 5
The `debug nhrp error` command displays information about NHRP error activity. The following example shows how to enable debugging for NHRP error messages:

```
Router# debug nhrp error
```

Step 6
The `logging dmvpn` command is used to enable DMVPN system logging. The following command shows how to enable DMVPN system logging at the rate of 1 message every 20 seconds:

```
Router(config)# logging dmvpn rate-limit 20
```

The following example shows a sample system log with DMVPN messages:

```
%DMVPN-7-CRYPTO_SS: Tunnel101-192.0.2.1 socket is UP
%DMVPN-5-NHRP_NHS: Tunnel101 192.0.2.251 is UP
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel1 Registered.
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel101 came UP.
%DMVPN-3-NHRP_ERROR: Registration Request failed for 192.0.2.251 on Tunnel101
```

Step 7
The `show crypto ipsec sa` command displays the settings used by the current SAs. The following example output shows the IPsec SA status of only the active device:

```
Router# show crypto ipsec sa active

interface: Ethernet0/0
  Crypto map tag: to-peer-outside, local addr 209.165.201.3
  protected vrf: (none)
  local ident (addr/mask/prot/port): (192.168.0.1/255.255.255.255/0/0)
  remote ident (addr/mask/prot/port): (172.16.0.1/255.255.255.255/0/0)
  current_peer 209.165.200.225 port 500
  PERMIT, flags=(origin_is_acl,)
  #pkts encaps: 3, #pkts encrypt: 3, #pkts digest: 3
```
#pkts decaps: 4, #pkts decrypt: 4, #pkts verify: 4
#pkts compressed: 0, #pkts decompressed: 0
#pkts not compressed: 0, #pkts compr. failed: 0
#pkts not decompressed: 0, #pkts decompress failed: 0
#send errors 0, #recv errors 0
local crypto endpt.: 209.165.201.3, remote crypto endpt.: 209.165.200.225
path mtu 1500, media mtu 1500
current outbound spi: 0xD42904F0(3559458032)
inbound esp sas:
spi: 0xD3E9ABD0(3555306448)
transform: esp-3des,
in use settings ={Tunnel, }
conn id: 2006, flow_id: 6, crypto map: to-peer-outside
sa timing: remaining key lifetime (k/sec): (4586265/3542)
HA last key lifetime sent(k): (4586267)
ike_cookies: 9263635C CA4B4E99 C14E908E 8EE2D79C
IV size: 8 bytes
replay detection support: Y
Status: ACTIVE

**Step 8**
The `show crypto isakmp sa` command displays all current IKE SAs at a peer. For example, the following sample output is displayed after IKE negotiations have successfully completed between two peers.

```
Router# show crypto isakmp sa
dst              src              state           conn-id  slot
172.17.63.19     172.16.175.76   QM_IDLE               2       0
172.17.63.19     172.17.63.20    QM_IDLE               1       0
172.16.175.75    172.17.63.19    QM_IDLE               3       0
```

**Step 9**
The `show crypto map` command displays the crypto map configuration.

The following sample output is displayed after a crypto map has been configured:

```
Router# show crypto map

Crypto Map "Tunnel5-head-0" 10 ipsec-isakmp
  Profile name: vpnprof
  Security association lifetime: 4608000 kilobytes/3600 seconds
  PFS (Y/N): N
  Transform sets={trans2, }

Crypto Map "Tunnel5-head-0" 20 ipsec-isakmp
  Map is a PROFILE INSTANCE.
  Peer = 172.16.175.75
  Extended IP access list
    access-list permit gre host 172.17.63.19 host 172.16.175.75
  Current peer: 172.16.175.75
  Security association lifetime: 4608000 kilobytes/3600 seconds
  PFS (Y/N): N
  Transform sets={trans2, }

Crypto Map "Tunnel5-head-0" 30 ipsec-isakmp
  Map is a PROFILE INSTANCE.
  Peer = 172.16.175.75
  Extended IP access list
    access-list permit gre host 172.17.63.19 host 172.16.175.75
  Current peer: 172.16.175.75
  Security association lifetime: 4608000 kilobytes/3600 seconds
  PFS (Y/N): N
  Transform sets={trans2, }

Crypto Map "Tunnel5-head-0" 40 ipsec-isakmp
  Map is a PROFILE INSTANCE.
  Peer = 172.16.175.75
```
Extended IP access list
access-list permit gre host 172.17.63.19 host 172.16.175.76
Current peer: 172.16.175.76
Security association lifetime: 4608000 kilobytes/3600 seconds
PFS (Y/N): N
Transform sets={trans2, } Interfaces using crypto map Tunnel1-head-0:

Tunnel5

**Step 10** The `show dmvpn` command displays DMVPN specific session information. The following example shows example summary output:

Router# show dmvpn

Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete
N - NATed, L - Local, X - No Socket
# Ent --> Number of NHRP entries with same NBMA peer

! The line below indicates that the sessions are being displayed for Tunnel1. Tunnel1 is acting as a spoke and is a peer with three other NBMA peers.

Tunnel1, Type: Spoke, NBMA Peers: 3,

<table>
<thead>
<tr>
<th># Ent</th>
<th>Peer NBMA Addr Peer Tunnel Add State UpDn Tm Attrb</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>192.0.2.21 192.0.2.116 IKE 3w0d D</td>
</tr>
<tr>
<td>1</td>
<td>192.0.2.102 192.0.2.11 NHRP 02:40:51 S</td>
</tr>
<tr>
<td>1</td>
<td>192.0.2.225 192.0.2.10 UP 3w0d S</td>
</tr>
</tbody>
</table>

Tunnel2, Type: Spoke, NBMA Peers: 1,

<table>
<thead>
<tr>
<th># Ent</th>
<th>Peer NBMA Addr Peer Tunnel Add State UpDn Tm Attrb</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>192.0.2.25 192.0.2.171 IKE never S</td>
</tr>
</tbody>
</table>

**Step 11** The `show ip nhrp traffic` command displays NHRP statistics. The following example shows output for a specific tunnel, tunnel7:

Router# show ip nhrp traffic interface tunnel7

Tunnel7: Max-send limit:100Pkts/10Sec, Usage:0%

Sent: Total 79

<table>
<thead>
<tr>
<th>18 Resolution Request</th>
<th>10 Resolution Reply</th>
<th>42 Registration Request</th>

</tr>
</tbody>
</table>

Rcvd: Total 69

<table>
<thead>
<tr>
<th>10 Resolution Request</th>
<th>15 Resolution Reply</th>
<th>0 Registration Request</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>36 Registration Reply</th>
<th>6 Purge Request</th>
<th>2 Purge Reply</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 Error Indication</td>
<td>0 Traffic Indication</td>
<td></td>
</tr>
</tbody>
</table>

**What to Do Next**

If you have troubleshooted your DMVPN configuration and proceed to contact technical support, the `show tech-support` command includes information for DMVPN sessions. For more information, see the `show tech-support` command in the Cisco IOS Configuration Fundamentals Command Reference.
Configuration Examples for Dynamic Multipoint VPN (DMVPN) Feature

This section provides the following comprehensive configuration examples:

- Hub Configuration for DMVPN: Example, page 31
- Spoke Configuration for DMVPN: Example, page 32
- VRF Aware DMVPN: Example, page 33

Hub Configuration for DMVPN: Example

In the following example, which configures the hub router for multipoint GRE and IPsec integration, no explicit configuration lines are needed for each spoke; that is, the hub is configured with a global IPsec policy template that all spoke routers can talk to. In this example, EIGRP is configured to run over the private physical interface and the tunnel interface.

```cisco
crypto isakmp policy 1
  authentication pre-share
crypto isakmp key cisco47 address 0.0.0.0
crypto ipsec transform-set trans2 esp-des esp-md5-hmac
  mode transport
crypto ipsec profile vpnprof
  set transform-set trans2
!
interface Tunnel0
  bandwidth 1000
  ip address 10.0.0.1 255.255.255.0
  ! Ensures longer packets are fragmented before they are encrypted; otherwise, the receiving router would have to do the reassembly.
  ip mtu 1400
  ! The following line must match on all nodes that "want to use" this mGRE tunnel:
  ip nhrp authentication donttell
  ! Note that the next line is required only on the hub.
  ip nhrp map multicast dynamic
  ! The following line must match on all nodes that want to use this mGRE tunnel:
  ip nhrp network-id 99
  ip nhrp holdtime 300
  ! Turns off split horizon on the mGRE tunnel interface; otherwise, EIGRP will not advertise routes that are learned via the mGRE interface back out that interface.
  no ip split-horizon eigrp 1
  ! Enables dynamic, direct spoke-to-spoke tunnels when using EIGRP.
  no ip next-hop-self eigrp 1
  ip tcp adjust-mss 1360
  delay 1000
  ! Sets IPsec peer address to Ethernet interface's public address.
  tunnel source Ethernet0
  tunnel mode gre multipoint
  ! The following line must match on all nodes that want to use this mGRE tunnel.
  tunnel key 100000
  tunnel protection ipsec profile vpnprof
  ! interface Ethernet0
  ip address 172.17.0.1 255.255.255.0
  ! interface Ethernet1
  ip address 192.168.0.1 255.255.255.0
```
For information about defining and configuring ISAKMP profiles, see the references in the "Related Documents" section.

Spoke Configuration for DMVPN: Example

In the following example, all spokes are configured the same except for tunnel and local interface address, thereby, reducing necessary configurations for the user:

crypto isakmp policy 1
    authentication pre-share
crypto isakmp key cisco47 address 0.0.0.0
    !
crypto ipsec transform-set trans2 esp-des esp-md5-hmac
    mode transport
    !
crypto ipsec profile vpnprof
    set transform-set trans2
    !
interface Tunnel0
    bandwidth 1000
    ip address 10.0.0.2 255.255.255.0
    ip mtu 1400
    ! The following line must match on all nodes that want to use this mGRE tunnel:
    ip nhrp authentication donttell
    ! Definition of NHRP server at the hub (10.0.0.1), which is permanently mapped to the
    static public address of the hub (172.17.0.1).
    ip nhrp map 10.0.0.1 172.17.0.1
    ! Sends multicast packets to the hub router, and enables the use of a dynamic routing
    protocol between the spoke and the hub.
    ip nhrp map multicast 172.17.0.1
    ! The following line must match on all nodes that want to use this mGRE tunnel:
    ip nhrp network-id 99
    ip nhrp holdtime 300
    ! Configures the hub router as the NHRP next-hop server.
    ip nhrp nh 10.0.0.1
    ip tcp adjust-mss 1360
    delay 1000
    tunnel source Ethernet0
    tunnel mode gre multipoint
    ! The following line must match on all nodes that want to use this mGRE tunnel:
    tunnel key 100000
    tunnel protection ipsec profile vpnprof
    !
    ! This is a spoke, so the public address might be dynamically assigned via DHCP.
    interface Ethernet0
    ip address dhcp hostname Spoke1
    ! interface Ethernet1
    ip address 192.168.1.1 255.255.255.0
    !
    ! EIGRP is configured to run over the inside physical interface and the tunnel.
    router eigrp 1
    network 10.0.0.0 0.0.0.255
    network 192.168.1.0 0.0.0.255
VRF Aware DMVPN: Example

When configuring VRF Aware DMVPN, you must create a separate DMVPN network for each VRF instance. In the following example, there are two DMVPN networks: BLUE and RED. In addition, a separate source interface has been used on the hub for each DMVPN tunnel—a must for Cisco IOS Release 12.2(18)SXE. For other Cisco IOS releases, you can configure the same tunnel source for both of the tunnel interfaces, but you must configure the tunnel key and tunnel protection (tunnel protection ipsec profile {name} shared) commands.

Note
If you use the shared keyword, then you should be running Cisco IOS Release 12.4(5) or Release 12.4(6)T, or a later release. Otherwise the IPsec/GRE tunnels under the two mGRE tunnel interfaces may not function correctly.

Hub Configuration

```plaintext
interface Tunnel0
  ! Note the next line.
  ip vrf forwarding BLUE
  bandwidth 1000
  ip address 10.0.0.1 255.255.255.0
  ip mtu 1436
  ! Note the next line.
  ip nhrp authentication BLUE!KEY
  ip nhrp map multicast dynamic
  ! Note the next line
  ip nhrp network-id 100000
  ip nhrp holdtime 600
  no ip split-horizon eigrp 1
  no ip next-hop-self eigrp 1
  ip tcp adjust-mss 1360
  delay 1000
  ! Note the next line.
  tunnel source Ethernet0
  tunnel mode gre multipoint
  tunnel protection ipsec profile vpnprof!

interface Tunnel1
  ! Note the next line.
  ip vrf forwarding RED
  bandwidth 1000
  ip address 10.0.0.1 255.255.255.0
  ip mtu 1436
  ! Note the next line.
  ip nhrp authentication RED!KEY
  ip nhrp map multicast dynamic
  ! Note the next line.
  ip nhrp network-id 20000
  ip nhrp holdtime 600
  no ip split-horizon eigrp 1
  no ip next-hop-self eigrp 1
  ip tcp adjust-mss 1360
  delay 1000
  ! Note the next line.
  tunnel source Ethernet1
  tunnel mode gre multipoint
  tunnel protection ipsec profile vpnprof!

interface Ethernet0
  ip address 172.17.0.1 255.255.255.0

! interface Ethernet1
```
ip address 192.0.2.171 255.255.255.0

Note
For the hub configuration shown above, a separate DMVPN network is configured for each VPN. The NHRP network ID and authentication keys must be unique on the two mGRE interfaces.

EIGRP Configuration on the Hub

```
router eigrp 1
auto-summary
!
address-family ipv4 vrf BLUE
  network 10.0.0.0 0.0.0.255
  no auto-summary
  autonomous-system 1
  exit-address-family
!
address-family ipv4 vrf RED
  network 10.0.0.0 0.0.0.255
  no auto-summary
  autonomous-system 1
  exit-address-family
```

Spoke Configurations

Spoke 1:

```
interface Tunnel0
  bandwidth 1000
  ip address 10.0.0.2 255.255.255.0
  ip mtu 1436
  ! Note the next line.
  ip nhrp authentication BLUE!KEY
  ip nhrp map 10.0.0.1 172.17.0.1
  ip nhrp network-id 100000
  ip nhrp holdtime 300
  ip nhrp nhs 10.0.0.1
  ip tcp adjust-mss 1360
  delay 1000
  tunnel mode gre multipoint
  tunnel source Ethernet0
  tunnel destination 172.17.0.1
  tunnel protection ipsec profile vpnprof
```

Spoke 2:

```
interface Tunnel0
  bandwidth 1000
  ip address 10.0.0.2 255.255.255.0
  ip mtu 1436
  ip nhrp authentication RED!KEY
  ip nhrp map 10.0.0.1 192.0.2.171
  ip nhrp network-id 200000
  ip nhrp holdtime 300
  ip nhrp nhs 10.0.0.1
  ip tcp adjust-mss 1360
  delay 1000
  tunnel source Ethernet0
  tunnel destination 192.0.2.171
  tunnel protection ipsec profile vpnprof
```
2547oDMVPN with Traffic Segmentation (with BGP only): Example

The following example show a traffic segmentation configuration in which traffic is segmented between two spokes that serve as provider edge (PE) devices.

**Hub Configuration**

```
hostname hub-pe1
boot-start-marker
boot-end-marker
no aaa new-model
resource policy
clock timezone EST 0
ip cef
no ip domain lookup

!This section refers to the forwarding table for VRF blue:
ip vrf blue
   rd 2:2

2547oDMVPN with Traffic Segmentation (Enterprise Branch): Example

The following example shows a configuration for segmenting traffic between two spokes located at branch offices of an enterprise. In this example, EIGRP is configured to learn routes to reach BGP neighbors within the DMVPN.

The following commands are introduced or modified in the feature or features:

- `clear dmvpn session`
- `clear dmvpn statistics`
- `debug dmvpn`
- `debug nhrp condition`
- `debug nhrp error`
- `logging dmvpn`
- `show dmvpn`
- `show ip nhrp traffic`

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Feature Information for Dynamic Multipoint VPN (DMVPN)

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

| Manageability Enhancements for DMVPN | 12.4(9)T | DMVPN session manageability was expanded with DMVPN specific commands for debugging, show output, session and counter control, and system log information. The following sections provide information about this feature: 
  - Troubleshooting Dynamic Multipoint VPN (DMVPN) |
| DMVPN Phase 2 | 12.2(SXE) 12.3(9)a 12.3(8)T1 | DMVPN Spoke-to-Spoke functionality was made more production ready. If you are using this functionality in a production network, the minimum release is Release 12.3(9a) or Release 12.3(8)T1. In Release 12.2(SXE), support was added for the Cisco Catalyst 6500 series switch and the Cisco 7600 series router. |
**Dynamic Multipoint VPN (DMVPN)**

**Glossary**

**AM**—aggressive mode. A mode during IKE negotiation. Compared to MM, AM eliminates several steps, making it faster but less secure than MM. Cisco IOS software will respond in aggressive mode to an IKE peer that initiates aggressive mode.

**GRE**—generic routing encapsulation. Tunnels that provide a specific pathway across the shared WAN and encapsulate traffic with new packet headers to ensure delivery to specific destinations. The network is private because traffic can enter a tunnel only at an endpoint. Tunnels do not provide true confidentiality (encryption does) but can carry encrypted traffic.

GRE tunneling can also be used to encapsulate non-IP traffic into IP and send it over the Internet or IP network. The Internet Package Exchange (IPX) and AppleTalk protocols are examples of non-IP traffic.

**IKE**—Internet Key Exchange. A hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

**IPsec**—IP security. A framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec devices (“peers”), such as Cisco routers.

**ISAKMP**—Internet Security Association Key Management Protocol. A protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.
**MM**—main mode. Mode that is slower than aggressive mode but more secure and more flexible than aggressive mode because it can offer an IKE peer more security proposals. The default action for IKE authentication (rsa-sig, rsa-encr, or preshared) is to initiate main mode.

**NHRP**—Next Hop Resolution Protocol. Routers, access servers, and hosts can use NHRP to discover the addresses of other routers and hosts connected to a NBMA network.

The Cisco implementation of NHRP supports the IETF draft version 11 of *NBMA Next Hop Resolution Protocol (NHRP)*.

The Cisco implementation of NHRP supports IP Version 4, Internet Packet Exchange (IPX) network layers, and, at the link layer, ATM, Ethernet, SMDS, and multipoint tunnel networks. Although NHRP is available on Ethernet, NHRP need not be implemented over Ethernet media because Ethernet is capable of broadcasting. Ethernet support is unnecessary (and not provided) for IPX.

**PFS**—Perfect Forward Secrecy. A cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised, because subsequent keys are not derived from previous keys.

**SA**—security association. Describes how two or more entities will utilize security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

**transform**—The list of operations done on a dataflow to provide data authentication, data confidentiality, and data compression. For example, one transform is the ESP protocol with the HMAC-MD5 authentication algorithm; another transform is the AH protocol with the 56-bit DES encryption algorithm and the ESP protocol with the HMAC-SHA authentication algorithm.

**VPN**—Virtual Private Network. A framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.

The Easy VPN Remote RSA Signature Support feature provides for the support of Rivest, Shamir, and Adelman (RSA) signatures on Easy VPN remote devices. The support is provided through RSA certificates that can be stored on or off the remote device.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Easy VPN Remote RSA Signature Support” section on page 6.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Contents

- Prerequisites for Easy VPN Remote RSA Signature Support, page 1
- Restrictions for Easy VPN Remote RSA Signature Support, page 2
- Information About Easy VPN Remote RSA Signature Support, page 2
- How to Configure Easy VPN Remote RSA Signature Support, page 2
- Additional References, page 3

Prerequisites for Easy VPN Remote RSA Signature Support

- You must have a Cisco Virtual Private Network (VPN) remote device and be familiar with configuring the device.
Easy VPN Remote RSA Signature Support

You must have a certification authority (CA) available to your network before you configure this interoperability feature. The CA must support the public key infrastructure (PKI) protocol of Cisco Systems, which is the Simple Certificate Enrollment Protocol (SCEP) (formerly called certificate enrollment protocol [CEP]).

You should be familiar with IP Security (IPSec) and PKI.

You should be familiar with configuring RSA key pairs.

You should be familiar with configuring CAs.

Restrictions for Easy VPN Remote RSA Signature Support

This feature should be configured only when you also configure both IPSec and Internet Key Exchange (IKE) in your network.

The Cisco IOS software does not support CA server public keys greater than 2048 bits.

Information About Easy VPN Remote RSA Signature Support

To configure the Easy VPN Remote RSA Signature Support feature, you should understand the following concept:

- Easy VPN Remote RSA Signature Support Overview, page 2

Easy VPN Remote RSA Signature Support Overview

The Easy VPN Remote RSA Signature Support feature allows you to configure RSA signatures on your Easy VPN remote device. The signatures can be stored on or off your remote device.

How to Configure Easy VPN Remote RSA Signature Support

This section contains the following procedure:

- Configuring Easy VPN Remote RSA Signature Support, page 2

Configuring Easy VPN Remote RSA Signature Support

The RSA signatures for an Easy VPN remote device are configured the same way that you would configure RSA signatures for any other Cisco device. (For information about configuring RSA signatures, refer to the “Configuring Certification Authority Interoperability” chapter of the “IP Security and Encryption” section of the Cisco IOS Security Configuration Guide, Release 12.4.)

To enable the RSA signatures, when you are configuring the Easy VPN remote and assigning the configuration to the outgoing interface, you must omit the group command. The content of the first Organizational Unit (OU) field will be used as the group. (For information about configuring Cisco Easy VPN remote devices, refer to the feature document “Cisco Easy VPN Remote,” Release 12.4(11)T.)

To troubleshoot your Easy VPN remote RSA signature configuration, you can use the following debug commands. The debug commands can be used in any order or individually.
SUMMARY STEPS

1. enable
2. debug crypto ipsec client ezvpn
3. debug crypto isakmp

DETAILED STEPS

<table>

Feature Information for Easy VPN Remote RSA Signature Support

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note: Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Easy VPN Server

First Published: February 25, 2002
Last Updated: November 4, 2008

The Easy VPN Server feature introduces server support for the Cisco VPN Client Release 3.x and later software clients and Cisco VPN hardware clients (such as the Cisco 800, Cisco 900, Cisco 1700, VPN 3002, and PIX 501 devices). This feature allows a remote end user to communicate using IP Security (IPsec) with any Cisco IOS Virtual Private Network (VPN) gateway. Centrally managed IPsec policies are “pushed” to the client device by the server, minimizing configuration by the end user.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Easy VPN Server” section on page 75.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Cisco Secure VPN Client 1.x Restrictions

When used with this feature, the Cisco Secure VPN Client 1.x has the following restrictions:

- It does not support dead peer detection (DPD) or any other keepalive scheme.
- It does not support initial contact.

This feature cannot use per-group attribute policy profiles such as IP addresses, and Domain Name Service (DNS). Thus, customers must continue to use existing, globally defined parameters for IP address assignment, Windows Internet Naming Service (WINS) and DNS, and preshared keys.

Multicast and Static NAT

Multicast and static NAT are supported only for Easy VPN servers using dynamic virtual tunnel interfaces (DVTIs).

Virtual IPsec Interface Restrictions

The Virtual IPsec Interface Support feature works only with a Cisco software VPN Client that is version 4.x or later, and an Easy VPN remote device that is configured to use a virtual interface.

cTCP Restrictions

- If a port is being used for Cisco Tunnel Control Protocol (cTCP), it cannot be used for other applications.
- cTCP can be used on only ten ports at a time.
- cTCP is supported on only Cisco IOS Easy VPN servers.
- If a cTCP connection is set up on a port, cTCP cannot be disabled on that port because doing so would cause the existing connection to stop receiving traffic.
- High Availability of cTCP is not currently supported on the Easy VPN server.
Information About Easy VPN Server

Before using the Easy VPN Server Enhancements feature, you should understand the following concepts:

- How It Works, page 3
- RADIUS Support for Group Profiles, page 4
- RADIUS Support for User Profiles, page 7
- Supported Protocols, page 8
- Functions Supported by Easy VPN Server, page 9

How It Works

When the client initiates a connection with a Cisco IOS VPN device, the “conversation” that occurs between the peers consists of device authentication via Internet Key Exchange (IKE), followed by user authentication using IKE Extended Authentication (Xauth), VPN policy push (using Mode Configuration), and IPsec security association (SA) creation. An overview of this process is as follows:

- The client initiates IKE Phase 1 via aggressive mode (AM) if a preshared key is to be used for authentication; the client initiates main mode (MM) if digital certificates are used. If the client identifies itself with a preshared key, the accompanying group name entered in the configuration GUI (ID_KEY_ID) is used to identify the group profile associated with this client. If digital certificates are used, the organizational unit (OU) field of a distinguished name (DN) is used to identify the group profile.

**Note**

Because the client may be configured for preshared key authentication, which initiates IKE AM, it is recommended that the administrator change the identity of the Cisco IOS VPN device via the `crypto isakmp identity hostname` command. This will not affect certificate authentication via IKE MM.

- The client attempts to establish an IKE SA between its public IP address and the public IP address of the Cisco IOS VPN device. To reduce the amount of manual configuration on the client, every combination of encryption and hash algorithms, in addition to authentication methods and D-H group sizes, is proposed.

- Depending on its IKE policy configuration, the Cisco IOS VPN device will determine which proposal is acceptable to continue negotiating Phase 1.

**Tip**

IKE policy is global for the Cisco IOS VPN device and can consist of several proposals. In the case of multiple proposals, the Cisco IOS VPN device will use the first match, so you should always list your most secure policies first.

**Note**

Device authentication ends and user authentication begins at this point.

- After the IKE SA is successfully established, and if the Cisco IOS VPN device is configured for Xauth, the client waits for a “username/password” challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using
authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, it is also possible for a user-specific attribute to be retrieved if the credentials of that user are validated via RADIUS.

**Note**

VPN devices that are configured to handle remote clients should always be configured to enforce user authentication.

- If the Cisco IOS VPN device indicates that authentication was successful, the client requests further configuration parameters from the peer. The remaining system parameters (for example, IP address, DNS, and split tunnel attributes) are pushed to the client at this time using Mode Configuration.

**Note**

The IP address pool and group preshared key (if Rivest, Shamir, and Adelman [RSA] signatures are not being used) are the only required parameter in a group profile, all other parameters are optional.

- After each client is assigned an internal IP address via Mode Configuration, it is important that the Cisco IOS VPN device knows how to route packets through the appropriate VPN tunnel. Reverse route injection (RRI) will ensure that a static route is created on the Cisco IOS VPN device for each client internal IP address.

**Note**

It is recommended that you enable RRI on the crypto map (static or dynamic) for the support of VPN clients unless the crypto map is being applied to a Generic Routing Encapsulation (GRE) tunnel that is already being used to distribute routing information.

- After the configuration parameters have been successfully received by the client, IKE quick mode is initiated to negotiate IPsec SA establishment.
- After IPsec SAs are created, the connection is complete.

### RADIUS Support for Group Profiles

Group policy information is stored in a profile that can be defined locally in the router configuration or on a RADIUS server that is accessible by the Cisco IOS VPN device. If RADIUS is used, you must configure access to the server and allow the Cisco IOS VPN device to send requests to the server.

To define group policy attributes for RADIUS, you must do the following task on your RADIUS server:

- Define a user that has a name equal to the group name as defined in the client graphical user interface (GUI). For example, if users will be connecting to the Cisco IOS VPN device using the group name “sales,” you will need a user whose name is “sales.” The password for this user is “cisco,” which is a special identifier that is used by the router for RADIUS purposes. The username must then be made a member of a group in which the correct policy is defined. For simplicity, it is recommended that the group name be the same as the username.

### For a Cisco Secure Access Control Server

If you are using a Cisco Secure access control server (ACS), you may configure your remote access VPN group profiles on this server. To perform this task, you must ensure that Internet Engineering Task Force (IETF) RADIUS attributes are selected for group configuration as shown in Figure 1. (This figure also
shows the compulsory attributes required for a remote access VPN group.) All values must be entered except the Tunnel-Password attribute, which is actually the preshared key for IKE purposes; if digital certificates are preferred, this attribute may be omitted.

In addition to the compulsory attributes shown in Figure 1, other values can be entered that represent the group policy that is pushed to the remote client via Mode Configuration. Figure 2 shows an example of a group policy. All attributes are optional except the addr-pool, key-exchange=preshared-key, and key-exchange=ike attributes. The values of the attributes are the same as the setting that is used if the policy is defined locally on the router rather than in a RADIUS server. (These values are explained in the section “Defining Group Policy Information for Mode Configuration Push” later in this document.)
Figure 2  CiscoSecure ACS Group Policy Setup

Cisco RADIUS Attributes

[009\001] cisco-av-pair

ipsec:key-exchange=ike
ipsec:addr-pool=fred
ipsec:default-domain=cisco.com
ipsec:inacl=199
ipsec:dnsc-servers=172.16.10.70
After the group profile is created, a user who is a member of the group should be added. (Remember that the username that is defined maps to the group name as defined on the remote client, and the password defined for the username in the RADIUS database must be “cisco.”) If digital certificates are the preferred method of IKE authentication, the username should reflect the OU field in the certificate presented by the remote client.

**For All Other RADIUS Servers**

Ensure that your RADIUS server allows you to define attribute-value (AV) pairs. (For an example, see the section “Configuring Cisco IOS for Easy VPN Server: Example” later in this document).

---

**Note**

If digital certificates are used, the username defined in RADIUS must be equal to the OU field of the DN of the certificate of the client.

---

**RADIUS Support for User Profiles**

Attributes may also be applied on a per-user basis. If you apply attributes on a per-user basis, you can override a group attribute value with an individual user attribute. The attributes are retrieved at the time that user authentication via Xauth occurs. The attributes are then combined with group attributes and applied during Mode Configuration.

User-based attributes are available only if RADIUS is being used for user authentication.

To define user policy attributes for RADIUS, you must do the following task on your RADIUS server:

- Define a user or add attributes to the existing profile of a user in your RADIUS database. The password for the user will be used during Xauth user authentication, or you may proxy to a third-party server, such as a token card server.

Figure 3 shows how CiscoSecure ACS may be used for user authentication and for the assignment of a Framed-IP-Address attribute that may be pushed to the client. The presence of this attribute means that the local address pool defined for the group to which that user belongs will be overridden.
Figure 3  CiscoSecure ACS User Profile Setup

User Setup

Client IP Address Assignment

- Use group settings
- No IP address assignment
- Assigned by dialup client
- Assign static IP address [192.168.1.1]
- Assigned by network access server pool

For All Other RADIUS Servers

Ensure that your RADIUS server allows you to define AV pairs. (For an example, see the “Configuring Cisco IOS for Easy VPN Server: Example” section later in this document.)

Supported Protocols

Table 2 outlines supported IPsec protocol options and attributes that can be configured for this feature. (See Table 1 for nonsupported options and attributes.)

- VRF Assignment by a AAA Server, page 18
Mode Configuration Version 6 Support

Mode Configuration version 6 is now supported for more attributes (as described in an IETF draft submission).

Xauth Version 6 Support

Cisco IOS has been enhanced to support version 6 of Xauth. Xauth for user authentication is based on an IETF draft submission.

IKE DPD

The client implements a new keepalives scheme—IKE DPD.

DPD allows two IPsec peers to determine whether the other is still “alive” during the lifetime of a VPN connection. DPD is useful because a host may reboot, or the dialup link of a remote user may disconnect without notifying the peer that the VPN connection has gone away. When an IPsec host determines that a VPN connection no longer exists, the host can notify a user, attempt to switch to another IPsec host, or clean up valuable resources that were allocated for the peer that no longer exists.

A Cisco IOS VPN device can be configured to send and reply to DPD messages. DPD messages are sent if no other traffic is being passed through the VPN tunnel. If a configured amount of time has lapsed since the last inbound data was received, DPD will send a message (“DPD R-U-THERE”) the next time it sends outbound IPsec data to the peer. DPD messages are unidirectional and are automatically sent by Cisco VPN clients. DPD must be configured on the router only if the router wishes to send DPD messages to the VPN client to determine the health of the client.

Split Tunneling Control

Remote clients can support split tunneling, which enables a client to have intranet and Internet access at the same time. If split tunneling is not configured, the client will direct all traffic through the tunnel, even traffic destined for the Internet.

Initial Contact

If a client is suddenly disconnected, the gateway may not be notified. Consequently, removal of connection information (IKE and IPsec SAs) for that client will not immediately occur. Thus, if the client attempts to reconnect to the gateway again, the gateway will refuse the connection because the previous connection information is still valid.

To avoid such a scenario, a new capability called initial contact has been introduced; it is supported by all Cisco VPN products. If a client or router is connecting to another Cisco gateway for the first time, an initial contact message is sent that tells the receiver to ignore and delete any old connection information that has been maintained for that newly connecting peer. Initial contact ensures that connection attempts are not refused because of SA synchronization problems, which are often identified via invalid security parameter index (SPI) messages and which require devices to have their connections cleared.

Group-Based Policy Control

Policy attributes such as IP addresses, DNS, and split tunnel access can be provided on a per-group or per-user basis.
User-Based Policy Control

Attributes may also be applied on a per-user basis. You can override a group attribute value with an individual user attribute. The attributes are retrieved at the time that user authentication via Xauth occurs. They are then combined with group attributes and applied during Mode Configuration.

From Cisco IOS Release 12.3(4)T forward, attributes can be applied on a per-user basis after the user has been authenticated. These attributes can override any similar group attributes. User-based attributes are available only if RADIUS is used as the database.

Framed-IP-Address

To select the Framed-IP-Address attribute for CiscoSecure for NT, do the following: Under the user profile, choose the “use this IP address” option under addressing and manually enter the address. (You should check the method of configuring a framed IP address with your own RADIUS server because this procedure will vary.)

Note

If a framed IP address is present, and there is also a local pool address configured for the group that the user belongs to, the framed IP address will override the local pool setting.

DHCP Client Proxy

Easy VPN servers currently assign an IP address to a remote device using either a local pool that is configured on the router or the framed IP address attribute that is defined in RADIUS. Effective with Cisco IOS Release 12.4(9)T, the DHCP Client Proxy feature provides the option of configuring an Easy VPN server to obtain an IP address from a DHCP server. The IP address is pushed to the remote device using mode configuration.

Note

This feature does not include functionality for the DHCP server to push the DNS, WINS server, or domain name to the remote client.

To configure DHCP Client Proxy, see the section “Configuring an Easy VPN Server to Obtain an IP Address from a DHCP Server.”

Benefits of DHCP Client Proxy

- The functionality provided with this feature helps in the creation of DDNS (dynamic Domain Name System) entries when a DNS server exists in conjunction with the DHCP server.
- The user is not restricted to IP address pools.

User-Save-Password

As per the group description, the User-Save-Password attribute can be received in addition to the group variant (Save-Password), but if it is received, it will override the value asserted by the group.

The following is an output example of a RADIUS AV pair for the User-Save-Password attribute:

ipsec:user-save-password=1

User-Include-Local-LAN

As per the group description, the User-Include-Local-LAN attribute can be received in addition to the group variant (Include-Local-LAN), but if it is received, it will override the value asserted by the group.
The following is an output example of a RADIUS AV pair for the User-Include-Local LAN attribute:

```
ipsec:user-include-local-lan=1
```

User-VPN-Group

The User-VPN-Group attribute is a replacement for the Group-Lock attribute. It allows support for both preshared key and RSA signature authentication mechanisms such as certificates.

If you need to check that the group a user is attempting to connect to is indeed the group the user belongs to, use the User-VPN-Group attribute. The administrator sets this attribute to a string, which is the group that the user belongs to. The group the user belongs to is matched against the VPN group as defined by group name (ID_KEY_ID) for preshared keys or by the OU field of a certificate. If the groups do not match, the client connection is terminated.

This feature works only with AAA RADIUS. Local Xauth authentication must still use the Group-Lock attribute.

The following is an output example of a RADIUS AV pair for the Use-VPN-Group attribute:

```
ipsec:user-vpn-group=cisco
```

Group-Lock

If you are only using pre-shared keys (no certificates or other RSA signature authentication mechanisms) with RADIUS or local AAA, you can continue to use the Group-Lock attribute. If you are only using pre-shared keys (no certificates or other RSA signature authentication mechanisms) with RADIUS, you can either continue to use the Group-Lock attribute or you can use the new User-VPN-Group attribute.

Caution

Do not use the Group-Lock attribute if you are using RSA signature authentication mechanisms such as certificates. Use the User-VPN-Group attribute instead.

Session Monitoring for VPN Group Access

It is possible to mimic the functionality provided by some RADIUS servers for limiting the maximum number of connections to a specific server group and also for limiting the number of simultaneous logins for users in that group. After user-defined thresholds are defined in each VPN group, connections will be denied until counts drop below these thresholds.

If you use a RADIUS server, such as CiscoSecure ACS, it is recommended that you enable this session control on the RADIUS server if the functionality is provided. In this way, usage can be controlled across a number of servers by one central repository. When enabling this feature on the router itself, only connections to groups on that specific device are monitored. Load-sharing scenarios are not accurately accounted for.

To configure session monitoring using command-line interface (CLI), use the `crypto isakmp client configuration group` command and the `max-users` and `max-logins` subcommands.

The following is an output example of RADIUS AV pairs that have been added to the relevant group:

```
ipsec:max-users=1000
ipsec:max-logins=1
```

Virtual IPsec Interface Support on a Server

Virtual IPsec Interface Support on a Server allows you to selectively send traffic to different Easy VPN concentrators (servers) as well as to the Internet.
Before Cisco IOS Release 12.4(4)T, at the tunnel-up/tunnel-down transition, attributes that were pushed during the mode configuration had to be parsed and applied. When such attributes resulted in the configurations being applied on the interface, the existing configuration had to be overridden.

With the Virtual Ipsec Interface Support feature, the tunnel-up configuration can be applied to separate interfaces, making it easier to support separate features at tunnel-up. Features that are applied to the traffic going into the tunnel can be separate from the features that are applied to traffic that is not going through the tunnel (for example, split-tunnel traffic and traffic leaving the device when the tunnel is not up). When the Easy VPN negotiation is successful, the line protocol state of the virtual-access interface gets changed to up. When the Easy VPN tunnel goes down because the SA expires or is deleted, the line protocol state of the virtual-access interfaces changes to down.

Note

This feature does not support multicast.

For more information about this feature, see the document *Cisco Easy VPN Remote*. (This feature is configured on the Easy VPN remote device.)

For information about the IPsec Virtual Tunnel Interface feature, see the document “IPSec Virtual Tunnel Interface” (link in the “Related Documents” section of this document).

**Virtual Tunnel Interface Per-User Attribute Support**

Effective with Cisco IOS Release 12.4(9)T, Virtual Tunnel Interface provides per-user attribute support for Easy VPN servers.

For more information about this feature, see the document *IPsec Virtual Tunnel Interface*.

**Banner, Auto-Update, and Browser Proxy**

The following features provide support for attributes that aid in the management of the Cisco Easy VPN remote device.

**Banner**

An Easy VPN server can be configured to push the banner to the Easy VPN remote device. A banner is needed for the web-based activation feature. The banner is displayed when the Easy VPN tunnel is up on the Easy VPN remote console or as a HTML page in the case of web-based activation.

**Auto-Update**

An Easy VPN server can be configured to provide an automated mechanism for software and firmware upgrades on an Easy VPN remote device.

**Browser Proxy**

An Easy VPN server can be configured so that an Easy VPN remote device can access resources on the corporate network. Using this feature, the user does not have to manually modify the proxy settings of his or her web browser when connecting to the corporate network using Cisco IOS VPN Client or manually revert the proxy settings upon disconnecting.
**Configuration Management Enhancements**

**Pushing a Configuration URL Through a Mode-Configuration Exchange**

When remote devices connect to a corporate gateway for creating an IPsec VPN tunnel, some policy and configuration information has to be applied to the remote device when the VPN tunnel is active to allow the remote device to become a part of the corporate VPN.

The Pushing a Configuration URL Through a Mode-Configuration Exchange feature provides for a mode-configuration attribute that “pushes” a URL from the concentrator (server) to the Cisco IOS Easy VPN remote device. The URL contains the configuration information that the remote device has to download and apply to the running configuration, and it contains the Cisco IOS CLI listing. (For more information about a Cisco IOS CLI listing, see Cisco IOS documentation for the `configuration url` command.) The CLI for this feature is configured on the concentrator.

The configuration that is pushed to the remote device is persistent by default. That is, the configuration is applied when the IPsec tunnel is “up,” but it is not withdrawn when the IPsec tunnel goes “down.” However, it is possible to write a section of configuration that is transient in nature, in which case the configuration of the section is reverted when the tunnel is disconnected.

There are no restrictions on where the configuration distribution server is physically located. However, it is recommended that a secure protocol such as HTTPS (Secure HTTP) be used to retrieve the configuration. The configuration server can be located in the corporate network, so because the transfer happens through the IPsec tunnel, insecure access protocols (HTTP) can be used.

Regarding backward compatibility: the remote device asks for the CONFIGURATION-URL and CONFIGURATION-VERSION attributes. Because the CONFIGURATION-URL and CONFIGURATION-VERSION attributes are not mandatory attributes, the server sends them only if it has them configured for the group. There is no built-in restriction to push the configuration, but bootstrap configurations (such as for the IP address) cannot be sent because those configurations are required to set up the Easy VPN tunnel, and the CONFIGURATION-URL comes into effect only after the Easy VPN tunnel comes up.

**After the Configuration Has Been Acquired by the Easy VPN Remote Device**

After the configuration has been acquired by the Easy VPN remote device, the remote device sends a new ISAKMP notification to the Easy VPN server. The notification contains several manageability information messages about the client (remote device). The Easy VPN server takes two actions when this information is received:

- The Easy VPN server caches the information in its peer database. The information can be displayed by using the `show crypto isakmp peer config` command. This command output displays all manageability information that is sent by the client (remote device).
- If accounting is enabled, the Easy VPN server sends an accounting update record that contains the manageability information messages about the remote device to the accounting RADIUS server. This accounting update is later available in the accounting log of the RADIUS server.

**How to Configure This Feature**

The commands that are used to configure this feature and the attributes CONFIGURATION-URL and CONFIGURATION-VERSION are described in the `crypto isakmp client configuration group` command documentation.
Per User AAA Policy Download with PKI

With the Support of Per User AAA Policy Download with PKI feature, user attributes are obtained from the AAA server and pushed to the remote device through mode configuration. The username that is used to get the attributes is retrieved from the remote device certificate.

Per-User Attribute Support for Easy VPN Servers

The Per-User Attribute Support for Easy VPN Servers feature provides users with the ability to support per-user attributes on Easy VPN servers. These attributes are applied on the virtual access interface.

Local Easy VPN AAA Server

For a local Easy VPN AAA server, the per-user attributes can be applied at the group level or at the user level using the command-line interface (CLI).

To configure per-user attributes for a local Easy VPN server, see “Configuring Per-User Attributes on a Local Easy VPN AAA Server.”

Remote Easy VPN AAA Server

Attribute value (AV) pairs can be defined on a remote Easy VPN AAA server as shown in this example:

```
cisco-avpair = "ip:outacl#101=permit tcp any any established"
```

Per-User Attributes

The following per-user attributes are currently defined in the AAA server and are applicable to IPsec:

- inacl
- interface-config
- outacl
- route
- rte-fltr-in
- rte-fltr-out
- sub-policy-In
- sub-policy-Out
- policy-route
- prefix

Syslog Message Enhancements

Some new syslog messages have been added for Easy VPN in Cisco IOS Release 12.4(4)T. The syslog messages can be enabled on your server by using the command-line interface (CLI). The format of the syslog messages is as follows:

```
timestamp: %CRYPTO-6-VPN_TUNNEL_STATUS: (Server) <event message> User=<username> Group=<groupname> Client_public_addr=<ip_addr> Server_public_addr=<ip_addr>
```

For an authentication-passed event, the syslog message looks like the following:
Jul 25 23:33:06.847: %CRYPTO-6-VPN_TUNNEL_STATUS: (Server) Authentication PASS
ED User=blue Group=Cisco1760group Client_public_addr=10.20.20.1
Server_public_addr=10.20.20.2

Three of the messages (Max users, Max logins, and Group does not exist) are authorization issues and are printed only with the group name in the format. The reason for only the group name being printed is that authorization check happens much before mode configuration happens. Therefore, the peer information is not yet present and cannot be printed. The following is an example of a “Group does not exit” message.

*Jun 30 18:02:58.107: %CRYPTO-6-VPN_TUNNEL_STATUS: Group: group_1 does not exist

Easy VPN Syslog Messages That Are Supported

Both ezvpn_connection_up and ezvpn_connection_down were already supported in a previous release of syslog messages. The enhancements in Cisco IOS Release 12.4(4)T follow the same format, but new syslogs are introduced. The added syslogs are as follows:

- Authentication Passed
- Authentication Rejected
  - Group Lock Enabled
  - Incorrect Username or Password
  - Max Users exceeded/Max Logins exceeded
  - No. of Retries exceeded
- Authentication Failed (AAA Not Contactable)
- IP Pool Not present/No Free IP Address available in the pool
- ACL associated with Ezvpn policy but NOT defined (hence, no split tunneling possible)
- Save password Turned ON
- Incorrect firewall record being sent by Client (incorrect vendor | product | capability)
- Authentication Rejected
  - Access restricted via incoming interface
  - Group does not exist

Network Admission Control Support for Easy VPN

Network Admission Control was introduced in Cisco IOS Release 12.3(8)T as a way to determine whether a PC client should be allowed to connect to the LAN. Network Admission Control uses Extensible Authentication Protocol over UDP (EAPoUDP) to query the Cisco trust agent on the PC and allows a PC to access the network if the client status is healthy. Different policies can be applied on the server to deny or limit access of PCs that are infected.

Effective with Cisco IOS Release 12.4(4)T, Network Admission Control can now be used to monitor the status of remote PC clients as well. After the Easy VPN tunnel comes up and the PC starts to send traffic, the traffic is intercepted at the Easy VPN server, and the posture validation process starts. The posture validation process consists of sending an EAPoUDP request over the Easy VPN tunnel and querying the Cisco trust agent. The authentication server is configured inside the trusted network, behind the IPsec aggregator.

The configuration of an Easy VPN server that has Network Admission Control enabled is shown in the output in Network Admission Control: Example, page 64.
Central Policy Push Firewall Policy Push

The Easy VPN server supports Central Policy Push (CPP) Firewall Policy Push. This feature allows administrators to push policies that enforce security to the Cisco Easy VPN (software) Client and related firewall software.

A split tunnel enables access to corporate networks, but it also allows a remote device to be exposed to attacks from the Internet. This feature enables the server to determine whether to allow or deny a tunnel if the remote device does not have a required firewall, thereby reducing exposure to attacks.

The following firewall types are supported:
- Cisco-Integrated-firewall (central-policy-push)
- Cisco-Security-Agent (check-presence)
- Zonelabs-Zonealarm (both)
- Zonelabs-ZonealarmPro (both)

The server can be used either to check the presence of a firewall on the client (remote device) using the check-presence option or to specify the specifics of the firewall policies that must be applied by the client using the central-policy-push.

**Note**

The policy check-presence command and keyword, which are used with this feature, replace the firewall are-u-there command functionality that was supported before Cisco IOS Release 12.4(6)T. The firewall are-u-there command will continue to be supported for backward compatibility.

To enable this feature, see the sections “Defining a CPP Firewall Policy Push Using a Local AAA Server” and “Applying a CPP Firewall Policy Push to the Configuration Group.”

Syslog Support for CPP Firewall Policy Push

Syslog support can be enabled using the `crypto logging ezvpn` command on your router. CPP syslog messages will be printed for the following error conditions:

- If policy is configured on a group configuration (using the `firewall policy` command), but a global policy with the same name is not defined (using the `crypto isakmp client firewall` command). The syslog message is as follows:
  
  Policy enabled on group configuration but not defined

  Tunnel setup proceeds as normal (with the firewall).

- If an incorrect firewall request (vendor/product/cap incorrect order) is received, the syslog message is as follows:
  
  Incorrect firewall record received from client

- If a policy mismatch occurs between the Cisco VPN Client and the server, the syslog is as follows:
  
  CPP policy mismatch between client and headend

Password Aging

Prior to Cisco IOS Release 12.4(6)T, EasyVPN remote devices (clients) sent username and password values to the Easy VPN server, which in turn sent them to the AAA subsystem. The AAA subsystem generated an authentication request to the RADIUS server. If the password had expired, the RADIUS
server replied with an authentication failure. The reason for the failure was not passed back to the AAA subsystem. The user was denied access due to authentication failure, but he or she did not know that the failure was due to password expiration.

Effective with Cisco IOS Release 12.4(6)T, if you have configured the Password Aging feature, the EasyVPN client is notified when a password has expired, and you are prompted to enter a new password. To configure the Password Aging feature, see the section “Configuring Password Aging.”

For more information about Password Aging, see the reference for “Password Aging” in the section Additional References (subsection “Related Documents”).

**Split DNS**

Effective with Cisco IOS Release 12.4(9)T, split DNS functionality is available on Easy VPN servers. This feature enables the Easy VPN hardware client to use primary and secondary DNS values to resolve DNS queries. These values are pushed by the Easy VPN server to the Easy VPN remote device. To configure this feature on your server, use the `split-dns` command (see the section “Defining Group Policy Information for Mode Configuration Push”). Configuring this command adds the split-dns attribute to the policy group. The attribute will include the list of domain names that you configured. All other names will be resolved using the public DNS server.

For more information about configuring split DNS, see “Configuring Split and Dynamic DNS on the Cisco VPN 3000” at the following URL:

**cTCP**

The Cisco Tunneling Control Protocol (cTCP) feature can be used for situations in which an Easy VPN remote device is operating in an environment in which standard IPsec does not function or in which it does not function transparently without modification to existing firewall rules. These situations include the following:

- Small or home office router performing Network Address Translation (NAT) or Port Address Translation (PAT)
- PAT-provided IP address behind a larger router (for example, in a corporation)
- Non-NAT firewall (packet filtering or stateful)
- Proxy server

The firewall should be configured to allow the headend to accept cTCP connections on the configured cTCP port. This configuration is enabled on the Easy VPN server. If the firewall is not configured, it will not allow the cTCP traffic.

---

**Note**

cTCP traffic is actually Transmission Control Protocol (TCP) traffic. cTCP packets are IKE or Encapsulating Security Payload (ESP) packets that are being transmitted over TCP.

**VRF Assignment by a AAA Server**

To assign VRF to Easy VPN users, the following attributes should be enabled on a AAA server:

```
Cisco-avpair "ip:interface-config=ip vrf forwarding example1"
Cisco-avpair "ip:interface-config=ip unnumbered loopback10"
```
How to Configure Easy VPN Server

This section includes the following procedures:

Enabling Policy Lookup via AAA

To enable policy lookup via AAA, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication password-prompt text-string
5. aaa authentication username prompt text-string
6. aaa authentication login [list-name method1] [method2...]
7. aaa authorization network list-name local group radius
8. username name password encryption-type encrypted-password

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa authentication password-prompt text-string</td>
<td>(Optional) Changes the text displayed when users are prompted for a password.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# aaa authentication password-prompt &quot;Enter your password now:&quot;</td>
<td></td>

</tbody>
</table>
Defining Group Policy Information for Mode Configuration Push

Although users can belong to only one group per connection, they may belong to specific groups with different policy requirements. Thus, users may decide to connect to the client using a different group ID by changing their client profile on the VPN device. To define the policy attributes that are pushed to the client via Mode Configuration, perform the following steps.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto isakmp client configuration group \{group-name | default\}
4. key name
5. dns primary-server secondary-server
6. wins primary-server secondary-server
7. domain name
8. pool name
9. netmask name
10. acl number
11. access-restrict \{interface-name\}
12. policy check-presence
   or
   firewall are-u-there
13. group-lock

</table>
### Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>pool name</td>
<td>Defines a local pool address.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# pool green</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>This command must be defined and refer to a valid IP local pool address or the client connection will fail.</td>
</tr>
<tr>
<td>9</td>
<td>netmask name</td>
<td>(Optional) Specifies that a subnet mask be downloaded to the client for local connectivity.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# netmask 255.255.255.255</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>Some VPN clients use the default mask for their particular classes of address. However, for a router, the host-based mask is typically used (/32). If you want to override the default mask, use the netmask command.</td>
</tr>
<tr>
<td>10</td>
<td>acl number</td>
<td>(Optional) Configures split tunneling.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# acl 199</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>The number argument specifies a group of access control list (ACL) rules that represent protected subnets for split tunneling purposes.</td>
</tr>
<tr>
<td>11</td>
<td>access-restrict (interface-name)</td>
<td>Restricts clients in a group to an interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# access-restrict fastethernet0/0</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>policy check-presence</td>
<td>(Optional) Denotes that the server should check for the presence of the specified firewall (as shown as the firewall type on the client).</td>
</tr>
<tr>
<td></td>
<td>or firewall are-u-there</td>
<td>Adds the firewall are-u-there attribute to the server group if your PC is running the Black Ice or Zone Alarm personal firewalls.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# policy check-presence</td>
<td></td>
</tr>
<tr>
<td></td>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# firewall are-u-there</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>The policy command and check-presence keyword were added to Cisco IOS documentation in Cisco IOS 12.4(6)T. It is recommended that the policy command be used instead of the firewall are-u-there command because the policy command is supported in local AAA and remote AAA configurations. The firewall are-u-there command can be figured only locally, but it is still supported for backward compatibility.</td>
</tr>
<tr>
<td>13</td>
<td>group-lock</td>
<td>Enforces the group lock feature.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# group-lock</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td>include-local-lan</td>
<td>(Optional) Configures the Include-Local-LAN attribute to allow a nonsplit-tunneling connection to access the local subnetwork at the same time as the client.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config-isakmp-group)# include-local-lan</td>
<td></td>
</tr>
</tbody>
</table>
Enabling VPN Session Monitoring

If you wish to set restrictions on the maximum number of connections to the router per VPN group and the maximum number of simultaneous logins per user, add the following attributes to the VPN group.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. `crypto isakmp client configuration group group-name`
4. **exit**
5. `max-logins number-of-logins`
6. `max-users number-of-users`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

(Optional) Saves your Xauth password locally on your PC.

(Optional) Rather than have backup gateways added to client configurations manually, it is possible to have the server “push down” a list of backup gateways to the client device.

- These gateways are tried in order in the case of a failure of the previous gateway. The gateways may be specified using IP addresses or host names.

(Optional) Notifies the client of the central-site policy regarding whether PFS is required for any IPsec SA.

- Because the client device does not have a user interface option to enable or disable PFS negotiation, the server will notify the client device of the central site policy using this parameter. The Diffie-Hellman (D-H) group that is proposed for PFS will be the same that was negotiated in Phase 1 of the IKE negotiation.
Verifying a VPN Session

To verify a VPN session, perform the following steps.

**SUMMARY STEPS**

1. enable
2. show crypto session group
3. show crypto session summary

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 3 crypto isakmp client configuration group group-name</td>
<td>Specifies the policy profile of the group that will be defined and enters ISAKMP group configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• group-name—Group definition that identifies which policy is enforced for users.</td>
</tr>
<tr>
<td>Step 4 exit</td>
<td>Exits ISAKMP group configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 5 max-logins number-of-logins</td>
<td>(Optional) Limits the number of simultaneous logins for users in a specific server group.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 6 max-users number-of-users</td>
<td>(Optional) Limits the number of connections to a specific server group.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
**Applying Mode Configuration and Xauth**

Mode Configuration and Xauth must be applied to a crypto map to be enforced. To apply Mode Configuration and Xauth to a crypto map, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto map tag client configuration address [initiate | respond]`
4. `crypto map map-name isakmp authorization list list-name`
5. `crypto map map-name client authentication list list-name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>crypto map tag client configuration address [initiate</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config)# crypto map dyn client configuration address initiate</td>
</tr>
</tbody>
</table>

**Note** Cisco clients require the `respond` keyword to be used; however, if the Cisco Secure VPN Client 1.x is used, the `initiate` keyword must be used; `initiate` and `respond` keywords may be used simultaneously.

<table>

Enabling Reverse Route Injection for the Client

To enable RRI on the crypto map (static or dynamic) for VPN client support, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto dynamic map-name seq-num`
   or
   `crypto map map-name seq-num ipsec-isakmp`
4. `set peer ip-address`
5. `set transform-set transform-set-name`
6. `reverse-route`
7. `match-address`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
Enabling IKE Dead Peer Detection

To enable a Cisco IOS VPN gateway (instead of the client) to send IKE DPD messages, perform the following steps.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto isakmp keepalive secs retries`

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>crypto dynamic map-name seq-num or crypto map map-name seq-num ipsec-isakmp</td>
</tr>
<tr>
<td></td>
<td>Creates a dynamic crypto map entry and enters crypto map configuration mode. or</td>
</tr>
<tr>
<td></td>
<td>Adds a dynamic crypto map set to a static crypto map set and enters crypto map configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config)# crypto dynamic mymap 10 or Router (config)# crypto map yourmap 15 ipsec-isakmp</td>
</tr>
<tr>
<td>Step 4</td>
<td>set peer ip-address</td>
</tr>
<tr>
<td></td>
<td>Specifies an IPsec peer IP address in a crypto map entry.</td>
</tr>
<tr>
<td></td>
<td>• This step is optional when configuring dynamic crypto map entries.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-crypto-map)# set peer 10.20.20.20</td>
</tr>
<tr>
<td>Step 5</td>
<td>set transform-set transform-set-name</td>
</tr>
<tr>
<td></td>
<td>Specifies which transform sets are allowed for the crypto map entry.</td>
</tr>
<tr>
<td></td>
<td>• Lists multiple transform sets in order of priority (highest priority first).</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-crypto-map)# set transform-set dessha</td>
</tr>
<tr>
<td>Note</td>
<td>This list is the only configuration statement required in dynamic crypto map entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td>reverse-route</td>

</tbody>
</table>

### Configuring Browser Proxy

To configure an EasyVPN server so that the Easy VPN remote device can access resources on the corporate network when using Cisco IOS VPN Client software, perform the following steps. With this configuration, the user does not have to manually modify the proxy settings of his or her web browser when connecting and does not have to manually revert the proxy settings when disconnecting.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration browser-proxy** `{browser-proxy-name}`
4. **proxy** `{proxy-parameter}`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>

<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>crypto isakmp client configuration browser-proxy <em>(browser-proxy-name)</em></td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config)# crypto isakmp client configuration browser-proxy bproxy</td>
</tr>
<tr>
<td></td>
<td>Configures browser-proxy parameters for an Easy VPN remote device and enters ISAKMP Browser Proxy configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>proxy <em>(proxy-parameter)</em></td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-ikmp-browser-proxy)# proxy auto-detect</td>
</tr>
<tr>
<td></td>
<td>Configures proxy parameters for an Easy VPN remote device.</td>
</tr>
</tbody>
</table>

Configuring the Pushing of a Configuration URL Through a Mode-Configuration Exchange

To configure an Easy VPN server to push a configuration URL through a Mode-Configuration Exchange, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto isakmp client configuration group *(group-name)*
4. configuration url *(url)*
5. configuration version *(version-number)*
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><strong>enable</strong>&lt;br&gt;Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>configure terminal</strong>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>crypto isakmp client configuration group</strong>&lt;br&gt;(group-name)&lt;br&gt;Specifies to which group a policy profile will be defined and enters crypto ISAKMP group configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config)# crypto isakmp client configuration group Group1</td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>configuration url</strong>&lt;br&gt;({url})&lt;br&gt;Specifies the URL the remote device must use to get the configuration from the server.&lt;br&gt;• The URL must be a non-NULL terminated ASCII string that specifies the complete path of the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-isakmp-group)# configuration url <a href="http://10.10.88.8/easy.cfg">http://10.10.88.8/easy.cfg</a></td>
</tr>
<tr>
<td>Step 5</td>
<td><strong>configuration version</strong>&lt;br&gt;({version-number})&lt;br&gt;Specifies the version of the configuration.&lt;br&gt;• The version number will be an unsigned integer in the range 1 through 32767.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-isakmp-group)# configuration version 10</td>
</tr>
</tbody>
</table>

Configuring Per User AAA Download with PKI—Configuring the Crypto PKI Trustpoint

To configure a AAA server to push user attributes to a remote device, perform the following steps.

Prerequisites

Before configuring a AAA server to push user attributes to a remote device, you must have configured AAA. The crypto PKI trustpoint must also be configured (see the first configuration task below). It is preferable that the trustpoint configuration contain the **authorization username** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint**<br>name
4. **enrollment url**<br>url
5. `revocation-check none`

6. `rsakeypair key-label`

7. `authorization username {subjectname subjectname}`

8. `exit`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1  | enable

  * Example:
    
    ```text
    Router> enable
    ```

Enables privileged EXEC mode.

  * Enter your password if prompted.

| Step 2  | configure terminal

  * Example:
    
    ```text
    Router# configure terminal
    ```

Enters global configuration mode.

| Step 3  | crypto pki trustpoint name

  * Example:
    
    ```text
    Router (config)# crypto pki trustpoint ca-server
    ```

Declares the trustpoint that your router should use and enters ca-trustpoint configuration mode.

| Step 4  | enrollment url url

  * Example:
    
    ```text
    Router (config-ca-trustpoint)# enrollment url http://10.7.7.2:80
    ```

Specifies the URL of the certification authority (CA) server to which to send enrollment requests.

| Step 5  | revocation-check none

  * Example:
    
    ```text
    Router (config-ca-trustpoint)# revocation-check none
    ```

Checks the revocation status of a certificate.

| Step 6  | rsakeypair key-label

  * Example:
    
    ```text
    Router (config-ca-trustpoint)# rsakeypair rsa-pair
    ```

Specifies which key pair to associate with the certificate.

| Step 7  | authorization username {subjectname subjectname}

  * Example:
    
    ```text
    Router (config-ca-trustpoint)# authorization username subjectname commonname
    ```

Specifies the parameters for the different certificate fields that are used to build the AAA username.

| Step 8  | exit

  * Example:
    
    ```text
    Router (config-ca-trustpoint)# exit
    ```

Exits ca-trustpoint configuration mode.
Configuring the Actual Per User AAA Download with PKI

To configure the actual per-user download with PKI, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto isakmp policy priority
4. group \{1 | 2\}
5. exit
6. crypto isakmp profile profile-name
7. match certificate certificate-map
8. client pki authorization list listname
9. client configuration address \{initiate | respond\}
10. virtual-template template-number
11. exit
12. crypto ipsec transform-set \[transform-set-name transform1] [transform2] [transform3] [transform4]
13. crypto ipsec profile name
14. set transform-set transform-set-name

DETAILED STEPS

<table>

</tbody>
</table>
**What to Do Next**

Apply the CPP firewall policy push to the configured group.

**Applying a CPP Firewall Policy Push to the Configuration Group**

Now that the CPP firewall policy push has been defined, it must be applied to the configuration group by performing the following steps.
How to Configure Easy VPN Server

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto isakmp client configuration group \{group-name\}
4. firewall policy \{policy-name\}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Enables privileged EXEC mode.</strong></td>

</table>

Defining a CPP Firewall Policy Push Using a Remote AAA Server

To define a CPP firewall policy push using a remote AAA server, see the section “Defining a CPP Firewall Policy Push Using a Local AAA Server.” The steps are the same for this configuration.

What to Do Next

After defining the CPP firewall policy push, you should add the VSA cpp-policy under the group definition.

Adding the VSA CPP-Policy Under the Group Definition

To add the the VSA cpp-policy under the group definition that is defined in RADIUS, perform the following step.
SUMMARY STEPS

1. Add the VSA cpp-policy under the group definition that is defined in RADIUS.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Add the VSA “cpp-policy” under the group definition that is defined in RADIUS.</td>
</tr>
<tr>
<td>Example:</td>
<td>Defines the CPP firewall push policy for a remote server.</td>
</tr>
<tr>
<td><code>ipsec:cpp-policy=&quot;Enterprise Firewall&quot;</code></td>
<td></td>
</tr>
</tbody>
</table>

Verifying CPP Firewall Policy Push

To verify the CPP firewall push policy on a local or remote AAA server, perform the following steps.

SUMMARY STEPS

1. enable
2. debug crypto isakmp

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>debug crypto isakmp</td>
</tr>
<tr>
<td>Example:</td>
<td>Displays messages about IKE events.</td>
</tr>
<tr>
<td><code>Router# debug crypto isakmp</code></td>
<td></td>
</tr>
</tbody>
</table>

Configuring Password Aging

To configure Password Aging so that the Easy VPN client is notified if the password has expired, perform the following steps.

Restrictions

The following restrictions apply to the Password Aging feature:

• It works only with VPN software clients. It does not work with VPN client hardware.
• It works only with RADIUS servers.
SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication login \{list-name\} password-expiry method1 [method2...]
5. radius-server host \{ip-address\} auth-port port-number acct-port port-number key string
6. Configure the ISAKMP profile
7. client authentication list \{list-name\}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3 aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 4 aaa authentication login {list-name}</td>
<td>Configures the authentication list so that the Password Aging feature is enabled.</td>
</tr>
<tr>
<td>password-expiry method1 [method2...]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 5 radius-server host {ip-address}</td>
<td>Configures the RADIUS server.</td>
</tr>

Router (config)# aaa new-model
Router (config)# aaa authentication login userauth paswd-expiry group radius
Router (config)# radius-server host 172.19.217.96 255.255.255.0 auth-port 1645 acct-port 1646 key cisco radius-server vsa send authentication
Configuring Split DNS

To configure Split DNS, perform the following steps.

Prerequisites

Before the Split DNS feature can work, the following commands should have been configured on the Easy VPN remote:

- ip dns server
- ip domain-lookup

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto isakmp client configuration group group-name
4. dns primary-server secondary-server
5. split-dns domain-name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
Verifying Split DNS

To verify a split DNS configuration, perform the following steps (the show commands can be used one at a time or together).

**SUMMARY STEPS**

1. **enable**
2. **show ip dns name-list [name-list-number]**
3. **show ip dns view [vrf vrf-name] [default | view-name]**
4. **show ip dns view-list [view-list-name]**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show ip dns name-list [name-list-number]</td>
<td>Displays information about DNS name lists.</td>
</tr>
<tr>
<td>Example: Router# show ip dns name-list 1</td>
<td></td>
</tr>
</tbody>
</table>
Monitoring and Maintaining Split DNS

To monitor and maintain the split DNS configuration on Easy VPN remote devices, perform the following steps.

**SUMMARY STEPS**

1. enable
2. debug ip dns name-list
3. debug ip dns view
4. debug ip dns view-list

**DETAILED STEPS**

**Step 1**  enable

**Example:**
```
Router> enable
```

Enables privileged EXEC mode.
- Enter your password if prompted.

**Step 2**  debug ip dns name-list

**Example:**
```
Router# debug ip dns name-list
```

Enables debugging output for Domain Name System (DNS) name-list events.

**Step 3**  debug ip dns view

**Example:**
```
Router# debug ip dns view
```

Enables debugging output for DNS view events.

**Step 4**  debug ip dns view-list

**Example:**
```
Router# debug ip dns view-list
```

Enables debugging output for DNS view-list events.
Configuring an Easy VPN Server to Obtain an IP Address from a DHCP Server

When the Easy VPN server selects the method for address assignment, it does so in the following order of precedence:

1. Selects the Framed IP address
2. Uses the IP address from the authentication server (group/user)
3. Uses the global IKE address pools
4. Uses DHCP

Note: To enable the Easy VPN server to obtain an IP address from a DHCP server, remove other address assignments.

To configure an Easy VPN server to obtain an IP address from a DHCP server, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** _group-name_
4. **dhcp server** (_ip-address_ | _hostname_)
5. **dhcp timeout** _time_
6. **dhcp giaddr** _scope_

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>2.</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3.</td>
<td>crypto isakmp client configuration group <em>group-name</em></td>
<td>Specifies to which group a policy profile will be defined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> Entering this command places the CLI in ISAKMP group configuration mode. From this mode, you can use subcommands to specify characteristics for the group policy.</td>
</tr>
<tr>
<td>4.</td>
<td>dhcp server (<em>ip-address</em></td>
<td><em>hostname</em>)</td>
</tr>
</tbody>
</table>

**Example:**

Step 1: `Router> enable`

Step 2: `Router# configure terminal`

Step 3: `Router (config)# crypto isakmp client configuration group group1`

Step 4: `Router (config-isakmp-group)# dhcp server 10.10.1.2`
Verifying DHCP Client Proxy

To verify your DHCP client proxy configuration, perform the following steps (use the show commands one at a time or together).

**SUMMARY STEPS**

1. `enable`
2. `show dhcp lease`
3. `show ip dhcp pool`
4. `show ip dhcp binding`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td><code>dhcp timeout</code></td>
<td>Sets the wait time in seconds before the next DHCP server on the list is tried.</td>
</tr>
<tr>
<td></td>
<td><code>time</code></td>
<td>Example: <code>Router (config-isakmp-group)# dhcp timeout 6</code></td>
</tr>
<tr>
<td>6</td>
<td><code>dhcp giaddr</code></td>
<td>Specifies the giaddr for the DHCP scope.</td>
</tr>
<tr>
<td></td>
<td><code>scope</code></td>
<td>Example: <code>Router (config-isakmp-group)# dhcp giaddr 10.1.1.4</code></td>
</tr>
</tbody>
</table>

**Step 1** `enable`

Example: `Router> enable`

Enables privileged EXEC mode.
- Enter your password if prompted.

**Step 1** `show dhcp lease`

Example: `Router# show dhcp lease`

Displays information about the DHCP address pools.

**Step 2** `show ip dhcp pool`

Example: `Router# show ip dhcp pool`

Displays information about the DHCP address pools.

**Step 3** `show ip dhcp binding`

Example: `Router# show ip dhcp binding`

Displays address bindings on the DHCP server.

**Note** This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server).
Monitoring and Maintaining DHCP Client Proxy

To monitor and maintain your DHCP client proxy configuration, perform the following steps (use the `debug` commands one at a time or together).

**SUMMARY STEPS**

1. enable
2. debug crypto isakmp
3. debug dhcp
4. debug dhcp detail
5. debug ip dhcp server events

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>debug crypto isakmp</td>
<td>Displays messages about Internet Key Exchange (IKE) event.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# debug crypto isakmp</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>debug dhcp</td>
<td>Reports server events, like address assignments and database updates.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# debug dhcp</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>debug dhcp detail</td>
<td>Displays detailed DHCP debugging information.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# debug dhcp detail</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>debug ip dhcp server events</td>
<td>Reports server events, like address assignments and database updates.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# debug ip dhcp server events</td>
<td>This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server).</td>
</tr>
</tbody>
</table>

**Configuring cTCP**

To enable cTCP, perform the following steps on your Easy VPN server.

**Prerequisites**

Before configuring cTCP, you should have configured crypto IPsec.
### SUMMARY STEPS

1. enable
2. configure terminal
3. crypto ctcp port \([port-number]\)

### DETAILED STEPS

| Step 1   | enable                                      | Enables privileged EXEC mode.  
|          |                                             | • Enter your password if prompted. |
| Example: | Router> enable                              |                                  |
| Step 2   | configure terminal                          | Enters global configuration mode. |
| Example: | Router# configure terminal                  |                                  |
| Step 3   | crypto ctcp port \([port-number]\)          | Configures cTCP encapsulation for Easy VPN.  
|          |                                             | • Up to 10 port numbers can be configured.  
|          |                                             | • If the \(port-number\) argument is not configured, cTCP is enabled on port 80 by default.  
| Example: | Router (config)# crypto ctcp port 120       |                                  |

### Verifying cTCP

To verify your cTCP configuration, perform the following steps (the `show` commands can be used one at a time or together).

### SUMMARY STEPS

1. enable
2. show crypto ctcp [peer ip-address]

### DETAILED STEPS

| Step 1   | enable                                      | Enables privileged EXEC mode.  
|          |                                             | • Enter your password if prompted. |
| Example: | Router> enable                              |                                  |
| Step 2   | show crypto ctcp [peer ip-address]          | Displays information about a specific cTCP peer. |
| Example: | Router# show crypto ctcp peer 10.76.235.21 |                                  |

### Monitoring and Maintaining a cTCP Configuration

To monitor and maintain your cTCP configuration, perform the following steps.
How to Configure Easy VPN Server

SUMMARY STEPS

1. enable
2. debug crypto ctcp

DETAILED STEPS

| Step 1 | enable | Enables privileged EXEC mode.  
|        |       | • Enter your password if prompted. |
|        |       | Example:  
|        | Router> enable | |
| Step 2 | debug crypto ctcp | Displays information about a cTCP session. |
|        |       | Example:  
|        | Router# debug crypto ctcp | |

Clearing a cTCP Configuration

To clear a cTCP configuration, perform the following steps.

SUMMARY STEPS

1. enable
2. clear crypto ctcp [peer ip-address]

DETAILED STEPS

| Step 1 | enable | Enables privileged EXEC mode.  
|        |       | • Enter your password if prompted. |
|        |       | Example:  
|        | Router> enable | |
| Step 2 | clear crypto ctcp [peer ip-address] | Displays information about a cTCP session. |
|        |       | Example:  
|        | Router# clear crypto ctcp peer 10.76.23.21 | |
Troubleshooting a cTCP Configuration

To troubleshoot a cTCP configuration, perform the following steps.

**SUMMARY STEPS**

1. Ensure that the cTCP session is in the CTCP_ACK_RECEIVED state.
2. If the cTCP session is not in the CTCP_ACK_RECEIVED state, enable the `debug crypto ctcp` command.
3. If no cTCP bugs are seen, ensure that the firewall is allowing the cTCP packets to get to the server.
4. If the firewall configuration is correct, debugging is enabled, and you do not see any cTCP debugs on your console, you must find out why the cTCP port on the router is not receiving packets.

**DETAILED STEPS**

---

**Step 1** To ensure that the cTCP session is in the CTCP_ACK_RECEIVED state, use the `show crypto ctcp` command.

**Step 2** If the cTCP session is not in the CTCP_ACK_RECEIVED state, enable the `debug crypto ctcp` command and then try using the `show crypto ctcp` command again.

**Step 3** If no cTCP bugs are seen, ensure that the firewall is allowing the cTCP packets to get to the server (check the firewall configuration).

**Step 4** If the firewall configuration is correct, debugging is enabled, and you do not see any cTCP debugs on your console, you must find out why the cTCP port on the router is not receiving packets. If you do not see any cTCP debugs and a cTCP session has not been set up, there is a possibility that cTCP packets that are actually TCP packets could have been delivered to a TCP stack instead of to the cTCP port. By enabling the `debug ip packet` and `debug ip tcp packet` commands, you may be able to determine whether the packet is being given to the TCP stack.

---

Configuration Examples for Easy VPN Server

This section provides the following configuration examples:

- Configuring Cisco IOS for Easy VPN Server: Example, page 54
- RADIUS Group Profile with IPsec AV Pairs: Example, page 55
- RADIUS User Profile with IPsec AV Pairs: Example, page 56
- Backup Gateway with Maximum Logins and Maximum Users: Example, page 56
- Easy VPN with an IPsec Virtual Tunnel Interface: Example, page 56
- Pushing a Configuration URL Through a Mode-Configuration Exchange: Examples, page 58
- Per User AAA Policy Download with PKI: Example, page 58
- Per-User Attributes on an Easy VPN Server: Example, page 62
- Network Admission Control: Example, page 64
- Configuring Password Aging: Example, page 66
Configuring Cisco IOS for Easy VPN Server: Example

The following example shows how to define group policy information locally for mode configuration. In this example, a group name is named “cisco” and another group name is named “default.” The policy is enforced for all users who do not offer a group name that matches “cisco.”

! Enable policy look-up via AAA. For authentication and authorization, send requests to RADIUS first, then try local policy.
aaa new-model
aaa authentication login userlist group radius local
aaa authorization network grouplist group radius local
enable password XXXX
!
username cisco password 0 cisco
clock timezone PST -8
ip subnet-zero
! Configure IKE policies, which are assessed in order so that the first policy that matches the proposal of the client will be used.
crypto isakmp policy 1
  group 2
! crypto isakmp policy 3
  hash md5
  authentication pre-share
  group 2
crypto isakmp identity hostname
!
! Define “cisco” group policy information for mode config push.
crypto isakmp client configuration group cisco
  key cisco
dns 10.2.2.2 10.2.2.3
wins 10.6.6.6
domain cisco.com
pool green
acl 199
! Define default group policy for mode config push.
crypto isakmp client configuration group default
  key cisco
dns 10.2.2.2 10.3.2.3
pool green
acl 199
!
!
crypto ipsec transform-set dessha esp-des esp-sha-hmac
!
crypto dynamic-map mode 1
  set transform-set dessha
!
! Apply mode config and xauth to crypto map “mode.” The list names that are defined here must match the list names that are defined in the AAA section of the config.
crypto map mode client authentication list userlist
crypto map mode isakmp authorization list grouplist
crypto map mode client configuration address respond
crypto map mode 1 ipsec-isakmp dynamic mode

RADIUS Group Profile with IPsec AV Pairs: Example

The following is an example of a standard RADIUS group profile that includes RADIUS IPsec AV pairs. To get the group authorization attributes, “cisco” must be used as the password.

client_r Password = "cisco"
Service-Type = Outbound
cisco-avpair = "ipsec:tunnel-type*ESP"
cisco-avpair = "ipsec:key-exchange=ike"
cisco-avpair = "ipsec:tunnel-password=lab"
cisco-avpair = "ipsec:addr-pool=pool1"
cisco-avpair = "ipsec:default-domain=cisco"
cisco-avpair = "ipsec:inacl=101"
cisco-avpair = "ipsec:access-restrict=fastethernet 0/0"
cisco-avpair = "ipsec:group-lock=1"
cisco-avpair = "ipsec:hostservers=10.1.1.1 10.2.2.2"
cisco-avpair = "ipsec:firewall=1"
cisco-avpair = "ipsec:include-local-lan=1"
cisco-avpair = "ipsec:save-password=1"
cisco-avpair = "ipsec:wins-servers=10.3.3.3 10.4.4.4"
cisco-avpair = "ipsec:split-dns=green.com"
cisco-avpair = "ipsec:ipsec-backup-gateway=10.1.1.1"
cisco-avpair = "ipsec:ipsec-backup-gateway=10.1.1.2"
cisco-avpair = "ipsec:pfs=1"
cisco-avpair = "ipsec:cpp-policy="Enterprise Firewall"
cisco-avpair = "ipsec:auto-update="Win http://abc.com 4.0.1"
cisco-avpair = "ipsec:browser-proxy=bproxy_profile_A"
cisco-avpair = "ipsec:xauth-banner="Xauth banner text here"

RADIUS User Profile with IPsec AV Pairs: Example

The following is an example of a standard RADIUS user profile that includes RADIUS IPsec AV pairs. These user attributes will be obtained during Xauth.

ualluall Password = "uall1234"
cisco-avpair = "ipsec:user-vpn-group=unity"
cisco-avpair = "ipsec:user-include-local-lan=1"
cisco-avpair = "ipsec:user-save-password=1"
Framed-IP-Address = 10.10.10.10

Backup Gateway with Maximum Logins and Maximum Users: Example

The following example shows that five backup gateways have been configured, that the maximum users have been set to 250, and that maximum logins have been set to 2:

crypto isakmp client configuration group sdm
key 6 RMZPPMRQMSdiZNJg`EBbCWTKSTi\d\{
pool POOL1
acl 150
backup-gateway 172.16.12.12
backup-gateway 172.16.12.13
backup-gateway 172.16.12.14
backup-gateway 172.16.12.130
backup-gateway 172.16.12.131
max-users 250
max-logins 2

Configuration Examples for Easy VPN Server

Pushing a Configuration URL Through a Mode-Configuration Exchange: Examples

The following `show crypto ipsec client ezvpn` command output displays the mode configuration URL location and version:

```
Router# show crypto ipsec client ezvpn

Easy VPN Remote Phase: 5
Tunnel name: branch
Inside interface list: Vlan1
Outside interface: FastEthernet0
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 172.16.1.209
Mask: 255.255.255.255
Default Domain: cisco.com
Save Password: Allowed
Config status: applied, Last successfully applied version: 11
Current EzVPN Peer: 192.168.10.1
```

The following `show crypto isakmp peers config` command output displays all manageability information that is sent by the remote device.

```
Router# show crypto isakmp peers config

Client-Public-Addr=192.168.10.2:500; Client-Assigned-Addr=172.16.1.209;
Client-Group=branch; Client-User=branch; Client-Hostname=branch.; Client-Platform=Cisco

Split DNS: Examples

In the following example, the split tunnel list named “101” contains the 10.168.0.0/16 network. It is necessary to include this network information so that the DNS requests to the internal DNS server of 10.168.1.1 are encrypted.

crypto isakmp client configuration group home
  key abcd
  acl 101
dns 10.168.1.1. 10.168.1.2

show Output

The following show command output example shows that www.ciscoexample1.com and www.ciscoexample2.com have been added to the policy group:

Router# show running-config | security group

crypto isakmp client configuration group 831server
  key abcd
dns 10.104.128.248
  split-dns www.ciscoexample1.com
  split-dns www.ciscoexample2.com
  group home2 key abcd

The following show command output example displays currently configured DNS views:

Router# show ip dns view

DNS View default parameters:
  Logging is off
DNS Resolver settings:
  Domain lookup is enabled
  Default domain name: cisco.com
  Domain search list:
  Lookup timeout: 3 seconds
  Lookup retries: 2
  Domain name-servers:
    172.16.168.183
DNS Server settings:
  Forwarding of queries is enabled
  Forwarder addresses:

DNS View ezvpn-internal-view parameters:
  Logging is off
DNS Resolver settings:
  Domain lookup is enabled
  Default domain name:
  Domain search list:
  Lookup timeout: 3 seconds
  Lookup retries: 2
  Domain name-servers:
    10.104.128.248
DNS Server settings:
  Forwarding of queries is enabled
  Forwarder addresses:

The following show command output example displays currently configured DNS view lists.

Router# show ip dns view-list

View-list ezvpn-internal-viewlist:
  View ezvpn-internal-view:
    Evaluation order: 10
Restrict to ip dns name-list: 1
View default:
  Evaluation order: 20

The following show command output displays DNS name lists.
Router# show ip dns name-list

ip dns name-list 1
  permit www.ciscoexample1.com
  permit www.ciscoexample2.com

**DHCP Client Proxy: Examples**

The following examples display DHCP client proxy output information using show and debug commands.

**show Output**

To use the show ip dhcp command, the DHCP server must be a Cisco IOS server.

The following show ip dhcp pool command output provides information about the DHCP parameters:

Router# show ip dhcp pool

Pool dynpool:
Utilization mark (high/low) : 100 / 0
Subnet size (first/next) : 0 / 0
Total addresses : 254
Leased addresses : 1
Pending event : none
1 subnet is currently in the pool:
Current index  IP address range     Leased addresses
              10.3.3.1 - 10.3.3.254     1
No relay targets associated with class aclass

The following show ip dhcp command output provides information about the DHCP bindings:

Router# show ip dhcp binding

Bindings from all pools not associated with VRF:
IP address  Client-ID/ Lease expiration  Type
          Hardware address/User name     
10.3.3.5   0065.7a76.706e.2d63. Apr 04 2006 06:01 AM  Automatic 6c69.656e.74

**debug Output**

The following example shows how the debug crypto isakmp and debug ip dhcp server events commands can be used to troubleshoot your DHCP client proxy support configuration:

*Apr 3 06:01:32.047: ISAKMP: Config payload REQUEST *Apr 3 06:01:32.047:
  ISAKMP: (1002): checking request:
  *Apr 3 06:01:32.047: ISAKMP: IP4_ADDRESS
  *Apr 3 06:01:32.047: ISAKMP: IP4_NETMASK
  *Apr 3 06:01:32.047: ISAKMP: MODECFG_CONFIG_URL
  *Apr 3 06:01:32.047: ISAKMP: MODECFG_CONFIG_VERSION
  *Apr 3 06:01:32.047: ISAKMP: IP4_DNS
  *Apr 3 06:01:32.047: ISAKMP: IP4_DNS
  *Apr 3 06:01:32.047: ISAKMP: IP4_NBNS
**cTCP Session: Example**

The following `debug crypto ctcp` command output displays information about a cTCP session, and it includes comments about the output:

```bash
Router# debug crypto ctcp

In the following two lines, a cTCP SYN packet is received from the client, and the cTCP connection is created.

In the following line, the SYN acknowledgement is sent to the client.
*Sep 26 11:14:37.135: cTCP: SYN from 10.76.235.21:3519

In the following two lines, an acknowledgement is received, and connection setup is complete. IKE packets should now be received on this newly created cTCP session.
*Sep 26 11:14:37.135: cTCP: Sending SYN(680723B2)ACK(100C637) to 10.76.235.21:3519
```
VRF Assignment by a AAA Server: Example

The following output example shows that neither a VRF nor an IP address has been defined:

```
aaa new-model
aaa authentication login VPN group radius
aaa authorization network VPN group radius
!
ip vrf example1
   rd 1:1

crypto isakmp profile example1
   match identity group example1group
   client authentication list VPN
   isakmp authorization list VPN
   client configuration address respond
tunnel mode point-to-point
tunnel protection ipsec profile example1

crypto ipsec transform-set TS esp-3des esp-sha-hmac
!
crypto ipsec profile example1
   transform-set TS
   set isakmp-profile example1
!
interface Virtual-Template10
   type tunnel

no ip address
```

The above lines show that neither a VRF nor an IP address has been defined. The next line shows that the tunnel mode is set to "ipsec ipv4".

## Command Reference

The following commands are introduced or modified in the feature or features.

- `aaa authentication login`
- `access-restrict`
- `acl (ISAKMP)`
- `auto-update client`
- `backup-gateway`
- `banner`
- `browser-proxy`
- `clear crypto ctcp`
- `clear crypto session`
- `client authentication list`
- `client pki authorization list`
- `configuration url`
- `configuration version`
- `crypto aaa attribute list`
- `crypto ctcp`
- `crypto ipsec server send-update`
- crypto isakmp client configuration browser-proxy
- crypto isakmp client configuration group
- crypto isakmp client firewall
- crypto logging ezvpn
- debug crypto ctcp
- debug crypto condition
- debug ip dns name-list
- debug ip dns view
- debug ip dns view-list
- dhcp server (isakmp)
- dhcp timeout
- domain (isakmp-group)
- firewall are-u-there
- firewall policy
- group-lock
- include-local-lan
- key (isakmp-group)
- max-logins
- max-users
- pfs
- policy
- pool (isakmp-group)
- proxy
- save-password
- show crypto ctcp
- show crypto debug-condition
- show crypto isakmp peers
- show crypto isakmp profile
- show crypto isakmp sa
- show crypto session
- show crypto session group
- show crypto session summary
- show ip dns name-list
- show ip dns view
- show ip dns view-list
- split-dns

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.

Feature Information for Easy VPN Server

Table 3 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Table 3 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

AAA—authentication, authorization, and accounting. Framework of security services that provides the method for identifying users (authentication), for remote access control (authorization), and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

aggressive mode (AM)—Mode during Internet Key Exchange negotiation. Compared to main mode (MM), AM eliminates several steps, which makes it faster but less secure than MM. Cisco IOS software will respond in aggressive mode to an Internet Key Exchange (IKE) peer that initiates aggressive mode.

AV pair—attribute-value pair. Additional authentication and authorization information in the following format: Cisco:AVPair="protocol:attribute=value".

IKE—Internet Key Exchange. Hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

IPsec—IP Security Protocol. Framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPsec provides these security services at the IP layer. IPsec uses IKE to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPsec. IPsec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

MM—main mode. Mode that is slower than aggressive mode but more secure and more flexible than aggressive mode because it can offer an IKE peer more security proposals. The default action for IKE authentication (Rivest, Shamir, and Adelman signature (rsa-sig), RSA encryption (rsa-encr), or preshared) is to initiate main mode.

policy push—Allows administrators to push policies that enforce security to the Cisco Easy VPN (software) Client and related firewall software.

reverse route injection (RRI)—Simplified network design for VPNs on which there is a requirement for redundancy or load balancing. RRI works with both dynamic and static crypto maps.

In the dynamic case, as remote peers establish IPsec security associations with an RRI enabled router, a static route is created for each subnet or host protected by that remote peer. For static crypto maps, a static route is created for each destination of an extended access-list rule.

SA—security association. Description of how two or more entities will utilize security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

VPN—Virtual Private Network. Framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.

Invalid Security Parameter Index Recovery

When an invalid security parameter index error (shown as “Invalid SPI”) occurs in IP Security (IPSec) packet processing, the feature allows for an Internet Key Exchange (IKE) security association (SA) to be established. The “IKE” module sends notification of the “Invalid SPI” error to the originating IPSec peer so that Security Association Databases (SADBs) can be resynchronized and successful packet processing can be resumed.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for” section on page 17.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for

Before configuring the feature, you must have enabled Internet Key Exchange (IKE) and IPSec on your router.

Restrictions for

If an IKE SA is being initiated to notify an IPSec peer of an “Invalid SPI” error, there is the risk that a denial-of-service (DoS) attack can occur. The feature has a built-in mechanism to minimize such a risk, but because there is a risk, the feature is not enabled by default. You must enable the command using command-line interface (CLI).

Information About

To use the feature, you should understand the following concept.

- How the Feature Works, page 2

How the Feature Works

An IPSec “black hole” occurs when one IPSec peer “dies” (for example, a peer can “die” if a reboot occurs or if an IPSec peer somehow gets reset). Because one of the peers (the receiving peer) is completely reset, it loses its IKE SA with the other peer. Generally, when an IPSec peer receives a packet for which it cannot find an SA, it tries to send an IKE “INVALID SPI NOTIFY” message to the data originator. This notification is sent using the IKE SA. If there is no IKE SA available, the receiving peer drops the packet.

Note

A single security association (SA) has only two peers. However, a SADB can have multiple SAs, whereby each SA has an association with a different peer.

When an invalid security parameter index (SPI) is encountered, the Invalid Security Parameter Index feature provides for the setting up of an IKE SA with the originator of the data, and the IKE “INVALID SPI NOTIFY” message is sent. The peer that originated the data “sees” the “INVALID SPI NOTIFY” message and deletes the IPSec SA that has the invalid SPI. If there is further traffic from the originating peer, there will not be any IPSec SAs, and new SAs will be set up. Traffic will flow again. The default behavior (that is, without configuring the feature) is that the data packet that caused the invalid SPI error is dropped. The originating peer keeps on sending the data using the IPSec SA that has the invalid SPI, and the receiving peer keeps dropping the traffic (thus creating the “black hole”).

The IPSec module uses the IKE module to send an IKE “INVALID SPI NOTIFY” message to the other peer. Once the invalid SPI recovery is in place, there should not be any significant dropping of packets although the IPSec SA setup can itself result in the dropping of a few packets.

To configure your router for the feature, use the `crypto isakmp invalid-spi-recovery` command. The IKE SA will not be initiated unless you have configured this command.
How to Configure

This section contains the following procedure.

- Configuring, page 3

Configuring

To configure the feature, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto isakmp invalid-spi-recovery

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto isakmp invalid-spi-recovery</td>
<td>Initiates the IKE module process whereby the IKE module notifies the receiving peer that an “Invalid SPI” error has occurred.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# crypto isakmp invalid-spi-recovery</td>
<td></td>
</tr>
</tbody>
</table>
Verifying an Configuration

To determine the status of the IPSec SA for traffic between two peers, you can use the `show crypto ipsec sa` command. If the IPSec SA is available on one peer and not on the other, there is a “black hole” situation, in which case you will see the invalid SPI errors being logged for the receiving peer. If you turn console logging on or check the syslog server, you will see that these errors are also being logged.

Figure 1 shows the topology of a typical preshared configuration setup. Host 1 is the initiating peer (initiator), and Host 2 is the receiving peer (responder).

**Figure 1  Preshared Configuration Topology**

**SUMMARY STEPS**

To verify the preshared configuration, perform the following steps.

1. Initiate the IKE and IPSec SAs between Host 1 and Host 2
2. Clear the IKE and IPSec SAs on Router B
3. Send traffic from Host 1 to Host 2 and ensure that IKE and IPSec SAs are correctly established
4. Check for an invalid SPI message on Router B

**DETAILED STEPS**

**Step 1  Initiate the IKE and IPSec SAs between Host 1 and Host 2**

Command Reference

The following commands are introduced or modified in the feature or features:

- `crypto isakmp invalid-spi-recovery`

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.

Feature Information for

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note: Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

IP Security VPN Monitoring

The IP Security VPN Monitoring feature provides VPN session monitoring enhancements that will allow you to troubleshoot the Virtual Private Network (VPN) and monitor the end-user interface. Session monitoring enhancements include the following:

- Ability to specify an Internet Key Exchange (IKE) peer description in the configuration file
- Summary listing of crypto session status
- Syslog notification for crypto session up or down status
- Ability to clear both IKE and IP Security (IPSec) security associations (SAs) using one command-line interface (CLI)

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Contents

- Prerequisites for IP Security VPN Monitoring, page 2
- Restrictions for IP Security VPN Monitoring, page 2
- Information About IPSec VPN Monitoring, page 2
- How to Configure IP Security VPN Monitoring, page 4
- Configuration Examples for IP Security VPN Monitoring, page 6
Prerequisites for IP Security VPN Monitoring

- You should be familiar with IPSec and encryption.
- Your router must support IPSec, and before using the IP Security VPN Monitoring feature, you must have configured IPSec on your router.

Restrictions for IP Security VPN Monitoring

- You must be running Cisco IOS k8 or k9 crypto images on your router.

Information About IPSec VPN Monitoring

To troubleshoot the IPSec VPN and monitor the end-user interface, you should understand the following concepts:

- Background: Crypto Sessions, page 2
- Per-IKE Peer Description, page 2
- Summary Listing of Crypto Session Status, page 3
- Syslog Notification for Crypto Session Up or Down Status, page 3
- IKE and IPSec Security Exchange Clear Command, page 3

Background: Crypto Sessions

A crypto session is a set of IPSec connections (flows) between two crypto endpoints. If the two crypto endpoints use IKE as the keying protocol, they are IKE peers to each other. Typically, a crypto session consists of one IKE security association (for control traffic) and at least two IPSec security associations (for data traffic—one per each direction). There may be duplicated IKE security associations (SAs) and IPSec SAs or duplicated IKE SAs or IPSec SAs for the same session in the duration of rekeying or because of simultaneous setup requests from both sides.

Per-IKE Peer Description

The Per-IKE Peer Description function allows you to enter a description of your choosing for an IKE peer. (Before Cisco IOS Release 12.3(4)T, you could use only the IP address or fully qualified domain name [FQDN] to identify the peer; there was no way to configure a description string.) The unique peer description, which can include up to 80 characters, can be used whenever you are referencing that particular IKE peer. To add the peer description, use the `description` command.
IKE peers that “sit” behind a Network Address Translation (NAT) device cannot be uniquely identified; therefore, they have to share the same peer description.

The primary application of this description field is for monitoring purposes (for example, when using `show` commands or for logging [syslog messages]). The description field is purely informational (for example, it cannot act as a substitute for the peer address or FQDN when defining crypto maps).

**Summary Listing of Crypto Session Status**

You can get a list of all the active VPN sessions by entering the `show crypto session` command. The listing will include the following:

- Interface
- IKE peer description, if available
- IKE SAs that are associated with the peer by whom the IPSec SAs are created
- IPSec SAs serving the flows of a session

Multiple IKE or IPSec SAs may be established for the same peer (for the same session), in which case IKE peer descriptions will be repeated with different values for the IKE SAs that are associated with the peer and for the IPSec SAs that are serving the flows of the session.

You can also use the `show crypto session detail` variant of this command to obtain more detailed information about the sessions.

**Syslog Notification for Crypto Session Up or Down Status**

The Syslog Notification for Crypto Session Up or Down Status function provides syslog notification every time the crypto session comes up or goes down.

The following is a sample syslog notification showing that a crypto session is up:

```
%CRYPTO-5-SESSION_STATUS: Crypto session is UP. Peer 10.6.6.1:500 fvrf=name10 ivrf=name20
Description: SJC24-2-VPN-Gateway Id: 10.5.5.2
```

The following is a sample syslog notification showing that a crypto session is down:

```
%CRYPTO-5-SESSION_STATUS: Crypto session is DOWN. Peer 10.6.6.1:500 fvrf=name10
ivrf=name20 Description: SJC24-2-VPN-Gateway Id: 10.5.5.2
```

**IKE and IPSec Security Exchange Clear Command**

In previous IOS versions, there was no single command to clear both IKE and IPSec connections (that is, SAs). Instead, you had to use the `clear crypto isakmp` command to clear IKE and the `clear crypto ipsec` command to clear IPSec. The new `clear crypto session` command allows you to clear both IKE and IPSec with a single command. To clear a specific crypto session or a subset of all the sessions (for example, a single tunnel to one remote site), you need to provide session-specific parameters, such as a local or remote IP address, a local or remote port, a front door VPN routing and forwarding (FVRF) name, or an inside VRF (IVRF) name. Typically, the remote IP address will be used to specify a single tunnel to be deleted.
If a local IP address is provided as a parameter when you use the `clear crypto session` command, all the sessions (and their IKE SAs and IPSec SAs) that share the IP address as a local crypto endpoint (IKE local address) will be cleared. If you do not provide a parameter when you use the `clear crypto session` command, all IPSec SAs and IKE SAs that are in the router will be deleted.

## How to Configure IP Security VPN Monitoring

See the following sections for configuration tasks for this feature. Each task in the list is identified as either required or optional.

- Adding the Description of an IKE Peer, page 4 (optional)
- Verifying Peer Descriptions, page 5 (optional)
- Clearing a Crypto Session, page 6 (optional)

## Adding the Description of an IKE Peer

To add the description of an IKE peer to an IPSec VPN session, perform the following steps.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto isakmp peer {ip-address ip-address}`
4. `description`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
To verify peer descriptions, use the `show crypto isakmp peer` command.

### SUMMARY STEPS

1. enable
2. show crypto isakmp peer

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><code>show crypto isakmp peer</code></td>
<td>Displays peer descriptions.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto isakmp peer {ip-address ip-address}</code></td>
<td>Enables an IPSec peer for IKE querying of authentication, authorization, and accounting (AAA) for tunnel attributes in aggressive mode and enters ISAKMP peer configuration mode.</td>
</tr>
</tbody>
</table>

### Examples

The following output example verifies that the description “connection from site A” has been added for IKE peer 10.2.2.9:

```
Router# show crypto isakmp peer
Peer: 10.2.2.9 Port: 500
Description: connection from site A
flags: PEER_POLICY
```

When the peer at address 10.2.2.9 connects and the session comes up, the syslog status will be shown as follows:

```
%CRYPTO-5-SESSION_STATUS: Crypto tunnel is UP. Peer 10.2.2.9:500 Description: connection from site A Id: ezvpn
```
Clearing a Crypto Session

To clear a crypto session, use the `clear crypto session` command from the router command line. No configuration statements are required in the configuration file to use this command.

**SUMMARY STEPS**

1. `enable`
2. `clear crypto session`

**DETAILED STEPS**

<table>
<thead>
<tr>

**Configuration Examples for IP Security VPN Monitoring**

This section provides the following configuration example:

- **show crypto session Command Output: Examples, page 6**

**show crypto session Command Output: Examples**

The following is sample output for the `show crypto session` output without the `detail` keyword:

```
Router# show crypto session

Crypto session current status

Interface: FastEthernet0/1
Session status: UP-ACTIVE
Peer: 172.0.0.2/500
IKE SA: local 172.0.0.1/500 remote 172.0.0.2/500 Active
IPSEC FLOW: permit ip 10.10.0.0/255.255.255.0 10.30.30.0/255.255.255.0
Active SAs: 2, origin: crypto map
```

The following is sample output using the `show crypto session command` and the `detail` keyword:

```
Router# show crypto session detail

Interface: Tunnel0
Session status: UP-ACTIVE
Peer: 10.1.1.3 port 500 fvrf: (none) ivrf: (none)
Desc: this is my peer at 10.1.1.3:500 Green
```
Phase1_id: 10.1.1.3
IKE SA: local 10.1.1.4/500 remote 10.1.1.3/500 Active
   Capabilities:(none) connid:3 lifetime:22:03:24
IPSEC FLOW: permit 47 host 10.1.1.4 host 10.1.1.3
   Active SAs: 0, origin: crypto map
   Inbound: #pkts dec'ed 0 drop 0 life (KB/Sec) 0/0
   Outbound: #pkts enc'ed 0 drop 0 life (KB/Sec) 0/0
IPSEC FLOW: permit ip host 10.1.1.4 host 10.1.1.3
   Active SAs: 4, origin: crypto map
   Inbound: #pkts dec'ed 4 drop 0 life (KB/Sec) 4605665/2949
   Outbound: #pkts enc'ed 4 drop 1 life (KB/Sec) 4605665/2949

Command Reference

The following commands are introduced or modified in the feature or features

- clear crypto session
- **description (isakmp peer)**
- **show crypto isakmp peer**
- **show crypto session**

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
IPSec and Quality of Service

The IPSec and Quality of Service feature allows Cisco IOS quality of service (QoS) policies to be applied to IP Security (IPSec) packet flows on the basis of a QoS group that can be added to the current Internet Security Association and Key Management Protocol (ISAKMP) profile.

Feature History for IPSec and Quality of Service

Prerequisites for IPSec and Quality of Service

- You should be familiar with IPSec and the concept of ISAKMP profiles.
- You should be familiar with Cisco IOS QoS.
Restrictions for IPSec and Quality of Service

- This feature can be applied only via the ISAKMP profile. The limit of 128 QoS groups that exists for QoS applications applies to this feature as well.
- You can apply an IPSec QoS group only to outbound service policies.
- QoS is not supported for software encryption.

Information About IPSec and Quality of Service

To configure the IPSec and Quality of Service feature, you should understand the following concept:

- IPSec and Quality of Service Overview, page 2

IPSec and Quality of Service Overview

The IPSec and Quality of Service feature allows you to apply QoS policies, such as traffic policing and shaping, to IPSec-protected packets by adding a QoS group to ISAKMP profiles. After the QoS group has been added, this group value will be mapped to the same QoS group as defined in QoS class maps. Any current QoS method that makes use of this QoS group tag can be applied to IPSec packet flows. Common groupings of packet flows can have specific policy classes applied by having the IPSec QoS group made available to the QoS mechanism. Marking IPSec flows allows QoS mechanisms to be applied to classes of traffic that could provide support for such things as restricting the amount of bandwidth that is available to specific groups or devices or marking the type of service (ToS) bits on certain flows.

The application of the QoS group is applied at the ISAKMP profile level because it is the profile that can uniquely identify devices through its concept of match identity criteria. These criteria are on the basis of the Internet Key Exchange (IKE) identity that is presented by incoming IKE connections and includes such things as IP address, fully qualified domain name (FQDN), and group (that is, the virtual private network [VPN] remote client grouping). The granularity of the match identity criteria will impose the granularity of the specified QoS policy, for example, to mark all traffic belonging to the VPN client group named “Engineering” as “TOS 5”. Another example of having the granularity of a specified QoS policy imposed would be to allocate 30 percent of the bandwidth on an outbound WAN link to a specific group of remote VPN devices.

How to Configure IPSec and Quality of Service

This section includes the following procedures:

- Configuring IPSec and Quality of Service, page 2 (required)
- Verifying IPSec and Quality of Service Sessions, page 3 (optional)
- Troubleshooting Tips, page 4 (optional)

Configuring IPSec and Quality of Service

To apply QoS policies to an ISAKMP profile, perform the following steps.
SUMMARY STEPS

1. enable
2. configure terminal
3. crypto isakmp-profile profile-name
4. qos-group group-number

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
  Example:  
  Router> enable  
  Enter your password if prompted. |
| Step 2 | configure terminal | Enters global configuration mode.  
  Example:  
  Router# configure terminal |
| Step 3 | crypto isakmp-profile profile-number | Defines an ISAKMP profile, audits IPSec user sessions, and enters ISAKMP profile configuration mode.  
  Example:  
  Router(config)# crypto isakmp-profile vnpnprofile |
| Step 4 | qos-group group-number | Applies a QoS group value to an ISAKMP profile.  
  Example:  
  Router(config-isa-prof)# qos-group 1 |

Verifying IPSec and Quality of Service Sessions

To verify your IPSec and QoS sessions, perform the following steps. The show commands can be used in any order or independent of each other.

SUMMARY STEPS

1. enable
2. show crypto isakmp profile
3. show crypto ipsec sa
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 show crypto isakmp profile</td>
<td>Shows that the QoS group is applied to the profile.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show crypto isakmp profile</td>
</tr>
<tr>
<td>Step 3 show crypto ipsec sa</td>
<td>Shows that the QoS group is applied to a particular pair of IPSec security associations (SAs).</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show crypto ipsec sa</td>
</tr>
</tbody>
</table>

Troubleshooting Tips

If you have a problem with your IPSec and QoS sessions, ensure that you have done the following:

- Validated the application of QoS by the QoS service using the QoS-specific commands in the Cisco IOS Quality of Service Solutions Command Reference, Release 12.3 T.
- Configured a QoS policy on the router that matches the same QoS group as that specified for the class map match criterion.
- Applied the service policy to the same interface to which a crypto map is applied.

Configuration Examples for IPSec and Quality of Service

This section provides the following output examples:

- QoS Policy Applied to Two Groups of Remote Users: Example, page 4
- show crypto isakmp profile Command: Example, page 6
- show crypto ipsec sa Command: Example, page 6

QoS Policy Applied to Two Groups of Remote Users: Example

In the following example, a specific QoS policy is applied to two groups of remote users. Two ISAKMP profiles are configured so that upon initial connection via IKE, remote users are mapped to a specific profile. From that profile, all IPSec SAs that have been created for that remote will be marked with the specific QoS group. As traffic leaves the outbound interface, the QoS service will map the IPSec set QoS group with the QoS group that is specified in the class maps that comprise the service policy that is applied on that outbound interface.

Cisco IP security (IPsec) authentication provides anti-replay protection against an attacker duplicating encrypted packets by assigning a unique sequence number to each encrypted packet. The decryptor keeps track of which packets it has seen on the basis of these numbers. Currently, the default window size is 64 packets. Generally, this number (window size) is sufficient, but there are times when you may want to expand this window size. The IPsec Anti-Replay Window: Expanding and Disabling feature allows you to expand the window size, allowing the decryptor to keep track of more than 64 packets.

Prerequisites for IPsec Anti-Replay Window: Expanding and Disabling

- Before configuring this feature, you should have already created a crypto map or crypto profile.

Information About IPsec Anti-Replay Window: Expanding and Disabling

To configure the IPsec Anti-Replay Window: Expanding and Disabling feature, you should understand the following concept:

- **IPsec Anti-Replay Window, page 2**

IPsec Anti-Replay Window

Cisco IPsec authentication provides anti-replay protection against an attacker duplicating encrypted packets by assigning a unique sequence number to each encrypted packet. (Security association [SA] anti-replay is a security service in which the receiver can reject old or duplicate packets to protect itself against replay attacks.) The decryptor checks off the sequence numbers that it has seen before. The encryptor assigns sequence numbers in an increasing order. The decryptor remembers the value X of the highest sequence number that it has already seen. N is the window size, and the decryptor also remembers whether it has seen packets having sequence numbers from X-N+1 through X. Any packet with the sequence number X–N is discarded. Currently, N is set at 64, so only 64 packets can be tracked by the decryptor.

At times, however, the 64-packet window size is not sufficient. For example, Cisco quality of service (QoS) gives priority to high-priority packets, which could cause some low-priority packets to be discarded even though they could be one of the last 64 packets received by the decryptor. The IPsec Anti-Replay Window: Expanding and Disabling feature allows you to expand the window size, allowing the decryptor to keep track of more than 64 packets.

Increasing the anti-replay window size has no impact on throughput and security. The impact on memory is insignificant because only an extra 128 bytes per incoming IPsec SA is needed to store the sequence number on the decryptor. It is recommended that you use the full 1024 window size to eliminate any future anti-replay problems.
How to Configure IPsec Anti-Replay Window: Expanding and Disabling

This section contains the following procedures:

- Configuring IPsec Anti-Replay Window: Expanding and Disabling Globally, page 3 (optional)
- Configuring IPsec Anti-Replay Window: Expanding and Disabling on a Crypto Map, page 4 (optional)

Configuring IPsec Anti-Replay Window: Expanding and Disabling Globally

To configure IPsec Anti-Replay Window: Expanding and Disabling globally (so that it affects all SAs that are created—except for those that are specifically overridden on a per-crypto map basis), perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto ipsec security-association replay window-size \([N]\)
4. crypto ipsec security-association replay disable
DETAILED STEPS

<table>
<thead>
<tr>

Configuring IPsec Anti-Replay Window: Expanding and Disabling on a Crypto Map

To configure IPsec Anti-Replay Window: Expanding and Disabling on a crypto map so that it affects those SAs that have been created using a specific crypto map or profile, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto map map-name seq-num [ipsec-isakmp]
4. set security-association replay window-size \([N]\)
5. set security-association replay disable
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable  | Enables privileged EXEC mode.  
**Example:**  
Router> enable  
- Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode.  
**Example:**  
Router# configure terminal |
| **Step 3** crypto map map-name seq-num [ipsec-isakmp] | Enters crypto map configuration mode and creates a crypto profile that provides a template for configuration of dynamically created crypto maps.  
**Example:**  
Router (config)# crypto map ETHO 17 ipsec-isakmp |
| **Step 4** set security-association replay window-size [N] | Controls the SAs that are created using the policy specified by a particular crypto map, dynamic crypto map, or crypto profile.  
**Note** Configure this command or the set security-association replay disable command. The two commands are not used at the same time.  
**Example:**  
Router (crypto-map)# set security-association replay window-size 128 |
| **Step 5** set security-association replay disable | Disables replay checking for a particular crypto map, dynamic crypto map, or crypto profile.  
**Note** Configure this command or the set security-association replay window-size command. The two commands are not used at the same time.  
**Example:**  
Router (crypto-map)# set security-association replay disable |

### Troubleshooting Tips

- If your replay window size has not been set to a number that is high enough for the number of packets received, you will receive a system message such as the following:
  
  *Nov 17 19:27:32.279: %CRYPTO-4-PKT_REPLAY_ERR: decrypt: replay check failed connection id=1*

  The above message is generated when a received packet is judged to be outside the anti-replay window.

### Configuration Examples for IPsec Anti-Replay Window: Expanding and Disabling

This section includes the following configuration examples:

- Global Expanding and Disabling of an Anti-Replay Window: Example, page 6
Expanding and Disabling of an Anti-Replay Window for a Particular Crypto Map, Dynamic Crypto Map, or Crypto Profile: Example, page 7

Global Expanding and Disabling of an Anti-Replay Window: Example

The following example shows that the anti-replay window size has been set globally to 1024:

```
version 12.3

The following commands are introduced or modified in the feature or features:

- `crypto ipsec security-association replay disable`
- `crypto ipsec security-association replay window-size`
- `set security-association replay disable`
- `set security-association replay window-size`

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
The IPSec Dead Peer Detection Periodic Message Option feature allows you to configure your router to query the liveliness of its Internet Key Exchange (IKE) peer at regular intervals. The benefit of this approach over the default approach (on-demand dead peer detection) is earlier detection of dead peers.

Prerequisites for IPSec Dead Peer Detection Periodic Message Option

Before configuring the IPSec Dead Peer Detection Periodic Message Option feature, you should have the following:

- Familiarity with configuring IP Security (IPSec).
- An IKE peer that supports DPD (dead peer detection). Implementations that support DPD include the Cisco VPN 3000 concentrator, Cisco PIX Firewall, Cisco VPN Client, and Cisco IOS software in all modes of operation—site-to-site, Easy VPN remote, and Easy VPN server.

Restrictions for IPSec Dead Peer Detection Periodic Message Option

Using periodic DPD potentially allows the router to detect an unresponsive IKE peer with better response time when compared to on-demand DPD. However, use of periodic DPD incurs extra overhead. When communicating to large numbers of IKE peers, you should consider using on-demand DPD instead.

Information About IPSec Dead Peer Detection Periodic Message Option

To configure IPSec Dead Peer Detection Periodic Message Option, you should understand the following concepts:

- How DPD and Cisco IOS Keepalive Features Work, page 2
- Using the IPSec Dead Peer Detection Periodic Message Option, page 3
- Using DPD and Cisco IOS Keepalive Features with Multiple Peers in the Crypto Map, page 3
- Using DPD in an Easy VPN Remote Configuration, page 3

How DPD and Cisco IOS Keepalive Features Work

DPD and Cisco IOS keepalives function on the basis of the timer. If the timer is set for 10 seconds, the router will send a “hello” message every 10 seconds (unless, of course, the router receives a “hello” message from the peer). The benefit of IOS keepalives and periodic DPD is earlier detection of dead peers. However, IOS keepalives and periodic DPD rely on periodic messages that have to be sent with considerable frequency. The result of sending frequent messages is that the communicating peers must encrypt and decrypt more packets.
DPD also has an on-demand approach. The contrasting on-demand approach is the default. With on-demand DPD, messages are sent on the basis of traffic patterns. For example, if a router has to send outbound traffic and the liveliness of the peer is questionable, the router sends a DPD message to query the status of the peer. If a router has no traffic to send, it never sends a DPD message. If a peer is dead, and the router never has any traffic to send to the peer, the router will not find out until the IKE or IPSec security association (SA) has to be rekeyed (the liveliness of the peer is unimportant if the router is not trying to communicate with the peer). On the other hand, if the router has traffic to send to the peer, and the peer does not respond, the router will initiate a DPD message to determine the state of the peer.

Using the IPSec Dead Peer Detection Periodic Message Option

With the IPSec Dead Peer Detection Periodic Message Option feature, you can configure your router so that DPD messages are “forced” at regular intervals. This forced approach results in earlier detection of dead peers. For example, if a router has no traffic to send, a DPD message is still sent at regular intervals, and if a peer is dead, the router does not have to wait until the IKE SA times out to find out.

If you want to configure the DPD periodic message option, you should use the `crypto isakmp keepalive` command with the `periodic` keyword. If you do not configure the `periodic` keyword, the router defaults to the on-demand approach.

**Note**

When the `crypto isakmp keepalive` command is configured, the Cisco IOS software negotiates the use of Cisco IOS keepalives or DPD, depending on which protocol the peer supports.

Using DPD and Cisco IOS Keepalive Features with Multiple Peers in the Crypto Map

DPD and IOS keepalive features can be used in conjunction with multiple peers in the crypto map to allow for stateless failover. DPD allows the router to detect a dead IKE peer, and when the router detects the dead state, the router deletes the IPSec and IKE SAs to the peer. If you configure multiple peers, the router will switch over to the next listed peer for a stateless failover.

Using DPD in an Easy VPN Remote Configuration

DPD can be used in an Easy VPN remote configuration. See the section “Configuring DPD for an Easy VPN Remote” section on page 5.

How to Configure IPSec Dead Peer Detection Periodic Message Option

This section contains the following procedures:

- Configuring a Periodic DPD Message, page 4
- Configuring DPD and Cisco IOS Keepalives with Multiple Peers in the Crypto Map, page 4
- Configuring DPD for an Easy VPN Remote, page 5
- Verifying That DPD Is Enabled, page 6
### Configuring a Periodic DPD Message

To configure a periodic DPD message, perform the following steps.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto isakmp keepalive seconds [retries] [periodic | on-demand]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 3 crypto isakmp keepalive seconds [retries] [periodic</td>
<td>on-demand]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>seconds—Number of seconds between DPD messages.</td>
</tr>
<tr>
<td>Step 3 crypto isakmp keepalive seconds [retries] [periodic</td>
<td>on-demand]</td>
</tr>
<tr>
<td>Example:</td>
<td>periodic—(Optional) DPD messages are sent at regular intervals.</td>
</tr>
<tr>
<td>Step 3 crypto isakmp keepalive seconds [retries] [periodic</td>
<td>on-demand]</td>
</tr>
</tbody>
</table>

### Configuring DPD and Cisco IOS Keepalives with Multiple Peers in the Crypto Map

To configure DPD and IOS keepalives to be used in conjunction with the crypto map to allow for stateless failover, perform the following steps. This configuration will cause a router to cycle through the peer list when it detects that the first peer is dead.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto map map-name seq-num ipsec-isakmp
4. set peer [host-name [dynamic] | ip-address]
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto map map-name seq-num ipsec-isakmp</td>
<td>Enters crypto map configuration mode and creates or modifies a crypto map entry.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config)# crypto map green 1 ipsec-isakmp</td>
</tr>
<tr>
<td><strong>Step 4</strong> set peer {host-name [dynamic]</td>
<td>Specifies an IPSec peer in a crypto map entry.</td>
</tr>
<tr>
<td></td>
<td>ip-address}</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-crypto-map)# set peer 10.12.12.12</td>
</tr>
<tr>
<td><strong>Step 5</strong> set transform-set transform-set-name</td>
<td>Specifies which transform sets can be used with the crypto map entry.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-crypto-map)# set transform-set txfm</td>
</tr>
<tr>
<td><strong>Step 6</strong> match address [access-list-id</td>
<td>Specifies an extended access list for a crypto map entry.</td>
</tr>
<tr>
<td></td>
<td>name]</td>
</tr>
</tbody>
</table>

### Configuring DPD for an Easy VPN Remote

To configure DPD in an Easy VPN remote configuration, perform the following steps. This configuration also will cause a router to cycle through the peer list when it detects that the first peer is dead.

**Note**

IOS keepalives are not supported for Easy VPN remote configurations.

### SUMMARY STEPS

1. enable
2. configure terminal
3. `crypto ipsec client ezvpn name`
4. `connect {auto | manual}`
5. `group group-name key group-key`
6. `mode {client | network-extension}`
7. `peer {ipaddress | hostname}`

**DETAILED STEPS**

**Step 1** `enable`

*Example:* `Router> enable`

Enables privileged EXEC mode.
- Enter your password if prompted.

**Step 2** `configure terminal`

*Example:* `Router# configure terminal`

Enters global configuration mode.

**Step 3** `crypto ipsec client ezvpn name`

*Example:* `Router (config)# crypto ipsec client ezvpn ezvpn-config1`

Creates a Cisco Easy VPN remote configuration and enters the Cisco Easy VPN Remote configuration mode.

**Step 4** `connect {auto | manual}`

*Example:* `Router (config-crypto-ezvpn)# connect manual`

Manually establishes and terminates an IPSec VPN tunnel on demand.
- The `auto` keyword option is the default setting.

**Step 5** `group group-name key group-key`

*Example:* `Router (config-crypto-ezvpn)# group unity key preshared`

Specifies the group name and key value for the Virtual Private Network (VPN) connection.

**Step 6** `mode {client | network-extension}`

*Example:* `Router (config-crypto-ezvpn)# mode client`

Specifies the VPN mode of operation of the router.

**Step 7** `peer {ipaddress | hostname}`

*Example:* `Router (config-crypto-ezvpn)# peer 10.10.10.10`

Sets the peer IP address or host name for the VPN connection.
- A hostname can be specified only when the router has a DNS server available for host-name resolution.
- This command can be repeated multiple times.

**Verifying That DPD Is Enabled**

DPD allows the router to clear the IKE state when a peer becomes unreachable. If DPD is enabled and the peer is unreachable for some time, you can use the `clear crypto session` command to manually clear IKE and IPSec SAs.
The `debug crypto isakmp` command can be used to verify that DPD is enabled.

**SUMMARY STEPS**

1. `enable`
2. `clear crypto session [local ip-address [port local-port]] [remote ip-address [port remote-port]] | [fvrf vrf-name] [ivrf vrf-name]`
3. `debug crypto isakmp`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | `enable` | Enables privileged EXEC mode.  
- Enter your password if prompted.  
Example:  
    ```bash  
    Router> enable  
    ```  
| 2    | `clear crypto session [local ip-address [port local-port]] [remote ip-address [port remote-port]] | [fvrf vrf-name] [ivrf vrf-name]` | Deletes crypto sessions (IPSec and IKE SAs).  
Example:  
    ```bash  
    Router# clear crypto session  
    ```  
| 3    | `debug crypto isakmp` | Displays messages about IKE events.  
Example:  
    ```bash  
    Router# debug crypto isakmp  
    ```

**Configuration Examples for IPSec Dead Peer Detection Periodic Message Option**

This section provides the following configuration examples:

- Site-to-Site Setup with Periodic DPD Enabled: Example, page 7
- Easy VPN Remote with DPD Enabled: Example, page 8
- Verifying DPD Configuration Using the `debug crypto isakmp` Command: Example, page 8
- DPD and Cisco IOS Keepalives Used in Conjunction with Multiple Peers in a Crypto Map: Example, page 11
- DPD Used in Conjunction with Multiple Peers for an Easy VPN Remote: Example, page 11

**Site-to-Site Setup with Periodic DPD Enabled: Example**

The following configurations are for a site-to-site setup with no periodic DPD enabled. The configurations are for the IKE Phase 1 policy and for the IKE preshared key.

**IKE Phase 1 Policy**

```plaintext  
crypto isakmp policy 1  
encryption 3des  
```
Easy VPN Remote with DPD Enabled: Example

The following configuration tells the router to send a periodic DPD message every 30 seconds. If the peer fails to respond to the DPD R_U_THERE message, the router will resend the message every 20 seconds (four transmissions altogether).

```conf
crypto isakmp keepalive 30 20 periodic
crypto ipsec client ezvpn ezvpn-config
  connect auto
  group unity key preshared
  mode client
  peer 10.2.80.209

! interface Ethernet0
  ip address 10.2.3.4 255.255.255.0
  half-duplex
  crypto ipsec client ezvpn ezvpn-config inside

! interface FastEthernet0
  ip address 10.1.32.14 255.255.255.0
  speed auto
  crypto ipsec client ezvpn ezvpn-config outside
```

Verifying DPD Configuration Using the debug crypto isakmp Command: Example

The following sample output from the `debug crypto isakmp` command verifies that IKE DPD is enabled:

```
```
To see that IKE DPD is enabled (and that the peer supports DPD): when periodic DPD is enabled, you should see the following debug messages at the interval specified by the command:

```
```

The above message corresponds to sending the DPD R_U_THERE message.

```
*Mar 25 15:18:52.123: ISAKMP (0:268435457): received packet from 10.2.80.209 dport 500 sport 500 Global (I) QM_IDLE
*Mar 25 15:18:52.131: ISAKMP:(0:1:HW:2): processing NOTIFY R_U_THERE_ACK protocol 1 spi 0, message ID = -443923643, sa = 81BA4DD4
*Mar 25 15:18:52.135: ISAKMP:(0:1:HW:2):DPD/R_U_THERE_ACK received from peer 10.2.80.209, sequence 0x9
```

The above message corresponds to receiving the acknowledge (ACK) message from the peer.

```
```

```
```

```
```

```
```
**PEERS_ALIVE_TIMER**

*Mar 25 15:47:43.379: ISAKMP: set new node -744493014 to QM_IDLE*  
*Mar 25 15:47:43.387: ISAKMP: (0:1:HW:2): sending packet to 10.2.80.209 my_port 500 peer_port 500 (I) QM_IDLE*

*Mar 25 15:47:45.391: ISAKMP: (0:1:HW:2): deleting SA reason "peers alive" state (I) QM_IDLE (peer 10.2.80.209) input queue 0*

*Mar 25 15:47:45.395: ISAKMP: Unlocking IPSec struct 0x81e5c4e8 from delete_siblings, count 0*

*Mar 25 15:47:45.395: %CRYPTO-5-SESSION_STATUS: Crypto tunnel is DOWN. Peer 10.2.80.209:500 Id: 10.2.80.209*

*Mar 25 15:47:45.399: ISAKMP: set new node -2061951065 to QM_IDLE*  
*Mar 25 15:47:45.411: ISAKMP: (0:1:HW:2): sending packet to 10.2.80.209 my_port 500 peer_port 500 (I) QM_IDLE*

*Mar 25 15:47:45.411: ISAKMP: (0:1:HW:2): Input = IKE_MSG_FROM_TIMER, IKE_TIMER_PEERS_ALIVE*

*Mar 25 15:47:45.415: ISAKMP: (0:1:HW:2): deleting SA reason "peers alive" state (I) QM_IDLE (peer 10.2.80.209) input queue 0*

*Mar 25 15:47:45.415: ISAKMP: Unlocking IKE struct 0x81e5c4e8 for isadh_mark_sa_deleted(), count 0*

*Mar 25 15:47:45.415: ISAKMP: Deleting peer node by peer_reap for 10.2.80.209:81e5c4e8*

*Mar 25 15:47:45.419: ISAKMP: (0:1:HW:2): Input = IKE_MSG_INTERNAL, IKE_PHASE1_DEL*

*Mar 25 15:47:45.419: ISAKMP: received ke message (4/1)*

*Mar 25 15:47:45.419: ISAKMP: received ke message (3/1)*

*Mar 25 15:47:45.423: ISAKMP: ignoring request to send delete notify (no ISAKMP sa) src 10.1.32.14 dst 10.2.80.209 for SPI 0x3a78e6bf*

The above message shows what happens when the remote peer is unreachable. The router sends one DPD R_U_THERE message and four retransmissions before it finally deletes the IPSec and IKE SAs.

### DPD and Cisco IOS Keepalives Used in Conjunction with Multiple Peers in a Crypto Map: Example

The following example shows that DPD and Cisco IOS keepalives are used in conjunction with multiple peers in a crypto map configuration when IKE will be used to establish the security associations (SAs). In this example, an SA could be set up to the IPSec peer at 10.0.0.1, 10.0.0.2, or 10.0.0.3.

```
crypto map green 1 ipsec-isakmp
  set peer 10.0.0.1
  set peer 10.0.0.2
  set peer 10.0.0.3
  set transform-set txfm
  match address 101
```

### DPD Used in Conjunction with Multiple Peers for an Easy VPN Remote: Example

The following example shows that DPD is used in conjunction with multiple peers in an Easy VPN remote configuration. In this example, an SA could be set up to the IPSec peer at 10.10.10.10, 10.2.2.2, or 10.3.3.3.

```
crypto ipsec client ezvpn ezvpn-config
  connect auto
  group unity key preshared
  mode client
  peer 10.10.10.10
  peer 10.2.2.2
  peer 10.3.3.3
```

IPSec NAT Transparency

The IPSec NAT Transparency feature introduces support for IP Security (IPSec) traffic to travel through Network Address Translation (NAT) or Port Address Translation (PAT) points in the network by addressing many known incompatibilities between NAT and IPSec.

Feature Specifications for the IPSec NAT Transparency feature

Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:
Availability of Cisco IOS Software Images
Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

Restrictions for IPSec NAT Transparency
Although this feature addresses many incompatibilities between NAT and IPSec, the following problems still exist:

Internet Key Exchange (IKE) IP Address and NAT
This incompatibility applies only when IP addresses are used as a search key to find a preshared key. Modification of the IP source or destination addresses by NAT or reverse NAT results in a mismatch between the IP address and the preshared key.

Embedded IP Addresses and NAT
Because the payload is integrity protected, any IP address enclosed within IPSec packets cannot be translated by NAT. Protocols that use embedded IP addresses include FTP, Internet Relay Chat (IRC), Simple Network Management Protocol (SNMP), Lightweight Directory Access Protocol (LDAP), H.323, and Session Initiation Protocol (SIP).

Information About IPSec NAT Transparency
To configure the IPSec NAT Transparency feature, you must understand the following concepts:

- Benefit of IPSec NAT Transparency, page 3
- Feature Design of IPSec NAT Traversal, page 3
- NAT Keepalives, page 6
Benefit of IPSec NAT Transparency

Before the introduction of this feature, a standard IPSec virtual private network (VPN) tunnel would not work if there were one or more NAT or PAT points in the delivery path of the IPSec packet. This feature makes NAT IPSec-aware, thereby, allowing remote access users to build IPSec tunnels to home gateways.

Feature Design of IPSec NAT Traversal

The IPSec NAT Transparency feature introduces support for IPSec traffic to travel through NAT or PAT points in the network by encapsulating IPSec packets in a User Datagram Protocol (UDP) wrapper, which allows the packets to travel across NAT devices. The following sections define the details of NAT traversal:

- IKE Phase 1 Negotiation: NAT Detection
- IKE Phase 2 Negotiation: NAT Traversal Decision
- UDP Encapsulation of IPSec Packets for NAT Traversal
- UDP Encapsulated Process for Software Engines: Transport Mode and Tunnel Mode ESP Encapsulation

IKE Phase 1 Negotiation: NAT Detection

During Internet Key Exchange (IKE) phase 1 negotiation, two types of NAT detection occur before IKE Quick Mode begins—NAT support and NAT existence along the network path.

To detect NAT support, you should exchange the vendor identification (ID) string with the remote peer. During Main Mode (MM) 1 and MM 2 of IKE phase 1, the remote peer sends a vendor ID string payload to its peer to indicate that this version supports NAT traversal. Thereafter, NAT existence along the network path can be determined.

Detecting whether NAT exists along the network path allows you to find any NAT device between two peers and the exact location of NAT. A NAT device can translate the private IP address and port to public value (or from public to private). This translation changes the IP address and port if the packet goes through the device. To detect whether a NAT device exists along the network path, the peers should send a payload with hashes of the IP address and port of both the source and destination address from each end. If both ends calculate the hashes and the hashes match, each peer knows that a NAT device does not exist on the network path between them. If the hashes do not match (that is, someone translated the address or port), then each peer needs to perform NAT traversal to get the IPSec packet through the network.

The hashes are sent as a series of NAT discovery (NAT-D) payloads. Each payload contains one hash; if multiple hashes exist, multiple NAT-D payloads are sent. In most environments, there are only two NAT-D payloads—one for the source address and port and one for the destination address and port. The destination NAT-D payload is sent first, followed by the source NAT-D payload, which implies that the receiver should expect to process the local NAT-D payload first and the remote NAT-D payload second. The NAT-D payloads are included in the third and fourth messages in Main Mode and in the second and third messages in Aggressive Mode (AM).
IKE Phase 2 Negotiation: NAT Traversal Decision

While IKE phase 1 detects NAT support and NAT existence along the network path, IKE phase 2 decides whether or not the peers at both ends will use NAT traversal. Quick Mode (QM) security association (SA) payload in QM1 and QM2 is used to for NAT traversal negotiation.

Because the NAT device changes the IP address and port number, incompatibilities between NAT and IPSec can be created. Thus, exchanging the original source address bypasses any incompatabilities.

UDP Encapsulation of IPSec Packets for NAT Traversal

In addition to allowing IPSec packets to traverse across NAT devices, UDP encapsulation also addresses many incompatibility issues between IPSec and NAT and PAT. The resolved issues are as follows:

Incompatability Between IPSec ESP and PAT—Resolved

If PAT found a legislative IP address and port, it would drop the Encapsulating Security Payload (ESP) packet. To prevent this scenario, UDP encapsulation is used to hide the ESP packet behind the UDP header. Thus, PAT treats the ESP packet as a UDP packet, processing the ESP packet as a normal UDP packet.

Incompatability Between Checksums and NAT—Resolved

In the new UDP header, the checksum value is always assigned to zero. This value prevents an intermediate device from validating the checksum against the packet checksum, thereby, resolving the TCP UDP checksum issue because NAT changes the IP source and destination addresses.

Incompatability Between Fixed IKE Destination Ports and PAT—Resolved

PAT changes the port address in the new UDP header for translation and leaves the original payload unchanged.

To see how UDP encapsulation helps to send IPSec packets see Figure 1 and Figure 2.
Figure 1  **Standard IPSec Tunnel Through a NAT/PAT Point (No UDP Encapsulation)**

![Diagram of standard IPSec tunnel through a NAT/PAT point (No UDP Encapsulation)](image)

Figure 2  **IPSec Packet with UDP Encapsulation**

![Diagram of IPSec packet with UDP encapsulation](image)
UDP Encapsulated Process for Software Engines: Transport Mode and Tunnel Mode ESP Encapsulation

After the IPSec packet is encrypted by a hardware accelerator or a software crypto engine, a UDP header and a non-IKE marker (which is 8 bytes in length) are inserted between the original IP header and ESP header. The total length, protocol, and checksum fields are changed to match this modification. Figure 3 shows an IPSec packet before and after transport mode is applied; Figure 4 shows an IPSec packet before and after tunnel mode is applied.

NAT Keepalives

NAT keepalives are enabled to keep the dynamic NAT mapping alive during a connection between two peers. NAT keepalives are UDP packets with an unencrypted payload of 1 byte. Although the current dead peer detection (DPD) implementation is similar to NAT keepalives, there is a slight difference: DPD is used to detect peer status, while NAT keepalives are sent if the IPSec entity did not send or receive the packet at a specified period of time—valid range is between 5 to 3600 seconds.

If NAT keepalives are enabled (via the `crypto isamkp nat keepalive` command), users should ensure that the idle value is shorter than the NAT mapping expiration time, which is 20 seconds.
How to Configure NAT and IPSec

This section contains the following procedures:

- Configuring NAT Traversal, page 7 (optional)
- Disabling NAT Traversal, page 7 (optional)
- Configuring NAT Keepalives, page 8 (optional)
- Verifying IPSec Configuration, page 8 (optional)

Configuring NAT Traversal

NAT Traversal is a feature that is auto detected by VPN devices. There are no configuration steps for a
router running Cisco IOS Release 12.2(13)T. If both VPN devices are NAT-T capable, NAT Traversal is
auto detected and auto negotiated.

Disabling NAT Traversal

You may wish to disable NAT traversal if you already know that your network uses IPSec-awareness
NAT (spi-matching scheme). To disable NAT traversal, use the following commands:

**SUMMARY STEPS:**

1. enable
2. configure terminal
3. no crypto ipsec nat-transparency udp-encapsulation

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
**enable** | Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted. |
| **Step 2**  
**configure terminal** | Enters global configuration mode. |
| **Step 3**  
**no crypto ipsec nat-transparency udp-encapsulation** | Disables NAT traversal. |

Example:

Router> enable

Router# configure terminal

Router(config)# no crypto ipsec nat-transparency udp-encapsulation
Configuring NAT Keepalives

To configure your router to send NAT keepalives, use the following commands:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto isakmp nat keepalive *seconds*

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto isakmp nat keepalive <em>seconds</em></td>
<td>Allows an IPSec node to send NAT keepalive packets.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto isakmp nat keepalive 20</td>
<td><em>seconds</em>—The number of seconds between keepalive packets; range is between 5 to 3,600 seconds.</td>
</tr>
</tbody>
</table>

Verifying IPSec Configuration

To verify your configuration, perform the following optional steps:

**SUMMARY STEPS**

1. enable
2. show crypto ipsec sa [map map-name | address | identity] [detail]
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show crypto ipsec sa [map map-name</td>
<td>address</td>
</tr>
<tr>
<td>Example: show crypto ipsec sa</td>
<td></td>
</tr>
</tbody>
</table>

Configuration Examples for IPSec and NAT

This section provides the following configuration example:

- **NAT Keepalives Configuration Example, page 9**

NAT Keepalives Configuration Example

The following example shows how to enable NAT keepalives to be sent every 20 seconds:

```plaintext
crypto isakmp policy 1  
   authentication pre-share  
crypto isakmp key 1234 address 56.0.0.1  
crypto isakmp nat keepalive 20  
!  
crypto ipsec transform-set t2 esp-des esp-sha-hmac  
!  
crypto map test2 10 ipsec-isakmp  
   set peer 56.0.0.1  
   set transform-set t2  
match address 101
```

Command Reference

The following commands are introduced or modified in the feature or features

- crypto isamkp nat keepalive
- access-list (IP extended)
- show crypto ipsec sa

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Glossary

IKE—Internet Key Exchange. Hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the Internet Security Association Key Management Protocol (ISAKMP) framework. Although IKE can be used with other protocols, its initial implementation is with IPSec. IKE provides authentication of the IPSec peers, negotiates IPSec keys, and negotiates IPSec security associations (SAs).

IPSec—IP Security. Framework of open standards developed by the Internet Engineering Task Force (IETF). IPSec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPSec acts at the network layer, protecting and authenticating IP packets between participating IPSec devices ("peers"), such as Cisco routers.

NAT—Network Address Translation. Translates a private IP address used inside the corporation to a public, routable address for use on the outside of the corporation, such as the Internet. NAT is considered a one-to-one mapping of addresses from private to public.

PAT—Port Address Translation. Like NAT, PAT also translated private IP address to public, routable addresses. Unlike NAT, PAT provides a many-to-one mapping of private addresses to a public address; each instance of the public address is associated with a particular port number to provide uniqueness. PAT can be used in environments where the cost of obtaining a range of public addresses is too expensive for an organization.

Refer to the Internetworking Terms and Acronyms for terms not included in this glossary.

Note

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

© 2007 Cisco Systems, Inc. All rights reserved.
The IP Security (IPsec) Preferred Peer feature allows you to control the circumstances by which multiple peers on a crypto map are tried in a failover scenario.

This feature includes the following capabilities:

- Default peer configuration
- IPsec idle-timer usage with default peer

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for IPsec Preferred Peer” section on page 9.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IPsec Preferred Peer

- You must have a properly defined, complete crypto map.

Restrictions for IPsec Preferred Peer

Default peer:
- This feature must be used in conjunction with Dead Peer Detection (DPD). It is most effective on a remote site running DPD in periodic mode. DPD detects the failure of a device quickly and resets the peer list so that the default peer is tried for the next attempted connection.
- Only one peer can be designated as the default peer in a crypto map.
- The default peer must be the first peer in the peer list.

IPsec idle-timer usage with default peer:
- This feature works only on the crypto map for which it is configured. You cannot configure the capability globally for all crypto maps.
- If there is a global idle timer, the crypto map idle-timer value must be different from the global value; otherwise, the idle timer is not added to the crypto map.

Information About IPsec Preferred Peer

To configure IPsec Preferred Peer, you need to understand the following concepts:
- IPsec, page 2
- Dead Peer Detection, page 3
- Default Peer Configuration, page 3
- Idle Timers, page 4
- IPsec Idle-Timer Usage with Default Peer, page 4
- Peers on Crypto Maps, page 4

IPsec

IPsec is a framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating Internet Protocol (IP) packets between participating IPsec devices (peers), such as Cisco routers.

IPsec provides the following network security services. These services are optional. In general, local security policy dictates the use of one or more of these services:
- Data Confidentiality—The IPsec sender can encrypt packets before transmitting them across a network.
• Data Integrity—The IPsec receiver can authenticate packets sent by the IPsec sender to ensure that the data has not been altered during transmission.
• Data Origin Authentication—The IPsec receiver can authenticate the source of the IPsec packets sent.
• Anti-Replay—The IPsec receiver can detect and reject replayed packets.

With IPsec, data can be transmitted across a public network without fear of observation, modification, or spoofing. This enables applications such as Virtual Private Networks (VPNs), including intranets, extranets, and remote user access.

IPsec provides secure tunnels between two peers, such as two routers. You define which packets are considered sensitive and should be sent through these secure tunnels, and you define the parameters that should be used to protect these sensitive packets, by specifying characteristics of these tunnels. When the IPsec peer sees such a sensitive packet, it sets up the appropriate secure tunnel and sends the packet through the tunnel to the remote peer.

**Dead Peer Detection**

The VPN Client uses a keepalive mechanism called Dead Peer Detection (DPD) to check the availability of the VPN device on the other side of an IPsec tunnel. If the network is unusually busy or unreliable, you can increase the number of seconds that the VPN Client will wait before deciding whether the peer is no longer active.

Keepalive packets are not sent if traffic is received. This lowers the overhead associated with DPD, because on a heavily loaded network very few keepalive packets will be sent because traffic is being received on the tunnels. In addition, DPD sends keepalive packets only if there is user traffic to send (and no user traffic is received).

You can configure Internet Key Exchange (IKE) DPD so that DPD sends the keepalive packets whether or not there is outbound user data. That is, as long as there is no inbound user data, the keepalive packets are sent at the configured keepalive interval.

**Default Peer Configuration**

If a connection timeout occurs, the connection to the current peer is closed. The set peer command allows you to configure the first peer as the default peer. If there is a default peer, the next time a connection is initiated, the connection is directed to the default peer instead of to the next peer in the peer list. If the default peer is unresponsive, the next peer in the peer list becomes the current peer and future connections through the crypto map try that peer.

This capability is useful when traffic on a physical link stops due to the failure of a remote peer. DPD indicates that the remote peer is unavailable, but that peer remains the current peer.

A default peer facilitates the failover to a preferred peer that was previously unavailable, but has returned to service. Users can give preference to certain peers in the event of a failover. This is useful if the original failure was due to a network connectivity problem rather than failure of the remote peer.
Idle Timers

When a router running Cisco IOS software creates an IPsec security association (SA) for a peer, resources must be allocated to maintain the SA. The SA requires both memory and several managed timers. For idle peers, these resources are wasted. If enough resources are wasted by idle peers, the router could be prevented from creating new SAs with other peers.

IPsec SA idle timers increase the availability of resources by deleting SAs associated with idle peers. Because IPsec SA idle timers prevent the wasting of resources by idle peers, more resources are available to create new SAs when required.

If IPsec SA idle timers are not configured, only the global lifetimes for IPsec SAs are applied. SAs are maintained until the global timers expire, regardless of peer activity.

IPsec Idle-Timer Usage with Default Peer

If all connections to the current peer time out, the next time a connection is initiated it is directed to the default peer configured in the `set peer` command. If a default peer is not configured and there is a connection timeout, the current peer remains the one that timed out.

This enhancement helps facilitate a failover to a preferred peer that was previously unavailable but is in service now.

Peers on Crypto Maps

A crypto map set can contain multiple entries, each with a different access list. The router searches the crypto map entries in order, and attempts to match the packet to the access list specified in that entry.

When a packet matches a `permit` entry in a particular access list, and the corresponding crypto map entry is tagged as Cisco, connections are established with the remote peer as specified in the `set peer` statements within the crypto map.

How to Configure IPsec Preferred Peer

This section contains the following procedures:

- Configuring a Default Peer, page 4 (required)
- Configuring the Idle Timer, page 5 (optional)

Configuring a Default Peer

To configure a default peer, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto map map-name seq-num [ipsec-isakmp] [dynamic dynamic-map-name] [discover] [profile profile-name]`
4. `set peer {host-name [dynamic] [default] | ip-address [default]}`
5. `exit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.
  - Enter your password if prompted. |
| **Example:**
  Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**
  Router# configure terminal | |
| **Step 3** crypto map map-name seq-num [ipsec-isakmp] [dynamic dynamic-map-name] [discover] [profile profile-name] | Enters crypto map configuration mode. Creates or modifies a crypto map entry, creates a crypto profile that provides a template for configuration of dynamically created crypto maps, or configures a client accounting list. |
| **Example:**
  Router(config)# crypto map mymap 10 ipsec-isakmp | |
| **Step 4** set peer {host-name [dynamic] [default] | ip-address [default] } | Specifies an IPsec peer in a crypto map entry. Ensures that the first peer specified is defined as the default peer. |
| **Example:**
  Router(config-crypto-map)# set peer 10.0.0.2 default | |
| **Step 5** exit | Exits crypto map configuration mode and returns to global configuration mode. |
| **Example:**
  Router(config-crypto-map)# exit | |

### Configuring the Idle Timer

To configure the idle timer, perform the following steps.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto map map-name seq-num [ipsec-isakmp] [dynamic dynamic-map-name] [discover] [profile profile-name]`
4. `set security-association idletime seconds [default]`
5. `exit`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable                 | Enables privileged EXEC mode.  

  - Enter your password if prompted. |
| **Step 2** configure terminal     | Enters global configuration mode. |
| **Step 3** crypto map map-name seq-num [ipsec-isakmp] [dynamic dynamic-map-name] [discover] [profile profile-name] | Enters crypto map configuration mode. Creates or modifies a crypto map entry, creates a crypto profile that provides a template for configuration of dynamically created crypto maps, or configures a client accounting list. |
| **Step 4** set security-association idletime seconds [default] | Specifies the maximum amount of time for which the current peer can be idle before the default peer is used. |
| **Step 5** exit                   | Exits crypto map configuration mode and returns to global configuration mode. |

### Configuration Examples for IPsec Preferred Peer

- Configuring a Default Peer: Example, page 6  
- Configuring the IPsec Idle Timer: Example, page 6

### Configuring a Default Peer: Example

The following example shows that the first peer, at IP address 10.1.1.1, is the default peer:

```plaintext
crypto map tohub 1 ipsec-isakmp  
set peer 10.1.1.1 default  
set peer 10.2.1.1 default
```

### Configuring the IPsec Idle Timer: Example

In the following example, if the current peer is idle for 120 seconds, the default peer 10.1.1.1 (which was specified in the `set peer` command) is used for the next attempted connection:

```plaintext
crypto map tohub 1 ipsec-isakmp
```
Additional References

The following sections provide references related to IPsec Preferred Peer.

Command Reference

The following commands are introduced or modified in the feature or features:

- `set peer (IPsec)`
- `set security-association idle-time`

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.

Feature Information for IPsec Preferred Peer

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note: Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.
Glossary

crypto access list—A list that defines which IP traffic will be protected by crypto and which traffic will not be protected by crypto.

crypto map—A map that specifies which traffic should be protected by IPsec, where IPsec-protected traffic should be sent, and what IPsec transform sets should be applied to this traffic.

dead peer detection—A feature that allows the router to detect an unresponsive peer.

keepalive message—A message sent by one network device to inform another network device that the virtual circuit between the two is still active.

peer—Router or other device that participates in IPsec and IKE. In IPsec, peers are devices or entities that communicate securely either through the exchange of keys or the exchange of digital certificates.

SA—security association. An instance of security policy and keying material applied to a data flow. Both IKE and IPsec use SAs, although SAs are independent of one another. IPsec SAs are unidirectional and are unique in each security protocol. An IKE SA is used by IKE only, and unlike the IPsec SA, it is bidirectional. IKE negotiates and establishes SAs on behalf of IPsec. A user also can establish IPsec SAs manually. A set of SAs are needed for a protected data pipe, one per direction per protocol. For example, if you have a pipe that supports Encapsulating Security Payload (ESP) between peers, one ESP SA is required for each direction. SAs are identified uniquely by destination (IPsec endpoint) address, security protocol (AH or ESP), and security parameter index (SPI).

transform set—An acceptable combination of security protocols, algorithms, and other settings to apply to IPsec-protected traffic. During the IPsec security association negotiation, the peers agree to use a particular transform set when protecting a particular data flow.

IPSec Security Association Idle Timers

When a router running the Cisco IOS software creates an IPsec security association (SA) for a peer, resources must be allocated to maintain the SA. The SA requires both memory and several managed timers. For idle peers, these resources are wasted. If enough resources are wasted by idle peers, the router could be prevented from creating new SAs with other peers. The IPsec Security Association Idle Timers feature introduces a configurable idle timer to monitor SAs for activity, allowing SAs for idle peers to be deleted. Benefits of this feature include:

- Increased availability of resources
- Improved scalability of Cisco IOS IPsec deployments

**Supported Platforms**

Cisco 1700 series access routers, Cisco 2400 series integrated access devices, Cisco 2600 series multiservice platforms, Cisco 3600 series multiservice platforms, Cisco 3700 series multiservice access routers, Cisco 7100 series VPN routers, Cisco 7200 series routers, Cisco 7400 series routers, Cisco 7500 series routers, Cisco 801–804 ISDN routers, Cisco 805 serial router, Cisco 806 broadband router, Cisco 811, Cisco 813, Cisco 820, Cisco 827 ADSL router, Cisco 828 G.SHDSL router, Cisco 8850-RPM, Cisco 950, Cisco AS5350 universal gateway, Cisco AS5400 series universal gateways, Cisco integrated communications system 7750, Cisco MC3810 series multiservice access concentrators, Cisco ubr7200, Cisco ubr900 series cable access routers

**Finding Support Information for Platforms and Cisco IOS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at [http://www.cisco.com/go/fn](http://www.cisco.com/go/fn). You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.
Prerequisites for IPsec Security Association Idle Timers

Information About IPsec Security Association Idle Timers

To configure the IPsec Security Association Idle Timers feature, you must understand the following concepts:

- Lifetimes for IPsec Security Associations, page 2
- IPsec Security Association Idle Timers, page 2
- Benefits of IPsec Security Association Idle Timers, page 3

Lifetimes for IPsec Security Associations

The Cisco IOS software currently allows the configuration of lifetimes for IPsec SAs. Lifetimes can be configured globally or per crypto map. There are two lifetimes: a “timed” lifetime and a “traffic-volume” lifetime. A security association expires after the first of these lifetimes is reached.

IPsec Security Association Idle Timers

The IPsec SA idle timers are different from the global lifetimes for IPsec SAs. The expiration of the global lifetime is independent of peer activity. The IPsec SA idle timer allows SAs associated with inactive peers to be deleted before the global lifetime has expired.

If the IPsec SA idle timers are not configured, only the global lifetimes for IPsec SAs are applied. SAs are maintained until the global timers expire, regardless of peer activity.

Note

If the last IPsec SA to a given peer is deleted due to idle timer expiration, the Internet Key Exchange (IKE) SA to that peer will also be deleted.
Benefits of IPsec Security Association Idle Timers

**Increased Availability of Resources**
Configuring the IPsec Security Association Idle Timers feature increases the availability of resources by deleting SAs associated with idle peers.

**Improved Scalability of Cisco IOS IPsec Deployments**
Because the IPsec Security Association Idle Timers feature prevents the wasting of resources by idle peers, more resources will be available to create new SAs as required.

How to Configure IPsec Security Association Idle Timers

- Configuring the IPsec SA Idle Timer Globally, page 3
- Configuring the IPsec SA Idle Timer per Crypto Map, page 4

Configuring the IPsec SA Idle Timer Globally

This task configures the IPsec SA idle timer globally. The idle timer configuration will be applied to all SAs.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto ipsec security-association idle-time `seconds`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td>Step 3 crypto ipsec security-association idle-time <code>seconds</code></td>
<td>Configures the IPsec SA idle timer.</td>
</tr>
<tr>
<td>Example:</td>
<td>• The <code>seconds</code> argument specifies the time, in seconds, that the idle timer will allow an inactive peer to maintain an SA. Valid values for the <code>seconds</code> argument range from 60 to 86400.</td>
</tr>
</tbody>
</table>

Example:
```
Router> enable
Router# configure terminal
Router(config)# crypto ipsec security-association idle-time 600
```
Configuring the IPsec SA Idle Timer per Crypto Map

This task configures the IPsec SA idle timer for a specified crypto map. The idle timer configuration will be applied to all SAs under the specified crypto map.

**Note**

This configuration task was available effective with Cisco IOS Release 12.3(14)T.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto map map-name seq-number ipsec-isakmp`
4. `set security-association idle-time seconds`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router&gt; enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>crypto map map-name seq-number ipsec-isakmp</code></td>
<td>Creates or modifies a crypto map entry and enters crypto map configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router(config)# crypto map test 1 ipsec-isakmp</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>set security-association idle-time seconds</code></td>
<td>Specifies the maximum amount of time for which the current peer can be idle before the default peer is used.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router(config-crypto-map)# set security-association idle-time 600</code></td>
<td>- The <code>seconds</code> argument is the number of seconds for which the current peer can be idle before the default peer is used. Valid values are 60 to 86400.</td>
</tr>
</tbody>
</table>
Configuration Examples for IPsec Security Association Idle Timers

- Configuring the IPsec SA Idle Timer Globally Example, page 5
- Configuring the IPsec SA Idle Timer per Crypto Map Example, page 5

Configuring the IPsec SA Idle Timer Globally Example

The following example globally configures the IPsec SA idle timer to drop SAs for inactive peers after 600 seconds:

```
crypto ipsec security-association idle-time 600
```

Configuring the IPsec SA Idle Timer per Crypto Map Example

The following example configures the IPsec SA idle timer for the crypto map named test to drop SAs for inactive peers after 600 seconds:

```
crypto map test 1 ipsec-isakmp
set security-association idle-time 600
```

Note

The above configuration was not available until Cisco IOS Release 12.3(14)T.

This document describes the IPSec—SNMP Support feature in Cisco IOS Release 12.1 E, 12.2 T, and 12.2 S and includes the following sections:

- Feature Overview, page 2
- Supported Platforms, page 3
- Supported Standards, MIBs, and RFCs, page 5
- Configuration Tasks, page 5
- Monitoring and Maintaining IPSec MIB, page 7
- Configuration Examples, page 7
- Command Reference, page 8
- Glossary, page 9
Note
This document focuses on Cisco IOS CLI support for the Cisco IPSec MIBs. This document also lists which elements of the MIBs are currently supported. This document does not describe SNMP configuration (from a Network Management Station) of the Cisco IPSec MIBs.

Feature Overview

The IP Security (IPSec) - SNMP Support feature introduces support for industry-standard IPSec MIBs and Cisco IOS-software specific IPSec MIBs.

The IPSec MIBs allow IPSec configuration monitoring and IPSec status monitoring using SNMP, and can be integrated in a variety of Virtual Private Network (VPN) management solutions.

For example, this feature allows you to specify the desired size of a tunnel history table or a tunnel failure table using the Cisco IOS CLI. The history table archives attribute and statistic information about the tunnel; the failure table archives tunnel failure reasons along with the time failure occurred. A failure history table can be used as a simple method to distinguish between a normal and an abnormal tunnel termination. That is, if a tunnel entry in the tunnel history table has no associated failure record, the tunnel must have terminated normally. However, a tunnel history table does not accompany every failure table because every failure does not correspond to a tunnel. Thus, supported setup failures are recorded in the failure table, but an associated history table is not recorded because a tunnel was never set up.

This feature also provides IPSec Simple Network Management Protocol (SNMP) notifications for use with network management systems.

Benefits

The commands in this feature allow you to examine the version of the IPSec MIB feature, to enable and disable SNMP traps, and to monitor and control the size of the buffers used by this feature.

Restrictions

Only the following tunnel setup failure logs are supported with the IPSec - SNMP Support feature:

- NOTIFY_MIB_IPSEC_PROPOSAL_INVALID
  “A tunnel could not be established because the peer did not supply an acceptable proposal.”
- NOTIFY_MIB_IPSEC_ENCRYPT_FAILURE
  “A tunnel could not be established because it failed to encrypt a packet to be sent to a peer.”
- NOTIFY_MIB_IPSEC_SYSCAP_FAILURE
  “A tunnel could not be established because the system ran out of resources.”
- NOTIFY_MIB_IPSEC_LOCAL_FAILURE
  “A tunnel could not be established because of an internal error.”

Note that these failure notices are recorded in the failure tables, but are not available as SNMP notifications (traps).
The following functions are not supported with the IPSec MIB feature:

- Checkpointing
- The Dynamic Cryptomap table of the CISCO-IPSEC-MIB

**Note**

CISCO-IPSEC-FLOW-MONITOR-MIB notifications are not supported before Cisco IOS Release 12.1(5a)E.

The CISCO-IPSEC-POLICY-MAP-MIB (ciscoIpSecPolMap) defines no notifications (the “IPSec Policy Map Notifications Group” is empty).

### Related Features and Technologies

The IPSec—SNMP Support feature was designed to support the VPN Device Manager (VDM). VDM enables network administrators to manage and configure site-to-site VPNs on a single device from a web browser and to see the effects of changes in real time. VDM implements a wizard-based graphical user interface (GUI) to simplify the process of configuring site-to-site VPNs using the IPSec protocol. VDM software is installed directly on Cisco VPN routers, and is designed for use and compatibility with future Device Manager products.

For more information on Cisco VDM, refer to the following URL:

### Related Documents

**IPSec and Related Security Information**

- Cisco IOS Security Configuration Guide
- Cisco IOS Security Command Reference

**SNMP Configuration Information**

- Cisco IOS Configuration Fundamentals Configuration Guide
- *Cisco IOS Configuration Fundamentals Command Reference*

For the Cisco IOS Release 12.1 E implementation of security and SNMP features, refer to the Cisco IOS Release 12.1 versions of these documents. For Cisco IOS Release 12.2 T and 12.2 S implementation of these features, refer to the Cisco IOS Release 12.2 versions of these documents.

### Supported Platforms

The IPSec MIB feature is supported on the following platforms in Cisco IOS Release 12.1(4)E:

- Cisco 7100 series
- Cisco 7200 series
- Cisco 7500 series (RSP7000 and 7500)

The IPSec MIB feature is supported on the following platforms in Cisco IOS Release 12.2(4)T:

- Cisco 800 series (800, 805, 806, 820, 827, 828)
- Cisco 900 series
- Cisco 1600 and 1600R series
- Cisco 1700 series (1710, 1720, 1750, 1751, 1760)
- Cisco 2400 series
- Cisco 2600 and 2600XM series
- Cisco 3600 series (Cisco 3620, 3640, and 3660)
- Cisco 3745
- Cisco 4000
- Cisco 4500
- Cisco 5300 series
- Cisco 5400 series
- Cisco 5800 series
- Cisco 7100 series
- Cisco 7200 series
- Cisco 7400 series
- Cisco 7500 series (Cisco IOS Release 12.2(4)T2 and later releases)
- Cisco 7700 series
- Cisco MC3810
- Cisco uBR900 series (uBR900, uBR904, uBR905, uBR910, uBR920, uBR925
- Cisco uBR7200

The IPSec MIB feature is supported on the following platforms in Cisco IOS Release 12.2(14)S:

- Cisco 7200 series
- Cisco 7400 series
- Cisco 7500 series

**Determining Platform Support Through Cisco Feature Navigator**

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register
Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn

**Availability of Cisco IOS Software Images**
Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

**Supported Standards, MIBs, and RFCs**

**Standards**
No new or modified standards are supported by this feature.

**MIBs**
The following MIBs are supported by the IPSec—SNMP Support feature:
- CISCO-IPSEC-FLOW-MONITOR-MIB
- CISCO-IPSEC-MIB
- CISCO-IPSEC-POLICY-MAP-MIB

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

http://tools.cisco.com/ITDIT/MIBS/servlet/index

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

**RFCs**
No new or modified RFCs are supported by this feature.

**Configuration Tasks**

See the following sections for configuration tasks for the IPSec—SNMP Support feature. Each task in the list is identified as either required or optional:
- **Enabling IPSec SNMP Notifications** (required)
Configuration Tasks

- Configuring IPSec Failure History Table Size (optional)
- Configuring IPSec Tunnel History Table Size (optional)

Enabling IPSec SNMP Notifications

To enable a router to send IPSec trap or inform notifications to a specified host, use the following commands in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
Router(config)# snmp-server enable traps ipsec
cryptomap [add | delete | attach | detach] | Enables a router to send IPSec SNMP notifications. |
| **Step 2**
Router(config)# snmp-server enable traps isakmp
{policy {add | delete | tunnel {start | stop}}} | Enables a router to send IPSec ISAKMP SNMP notifications. |
| **Step 3**
Router(config)# snmp-server host host-address traps
community-string ipsec | Specifies the recipient of IPSec SNMP notification operations. |

For more information on configuring SNMP, refer to the chapter “Configuring SNMP Support” in the Cisco IOS Configuration Fundamentals Configuration Guide.

Configuring IPSec Failure History Table Size

The default failure history table size is 200. To change the size of the failure history table, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# crypto mib ipsec flowmib history failure size number</td>
<td>Changes the size of the IPSec failure history table.</td>
</tr>
</tbody>
</table>

Configuring IPSec Tunnel History Table Size

The default tunnel history table size is 200. To change the size of the tunnel history table, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# crypto mib ipsec flowmib history tunnel size number</td>
<td>Changes the size of the IPSec tunnel history table.</td>
</tr>
</tbody>
</table>

Verifying IPSec MIB Configuration

To verify that the IPSec MIB feature is configured properly, perform the following tasks:

- Enter the **show crypto mib ipsec flowmib history failure size** privileged EXEC command to display the size of the failure history table:

  ```
  Router# show crypto mib ipsec flowmib history failure size
  ```
IPSec Failure Window Size: 140

- Enter the `show crypto mib ipsec flowmib history tunnel size` privileged EXEC command to display the size of the tunnel history table:
  
  ```
  Router# show crypto mib ipsec flowmib history tunnel size
  IPSec History Window Size: 130
  ```

- Enter the `show crypto mib ipsec flowmib version` privileged EXEC command to display the MIB version used by the management applications to identify the feature set:
  
  ```
  Router# show crypto mib ipsec flowmib version
  IPSec Flow MIB version: 1
  ```

- Enter the `debug crypto mib` command to display the IPSec MIB debug message notifications:
  
  ```
  Router# debug crypto mib
  Crypto IPSec Mgmt Entity debugging is on
  ```

## Monitoring and Maintaining IPSec MIB

To monitor the status of IPSec MIB information, use any of the following commands in EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router# show crypto mib ipsec flowmib history failure size</code></td>
<td>Displays the size of the IPSec failure history table.</td>
</tr>
<tr>
<td><code>Router# show crypto mib ipsec flowmib history tunnel size</code></td>
<td>Displays the size of the IPSec tunnel history table.</td>
</tr>
<tr>
<td><code>Router# show crypto mib ipsec flowmib version</code></td>
<td>Displays the IPSec Flow MIB version used by the router.</td>
</tr>
</tbody>
</table>

## Configuration Examples

This section provides the following configuration examples:

- **Enabling IPSec Notifications Examples**
- **Specifying History Table Size Examples**

### Enabling IPSec Notifications Examples

In the following example, IPSec notifications are enabled:

```
snmp-server enable traps ipsec isakmp
```

In the following example, the router is configured to send IPSec notifications to the host `nms1.cisco.com`:

```
snmp-server host nms1.cisco.com public ipsec isakmp
Translating "nms1.cisco.com"...domain server (171.00.0.01) [OK]
```
Specifying History Table Size Examples

In the following example, the specified failure history table size is 140:
```
crypto mib ipsec flowmib history failure size 140
```

In the following example, the specified tunnel history table size is 130:
```
crypto mib ipsec flowmib history tunnel size 130
```

Command Reference

The following commands are introduced or modified in the feature or features:
- `crypto mib ipsec flowmib history failure size`
- `crypto mib ipsec flowmib history tunnel size`
- `debug crypto mib`
- `show crypto mib ipsec flowmib history failure size`
- `show crypto mib ipsec flowmib history tunnel size`
- `show crypto mib ipsec flowmib version`
- `snmp-server enable traps ipsec`
- `snmp-server enable traps isakmp`
- `snmp-server host`

For information about all Cisco IOS commands, see the Command Lookup Tool at [http://tools.cisco.com/Support/CLILookup](http://tools.cisco.com/Support/CLILookup) or the Master Command List.
CA—certificate authority. A certificate authority (CA) is an entity in a network that issues and manages security credentials and public keys (in the form of X509v3 certificates) for message encryption. As part of a public key infrastructure (PKI), a CA checks with a registration authority (RA) to verify information provided by the requestor of a digital certificate. If the RA verifies the requestor’s information, the CA can then issue a certificate. Certificates generally include the owner’s public key, the expiration date of the certificate, the owner’s name, and other information about the public key owner.

IP Security—See IPSec.

IPSec—Internet Protocol Security. A framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses Internet Key Exchange (IKE) to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

Management Information Base—See MIB.

MIB—Management Information Base. Database of network management information that is used and maintained by a network management protocol such as Simple Network Management Protocol (SNMP) or Common Management Information Protocol (MIP). The value of a MIB object can be changed or retrieved using SNMP or CMIP commands, usually through a graphical user interface (GUI) network management system (NMS). MIB objects are organized in a tree structure that includes public (standard) and private (proprietary) branches.

Simple Network Management Protocol—See SNMP.

SNMP—Simple Network Management Protocol. An application-layer protocol that provides a message format for communication between SNMP managers and agents.

trap—Message sent by an SNMP agent to a network management system, console, or terminal to indicate the occurrence of a significant event, such as a specifically defined condition or a threshold that was reached.
IPsec Virtual Tunnel Interface

First Published: October 18, 2004
Last Updated: June 11, 2008
IP security (IPsec) virtual tunnel interfaces (VTIs) provide a routable interface type for terminating IPsec tunnels and an easy way to define protection between sites to form an overlay network. IPsec VTIs simplify configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for IPsec Virtual Tunnel Interface” section on page 24.

Finding Support Information for Platforms and Cisco IOS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for IPsec Virtual Tunnel Interface

**IPsec Transform Set**
The IPsec transform set must be configured in tunnel mode only.

**IKE Security Association**
The Internet Key Exchange (IKE) security association (SA) is bound to the VTI. Because IKE SA is bound to the VTI, the same IKE SA cannot be used for a crypto map.

**IPsec SA Traffic Selectors**
Static VTIs support only a single IPsec SA that is attached to the VTI interface. The traffic selector for the IPsec SA is always “IP any any.”

A dynamic VTI also is a point-point interface that supports only a single IPsec SA, but the dynamic VTI is flexible in that it can accept the IPsec selectors that are proposed by the initiator.

**IPv4 and IPv6 Packets**
This feature supports static VTIs that are configured to encapsulate IPv4 packets or IPv6 packets, but IPv4 packets cannot carry IPv6 packets, and IPv6 packets cannot carry IPv4 packets.

**Proxy**
Static VTIs support only the “IP any any” proxy.
Dynamic VTIs support only one proxy, which can be “IP any any” or any subset of it.

**QoS Traffic Shaping**
The shaped traffic is process switched.

**Stateful Failover**
IPsec stateful failover is not supported with IPsec VTIs.

**Tunnel Protection**
The `shared` keyword is not required and must not be configured when using the `tunnel mode ipsec ipv4` command for IPsec IPv4 mode.

**Static VTIs Versus GRE Tunnels**
The IPsec VTI is limited to IP unicast and multicast traffic only, as opposed to GRE tunnels, which have a wider application for IPsec implementation.

**VRF-Aware IPsec Configuration**
In VRF-aware IPsec configurations with either static or dynamic VTIs (DVTIs), the VRF must not be configured in the Internet Security Association and Key Management Protocol (ISAKMP) profile. Instead, the VRF must be configured on the tunnel interface for static VTIs. For DVTIs, you must apply VRF to the vtemplate using the `ip vrf forwarding` command.
Information About IPsec Virtual Tunnel Interface

The use of IPsec VTIs both greatly simplifies the configuration process when you need to provide protection for remote access and provides a simpler alternative to using generic routing encapsulation (GRE) or Layer 2 Tunneling Protocol (L2TP) tunnels for encapsulation and crypto maps with IPsec. A major benefit associated with IPsec VTIs is that the configuration does not require a static mapping of IPsec sessions to a physical interface. The IPsec tunnel endpoint is associated with an actual (virtual) interface. Because there is a routable interface at the tunnel endpoint, many common interface capabilities can be applied to the IPsec tunnel.

The IPsec VTI allows for the flexibility of sending and receiving both IP unicast and multicast encrypted traffic on any physical interface, such as in the case of multiple paths. Traffic is encrypted or decrypted when it is forwarded from or to the tunnel interface and is managed by the IP routing table. Using IP routing to forward the traffic to the tunnel interface simplifies the IPsec VPN configuration compared to the more complex process of using access control lists (ACLs) with the crypto map in native IPsec configurations. DVTIs function like any other real interface so that you can apply quality of service (QoS), firewall, and other security services as soon as the tunnel is active.

Without Virtual Private Network (VPN) Acceleration Module2+ (VAM2+) accelerating virtual interfaces, the packet traversing an IPsec virtual interface is directed to the router processor (RP) for encapsulation. This method tends to be slow and has limited scalability. In hardware crypto mode, all the IPsec VTIs are accelerated by the VAM2+ crypto engine, and all traffic going through the tunnel is encrypted and decrypted by the VAM2+.

The following sections provide details about the IPsec VTI:

- Benefits of Using IPsec Virtual Tunnel Interfaces, page 3
- Routing with IPsec Virtual Tunnel Interfaces, page 5
- Static Virtual Tunnel Interfaces, page 3
- Dynamic Virtual Tunnel Interfaces, page 4
- Dynamic Virtual Tunnel Interface Life Cycle, page 5
- Traffic Encryption with the IPsec Virtual Tunnel Interface, page 6

Benefits of Using IPsec Virtual Tunnel Interfaces

IPsec VTIs allow you to configure a virtual interface to which you can apply features. Features for clear-text packets are configured on the VTI. Features for encrypted packets are applied on the physical outside interface. When IPsec VTIs are used, you can separate the application of features such as NAT, ACLs, and QoS and apply them to clear-text or encrypted text, or both. When crypto maps are used, there is no simple way to apply encryption features to the IPsec tunnel.

There are two types of VTI interfaces: static VTIs (SVTIs) and dynamic VTIs (DVTIs).

Static Virtual Tunnel Interfaces

SVTI configurations can be used for site-to-site connectivity in which a tunnel provides always-on access between two sites. The advantage of using SVTIs as opposed to crypto map configurations is that users can enable dynamic routing protocols on the tunnel interface without the extra 24 bytes required for GRE headers, thus reducing the bandwidth for sending encrypted data.
Additionally, multiple Cisco IOS software features can be configured directly on the tunnel interface and on the physical egress interface of the tunnel interface. This direct configuration allows users to have solid control on the application of the features in the pre- or post-encryption path. Figure 1 illustrates how a static VTI is used.

**Figure 1**  
*IPsec Static VTI*

The IPsec VTI supports native IPsec tunneling and exhibits most of the properties of a physical interface.

**Dynamic Virtual Tunnel Interfaces**

DVTIs can provide highly secure and scalable connectivity for remote-access VPNs. The DVTI technology replaces dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels.

Dynamic VTIs can be used for both the server and remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is cloned from a virtual template configuration, which includes the IPsec configuration and any Cisco IOS software feature configured on the virtual template interface, such as QoS, NetFlow, or ACLs.

Dynamic VTIs function like any other real interface so that you can apply QoS, firewall, other security services as soon as the tunnel is active. QoS features can be used to improve the performance of various applications across the network. Any combination of QoS features offered in Cisco IOS software can be used to support voice, video, or data applications.

Dynamic VTIs provide efficiency in the use of IP addresses and provide secure connectivity. Dynamic VTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. The per-group or per-user definition can be created using extended authentication (Xauth) User or Unity group, or it can be derived from a certificate. Dynamic VTIs are standards based, so interoperability in a multiple-vendor environment is supported. IPsec DVTIs allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The DVTI simplifies Virtual Private Network (VRF) routing and forwarding- (VRF-) aware IPsec deployment. The VRF is configured on the interface.

A DVTI requires minimal configuration on the router. A single virtual template can be configured and cloned.
The DVTI creates an interface for IPsec sessions and uses the virtual template infrastructure for dynamic instantiation and management of dynamic IPsec VTIs. The virtual template infrastructure is extended to create dynamic virtual-access tunnel interfaces. Dynamic VTIs are used in hub-and-spoke configurations. A single DVTI can support several static VTIs. Figure 2 illustrates the DVTI authentication path.

The authentication shown in Figure 2 follows this path:

1. User 1 calls the router.
2. Router 1 authenticates User 1.
3. IPsec clones virtual access interface from virtual template interface.

**Dynamic Virtual Tunnel Interface Life Cycle**

IPsec profiles define policy for dynamic VTIs. The dynamic interface is created at the end of IKE Phase 1 and IKE Phase 1.5. The interface is deleted when the IPsec session to the peer is closed. The IPsec session is closed when both IKE and IPsec SAs to the peer are deleted.

**Routing with IPsec Virtual Tunnel Interfaces**

Because VTIs are routable interfaces, routing plays an important role in the encryption process. Traffic is encrypted only if it is forwarded out of the VTI, and traffic arriving on the VTI is decrypted and routed accordingly. VTIs allow you to establish an encryption tunnel using a real interface as the tunnel endpoint. You can route to the interface or apply services such as QoS, firewalls, network address translation, and Netflow statistics as you would to any other interface. You can monitor the interface, route to it, and it has an advantage over crypto maps because it is a real interface and provides the benefits of any other regular Cisco IOS interface.
Traffic Encryption with the IPsec Virtual Tunnel Interface

When an IPsec VTI is configured, encryption occurs in the tunnel. Traffic is encrypted when it is forwarded to the tunnel interface. Traffic forwarding is handled by the IP routing table, and dynamic or static routing can be used to route traffic to the SVTI. DVTI uses reverse route injection to further simplify the routing configurations. Using IP routing to forward the traffic to encryption simplifies the IPsec VPN configuration because the use of ACLs with a crypto map in native IPsec configurations is not required. The IPsec virtual tunnel also allows you to encrypt multicast traffic with IPsec.

IPsec packet flow into the IPsec tunnel is illustrated in Figure 3.

**Figure 3**  Packet Flow into the IPsec Tunnel

1. Clear-text IP packets enter the router.
2. Packets are routed to virtual interface.
3. Encrypted packets are forwarded to the forwarding engine.
4. Encrypted packets are passed out of the physical outside interface.

After packets arrive on the inside interface, the forwarding engine switches the packets to the VTI, where they are encrypted. The encrypted packets are handed back to the forwarding engine, where they are switched through the outside interface.

**Figure 4** shows the packet flow out of the IPsec tunnel.
How to Configure IPsec Virtual Tunnel Interface

- Configuring Static IPsec Virtual Tunnel Interfaces, page 7
- Configuring Dynamic IPsec Virtual Tunnel Interfaces, page 9

Configuring Static IPsec Virtual Tunnel Interfaces

This configuration shows how to configure a static IPsec VTI.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto IPsec profile profile-name
4. set transform-set transform-set-name
5. interface type number
6. ip address address mask
7. tunnel mode ipsec ipv4
8. tunnel source interface
9. tunnel destination ip-address
10. tunnel protection IPsec profile profile-name [shared]
## How to Configure IPsec Virtual Tunnel Interface

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>

</table>
Static Virtual Tunnel Interface with IPsec: Example

The following example configuration uses a preshared key for authentication between peers. VPN traffic is forwarded to the IPsec VTI for encryption and then sent out the physical interface. The tunnel on subnet 10 checks packets for IPsec policy and passes them to the Crypto Engine (CE) for IPsec encapsulation. Figure 5 illustrates the IPsec VTI configuration.

Verifying the Results for the IPsec Static Virtual Tunnel Interface: Example

This section provides information that you can use to confirm that your configuration is working properly. In this display, Tunnel 0 is “up,” and the line protocol is “up.” If the line protocol is “down,” the session is not active.

Verifying the C7206 Status

Router# show interface tunnel 0

Tunnel0 is up, line protocol is up
Hardware is Tunnel
Internet address is 10.0.51.203/24
MTU 1514 bytes, BW 9 Kbit, DLY 500000 usec,
reliability 255/255, txload 103/255, rxload 110/255
Encapsulation TUNNEL, loopback not set
Keepalive not set
Tunnel source 10.0.149.203, destination 10.0.149.217
Tunnel protocol/transport IPsec/IP, key disabled, sequencing disabled
Tunnel TTL 255

Checksumming of packets disabled, fast tunneling enabled
Tunnel transmit bandwidth 8000 (kbps)
Tunnel receive bandwidth 8000 (kbps)
Tunnel protection via IPsec (profile "P1")
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 1/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/0 (size/max)
30 second input rate 13000 bits/sec, 34 packets/sec
30 second output rate 36000 bits/sec, 34 packets/sec
191320 packets input, 30129126 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
59968 packets output, 15369696 bytes, 0 underruns
0 output errors, 0 collisions, 0 interface resets
0 output buffer failures, 0 output buffers swapped out

Router# show crypto session

i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default, U - per-user static route
o - ODR, P - periodic downloaded static route
Gateway of last resort is not set
10.0.0.0/8 is variably subnetted, 4 subnets, 2 masks
C 10.0.35.0/24 is directly connected, Ethernet3/3
S 10.0.36.0/24 is directly connected, Tunnel0
VRF-Aware Static Virtual Tunnel Interface: Example

To add VRF to the static VTI example, include the `ipvrf` and `ip vrf forwarding` commands to the configuration as shown in the following example.

```
C7206 Router Configuration
hostname c7206
.
ip vrf sample-vti1
    rd 1:1
    route-target export 1:1
    route-target import 1:1

interface Tunnel0
    ip vrf forwarding sample-vti1
    ip address 10.0.51.217 255.255.255.0
    tunnel source 10.0.149.217
    tunnel destination 10.0.149.203
    tunnel mode ipsec ipv4
    tunnel protection ipsec profile P1
.
.
end
```

Static Virtual Tunnel Interface with QoS: Example

You can apply any QoS policy to the tunnel endpoint by including the `service-policy` statement under the tunnel interface. The following example is policing traffic out the tunnel interface.

```
C7206 Router Configuration
hostname c7206
.
.
class-map match-all VTI
    match any

policy-map VTI
    class VTI
        police cir 2000000
        conform-action transmit
        exceed-action drop

interface Tunnel0
    ip address 10.0.51.217 255.255.255.0
    tunnel source 10.0.149.217
    tunnel destination 10.0.149.203
    tunnel mode ipsec ipv4
    tunnel protection ipsec profile P1
```
service-policy output VTI
!
.
.
!
end

**Static Virtual Tunnel Interface with Virtual Firewall: Example**

Applying the virtual firewall to the static VTI tunnel allows traffic from the spoke to pass through the hub to reach the internet. Figure 6 illustrates a static VTI with the spoke protected inherently by the corporate firewall.

**Figure 6**  
*Static VTI with Virtual Firewall*

![Static VTI with Virtual Firewall](image)

The basic static VTI configuration has been modified to include the virtual firewall definition.

**C7206 Router Configuration**

```
hostname c7206

Dynamic Virtual Tunnel Interface Easy VPN Server: Example

The following example illustrates the use of the DVTI Easy VPN server, which serves as an IPsec remote
access aggregator. The client can be a home user running a Cisco VPN client or it can be a Cisco IOS
router configured as an Easy VPN client.

C7206 Router Configuration
hostname c7206
!
aaa new-model
aaa authentication login local_list local
aaa authorization network local_list local
aaa session-id common
!

!
end

Verifying the Results for the Dynamic Virtual Tunnel Interface Easy VPN Server: Example

The following examples show that a dynamic VTI has been configured for an Easy VPN server.

Router# show running-config interface Virtual-Access2

Building configuration...

Current configuration : 250 bytes
!
interface Virtual-Access2
  ip unnumbered GigabitEthernet0/1
  ip virtual-reassembly
tunnel source 172.18.143.246
tunnel destination 172.18.143.208
tunnel mode ipsec ipv4
tunnel protection ipsec profile test-vti1
no tunnel protection ipsec initiate
end

Router# show ip route

Codes:  C - connected,  S - static,  R - RIP,  M - mobile,  B - BGP
       D - EIGRP,  EX - EIGRP external,  O - OSPF,  IA - OSPF inter area
       N1 - OSPF NSSA external type 1,  N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1,  E2 - OSPF external type 2
       L1 - IS-IS level-1,  L2 - IS-IS level-2
       I - IS-IS inter area,  * - candidate default,  U - per-user static route
       O - ODR,  P - periodic downloaded static route

Gateway of last resort is 10.2.1.10 to network 0.0.0.0

    172.18.0.0/24 is subnetted, 1 subnets
C  172.18.143.0 is directly connected, GigabitEthernet0/1
Dynamic Virtual Tunnel Interface Easy VPN Client: Example

The following example shows how you can set up a router as the Easy VPN client. This example uses basically the same idea as the Easy VPN client that you can run from a PC to connect. In fact, the configuration of the Easy VPN server will work for the software client or the Cisco IOS client.

hostname c1841
!
no aaa new-model
!
ip cef
!
username cisco password 0 cisco123
!
crypto ipsec client ezvpn CLIENT connect manual
  group group1 key cisco123
  mode client
  peer 172.18.143.246
  virtual-interface 1
  username cisco password cisco123
  xauth userid mode local
!
interface Loopback0
  ip address 10.1.1.1 255.255.255.255
!
interface FastEthernet0/0
  description Internet Connection
  ip address 172.18.143.208 255.255.255.0
  crypto ipsec client ezvpn CLIENT
!
interface FastEthernet0/1
  ip address 10.1.1.252 255.255.255.0
  crypto ipsec client ezvpn CLIENT inside
!
interface Virtual-Template1 type tunnel
  ip unnumbered Loopback0
!
ip route 0.0.0.0 0.0.0.0 172.18.143.1 254
!
end

The client definition can be set up in many different ways. The mode specified with the `connect` command can be automatic or manual. If the connect mode is set to manual, the IPsec tunnel has to be initiated manually by a user.

Also note use of the `mod`e command. The mode can be client, network-extension, or network-extension-plus. This example indicates client mode, which means that the client is given a private address from the server. Network-extension mode is different from client mode in that the client specifies for the server its attached private subnet. Depending on the mode, the routing table on either end will be slightly different. The basic operation of the IPSec tunnel remains the same, regardless of the specified mode.
Verifying the Results for the Dynamic Virtual Tunnel Interface Easy VPN Client: Example

The following examples illustrate different ways to display the status of the DVTI.

Router# show running-config interface Virtual-Access2

Building configuration...

Current configuration : 148 bytes
!
interface Virtual-Access2
 ip unnumbered Loopback1
 tunnel source FastEthernet0/0
 tunnel destination 172.18.143.246
 tunnel mode ipsec ipv4
end

Router# show running-config interface Loopback1

Building configuration...

Current configuration : 65 bytes
!
interface Loopback1
 ip address 192.168.1.1 255.255.255.255
end

Router# show ip route

Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP

Current EzVPN Peer: 172.18.143.246
VRF-Aware IPsec with Dynamic VTI: Example

This example shows how to configure VRF-Aware IPsec to take advantage of the dynamic VTI:

```conf
hostname c7206
.
.
ip vrf test-vti1
rd 1:1
route-target export 1:1
route-target import 1:1
!
.
interface Virtual-Template1 type tunnel
ip vrf forwarding test-vti1
ip unnumbered Loopback0
ip virtual-reassemble
tunnel mode ipsec ipv4
tunnel protection ipsec profile test-vti1
!
.
end
```

Dynamic Virtual Tunnel Interface with Virtual Firewall: Example

The DVTI Easy VPN server can be configured behind a virtual firewall. Behind-the-firewall configuration allows users to enter the network, while the network firewall is protected from unauthorized access. The virtual firewall uses Context-Based Access Control (CBAC) and NAT applied to the Internet interface as well as to the virtual template.

```conf
hostname c7206
.
.
ip inspect max-incomplete high 1000000
ip inspect max-incomplete low 800000
ip inspect one-minute high 1000000
ip inspect one-minute low 800000
ip inspect tcp synwait-time 60
ip inspect tcp max-incomplete host 100000 block-time 2
ip inspect name IOSFW1 tcp timeout 300
ip inspect name IOSFW1 udp
!
.
interface GigabitEthernet0/1
description Internet Connection
ip address 172.18.143.246 255.255.255.0
ip access-group 100 in
ip nat outside
!
interface GigabitEthernet0/2
description Internal Network
ip address 10.2.1.1 255.255.255.0
!
interface Virtual-Template1 type tunnel
ip unnumbered Loopback0
ip nat inside
ip inspect IOSFW1 in
```
IPsec Virtual Tunnel Interface

Dynamic Virtual Tunnel Interface with QoS: Example
You can add QoS to the DVTI tunnel by applying the service policy to the virtual template. When the
template is cloned to make the virtual-access interface, the service policy will be applied there. The
following example shows the basic DVTI configuration with QoS added.
hostname c7206
.
.
class-map match-all VTI
match any
!
policy-map VTI
class VTI
police cir 2000000
conform-action transmit
exceed-action drop
!
.
.
interface Virtual-Template1 type tunnel
ip vrf forwarding test-vti1
ip unnumbered Loopback0
ip virtual-reassembly
tunnel mode ipsec ipv4
tunnel protection ipsec profile test-vti1
service-policy output VTI
!
.
.
!
end

Additional References
The following sections provide references related to IPsec virtual tunnel interface.

Command Reference

The following commands are introduced or modified in the feature or features:

- `crypto isakmp profile`
- `interface virtual-template`
- `show vtemplate`
- `tunnel mode`
- `virtual-template`

Feature Information for IPsec Virtual Tunnel Interface

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

<td>IPsec VTIs (VTIs) provide a routable interface type for terminating IPsec tunnels and an easy way to define protection between sites to form an overlay network. IPsec VTIs simplify configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.</td>
</tr>
<tr>
<td>Dynamic IPsec VTIs</td>
<td>12.3(7)T 12.3(14)T</td>
<td>Dynamic VTIs provide efficiency in the use of IP addresses and provide secure connectivity. Dynamic VTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. The per-group or per-user definition can be created using Xauth User or Unity group, or it can be derived from a certificate. Dynamic VTIs are standards based, so interoperability in a multiple-vendor environment is supported. IPsec dynamic VTIs allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The dynamic VTI simplifies VRF-aware IPsec deployment. The VRF is configured on the interface.</td>

IPSec VPN Accounting

The IPSec VPN Accounting feature allows for a session to be accounted for by indicating when the session starts and when it stops.

A VPN session is defined as an Internet Key Exchange (IKE) security association (SA) and the one or more SA pairs that are created by the IKE SA. The session starts when the first IP Security (IPSec) pair is created and stops when all IPSec SAs are deleted.

Session identifying information and session usage information is passed to the Remote Authentication Dial-In User Service (RADIUS) server via standard RADIUS attributes and vendor-specific attributes (VSAs).

Supported Platforms

Cisco 2610–2613, Cisco 2620–Cisco 2621, Cisco 2650–Cisco 2651, Cisco 3620, Cisco 3640, Cisco 3660, Cisco 3725, Cisco 3745, Cisco 7100, Cisco 7200, Cisco 7400, Cisco ubr7100, Cisco ubr7200.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Contents

- Prerequisites for IPSec VPN Accounting, page 2
- Information About IPSec VPN Accounting, page 2
Prerequisites for IPSec VPN Accounting

You need to understand how to configure RADIUS and authentication, authorization, and accounting (AAA) accounting. For information about configuring RADIUS and AAA, refer to the following documents:

- Configuring Basic AAA RADIUS for Dial-In Clients
- How Does RADIUS Work?
- The chapter “Configuring RADIUS” in the Cisco IOS Security Configuration Guide
- The chapter “RADIUS Commands” in the Cisco IOS Security Command Reference, Release 12.2
- The chapter “Configuring Accounting” in the Cisco IOS Security Configuration Guide, Release 12.2

You also need to know how to configure IPSec accounting. For information about configuring IPSec accounting, refer to the chapter “Configuring IPSec Network Security” in the Cisco IOS Security Configuration Guide, Release 12.2.

Information About IPSec VPN Accounting

To configure IPSec VPN accounting, you must understand the following concepts:

- RADIUS Accounting, page 2
- IKE and IPSec Subsystem Interaction, page 4

RADIUS Accounting

For many large networks, it is required that user activity be recorded for auditing purposes. The method that is used most is RADIUS accounting.

RADIUS accounting allows for a session to be accounted for by indicating when the session starts and when it stops. Additionally, session identifying information and session usage information will be passed to the RADIUS server via RADIUS attributes and VSAs.

RADIUS Start Accounting

The RADIUS Start packet contains many attributes that generally identify who is requesting the service and of what the property of that service consists. Table 1 represents the attributes required for the start.
RADIUS Stop Accounting

The RADIUS Stop packet contains many attributes that identify the usage of the session. Table 2 represents the additional attributes required for the RADIUS stop packet. It is possible that only the stop packet will be sent without the start if configured to do so. If only the stop packet is sent, this allows an easy way to reduce the number of records going to the AAA server.

<table>
<thead>
<tr>
<th>Table 2</th>
<th>RADIUS Accounting Stop Packet Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>RADIUS Attributes Value</td>
<td>Attribute</td>
</tr>
<tr>

<td>acct-input-octets</td>
</tr>
<tr>
<td>43</td>
<td>acct-output-octets</td>
</tr>
</tbody>
</table>
Information About IPSec VPN Accounting

RADIUS Update Accounting

RADIUS accounting updates are supported. Packet and octet counts are shown in the updates. To learn more about AAA, refer to the following documents:

- Configuring Basic AAA RADIUS for Dial-In Clients
- The chapter “RADIUS Commands” in the Cisco IOS Security Command Reference, Release 12.2 T
- How to Assign Privilege Levels with TACACS+ and RADIUS
- Other AAA documentation at the Cisco.com website

IKE and IPSec Subsystem Interaction

Accounting Start

If IPSec accounting is configured, after IKE phases are complete, an accounting start record is generated for the session. New accounting records are not generated during a rekeying.

The following is an account start record that was generated on a router and that is to be sent to the AAA server that is defined:

```
*Aug 23 04:06:20.131: RADIUS(00000002): sending
*Aug 23 04:06:20.131: RADIUS(00000002):Send Accounting-Request to 10.1.1.4:1646 id 4, len 220
*Aug 23 04:06:20.131: RADIUS: authenticator 38 F5 EB 46 4D BE 4A 6F - 45 FB 3F
```

### Table 2: RADIUS Accounting Stop Packet Attributes (continued)

<table>
<thead>
<tr>
<th>RADIUS Attributes Value</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>

<td>How many times the Acct-Input-Octets counter has wrapped around the $2^{32}$ (2 to the 32nd power) over the course of this service.</td>
</tr>
</tbody>
</table>
Accounting Stop

An accounting stop packet is generated when there are no more flows (IPSec SA pairs) with the remote peer.

The accounting stop records contain the following information:

- Packets out
- Packets in
- Octets out
- Gigawords in
- Gigawords out

Below is an account start record that was generated on a router. The account start record is to be sent to the AAA server that is defined.

*Aug 23 04:20:16.519: RADIUS(00000003): Using existing nas_port 0
*Aug 23 04:20:16.519: RADIUS(00000003): Send Accounting-Request to 100.1.1.4:1646 id 19, len 238
*Aug 23 04:20:16.519: RADIUS: authenticator B7 E3 D0 F5 61 9A 89 D8 - 99 A6 8A 98 79 9D 5D
Accounting Updates

If accounting updates are enabled, accounting updates are sent while a session is “up.” The update interval is configurable. To enable the accounting updates, use the `aaa accounting update` command.

The following is an accounting update record that is being sent from the router:

```
Router# *Aug 23 21:46:05.263: RADIUS(00000004): Using existing nas_port 0
*Aug 23 21:46:05.263: RADIUS(00000004): Config NAS IP: 100.1.1.147
*Aug 23 21:46:05.263: RADIUS(00000004): sending
*Aug 23 21:46:05.263: RADIUS(00000004): Send Accounting-Request to 100.1.1.4:1646 id 22, len 200
*Aug 23 21:46:05.263: RADIUS: authenticator 30 FA 48 86 8E 43 8E 4B - F9 09 71 04 4A F1 52 25
*Aug 23 21:46:05.267: RADIUS: Received from id 21645/22 100.1.1.4:1646, Accounting-response, len 20
*Aug 23 21:46:05.267: RADIUS: authenticator 51 6B BB 27 A4 F5 D7 61 - A7 03 73 D3 0A AC 1C
```

How to Configure IPSec VPN Accounting

This section contains the following procedures:

- Configuring IPSec VPN Accounting, page 7
- Configuring Accounting Updates, page 10
- Troubleshooting for IPSec VPN Accounting, page 11
Configuring IPSec VPN Accounting

To enable IPSec VPN Accounting, you need to perform the following required task:

**Prerequisites**

Before configuring IPSec VPN accounting, you must first configure IPSec. To learn about configuring IPSec, refer to the following documents:

- Other IPSec documentation at the [Cisco.com](http://www.cisco.com) website

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login list-name method`
5. `aaa authorization network list-name method`
6. `aaa accounting network list-name start-stop [broadcast] group group-name`
7. `aaa session-id common`
8. `crypto isakmp profile profile-name`
9. `vrf ivrf`
10. `match identity group group-name`
11. `client authentication list list-name`
12. `isakmp authorization list list-name`
13. `client configuration address [initiate | respond]`
14. `accounting list-name`
15. `exit`
16. `crypto dynamic-map dynamic-map-name dynamic-seq-num`
17. `set transform-set transform-set-name`
18. `set isakmp-profile profile-name`
19. `reverse-route [remote-peer]`
20. `exit`
21. `crypto map map-name ipsec-isakmp dynamic dynamic-template-name`
22. `radius-server host ip-address [auth-port port-number] [acct-port port-number]`
23. `radius-server key string`
24. `radius-server vsa send accounting`
25. `interface interface-id`
26. `crypto map map-name`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
<p>| <strong>Example:</strong> Router&gt; enable | |
| <strong>Step 2</strong> configure terminal | Enters global configuration mode. |
| <strong>Example:</strong> Router# configure terminal | |
| <strong>Step 3</strong> aaa new-model | Enables periodic interim accounting records to be sent to the accounting server. |
| <strong>Example:</strong> Router (config)# aaa new-model | |
| <strong>Step 4</strong> aaa authentication login list-name method | Enforces authentication, authorization, and accounting (AAA) authentication for extended authorization (XAUTH) via RADIUS or local. |
| <strong>Example:</strong> Router (config)# aaa authentication login cisco-client group radius | |
| <strong>Step 5</strong> aaa authorization network list-name method | Sets AAA authorization parameters on the remote client from RADIUS or local. |
| <strong>Example:</strong> Router (config)# aaa authorization network cisco-client group radius | |
| <strong>Step 6</strong> aaa accounting network list-name start-stop [broadcast] group group-name | Enables AAA accounting of requested services for billing or security purposes when you use RADIUS or TACACS+. |
| <strong>Example:</strong> Router (config)# aaa accounting network acc start-stop broadcast group radius | |
| <strong>Step 7</strong> aaa session-id common | Specifies whether the same session ID will be used for each AAA accounting service type within a call or whether a different session ID will be assigned to each accounting service type. |
| <strong>Example:</strong> Router (config)# aaa session-id common | |
| <strong>Step 8</strong> crypto isakmp profile profile-name | Audits IP security (IPSec) user sessions and enters isakmp-profile submode. |
| <strong>Example:</strong> Router (config)# crypto isakmp profile cisco | |
| <strong>Step 9</strong> vrf ivrf | Associates the on-demand address pool with a Virtual Private Network (VPN) routing and forwarding (VRF) instance name. |
| <strong>Example:</strong> Router (conf-isa-prof)# vrf cisco | |</p>

# How to Configure IPSec VPN Accounting

## Configuring Accounting Updates

To send accounting updates while a session is “up,” perform the following optional task:

### Prerequisites

Before you configure accounting updates, you must first configure IPSec VPN accounting. See the section “Configuring IPSec VPN Accounting.”

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 19</strong> reverse-route [remote-peer]</td>
<td>Allows routes (ip addresses) to be injected for destinations behind the VPN remote tunnel endpoint and may include a route to the tunnel endpoint itself (using the <strong>remote-peer</strong> keyword for the crypto map).</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-map)# reverse-route</td>
<td></td>
</tr>
<tr>
<td><strong>Step 20</strong> exit</td>
<td>Exits dynamic crypto map configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-map)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 21</strong> crypto map map-name ipsec-isakmp dynamic dynamic-template-name</td>
<td>Enters crypto map configuration mode</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto map mymap ipsec-isakmp dynamic dmap</td>
<td></td>
</tr>
<tr>
<td><strong>Step 22</strong> radius-server host ip-address [auth-port port-number] [acct-port port-number]</td>
<td>Specifies a RADIUS server host.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# radius-server host 172.16.1.4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 23</strong> radius-server key string</td>
<td>Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# radius-server key nsite</td>
<td></td>
</tr>
<tr>
<td><strong>Step 24</strong> radius-server vsa send accounting</td>
<td>Configures the network access server to recognize and use vendor-specific attributes.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# radius-server vsa send accounting</td>
<td></td>
</tr>
<tr>
<td><strong>Step 25</strong> interface type slot/port</td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# interface FastEthernet 1/0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 26</strong> crypto map map-name</td>
<td>Applies a previously defined crypto map set to an interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# crypto map mymap</td>
<td></td>
</tr>
</tbody>
</table>

---

**Table of Commands or Actions:***

- **Step 19**: reverse-route [remote-peer]
- **Step 20**: exit
- **Step 21**: crypto map map-name ipsec-isakmp dynamic
dynamic-template-name
- **Step 22**: radius-server host ip-address [auth-port port-number] [acct-port port-number]
- **Step 23**: radius-server key string
- **Step 24**: radius-server vsa send accounting
- **Step 25**: interface type slot/port
- **Step 26**: crypto map map-name

### Command Reference

The following commands are introduced or modified in the feature or features:

- `client authentication list`
- `client configuration address`
- `crypto isakmp profile`
- `crypto map (global IPSec)`
- `debug crypto isakmp`
- `isakmp authorization list`
- `match identity`
- `set isakmp-profile`
- `vrf`

For information about all Cisco IOS commands, see the Command Lookup Tool at
http://tools.cisco.com/Support/CLILookup or the Master Command List.
IKE—Internet Key Exchange. IKE establishes a shared security policy and authenticates keys for services (such as IP security [IPSec]) that require keys. Before any IPSec traffic can be passed, each router, firewall, and host must verify the identity of its peer. This can be done by manually entering preshared keys into both hosts or by a certification authority (CA) service.

IPSec—IP security. IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses IKE to handle the negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

ISAKMP—Internet Security Association and Key Management Protocol. ISAKMP is an Internet IPSec protocol (RFC 2408) that negotiates, establishes, modifies, and deletes security associations. It also exchanges key generation and authentication data (independent of the details of any specific key generation technique), key establishment protocol, encryption algorithm, or authentication mechanism.

L2TP session—Layer 2 Transport Protocol. L2TP are communications transactions between the L2TP access concentrator (LAC) and the L2TP network server (LNS) that support tunneling of a single PPP connection. There is a one-to-one relationship among the PPP connection, L2TP session, and L2TP call.

NAS—network access server. A NAS is a Cisco platform (or collection of platforms, such as an AccessPath system) that interfaces between the packet world (for example, the Internet) and the circuit world (for example, the public switched telephone network [PSTN]).

PFS—perfect forward secrecy. PFS is a cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised because subsequent keys are not derived from previous keys.

QM—Queue Manager. The Cisco IP Queue Manager (IP QM) is an intelligent, IP-based, call-treatment and routing solution that provides powerful call-treatment options as part of the Cisco IP Contact Center (IPCC) solution.

RADIUS—Remote Authentication Dial-In User Service. RADIUS is a database for authenticating modem and ISDN connections and for tracking connection time.

RSA—Rivest, Shamir, and Adelman. Rivest, Shamir, and Adelman are the inventors of the Public-key cryptographic system that can be used for encryption and authentication.

SA—security association. A SA is an instance of security policy and keying material that is applied to a data flow.

TACACS+—Terminal Access Controller Access Control System Plus. TACACS+ is a security application that provides centralized validation of users attempting to gain access to a router or network access server.

TED—Tunnel Endpoint Discovery. TED is a Cisco IOS software feature that allows routers to discover IPSec endpoints.

VPN—Virtual Private Network. A VPN enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another. A VPN uses "tunneling" to encrypt all information at the IP level.

VRF—A VPN routing/forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.
**VSA**—vendor-specific attribute. A VSA is an attribute that has been implemented by a particular vendor. It uses the attribute Vendor-Specific to encapsulate the resulting AV pair: essentially, Vendor-Specific = protocol:attribute = value.

**XAUTH**—Extended authentication. XAUTH is an optional exchange between IKE Phase 1 and IKE Phase 2, in which the router demands additional authentication information in an attempt to authenticate the actual user (as opposed to authenticating the peer).

This feature module describes the IPSec VPN High Availability Enhancements. It includes the following sections:

- Feature Overview, page 1
- Supported Platforms, page 4
- Supported Standards, MIBs, and RFCs, page 5
- Configuration Tasks, page 6
- Configuration Examples, page 8
- Command Reference, page 10

Feature Overview

The IPSec VPN High Availability Enhancements feature consists of two new features—Reverse Route Injection (RRI) and Hot Standby Router Protocol and IPSec (HSRP)—that work together to provide users with a simplified network design for VPNs, and reduced configuration complexity on remote peers with respect to defining gateway lists. When used together, RRI and HSRP provide a more reliable network design for VPNs and reduce configuration complexity on remote peers.
Reverse Route Injection

Reverse Route Injection (RRI) is a feature designed to simplify network design for Virtual Private Networks (VPNs) in which there is a requirement for redundancy or load balancing. RRI works with both dynamic and static crypto maps.

In the dynamic case, as remote peers establish IPSec security associations (SAs) with an RRI-enabled router, a static route is created for each subnet or host protected by that remote peer. For static crypto maps, a static route is created for each destination of an extended access list rule. When RRI is used on a static crypto map with an access control list (ACL), routes will always exist, even without the negotiation of IPsec SAs.

Note

Use of any keyword in ACLs with RRI is not supported.

When routes are created, they are injected into any dynamic routing protocol and distributed to surrounding devices. This traffic flows, requiring IPSec to be directed to the appropriate RRI router for transport across the correct SAs to avoid IPSec policy mismatches and possible packet loss.

Figure 87 shows a RRI configuration functionality topology. Remote A is being serviced by Router A and Remote B connected to Router B, providing load balancing across VPN gateways at the central site. RRI on the central site devices will ensure that the other router on the inside of the network can automatically make the correct forwarding decision. RRI also eliminates the need to administer static routes on the inside router.

Figure 87  Topology Showing Reverse Route Injection Configuration Functionality
Hot Standby Router Protocol and IPSec

Hot Standby Router Protocol (HSRP) is designed to provide high network availability by routing IP traffic from hosts on Ethernet networks without relying on the availability of any single router. HSRP is particularly useful for hosts that do not support a router discovery protocol, such as ICMP Router Discovery Protocol (IRDP), and do not have the functionality to switch to a new router when their selected router reloads or loses power. Without this functionality, a router that loses its default gateway because of a router failure is unable to communicate with the network.

HSRP is configurable on LAN interfaces using standby command-line interface (CLI) commands. It is now possible to use the standby IP address from an interface as the local IPSec identity, or local tunnel endpoint.

By using the standby IP address as the tunnel endpoint, failover can be applied to VPN routers by using HSRP. Remote VPN gateways connect to the local VPN router via the standby address that belongs to the active device in the HSRP group. In the event of failover, the standby device takes over ownership of the standby IP address and begins to service remote VPN gateways.

Figure 88 shows the enhanced HSRP functionality topology. Traffic is serviced by the active Router P, the active device in the standby group. In the event of failover, traffic is diverted to Router S, the original standby device. Router S assumes the role of the new active router and takes ownership of the standby IP address.

Figure 88  Topology Showing Hot Standby Router Protocol Functionality

In case of a failover, HSRP does not facilitate IPSec state information transference between VPN routers. This means that without this state transference, SAs to remotes will be deleted requiring Internet Key Exchange (IKE) and IPSec SAs to be reestablished. To make IPSec failover more efficient, it is recommended that IKE keepalives be enabled on all routers.

Benefits

Reverse Route Injection
- Enables routing of IPSec traffic to a specific VPN headend device in environments that have multiple (redundant) VPN headend devices.
• Ensures predictable failover time of remote sessions between headend devices when using IKE keepalives, especially in environments in which remote device route flapping is common (not taking into consideration the effects of route convergence, which may vary depending on the routing protocol used and the size of the network).
• Eliminates the need for the administration of static routes on upstream devices as routes are dynamically learned by these devices.

Hot Standby Router Protocol with IPSec
Failover can be applied to VPN routers through the use of HSRP. Remote VPN gateways connect to the local VPN router through the standby address that belongs to the active device in the HSRP group. This functionality reduces configuration complexity on remote peers with respect to defining gateway lists because only the HSRP standby address needs to be defined.

Finding Support Information for Platforms and Cisco IOS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Supported Standards, MIBs, and RFCs

Standards
- No new or modified standards are supported by this feature.

MIBs
- No new or modified standards are supported by this feature.

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:
http://tools.cisco.com/ITDIT/MIBS/servlet/index

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:
http://www.cisco.com/register

RFCs
- No new or modified RFCs are supported by this feature.
Configuration Tasks

See the following sections for configuration tasks for the IPSec VPN High Availability Enhancements feature. Each task in the list is identified as either required or optional.

- Configuring Reverse Route Injection on a Dynamic Crypto Map (required)
- Configuring Reverse Route Injection on a Static Crypto Map (required)
- Configuring HSRP with IPSec (required)
- Verifying VPN IPSec Crypto Configuration (optional)

Configuring Reverse Route Injection on a Dynamic Crypto Map

Dynamic crypto map entries, like regular static crypto map entries, are grouped into sets. A set is a group of dynamic crypto map entries all with the same dynamic map name but each with a different dynamic sequence number. Each member of the set may be configured for RRI.

To create a dynamic crypto map entry and enable RRI, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Creates a dynamic crypto map entry and enters crypto map configuration mode.</td>
</tr>
<tr>
<td>Router (config)# crypto dynamic map-name seq-num</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies which transform sets are allowed for the crypto map entry. Lists multiple transform sets in order of priority (highest priority first). This entry is the only configuration statement required in dynamic crypto map entries.</td>
</tr>
<tr>
<td>Router (config-crypto-m)# set transform-set</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Creates source proxy information.</td>
</tr>
<tr>
<td>Router (config-crypto-m)# reverse-route</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Reverse Route Injection on a Static Crypto Map

Before configuring RRI on a static crypto map, please note the following items:

- Routes are not created based on access list 102 as reverse-route is not enabled on mymap 2. RRI is not enabled by default and is not displayed in the router configuration.
- Enable a routing protocol to distribute the VPN routes to upstream devices.
- If Cisco Express Forwarding (CEF) is run on a VPN router configured for RRI, adjacencies need to be formed for each RRI injected network through the next hop device. As the next hop is not explicitly defined in the routing table for these routes, proxy-ARP should be enabled on the next hop router which allows the CEF adjacency to be formed using the layer two addresses of that device. In cases where there are many RRI injected routes, adjacency tables may become quite large as an entry is created for each device from each of the subnets represented by the RRI route. This issue is to be resolved in a future release.
To add RRI to a static crypto map set, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Router (config)# crypto map map-name seq-num ipsec-isakmp</td>
<td>Adds a dynamic crypto map set to a static crypto map set and enters interface configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Router (config-if)# set peer ip address</td>
<td>Specifies an IPSec peer IP address in a crypto map entry.</td>
</tr>
<tr>
<td>3</td>
<td>Router (config-if)# reverse-route</td>
<td>Creates dynamically static routes based on crypto access control lists (ACLs).</td>
</tr>
<tr>
<td>4</td>
<td>Router (config-if)# match address</td>
<td>Specifies an extended access list for a crypto map entry.</td>
</tr>
<tr>
<td>5</td>
<td>Router (config-if)# set transform-set</td>
<td>Specifies which transform sets are allowed for the crypto map entry. Lists multiple transform sets in order of priority (highest priority first).</td>
</tr>
</tbody>
</table>

### Configuring HSRP with IPSec

When configuring HSRP with IPSec, the following conditions may apply:

- When HSRP is applied to a crypto map on an interface, the crypto map must be reapplied if the standby IP address or the standby name is changed on that interface.
- If HSRP is applied to a crypto map on an interface, and the user deletes the standby IP address or the standby name from that interface, the crypto tunnel endpoint is reinitialized to the actual IP address of that interface.
- If a user adds the standby IP address and the standby name to an interface with the requirement IPSec failover, the crypto map must be reapplied with the appropriate redundancy information.
- Standby priorities should be equal on active and standby routers. If they are not, the higher priority router takes over as the active router. If the old active router comes back up and immediately assumes the active role before having time to report itself standby and sync, connections will be dropped.
- The IP addresses on the HSRP-tracked interfaces on the standby and active routers should both be either lower or higher on one router than the other. In the case of equal priorities (an HA requirement), HSRP will assign the active state-based IP address. If an addressing scheme exists so that the public IP address of router A is lower than the public IP address of router B, but the opposite is true for their private interfaces, an active/standby-standby/active split condition could exist which will break connectivity.

**Note**

To configure HSRP without IPSec refer to the “Configuring IP Services” chapter of the *Cisco IOS IP Configuration Guide*, Release 12.2.
To apply a crypto map set to an interface, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router (config)# interface type slot/port</td>
<td>Specifies an interface and enters interface configuration mode.</td>
</tr>
<tr>
<td>Router (config-if)# standby name group-name</td>
<td>Specifies the standby group name (required).</td>
</tr>
<tr>
<td>Router (config-if)# standby ip ip-address</td>
<td>Specifies the IP address of the standby groups (required for one device in the group).</td>
</tr>
<tr>
<td>Router (config-if)# crypto map map-name redundancy [standby-name]</td>
<td>Specifies IP redundancy address as the tunnel endpoint for IPSec.</td>
</tr>
</tbody>
</table>

Verifying VPN IPSec Crypto Configuration

To verify your VPN IPSec crypto configuration, use the following EXEC commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# show crypto ipsec transform-set</td>
<td>Displays your transform set configuration.</td>
</tr>
<tr>
<td>Router# show crypto map [interface interface</td>
<td>tag map-name]</td>
</tr>
<tr>
<td>Router# show crypto ipsec sa [map map-name</td>
<td>address</td>
</tr>
<tr>
<td>Router# show crypto dynamic-map [tag map-name]</td>
<td>Displays information about dynamic crypto maps.</td>
</tr>
</tbody>
</table>

Configuration Examples

This section provides the following configuration examples:

- Reverse Route Injection on a Dynamic Crypto Map Example
- Reverse Route Injection on a Static Crypto Map Example
- HSRP and IPSec Example

Reverse Route Injection on a Dynamic Crypto Map Example

In the following example, using the reverse route crypto map subcommand in the definition of the dynamic crypto map template ensures that routes are created for any remote proxies (subnets or hosts), protected by the connecting remote IPSec peers.

```plaintext
crypto dynamic mydynmap 1
  set transform-set esp-3des-sha
  reverse-route
```
This template is then associated with a “parent” crypto map statement and then applied to an interface.

```
crypto map mymap 3 ipsec-isakmp dynamic mydynmap
interface FastEthernet 0/0
crypto map mymap
```

**Reverse Route Injection on a Static Crypto Map Example**

RRI is a good solution for topologies that require encrypted traffic to be diverted to a VPN router and all other traffic to a different router.

In these scenarios, RRI eliminates the need to manually define static routes on devices.

RRI is not required if a single VPN router is used and all traffic passes through the VPN router during its path in and out of the network.

If the user chooses to manually define static routes on the VPN router for remote proxies, and have these routes permanently installed in the routing table, RRI should not be enabled on the crypto map instance that covers the same remote proxies. In this case, there is no possibility of user defined static routes being removed by RRI.

Routing convergence can affect the success of a failover based on the routing protocol used to advertise routes (link state versus periodic update). It is recommended that a link state routing protocol such as OSPF be used to help speed convergence time by ensuring that routing updates are sent as soon as a change in routing state is detected.

In the following example, RRI is enabled for mymap 1, but not for mymap 2. Upon the application of the crypto map to the interface, a route is created based on access-list 101 analogous to the following:

```
IP route 172.17.11.0 255.255.255.0 FastEthernet 0/0
```

```
crypto map mymap 1 ipsec-isakmp
  set peer 172.17.11.1
  reverse-route
  set transform-set esp-3des-sha
  match address 101

crypto map mymap 2 ipsec-isakmp
  set peer 10.1.1.1
  set transform-set esp-3des-sha
  match address 102
```

```
access-list 101 permit ip 192.168.1.0 0.0.0.255 172.17.11.0 0.0.0.255
access-list 102 permit ip 192.168.1.0 0.0.0.255 10.0.0.0 0.0.255.255
```

```
interface FastEthernet 0/0
  crypto map mymap
```

**HSRP and IPSec Example**

The following example shows how all remote VPN gateways connect to the router via 192.168.0.3. The crypto map on the interface binds this standby address as the local tunnel endpoint for all instances of mymap and at the same time ensures that HSRP failover is facilitated between an active and standby device belonging to the same standby group, group1.

Note that RRI is also enabled to provide the ability for only the active device in the HSRP group to be advertising itself to inside devices as the next hop VPN gateway to the remote proxies. If there is a failover, routes are deleted on the formerly active device and created on the newly active device.
crypto map mymap 1 ipsec-isakmp
  set peer 10.1.1.1
  reverse-route
  set transform-set esp-3des-sha
  match address 102

Interface FastEthernet 0/0
  ip address 192.168.0.2 255.255.255.0
  standby name group1
  standby ip 192.168.0.3
  crypto map mymap redundancy group1

access-list 102 permit ip 192.168.1.0 0.0.0.255 10.0.0.0 0.0.255.255

The standby name needs to be configured on all devices in the standby group and the standby address needs to be configured on at least one member of the group. If the standby name is removed from the router, the IPSec SAs will be deleted. If the standby name is added again, regardless of whether the same name or a different name is used, the crypto map (using the redundancy option) will have to be reapplied to the interface.

Command Reference

The following commands are introduced or modified in the feature or features:

documented in this module:

- crypto map (interface IPSec)
- reverse-route

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Low Latency Queueing (LLQ) for IPSec Encryption Engines

Feature History

<table>

</tr>
</tbody>
</table>

This feature module describes the Low Latency Queueing (LLQ) for IPSec encryption engines feature in Cisco IOS Release 12.2(13)T and 12.2(14)S. It includes the following sections:

- Feature Overview, page 1
- Supported Platforms, page 3
- Supported Standards, MIBs, and RFCs, page 4
- Prerequisites, page 4
- Configuration Tasks, page 4
- Monitoring and Maintaining LLQ for IPSec Encryption Engines, page 8
- Configuration Examples, page 8
- Command Reference, page 9
- Glossary, page 9

Feature Overview

Low Latency Queueing (LLQ) for IPSec encryption engines helps reduce packet latency by introducing the concept of queueing before crypto engines. Prior to this, the crypto processing engine gave data traffic and voice traffic equal status. Administrators now designate voice traffic as priority. Data packets arriving at a router interface are directed into a data packet inbound queue for crypto engine processing. This queue is called the best effort queue. Voice packets arriving on a router interface are directed into
a priority packet inbound queue for crypto engine processing. This queue is called the priority queue. The crypto engine undertakes packet processing in a favorable ratio for voice packets. Voice packets are guaranteed a minimum processing bandwidth on the crypto engine.

Benefits

The Low Latency Queueing (LLQ) for IPSec encryption engines feature guarantees a certain level of crypto engine processing time for priority designated traffic.

Note

On the Cisco 2600 platform, with the exception of the Cisco 2691 router, the CPU utilization maximizes out before the crypto engine becomes congested, so latency is not improved.

Better Voice Performance

Voice packets can be identified as priority, allowing the crypto engine to guarantee a certain percentage of processing bandwidth. This feature impacts the end user experience by assuring voice quality if voice traffic is directed onto a congested network.

Improved Latency and Jitters

Predictability is a critical component of network performance. The Low Latency Queueing (LLQ) for IPSec encryption engines feature delivers network traffic predictability relating to VPN. With this feature disabled, an end user employing an IP phone over VPN might experience jitter or latency, both symptoms of overall network latency and congestion. With this feature enabled, these undesirable characteristics are dissipated.

Restrictions

- No per-tunnel QoS policy. An interface QoS policy represents all tunnels.
- Assume the same IP precedence/DSCP marking for inbound and outbound voice packets.
- Assume the IP precedence/DSCP marking for voice packets are done at the source.
- Limited match criteria for voice traffic in the interface QoS policy.
- Assume call admission control is enforced within the enterprise.
- No strict error checking when aggregate policy’s bandwidth exceeds crypto engine bandwidth. Only a warning is displayed but configuration is allowed.
- Assume voice packets are either all encrypted or unencrypted.

Related Features and Technologies

- CBWFQ
- Priority Queueing
- Weighted Fair Queueing
Related Documents

- *Quality of Service Solutions Command Reference*, Cisco IOS Release 12.2
- *Class-Based Weighted Fair Queueing* feature module, Cisco IOS Release 12.1
- *IP RTP Priority* feature module, Cisco IOS Release 12.0

Supported Platforms

12.2(14)S and higher
The LLQ for IPSec encryption engines feature is supported on the following platform:

- Cisco 7200 series

12.2(13)T
The LLQ for IPSec encryption engines feature is supported on all platforms using Cisco IOS Release 12.2(13)T or later, including:

- Cisco 2600 series
- Cisco 3600 series
- Cisco 7100 series
- Cisco 7200 series

Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to quickly determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side-by-side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn
Availability of Cisco IOS Software Images

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

Supported Standards, MIBs, and RFCs

Standards

• No new or modified standards are supported by this feature.

MIBs

• No new or modified standards are supported by this feature.

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

http://tools.cisco.com/ITDIT/MIBS/servlet/index

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

RFCs

• No new or modified RFCs are supported by this feature.

Prerequisites

To use this feature, you should be familiar with the following:

• Access control lists
• Bandwidth management
• CBWFQ

Configuration Tasks

To configure LLQ for IPSec encryption engines, perform the tasks described in the following section.
Defining Class Maps

To create a class map containing match criteria against which a packet is checked to determine if it belongs to a class, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# class-map class-map-name</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-cmap)# match access-group {access-group / name access-group-name}</td>
</tr>
<tr>
<td></td>
<td>or Router(config-cmap)# match input-interface interface-name</td>
</tr>
<tr>
<td></td>
<td>or Router(config-cmap)# match protocol protocol</td>
</tr>
</tbody>
</table>

Configuring Class Policy in the Policy Map

To configure a policy map and create class policies that make up the service policy, begin with the policy-map command to specify the policy map name. Then use one or more of the following commands to configure the policy for a standard class or the default class:

- **priority**
- **bandwidth**
- **queue-limit** or **random-detect**
- **fair-queue** (for class-default class only)

For each class that you define, you can use one or more of the commands listed to configure the class policy. For example, you might specify bandwidth for one class and both bandwidth and queue limit for another class.
The default class of the policy map (commonly known as the class-default class) is the class to which traffic is directed if that traffic does not satisfy the match criteria of the other classes defined in the policy map.

You can configure class policies for as many classes as are defined on the router, up to the maximum of 64. However, the total amount of bandwidth allocated for all classes in a policy map must not exceed the minimum committed information rate (CIR) configured for the virtual circuit (VC) minus any bandwidth reserved by the `frame-relay voice bandwidth` and `frame-relay ip rtp priority` commands. If the minimum CIR is not configured, the bandwidth defaults to one half of the CIR. If all of the bandwidth is not allocated, the remaining bandwidth is allocated proportionally among the classes on the basis of their configured bandwidth.

To configure class policies in a policy map, perform the tasks described in the following sections. The task in the first section is required; the tasks in the remaining sections are optional.

### Configuring Class Policy for a Priority Queue

To configure a policy map and give priority to a class within the policy map, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# policy-map policy-map Specifies the name of the policy map to be created or modified.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-cmap)# class class-name Specifies the name of a class to be created and included in the service policy.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router(config-pmap-c)# priority bandwidth-kbps Creates a strict priority class and specifies the amount of bandwidth, in kbps, to be assigned to the class.</td>
</tr>
</tbody>
</table>

### Configuring Class Policy Using a Specified Bandwidth

To configure a policy map and create class policies that make up the service policy, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# policy-map policy-map Specifies the name of the policy map to be created or modified.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-cmap)# class class-name Specifies the name of a class to be created and included in the service policy.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router(config-pmap-c)# bandwidth bandwidth-kbps Specifies the amount of bandwidth to be assigned to the class, in kbps, or as a percentage of the available bandwidth. Bandwidth must be specified in kbps or as a percentage consistently across classes. (Bandwidth of the priority queue must be specified in kbps.)</td>
</tr>
</tbody>
</table>

To configure more than one class in the same policy map, repeat Step 2 and Step 3.
Configuring the Class-Default Class Policy

The class-default class is used to classify traffic that does not fall into one of the defined classes. Even though the class-default class is predefined when you create the policy map, you still have to configure it. If a default class is not configured, then traffic that does not match any of the configured classes is given best-effort treatment, which means that the network will deliver the traffic if it can, without any assurance of reliability, delay prevention, or throughput.

To configure a policy map and the class-default class, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# policy-map policy-map</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-cmap)# class class-default default-class-name</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router(config-pmap-c)# bandwidth bandwidth-kbps</td>
</tr>
<tr>
<td>or</td>
<td>Router(config-pmap-c)# fair-queue [number-of-dynamic-queues]</td>
</tr>
</tbody>
</table>

Attaching the Service Policy

To attach a service policy to the output interface and enable LLQ for IPSec encryption engines, use the following command in map-class configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# interface type number</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-if)# service-policy output policy-map</td>
</tr>
</tbody>
</table>

Verifying Configuration of Policy Maps and Their Classes

To display the contents of a specific policy map or all policy maps configured on an interface, use the following commands in EXEC mode, as needed:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router# show frame-relay pvc dlci</td>
</tr>
</tbody>
</table>
Monitoring and Maintaining LLQ for IPSec Encryption Engines

To monitor and maintain LLQ for IPSec encryption engines, use the following command in EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router# show crypto eng qos</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router# show policy-map interface interface-name</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router# show policy-map interface interface-name dlci dlci</td>
</tr>
</tbody>
</table>

For a more detailed list of commands that can be used to monitor LLQ for IPSec encryption engines, see the section “Verifying Configuration of Policy Maps and Their Classes”

Configuration Examples

This section provides the following configuration example:

- **LLQ for IPSec Encryption Engines Example**

LLQ for IPSec Encryption Engines Example

In the following example, a strict priority queue with a guaranteed allowed bandwidth of 50 kbps is reserved for traffic that is sent from the source address 10.10.10.10 to the destination address 10.10.10.20, in the range of ports 16384 through 20000 and 53000 through 56000.

First, the following commands configure access list 102 to match the desired voice traffic:

Router(config)# access-list 102 permit udp host 10.10.10.10 host 10.10.10.20 range 16384 20000  
Router(config)# access-list 102 permit udp host 10.10.10.10 host 10.10.10.20 range 53000 56000

Next, the class map voice is defined, and the policy map called policy1 is created; a strict priority queue for the class voice is reserved, a bandwidth of 20 kbps is configured for the class bar, and the default class is configured for WFQ. The service-policy command then attaches the policy map to the fas0/0.

Router(config)# class-map voice  
Router(config-cmap)# match access-group 102  
Router(config)# policy-map policy1  
Router(config-pmap)# class voice  
Router(config-pmap-c)# priority 50  
Router(config-pmap-c)# class bar  
Router(config-pmap-c)# bandwidth 20  
Router(config-pmap-c)# class class-default  
Router(config-pmap-c)# fair-queue  
Router(config)# interface fas0/0
Router(config-if)# service-policy output policy1

Command Reference

The following new command is pertinent to this feature. To see the command pages for this command and other commands used with this feature, go to the Cisco IOS Master Commands List, Release 12.4, at http://www.cisco.com/univercd/cc/td/doc/product/software/ios124/124mindx/124index.htm.

- show crypto eng qos

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.

Glossary

IKE—Internet Key Exchange. IKE establishes a shared security policy and authenticates keys for services (such as IPSec). Before any IPSec traffic can be passed, each router/firewall/host must verify the identity of its peer. This can be done by manually entering preshared keys into both hosts or by a CA service.

IPSec—IP Security. A framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses IKE to handle the negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.
L2TP—IPSec Support for NAT and PAT Windows Clients

The L2TP—IPSec Support for NAT and PAT Windows Clients feature allows more than one Windows client to connect to a Layer 2 Tunneling Protocol (L2TP) Network Server (LNS) at one time with IP Security (IPSec) enabled and a network address translation (NAT) or port address translation (PAT) server between the Windows client and LNS.

Currently, if one Windows client is connected to a Cisco IOS LNS router through a NAT or PAT server with IPSec enabled, and then another Windows client connects to the same Cisco IOS LNS router, the first client’s connection is effectively terminated. Enabling L2TP—IPSec Support for NAT and PAT Windows Clients ensures that Windows client connections in this environment are established and maintained until the connection is closed.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.
Prerequisites for L2TP—IPSec Support for NAT and PAT Windows Clients

- You have an environment consisting of Windows clients and Cisco IOS LNS routers with IPSec enabled and a NAT or PAT server between the Windows client and LNS router.
- You must have a version of IPSec that contains the L2TP—IPSec Support for NAT and PAT Windows Clients feature.
- You must understand Windows 2000 concepts and configuration requirements.
- You must understand Cisco IOS LNS routers concepts and configuration requirements.
- You must understand NAT and PAT concepts and configuration requirements.
- You must understand IPSec concepts and configuration requirements.
- You must understand L2TP concepts and configuration requirements.

Restrictions for L2TP—IPSec Support for NAT and PAT Windows Clients

- Tested only with Windows 2000 L2TP/IPsec clients running hotfix 818043.
- Port translation is not a standard default behavior. Port translation is incompatible with standard IPSec because it changes the LNS header port information.
- L2TP requires the client to have Microsoft DUN configured. L2TP is supported solely by Windows 2000 MS-DUN (L2TP is not supported by Windows 95, Windows 98, or Windows NT).

Information About L2TP—IPSec Support for NAT and PAT Windows Clients

To use the L2TP—IPSec Support for NAT and PAT Windows Clients feature, the following concept should be understood:
- How L2TP—IPSec Support for NAT and PAT Windows Clients Works, page 2

How L2TP—IPSec Support for NAT and PAT Windows Clients Works

With the L2TP—IPSec Support for NAT and PAT Windows Clients feature not enabled, Windows clients lose connection with the Cisco IOS LNS router when another Windows client establishes an IPSec-protected L2TP tunnel to the Cisco IOS LNS router when IPSec is enabled and there is a NAT or PAT server between the Windows clients and the LNS.
If you do not have IPSec enabled, or you do not have a NAT or PAT server, you can have multiple Windows clients connect to a LNS without this command enabled.

**Without L2TP—IPSec Support for NAT and PAT Windows Clients Feature Enabled**

For example, Figure 91 shows two Windows 2000 clients that are trying to connect to the end host through the router running NAT or PAT and the same Cisco IOS LNS router. IPSec is enabled.

![Figure 91](10.0.0.2)

The Windows 2000 Client #1 establishes an IPSec-protected L2TP tunnel to the Cisco IOS LNS router. The Windows 2000 client and the Cisco IOS LNS router recognize that there is a router running NAT between them and IPSec and NAT-Traversal (NAT-T) are enabled. The Windows 2000 client attempts to establish an IPSec security association (SA) and requests transport mode (which it does by default) with proxies from 10.0.0.2, its local address, to 209.265.200.231, the Cisco IOS LNS router’s address.

In transport mode NAT, running on the router, translates all outgoing connections (including 10.0.0.2) to its outside IP address (209.265.200.232), the address the traffic will come in on. However, NAT cannot modify the L2TP port designation (1701), which is protected by the IPSec encrypted area. So now, we have a local address of 209.265.200.231, a remote address of 209.265.200.232 and a remote port of 1701. All traffic is sent to the Windows 2000 Client #1 that matches the tunnel 209.265.200.231, port 1701.

Then Windows 2000 Client #2 establishes an IPSec-protected L2TP tunnel to the Cisco IOS LNS router, again in transport mode. And NAT, again, translates all outgoing connections to its outside IP address (209.265.200.232), but it cannot modify the L2TP port designation (1701). All traffic is now sent to Windows 2000 Client #2 that matches tunnel 209.265.200.231, port 1701. This second Windows client connection has effectively ended Windows Client #1’s connection to the Cisco IOS LNS router since it is no longer receiving traffic.

**With L2TP—IPSec Support for NAT and PAT Windows Clients Feature Enabled**

With the L2TP—IPSec Support for NAT and PAT Windows Clients feature enabled, IPSec can translate the L2TP ports after decryption. This feature allows IPSec to map traffic from different hosts to different source ports. L2TP can now distinguish between traffic destined for multiple Windows 2000 clients.

So now, when an SA is created, a translated port will be assigned to it. This port is client-specific. The same port will be used for any new SA created by that client. When an encrypted request is received and decrypted, the source port is translated from the standard value, 1701, to a client specific value. The request with the translated port is then forwarded to L2TP.
As shown in Figure 91 with port translation enabled, the Windows 2000 Client #1 would have a translated port number of 1024 assigned and Windows 2000 Client #2 would have a translated port number of 1025 assigned.

When L2TP sends the reply packet, it uses the translated port number and creates a packet to that destination port. IPSec uses the destination port number to select the SA with which to encrypt the packet. Before encrypting the packet, IPSec translates the destination port back to the standard port number, 1701, which the Windows 2000 client expects. IPSec encrypts the packet, either with the SA to Windows 2000 Client #1 if the destination port was 1024 or with the SA to Windows 2000 Client #2 if the destination port was 1025. And now, all traffic is sent to the appropriate client and multiple Windows clients can be connected to a Cisco IOS LNS router through a NAT server at the same time.

The connection is maintained until one of the following actions occurs:

- The IPSec connection is closed.
- The NAT or PAT device ends the session.
- The LNS closes the session.
- The Windows client closes the session.

How to Enable L2TP—IPSec Support for NAT and PAT Windows Clients

This section contains the following procedure that allows you to enable NAT/PAT port translation:

- Enabling L2TP—IPSec Support, page 4

Enabling L2TP—IPSec Support

Use the following task to enable L2TP—IPSec Support for NAT and PAT Windows Clients for environments that have IPSec enabled and include multiple windows clients, a NAT or PAT server, L2TP, and a Cisco IOS LNS router.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto map map-name seq-num [ipsec-isakmp]
   or
   crypto dynamic-map dynamic-map-name dynamic-seq-num
4. set nat demux
5. exit
6. exit
7. show crypto map [interface interface | tag map-name]
   or
   show crypto dynamic-map [tag map-name]
8. show crypto ipsec sa
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Example:          |         |
| Router> enable    |         |
| Step 2 configure terminal | Enters global configuration mode. |
| Example:          |         |
| Router# configure terminal |         |
| Step 3 crypto map map-name seq-num [ipsec-isakmp] | Names the static crypto map entry to create (or modify) and enters crypto map configuration mode.  
or  
Names the dynamic crypto map entry to create (or modify) and enters crypto map configuration mode. |
| Example:          |         |
| Router(config)# crypto map STATIC_MAP 5 |         |
| or                |         |
| crypto dynamic-map dynamic-map-name dynamic-seq-num |         |
| Example:          |         |
| Router(config)# crypto dynamic-map DYNAMIC_MAP 10 |         |
| Step 4 set nat demux | Enables L2TP—IPSec support. |
| Example:          |         |
| Router(config-crypto-map)# set nat demux |         |
| Step 5 exit       | Exits crypto map configuration mode and returns to global configuration mode.  
Example:          |         |
| Router(config-crypto-map)# exit |         |
| Step 6 exit       | Exits global configuration mode and returns to privileged EXEC mode. |
| Example:          |         |
| Router(config)# exit |         |
This section provides the following configuration example:

- **Dynamic Map Configuration: Example, page 6**

### Dynamic Map Configuration: Example

The following example shows how to enable the L2TP—IPSec Support for NAT and PAT Windows Clients feature for a dynamic crypto map:

</tbody>
</table>

This feature module describes the Pre-fragmentation for IPSec VPNs feature in Cisco IOS Release 12.2(13)T and 12.2(14)S. It includes the following sections:

- Feature Overview, page 1
- Supported Platforms, page 4
- Configuration Tasks, page 6
- Configuration Tasks, page 6
- Configuration Examples, page 8
- Command Reference, page 9

Feature Overview

When a packet is nearly the size of the maximum transmission unit (MTU) of the outbound link of the encrypting router, and it is encapsulated with IPSec headers, it is likely to exceed the MTU of the outbound link. This causes packet fragmentation after encryption, which makes the decrypting router reassemble in the process path. Pre-fragmentation for IPSec VPNs increases the decrypting router’s performance by enabling it to operate in the high performance CEF path instead of the process path.

This feature allows an encrypting router to predetermine the encapsulated packet size from information available in transform sets, which are configured as part of the IPSec security association (SA). If it is predetermined that the packet will exceed the MTU of the output interface, the packet is fragmented before encryption. This function avoids process level reassembly before decryption and helps improve decryption performance and overall IPSec traffic throughput.
The pre-fragmentation feature is turned off by default for tunnel interfaces. To receive pre-fragmentation performance benefits, turn pre-fragmentation on after insuring that the tunnel interfaces have the same MTU on both ends.
**Benefits**

**Increased Performance**
Delivers encryption throughput at maximum encryption hardware accelerator speeds. This performance increase is for near MTU-sized packets.

**Uniform Fragmentation**
Packets are fragmented into equally sized units to prevent further downstream fragmentation.

**Interoperability**
This feature is interoperable with all Cisco IOS platforms and a number of Cisco VPN clients.

**Restrictions**

Take the following information into consideration before this feature is configured:

- Pre-fragmentation for IPSec VPNs operates in IPSec tunnel mode and IPSec tunnel mode with GRE, but not with IPSec transport mode.
- Pre-fragmentation for IPSec VPNs configured on the decrypting router in a unidirectional traffic scenario does not improve the performance or change the behavior of either of the peers.
- Pre-fragmentation for IPSec VPNs occurs before the transform is applied if compression is turned on for outgoing packets.
- Pre-fragmentation for IPSec VPNs functionality depends on the egress interface `crypto ipsec df-bit` configuration and the incoming packet “do not fragment” (DF) bit state. See Table 1.

<table>

Supported Platforms

12.2(14)S and higher
The Pre-fragmentation for IPSec VPN feature is supported on the following platforms:

- Cisco 7200 series
- Cisco 7400 series

12.2(13)T
The Pre-fragmentation for IPSec VPN feature is supported on all platforms using Cisco IOS Release 12.2(13)T or higher, including:

- Cisco 1710
- Cisco 1720
- Cisco 1721
- Cisco 1751
- Cisco 1760
- Cisco 2600
- Cisco 2691
- Cisco 3620
- Cisco 3640
- Cisco 3660

Pre-Fragmentation for IPSec VPNs

Supported Platforms

- Cisco 3725
- Cisco 3745
- Cisco 7100 series
- Cisco 7200 series
- Cisco 7400 series

12.1(11b)E
The Pre-fragmentation for IPSec VPN feature is supported on all platforms using Cisco IOS Release 12.1(11b)E or higher, including:

- Cisco 7100 series

Determining Platform Support Through Cisco Feature Navigator
Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:
http://www.cisco.com/register

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:
http://www.cisco.com/go/fn

Availability of Cisco IOS Software Images
Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.
Supported Standards, MIBs, and RFCs

Standards
- No new or modified standards are supported by this feature.

MIBs
- No new or modified standards are supported by this feature.

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

http://tools.cisco.com/ITDIT/MIBS/servlet/index

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

RFCs
- No new or modified RFCs are supported by this feature.

Configuration Tasks

See the following sections for configuration tasks for the Pre-fragmentation for IPSec VPNs feature. Each task in the list is identified as either required or optional.

- Configuring Pre-Fragmentation For IPSec VPNs (required)
- Verifying Pre-Fragmentation For IPSec VPNs (optional)

Configuring Pre-Fragmentation For IPSec VPNs

Pre-fragmentation for IPSec VPNs is globally enabled by default. To enable or disable pre-fragmentation for IPSec VPNs while in interface configuration mode, enter the commands in the following table. Use the no form of the commands to revert back to the default configuration, or use the commands themselves to enable configuration of the pre-fragmentation IPSec VPNs.

Note
Manually enabling or disabling this feature will override the global configuration.
Verifying Pre-Fragmentation For IPSec VPNs

To verify that this feature is enabled, consult the interface statistics on the encrypting router and the decrypting router. If fragmentation occurs on the encrypting router, and no reassembly occurs on the decrypting router, fragmentation is happening before encryption, and thus the packets are not being reassembled before decryption. This means that the feature is enabled.

Note
This method of verification does not apply to packets destined for the decrypting router.

### Step 1
Enter the `show running-configuration` command on the encrypting router. If the feature is enabled, you will observe output similar to the following:

```plaintext
Router# show running-configuration
crypto isakmp policy 10
    authentication pre-share
    crypto isakmp key abcd123 address 25.0.0.7
    
    crypto ipsec transform-set fooprime esp-3des esp-sha-hmac
    
    crypto map bar 10 ipsec-isakmp
    set peer 25.0.0.7
    set transform-set fooprime
    match address 102
```

If the feature has been disabled, you will observe output similar to the following:

```plaintext
Router# show running-configuration
crypto isakmp policy 10
    authentication pre-share
    crypto isakmp key abcd123 address 25.0.0.7
    
    crypto ipsec transform-set fooprime esp-3des esp-sha-hmac
    
    crypto ipsec fragmentation after-encryption
    
    crypto map bar 10 ipsec-isakmp
    set peer 25.0.0.7
    set transform-set fooprime
    match address 102
```
Step 2 Enter the `show running-configuration interface` type `number` command to display statistics for the encrypting router egress interface. If the feature is enabled, you will observe output similar to the following:

```
Router# show running-configuration interface fastetherent 0/0
interface FastEthernet0/0
  ip address 25.0.0.6 255.0.0.0
  no ip mroute-cache
  load-interval 30
  duplex full
  speed 100
  crypto map bar
```

If the feature has been disabled, you will observe output similar to the following:

```
Router# show running-configuration interface fastetherent 0/0
interface FastEthernet0/0
  ip address 25.0.0.6 255.0.0.0
  no ip mroute-cache
  load-interval 30
  duplex full
  speed 100
  crypto map bar
  crypto ipsec fragmentation after-encryption
```

### Configuration Examples

This section provides the following configuration example:

- **Enabling Pre-Fragmentation For IPSec VPNs Example**

### Enabling Pre-Fragmentation For IPSec VPNs Example

The following configuration example shows how to configure the Pre-Fragmentation for IPSec VPNs feature:

```
crypto isakmp policy 10
  authentication pre-share
crypto isakmp key abcd123 address 25.0.0.7
! crypto ipsec transform-set fooprime esp-3des esp-sha-hmac
! crypto map bar 10 ipsec-isakmp
  set peer 25.0.0.7
  set transform-set fooprime
  match address 102
```

**Note** This feature does not show up in the running configuration in this example because the default global pre-fragmentation for IPSec VPNs feature is enabled. Pre-fragmentation for IPSec VPNs shows in the running configuration only when you explicitly enable the feature on the interface.
Command Reference

The following commands are introduced or modified in the feature or features

- crypto ipsec fragmentation
- crypto ipsec fragmentation (interface configuration)

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

Real-Time Resolution for IPSec Tunnel Peer

After a user specifies a host name (instead of an IP address) for remote IP Security (IPSec) peer, the Real-Time Resolution for IPSec Tunnel Peer feature allows the host name to be domain name server (DNS) resolved before the router establishes the IPSec tunnel. Thus, the router can immediately discover whether the IP address of the peer has changed.

Restrictions for Real-Time Resolution for IPSec Tunnel Peer

Secure DNS Requirement
It is recommended that you use this feature only with secure DNS and when the DNS responses can be authenticated. Otherwise, an attacker can spoof or forge DNS responses and have access to Internet Key Exchange (IKE) authentication data, such as a certificate. If an attacker has a certificate that is trusted by the initiating host, the attacker can successfully establish Phase 1 IKE security association (SA), or the attacker can try to guess the preshared key that is shared between the initiator and the actual responder.

DNS Initiator
DNS names resolution for remote IPSec peers will work only if they are used as an initiator. The first packet that is to be encrypted will trigger a DNS lookup; after the DNS lookup is complete, subsequent packets will trigger IKE.

Information About Real-Time Resolution for IPSec Tunnel Peer
To configure real-time resolution for your IPSec peer, you should understand the following concept:

- Benefits of Real-Time Resolution Via Secure DNS, page 2

Benefits of Real-Time Resolution Via Secure DNS
When specifying the host name of a remote IPSec peer via the `set peer` command, you can also issue the `dynamic` keyword, which defers DNS resolution of the host name until right before the IPSec tunnel has been established. Deferring resolution enables the Cisco IOS software to detect whether the IP address of the remote IPSec peer has changed. Thus, the software can contact the peer at the new IP address.

If the `dynamic` keyword is not issued, the host name is resolved immediately after it is specified. So, the Cisco IOS software cannot detect an IP address change and, therefore, attempts to connect to the IP address that it previously resolved.

DNS resolution assures users that their established IPSec tunnel is secure and authenticated.

How to Configure Real-Time Resolution
This section contains the following procedure:

- Configuring Real-Time Resolution for IPSec Peers, page 2

Configuring Real-Time Resolution for IPSec Peers
Use this task to configure a router to perform real-time DNS resolution with a remote IPSec peer; that is, the host name of peer is resolved via a DNS lookup right before the router establishes a connection (an IPSec tunnel) with the peer.
Prerequisites

Before creating a crypto map, you should perform the following tasks:

- Define Internet Security Association Key Management Protocol (ISAKMP) policies.
- Define IPSec transform sets.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **crypto map map-name seq-num ipsec-isakmp**
4. **match address access-list-id**
5. **set peer {host-name [dynamic] \ ip-address}**
6. **set transform-set transform-set-name1 [transform-set-name2...transform-set-name6]**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>crypto map map-name seq-num ipsec-isakmp</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# crypto map secure_b 10 ipsec-isakmp</td>
</tr>
<tr>
<td></td>
<td>Specifies the crypto map entry to create (or modify) and enters crypto map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>match address access-list-id</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-crypto-m)# match address 140</td>
</tr>
<tr>
<td></td>
<td>Names an extended access list.</td>
</tr>
<tr>
<td></td>
<td>This access list determines which traffic should be protected by IPSec and which traffic should not be protected by IPSec in the context of this crypto map entry.</td>
</tr>
</tbody>
</table>
To display crypto map configuration information, use the `show crypto map` command.

**What to Do Next**

You need to apply a crypto map set to each interface through which IPSec traffic will flow. Applying the crypto map set to an interface instructs the router to evaluate all the interface’s traffic against the crypto map set and to use the specified policy during connection or security association (SA) negotiation on behalf of traffic to be protected by crypto.

**Troubleshooting Tips**

To display crypto map configuration information, use the `show crypto map` command.

**Configuration Examples for Real-Time Resolution**

This section provides the following configuration example:

- **Configuring Real-Time Resolution for an IPSec Peer: Example**, page 4

**Configuring Real-Time Resolution for an IPSec Peer: Example**

Figure 1 and the following example illustrate how to create a crypto map that configures the host name of a remote IPSec peer to DNS resolved via a DNS lookup right before the Cisco IOS software attempts to establish a connection with that peer.
Figure 1  Real-Time Resolution Sample Topology

! Configure the initiating router.
hostname a.cisco.com
ip domain name cisco.com
ip name server 10.0.0.1
!
crypto map secure_b 10 ipsec-isakmp
match address 140
set peer b.cisco.com dynamic
set transform-set xset
interface serial1
  ip address 30.0.0.1
  crypto map secure_b
access-list 140 permit ...
!
! Configure the responding router (the remote IPSec peer).
hostname b.cisco.com
!
crypto map secure_a 10 ipsec-isakmp
match address 150
set peer 30.0.0.1
set transform-set
interface serial0/1
  ip address 40.0.0.1
  crypto map secure_a
access-list 150 ...

! DNS server configuration
b.cisco.com  40.0.0.1  # the address of serial0/1 of b.cisco.com

Command Reference

The following commands are introduced or modified in the feature or features

- set peer (IPSec)
For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Reverse Route Injection

First Published: August 16, 2001
Last Updated: November 5, 2007

Reverse route injection (RRI) is the ability for static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities.

Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote Virtual Private Network (VPN) router as the next hop, the traffic is forced through the crypto process to be encrypted.

Enhancements to the default behavior of RRI, the addition of a route tag value, and enhancements to how RRI is configured were added to the Reverse Route Injection feature in Cisco IOS Release 12.3(14)T.

An enhancement was added in Cisco IOS Release 12.4(15)T that allows a distance metric to be set for routes that are created by a VPN process so that the dynamically learned route on a router can take precedence over a locally configured static route.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Reverse Route Injection” section on page 18.

Finding Support Information for Platforms and Cisco IOS Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Contents

- Prerequisites for Reverse Route Injection, page 2
- Restrictions for Reverse Route Injection, page 2
- Information About Reverse Route Injection, page 2
- How to Configure Reverse Route Injection, page 4
Prerequisites for Reverse Route Injection

- IP routing should be enabled and static routes should be redistributed if dynamic routing protocols are to be used to propagate RRI-generated static routes.

Restrictions for Reverse Route Injection

- If RRI is applied to a crypto map, that map must be unique to one interface on the router. In other words, the same crypto map cannot be applied to multiple interfaces. If more than one crypto map is applied to multiple interfaces, routes may not be cleaned up correctly. If multiple interfaces require a crypto map, each must use a uniquely defined map. This restriction applies only to RRI before Cisco IOS Release 12.3(14)T.
- For static crypto maps, routes are always present if RRI is configured on an applied crypto map. In Cisco IOS Release 12.3(14)T, the default behavior—of routes always being present for a static map—will not apply unless the static keyword is added to the reverse-route command.

Information About Reverse Route Injection

To configure the Reverse Route Injection enhancements, you should understand the following concepts:

- Reverse Route Injection, page 2
- Enhancements to Reverse Route Injection in Cisco IOS Release 12.4(15)T, page 3

Reverse Route Injection

RRI is the ability for static routes to be automatically inserted into the routing process for those networks and hosts that are protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities.

Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote VPN router as the next hop, the traffic is forced through the crypto process to be encrypted.

After the static route is created on the VPN router, this information is propagated to upstream devices, allowing them to determine the appropriate VPN router to which to send returning traffic in order to maintain IPsec state flows. Being able to determine the appropriate VPN router is particularly useful if multiple VPN routers are used at a site to provide load balancing or failover or if the remote VPN devices are not accessible via a default route. Routes are created in either the global routing table or the appropriate virtual route forwarding (VRF) table.

RRI is applied on a per-crypto map basis, whether this is via a static crypto map or a dynamic crypto map template. The default behavior for the two map types is as follows:
In the case of a dynamic crypto map, routes are created upon the successful establishment of IPsec security associations (SAs) for those remote proxies. The next hop back to those remote proxies is via the remote VPN router whose address is learned and applied during the creation of the dynamic crypto map template. The routes are deleted after the SAs are deleted. In Cisco IOS Release 12.3(14)T, the creation of routes on the basis of IPsec source proxies on static crypto maps was added. This behavior became the default behavior on static maps and overrode the creation of routes on the basis of crypto ACLs (see the next bullet).

For static crypto maps, routes are created on the basis of the destination information defined in the crypto access list. The next hop is taken from the first set peer statement that is attached to the crypto map. If at any time, RRI, the peer, or the access list is removed from the crypto map, routes will be deleted. This behavior changes with the addition of the RRI enhancements, as explained in the sections below.

**Enhancements to Reverse Route Injection in Cisco IOS Release 12.4(15)T**

The following enhancements have been added to the Reverse Route Injection feature in Cisco IOS Release 12.4(15)T:

- RRI Distance Metric, page 3
- Gateway Option, page 3
- Support for RRI on IPsec Profiles, page 4
- Tag Option Configuration Changes, page 4
- `show crypto route` Command, page 4

**RRI Distance Metric**

In general, a static route is created having an administrative distance of 1, which means that static routes always have precedence in the routing table. In some scenarios, however, it is required that dynamically learned routes take precedence over static routes, with the static route being used in the absence of a dynamically learned route. The addition of the `set reverse-route distance` command under either a crypto map or IPsec profile allows you to specify a different distance metric for VPN-created routes so that those routes will be in effect only if a dynamic or more favored route becomes unavailable.

**Gateway Option**

This RRI gateway option is relevant to the crypto map only.

This option allows you to configure unique next hops or gateways for remote tunnel endpoints. The option is identical to the way the `reverse-route remote-peer {ip-address}` command worked prior to Cisco IOS Release 12.3(14)T in that two routes are created for each VPN tunnel. The first route is to the destination-protected subnet via the remote tunnel endpoint. The second route specifies the next hop to be taken to reach this tunnel endpoint. This RRI gateway option allows specific default paths to be specified for specific groups of VPN connections on platforms that support recursive route lookups.

**Note**

In 12.4(15)T and later releases, the `gateway` keyword option replaces the `reverse-route remote-peer` command (with no `ip-address`). Due to changes to Cisco Express Forwarding (CEF), an interface as a next-hop cannot be used without also adding a next-hop IP address.
Support for RRI on IPsec Profiles

Previously RRI was available for crypto map configurations only. Cisco IOS Release 12.4(15)T introduces support for relevant RRI options on IPsec profiles that are predominantly used for virtual tunnel interfaces. On tunnel interfaces, only the distance metric and tag options are useful with the generic RRI capability.

Note

It is not necessary to specifically enable RRI on dynamic virtual interfaces for Easy VPN clients. Route support is enabled by default. It is necessary to specify tag or distance metric values if these are required.

Tag Option Configuration Changes

The tag option was introduced in 12.3(14)T for crypto maps. This option is now supported with IPsec profiles under the `set reverse-route tag` command syntax. The `set reverse-route tag` command is also available under the crypto map for uniformity although the legacy `reverse-route tag` command is no longer supported.

show crypto route Command

The `show crypto route` command displays routes that are created through IPsec via RRI or Easy VPN virtual tunnel interfaces (VTIs). The routes are displayed in one table. To see sample output for the `show crypto route` command, see the section “show crypto route Command Output: Example.”

How to Configure Reverse Route Injection

The following sections show how to configure reverse route injection for Cisco IOS software before Release 12.4(15)T and for Release 12.4(15)T.

- Configuring RRI on Crypto Maps for Cisco IOS Releases Prior to 12.4(15)T, page 4
- Configuring RRI with Enhancements Added in Cisco IOS Release 12.4(15)T, page 6

Configuring RRI on Crypto Maps for Cisco IOS Releases Prior to 12.4(15)T

This section includes the following tasks:

- Configuring RRI Under a Static Crypto Map, page 4
- Configuring RRI Under a Dynamic Map Template, page 5

Configuring RRI Under a Static Crypto Map

To configure RRI under a static crypto map for Cisco IOS software prior to Release 12.4(15)T, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. `crypto map {map-name} {seq-name} ipsec-isakmp`

4. `reverse-route [static | tag tag-id [static] | remote-peer [static] | remote-peer ip-address [static]]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

</tbody>
</table>

**Configuring RRI Under a Dynamic Map Template**

To configure RRI under a dynamic map template for Cisco IOS software prior to Release 12.4(15)T, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto dynamic-map dynamic-map-name dynamic-seq-name`
4. `reverse-route [static | tag tag-id [static] | remote-peer [static] | remote-peer ip-address [static]]`
How to Configure Reverse Route Injection

DETAILED STEPS

### Command or Action | Purpose
--- | ---
**Step 1** | enable
**Example:**
Router> enable
Enables privileged EXEC mode.
- Enter your password if prompted.

**Step 2** | configure terminal
**Example:**
Router# configure terminal
Enters global configuration mode.

**Step 3** | crypto dynamic-map dynamic-map-name
**Example:**
Router (config)# crypto dynamic-map mymap 1
Creates a dynamic crypto map entry and enters the crypto map configuration command mode.

**Step 4** | reverse-route [static | tag tag-id [static] | remote-peer [static] | remote-peer ip-address [static]]
**Example:**
Router (config-crypto-map)# reverse-route remote peer 10.1.1.1
Creates source proxy information for a crypto map entry.

Configuring RRI with Enhancements Added in Cisco IOS Release 12.4(15)T

The following sections show how to configure RRI with the enhancements that were added in Cisco IOS Release 12.4(15)T:

- Configuring RRI with Enhancements Under a Static Crypto Map, page 6
- Configuring RRI with Enhancements Under a Dynamic Map Template, page 7
- Configuring a RRI Distance Metric Under an IPsec Profile, page 8
- Verifying Routes That Are Created Through IPsec via RRI or Easy VPN VTIs, page 9

Configuring RRI with Enhancements Under a Static Crypto Map

To configure RRI with enhancements under a static crypto map (for Cisco IOS Release 12.4(15)T and later releases), perform the following steps.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto map map-name seq-name ipsec-isakmp
4. reverse-route [static | remote-peer ip-address [gateway] [static]]
5. set reverse-route [distance number | tag tag-id]
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:**  
  Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**  
  Router# configure terminal | |
| **Step 3** crypto map map-name seq-name ipsec-isakmp | Creates or modifies a crypto map entry and enters crypto map configuration mode. |
| **Example:**  
  Router (config)# crypto map mymap 1 ipsec-isakmp | |
| **Step 4** reverse-route [static | remote-peer ip-address [gateway] [static]] | Creates source proxy information for a crypto map entry.  
  **Note**  
The gateway keyword can be added to enable the dual route functionality for default gateway support. |
| **Example:**  
  Router (config-crypto-map)# reverse-route | |
| **Step 5** set reverse-route [distance number | tag tag-id] | Specifies a distance metric to be used or a tag value to be associated with these routes. |
| **Example:**  
  Router (config-crypto-map)# set reverse-route distance 20 | |

### Configuring RRI with Enhancements Under a Dynamic Map Template

To configure RRI with enhancements under a dynamic map template (for Cisco IOS Release 12.4(15)T and later releases), perform the following steps.

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. crypto dynamic-map dynamic-map-name dynamic-seq-name  
4. reverse-route [static | remote-peer ip-address [gateway] [static]]  
5. set reverse-route [distance number | tag tag-id]
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>[Enter your password if prompted.](Example: Router&gt; enable)</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>[Configure terminal](Example: Router# configure terminal)</td>

### Configuring a RRI Distance Metric Under an IPsec Profile

To configure a RRI distance metric under an IPsec profile for Cisco IOS Release 12.4(15)T and later releases, perform the following steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec profile name**
4. **set reverse-route [distance number | tag tag-id]**

---

**DETAILED STEPS**

**Command or Action** | **Purpose**
--- | ---
**Step 1** enable | Enables privileged EXEC mode.
**Example:** | Enter your password if prompted.
**Step 2** configure terminal | Enters global configuration mode.
**Step 3** crypto dynamic-map dynamic-map-name dynamic-seq-name | Creates a dynamic crypto map entry and enters the crypto map configuration command mode.
**Example:** | [Crypto dynamic-map](Example: Router (config)# crypto dynamic-map mymap 1) [Dynamic-seq-name](Example: Router (config)# crypto dynamic-map mymap 1)
**Step 4** reverse-route [static | remote-peer ip-address [gateway] [static]] | Creates source proxy information for a crypto map entry.
**Example:** | [Reverse-route](Example: Router (config-crypto-map)# reverse-route remote peer 10.1.1.1 gateway)
**Step 5** set reverse-route [distance number | tag tag-id] | Specifies a distance metric to be used or a tag value to be associated with these routes.
**Example:** | [Set reverse-route](Example: Router (config-crypto-map)# set reverse-route distance 20)
DETAILED STEPS

<tr>
<td>Router# show crypto route</td>
<td></td>
</tr>
</tbody>
</table>
Troubleshooting Tips

To observe the behavior of RRI and its relationship to the creation and deletion of an IPsec SA, you can use the `debug crypto ipsec` command (see the Cisco IOS Debug Command Reference, Release 12.4T).

Configuration Examples for Reverse Route Injection

This section contains the following sections:

- Configuring RRI Prior to Cisco IOS Release 12.3(14)T: Examples, page 10
- Configuring RRI with Enhancements Added in Cisco IOS Release 12.3(14)T: Examples, page 11
- Configuring RRI with Enhancements Added in Cisco IOS Release 12.4(15)T: Examples, page 12

Configuring RRI Prior to Cisco IOS Release 12.3(14)T: Examples

The following are examples of RRI configurations and output before Cisco IOS Release 12.3(14))T:

- Configuring RRI When Crypto ACLs Exist: Example, page 10
- Configuring RRI When Two Routes Are Created, One for the Remote Endpoint and One for Route Recursion: Example, page 11

Configuring RRI When Crypto ACLs Exist: Example

The following example shows that all remote VPN gateways connect to the router via 192.168.0.3. RRI is added on the static crypto map, which creates routes on the basis of the source network and source netmask that are defined in the crypto access control list (ACL):

```
crypto map mymap 1 ipsec-isakmp
  set peer 10.1.1.1
  reverse-route
  set transform-set esp-3des-sha
  match address 102

interface FastEthernet 0/0
  ip address 192.168.0.2 255.255.255.0
  standby name group1
  standby ip 192.168.0.3
  crypto map mymap redundancy group1

access-list 102 permit ip 192.168.1.0 0.0.0.255 10.0.0.0 0.0.255.255
```

In Cisco IOS Release 12.3(14)T and later releases, for the static map to retain this same behavior of creating routes on the basis of crypto ACL content, the `static` keyword is required, that is, `reverse-route static`.

Note

The `reverse-route` command in this situation creates routes that are analogous to the following static route command-line interface (CLI) commands (`ip route`):

```
Remote Tunnel Endpoint
ip route 10.1.1.1 255.255.255.255 192.168.1.1
```
VPNSM
ip route 10.1.1.1 255.255.255.255 vlan0.1

Configuring RRI When Two Routes Are Created, One for the Remote Endpoint and One for Route Recursion: Example

In the following example, two routes are created, one for the remote endpoint and one for route recursion to the remote endpoint via the interface on which the crypto map is configured:

```
reverse-route remote-peer
```

Configuring RRI with Enhancements Added in Cisco IOS Release 12.3(14)T: Examples

The following are examples of configurations and output for RRI enhancements that were added in Cisco IOS Release 12.3(14)T.

- Configuring RRI When Crypto ACLs Exist: Example, page 11
- Configuring RRI with Route Tags: Example, page 11
- Configuring RRI for One Route to the Remote Proxy via a User-Defined Next Hop: Example, page 12

Configuring RRI When Crypto ACLs Exist: Example

The following example shows that RRI has been configured for a situation in which there are existing ACLs:

```
crypto map mymap 1 ipsec-isakmp
  set peer 172.17.11.1
  reverse-route static
  set transform-set esp-3des-sha
  match address 101
  access-list 101 permit ip 192.168.1.0 0.0.0.255 172.17.11.0 0.0.0.255
```

Configuring RRI with Route Tags: Example

The following example shows how RRI-created routes can be tagged with a tag number and then used by a routing process to redistribute those tagged routes via a route map:

```
crypto dynamic-map ospf-clients 1
  reverse-route tag 5

router ospf 109
  redistribute rip route-map rip-to-ospf

route-map rip-to-ospf permit
  match tag 5
  set metric 5
  set metric-type type1

Router# show ip ospf topology
```
P 10.81.7.48/29, 1 successors, FD is 2588160, tag is 5
via 192.168.82.25 (2588160/2585600), FastEthernet0/1

Configuring RRI for One Route to the Remote Proxy via a User-Defined Next Hop: Example

**Note**  This option is applicable only to crypto maps.

The preceding example shows that one route has been created to the remote proxy via a user-defined next hop. This next hop should not require a recursive route lookup unless it will recurse to a default route.

```
reverse-route remote-peer 10.4.4.4
```

The preceding example yields the following prior to Cisco IOS Release 12.3(14)T:

- 10.0.0.0/24 via 10.1.1.1 (in the VRF table if VRFs are configured)
- 10.1.1.1/32 via 10.4.4.4 (in the global route table)

And this result occurs with RRI enhancements:

- 10.0.0.0/24 via 10.4.4.4 (in the VRF table if VRFs are configured, otherwise in the global table)

Configuring RRI with Enhancements Added in Cisco IOS Release 12.4(15)T: Examples

The following are examples of configurations and output for RRI enhancements that were added in Cisco IOS Release 12.4(15)T.

- Configuring a RRI Distance Metric Under a Crypto Map: Example, page 12
- Configuring RRI with Route Tags: Example, page 11
- debug and show Command Output for a RRI Distance Metric Configuration Under a Crypto Map: Example, page 13
- Configuring a RRI Distance Metric for a VTI: Example, page 14
- debug and show Command Output for a RRI Metric Configuration Having a VTI: Example, page 14
- show crypto route Command Output: Example, page 15

Configuring a RRI Distance Metric Under a Crypto Map: Example

The following configuration shows a server and client configuration for which a RRI distance metric has been set under a crypto map:

**Server**

```
crypto dynamic-map mymap
  set security-association lifetime seconds 300
  set transform-set 3dessha
  set isakmp-profile profile1
  set reverse-route distance 20
  reverse-route
```

**Client**

```
crypto ipsec client ezvpn ez
  connect auto
  group cisco key cisco
```
Reverse Route Injection

Configuration Examples for Reverse Route Injection

mode client
peer 10.0.0.119
username XXX password XXX
xauth userid mode local

Configuring RRI with Route Tags: Example

The following example shows how RRI-created routes can be tagged with a tag number and then used by a routing process to redistribute those tagged routes via a route map:

crypto dynamic-map ospf-clients 1
  set reverse-route tag 5

router ospf 109
  redistribute rip route-map rip-to-ospf

route-map rip-to-ospf permit
  match tag 5
  set metric 5
  set metric-type type1

Router# show ip ospf topology
P 10.81.7.48/29, 1 successors, FD is 2588160, tag is 5
via 192.168.82.25 (2588160/2585600), FastEthernet0/1

debug and show Command Output for a RRI Distance Metric Configuration Under a Crypto Map: Example

The following are debug and show command output for a RRI distance metric configuration under a crypto map on a server:

Router# debug crypto ipsec

00:23:37: IPSEC(validate_proposal_request): proposal part #1,
  (key eng. msg.) INBOUND local= 10.0.0.119, remote= 10.0.0.14,
  local_proxy= 0.0.0.0/0.0.0.0/0/0 (type=4),
  remote_proxy= 192.168.6.1/255.255.255.255/0/0 (type=1),
  protocol= ESP, transform= esp-3des esp-sha-hmac (Tunnel),
  lifedur= 0s and 0kb,
  spi= 0x0(0), conn_id= 0, keysize= 0, flags= 0x0
00:23:37: IPSEC(key_engine): got a queue event with 1 KMI message(s)
00:23:37: IPSEC(rte_mgr): VPN Route Event create routes for peer or rekeying for
  10.0.0.128
00:23:37: IPSEC(rte_mgr): VPN Route Recount 1 FastEthernet0/0
00:23:37: IPSEC(rte_mgr): VPN Route Added 192.168.6.1 255.255.255.255 via 10.0.0.14 in IP
  DEFAULT TABLE with tag 0 distance 20
00:23:37: IPSEC(policy_db_add_ident): src 0.0.0.0, dest 192.168.6.1, dest_port 0

Router# show ip route

Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default, U - per-user static route
o - ODR, P - periodic downloaded static route

Gateway of last resort is 10.0.0.14 to network 0.0.0.0
Configuring a RRI Distance Metric for a VTI: Example

The following configuration shows a server and client configuration in which a RRI distance metric has been set for a VTI:

**Server Configuration**

crypto isakmp profile profile1
keyring mykeyring
match identity group cisco
client authentication list authenlist
isakmp authorization list autholist
client configuration address respond
virtual-template 1
crypto ipsec profile vi
set transform-set 3dessha
set reverse-route distance 20
set isakmp-profile profile1
interface Virtual-Template1 type tunnel
ip unnumbered
tunnel mode ipsec ipv4
tunnel protection ipsec profile vi

**Client Configuration**

crypto ipsec client ezvpn ez
connect auto
group cisco key cisco
mode client
peer 10.0.0.119
username XXX password XXX
virtual-interface 1

debuge and show Command Output for a RRI Metric Configuration Having a VTI: Example

The following are debug and show command output for a RRI metric configuration for a VTI on a server:

Router# debug crypto ipsec
00:47:56: IPSEC(key_engine): got a queue event with 1 KMI message(s)
00:47:56: Crypto mapdb : proxy_match
    src addr      : 0.0.0.0
dst addr      : 192.168.6.1
    protocol      : 0
    src port      : 0
show crypto route Command Output: Example

The following output example displays routes, in one table, that are created through IPsec via RRI or Easy VPN VTIs:

Router# show crypto route

VPN Routing Table: Shows RRI and VTI created routes
Codes: RRI - Reverse-Route, VTI- Virtual Tunnel Interface
S - Static Map ACLs

Gateway of last resort is 10.0.0.14 to network 0.0.0.0

C 192.200.200.0/24 is directly connected, Loopback0
10.20.20.20/24 is subnetted, 1 subnets

Command Reference

The following commands are introduced or modified in the feature or features

- `reverse-route`
- `set reverse-route`
- `show crypto route`

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

### Table 1  Feature Information for Reverse Route Injection

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Reverse Route Injection                   | 12.1(9)E, 12.2(8)T, 12.2(8)YE | Reverse route injection (RRI) is the ability for static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities. Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote Virtual Private Network (VPN) router as the next hop, the traffic is forced through the crypto process to be encrypted. The following sections provide information about this feature:  
  - “Reverse Route Injection” section on page 2  
  The following commands were introduced or modified by this feature: **reverse-route**. |
| Reverse Route Remote Peer Options         | 12.2(13)T, 12.2(14)S | An enhancement was added to RRI to allow you to specify an interface or address as the explicit next hop to the remote VPN device. This functionality allows the overriding of a default route to properly direct outgoing encrypted packets. The following sections provide information about the remote peer options:  
The following enhancements were added to the Reverse Route Injection feature:

- The default behavior of static crypto maps will be the same as that of dynamic crypto maps unless the `reverse-route` command and `static` keyword are used.
- A route tag value was added for any routes that are created using RRI.
- RRI can be configured on the same crypto map that is applied to multiple router interfaces.
- RRI configured with the `reverse-route remote-peer {ip-address}` command, keyword, and argument will create one route instead of two.

The following sections provide information about the Reverse Route Injection enhancements:

- “Reverse Route Injection” section on page 2

  The following commands were introduced or modified by this feature: `reverse-route`, `set reverse-route`. |
| show crypto route Command     | 12.4(15)T      | This command displays routes that are created through IPsec via RRI or Easy VPN VTIs.  
  Support for RRI on IPsec Profiles | 12.4(15)T | This feature provides support for relevant RRI options on IPsec profiles that are predominantly used by VTIs.  
  The following section provides information about the Support for RRI on IPsec Profiles feature:  
  • “Support for RRI on IPsec Profiles” section on page 4  
  Tag Option Configuration Changes | 12.4(15)T | The tag option is now supported with IPsec profiles under the `set reverse-route tag` command.  
  The following section provides information about this feature enhancement:  
  • “Tag Option Configuration Changes” section on page 4  
  Reverse Route Injection (RRI) | Cisco IOS XE Release 2.1 | This feature was introduced on Cisco ASR 1000 Series Routers. |
SafeNet IPSec VPN Client Support

The SafeNet IPSec VPN Client Support feature allows you to limit the scope of an Internet Security Association and Key Management Protocol (ISAKMP) profile or ISAKMP keyring configuration to a local termination address or interface. The benefit of this feature is that different customers can use the same peer identities and ISAKMP keys by using different local termination addresses.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Contents

- Prerequisites for SafeNet IPSec VPN Client Support, page 2
- Restrictions for SafeNet IPSec VPN Client Support, page 2
- Information About SafeNet IPSec VPN Client Support, page 2
- How to Configure SafeNet IPSec VPN Client Support, page 3
- Configuration Examples for SafeNet IPSec VPN Client Support, page 7
- Additional References, page 8
- Command Reference, page 9
Prerequisites for SafeNet IPSec VPN Client Support

- You must understand how to configure ISAKMP profiles and ISAKMP keyrings.

Restrictions for SafeNet IPSec VPN Client Support

- The local address option works only for the primary address of an interface.
- If an IP address is provided, the administrator has to ensure that the connection of the peer terminates to the address that is provided.
- If the IP address does not exist on the device, or if the interface does not have an IP address, the ISAKMP profile or ISAKMP keyring will be effectively disabled.

Information About SafeNet IPSec VPN Client Support

Before configuring SafeNet IPSec VPN Client Support, you should understand the following concepts:

- ISAKMP Profile and ISAKMP Keyring Configurations: Background, page 2
- Local Termination Address or Interface, page 2

ISAKMP Profile and ISAKMP Keyring Configurations: Background

Prior to Cisco IOS Release 12.3(14)T, ISAKMP-profile and ISAKMP-keyring configurations could be only global, meaning that the scope of these configurations could not be limited by any locally defined parameters (VRF instances were an exception). For example, if an ISAKMP keyring contained a preshared key for address 10.11.12.13, the same key would be used if the peer had the address 10.11.12.13, irrespective of the interface or local address to which the peer was connected. There are situations, however, in which users prefer that associate keyrings be bound not only with virtual route forwarding (VRF) instances but also to a particular interface. For example, if instead of VRF instances, there are virtual LANS, and the Internet Key Exchange (IKE) is negotiated with a group of peers using one fixed virtual LAN (VLAN) interface. Such a group of peers uses a single preshared key, so if keyrings could be bound to an interface, it would be easy to define a wildcard key without risking that the keys would also be used for other customers.

Sometimes the identities of the peer are not in the control of the administrator, and even if the same peer negotiates for different customers, the local termination address is the only way to distinguish the peer. After such a distinction is made, if the traffic is sent to different VRF instances, configuring an ISAKMP profile is the only way to distinguish the peer. Unfortunately, when the peer uses an identical identity for all such situations, the ISAKMP profile cannot distinguish among the negotiations. For such scenarios, it would be beneficial to bind ISAKMP profiles to a local termination address. If a local termination address could be assigned, identical identities from the peer would not be a problem.

Local Termination Address or Interface

Effective with Cisco IOS Release 12.3(14)T, the SafeNet IPSec VPN Client Support feature allows you to limit the scope of ISAKMP profiles and ISAKMP keyrings to a local termination address or interface.
Benefit of SafeNet IPSec VPN Client Support

The benefit of this feature is that different customers can use the same peer identities and ISAKMP keys by using different local termination addresses.

How to Configure SafeNet IPSec VPN Client Support

This section contains the following procedures. The first two configurations are independent of each other.

- Limiting an ISAKMP Profile to a Local Termination Address or Interface, page 3 (required)
- Limiting a Keyring to a Local Termination Address or Interface, page 4 (required)
- Monitoring and Maintaining SafeNet IPSec VPN Client Support, page 5 (optional)
- Examples, page 6 (optional)

Limiting an ISAKMP Profile to a Local Termination Address or Interface

To configure an ISAKMP profile and limit it to a local termination address or interface, perform the following steps.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto isakmp profile *profile-name*
4. keyring *keyring-name*
5. match identity address *address*
6. local-address {interface-name | ip-address [vrf-tag]}

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Router> enable
```

```
Router# configure terminal
```
## How to Configure SafeNet IPSec VPN Client Support

### Limiting a Keyring to a Local Termination Address or Interface

To configure an ISAKMP keyring and limit its scope to a local termination address or interface, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto keyring keyring-name`
4. `local-address {interface-name | ip-address [vrf-tag]}`
5. `pre-shared-key address address`
### DETAILED STEPS

### Monitoring and Maintaining SafeNet IPSec VPN Client Support

The following `debug` and `show` commands may be used to monitor and maintain the configuration in which you limited the scope of an ISAKMP profile or ISAKMP keyring to a local termination address or interface.

### SUMMARY STEPS

1. enable
2. debug crypto isakmp
3. show crypto isakmp profile
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>   Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

**Step 2** debug crypto isakmp

| **Example:**   Router# debug crypto isakmp | Displays messages about IKE events. |

**Step 3** show crypto isakmp profile

| **Example:**   Router# show crypto isakmp profile | Lists all the ISAKMP profiles that are defined on a router. |

**Examples**

**debug crypto isakmp Command Output for an ISAKMP Keyring That Is Bound to Local Termination Addresses: Example**

You have an ISAKMP configuration as follows (the address of serial2/0 is 10.0.0.1, and the address of serial2/1 is 10.0.0.2),

crypto keyring keyring1
! Scope of the keyring is limited to interface serial2/0.
  local-address serial2/0
! The following is the key string used by the peer.
  pre-shared-key address 10.0.0.3 key somerandomkeystring
crypto keyring keyring2
  local-address serial2/1
! The following is the keystring used by the peer coming into serial2/1.
  pre-shared-key address 10.0.0.3 key someotherkeystring

and if the connection is coming into serial2/0, keyring1 is chosen as the source of the preshared key (and keyring2 is ignored because it is bound to serial2/1), you would see the following output:

Router# debug crypto isakmp

*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0):Keyring keyring2 is bound to 10.0.0.0, skipping
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0):Looking for a matching key for 10.0.0.3 in keyring1
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0): : success
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0):found peer pre-shared key matching 10.0.0.3
*Feb 11 15:01:29.595: ISAKMP:(0:0:N/A:0): local preshared key found

**debug crypto isakmp Command Output for an ISAKMP Profile That Is Bound to a Local Termination Address: Example**

If you have the following configuration,

crypto isakmp profile profile1
keyring keyring1
match identity address 10.0.0.0 255.0.0.0
local-address serial2/0
crypto isakmp profile profile2
  keyring keyring1
  keyring keyring2
  self-identity fqdn
match identity address 10.0.0.1 255.255.255.255
local-address serial2/1

and the connection is coming through the local terminal address serial2/0, you will see the following output:

Router# debug crypto isakmp

*Feb 11 15:01:29.935: ISAKMP:(0:0:N/A:0): Profile profile2 bound to 10.0.0.0 skipped
*Feb 11 15:01:29.935: ISAKMP:(0:1:SW:1):: peer matches profile1 profile

show crypto isakmp profile Command Output: Example

The following is an example of typical `show` command output for an ISAKMP profile that is bound to serial2/0:

Router# show crypto isakmp profile

ISAKMP PROFILE profile1
  Identities matched are:
  ip-address 10.0.0.0 255.0.0.0
  Certificate maps matched are:
  keyring(s): keyring1
  trustpoint(s): <all>
  Interface binding: serial2/0 (10.20.0.1:global)

Troubleshooting SafeNet IPSec VPN Client Support

If an ISAKMP profile or ISAKMP keyring fails to be selected, you should double-check the local-address binding in the ISAKMP profile or ISAKMP keyring configuration and follow the output of the IKE debugs to determine whether the peer is correctly terminating on the address. You may remove the local-address binding (to make the scope of the profile or keyring global) and check to determine whether the profile or keyring is selected to confirm the situation.

Configuration Examples for SafeNet IPSec VPN Client Support

This section contains the following configuration, `debug` command, and `show` command examples.

- ISAKMP Profile Bound to a Local Interface: Example, page 8
- ISAKMP Keyring Bound to a Local Interface: Example, page 8
- ISAKMP Keyring Bound to a Local IP Address: Example, page 8
- ISAKMP Keyring Bound to an IP Address and Limited to a VRF: Example, page 8
ISAKMP Profile Bound to a Local Interface: Example

The following example shows that the ISAKMP profile is bound to a local interface:

crypto isakmp profile profile1
    keyring keyring1
    match identity address 10.0.0.0 255.0.0.0
    local-address serial2/0

ISAKMP Keyring Bound to a Local Interface: Example

The following example shows that the ISAKMP keyring is bound only to interface serial2/0:

crypto keyring
    local-address serial2/0
    pre-shared-key address 10.0.0.1

ISAKMP Keyring Bound to a Local IP Address: Example

The following example shows that the ISAKMP keyring is bound only to IP address 10.0.0.2:

crypto keyring keyring1
    local-address 10.0.0.2
    pre-shared-key address 10.0.0.2 key

ISAKMP Keyring Bound to an IP Address and Limited to a VRF: Example

The following example shows that an ISAKMP keyring is bound to IP address 10.34.35.36 and that the scope is limited to VRF examplevrf1:

ip vrf examplevrf1
    rd 12:3456
crypto keyring ring1
    local-address 10.34.35.36 examplevrf1
interface ethernet2/0
    ip vrf forwarding examplevrf1
    ip address 10.34.35.36 255.255.0.0

Command Reference

The following commands are introduced or modified in the feature or features

- **local-address**

For information about these commands, see the Cisco IOS Security Command Reference at
For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Stateful Failover for IPSec

Stateful failover for IP Security (IPSec) enables a router to continue processing and forwarding IPSec packets after a planned or unplanned outage occurs. Customers employ a backup (secondary) router that automatically takes over the tasks of the active (primary) router if the active router loses connectivity for any reason. This process is transparent to the user and does not require adjustment or reconfiguration of any remote peer.

Stateful failover for IPSec is designed to work in conjunction with stateful switchover (SSO) and Hot Standby Routing Protocol (HSRP). HSRP provides network redundancy for IP networks, ensuring that user traffic immediately and transparently recovers from failures in network edge devices or access circuits. That is, HSRP monitors both the inside and outside interfaces so that if either interface goes down, the whole router is deemed to be down and ownership of Internet Key Exchange (IKE) and IPSec security associations (SAs) is passed to the standby router (which transitions to the HSRP active state). SSO allows the active and standby routers to share IKE and IPSec state information so that each router has enough information to become the active router at any time. To configure stateful failover for IPSec, a network administrator should enable HSRP, assign a virtual IP address, and enable the SSO protocol.

Prerequisites for Stateful Failover for IPSec

Complete, Duplicate IPSec and IKE Configuration on the Active and Standby Devices
This document assumes that you have a complete IKE and IPSec configuration. (This document describes only how to add stateful failover to a working IPSec configuration.)

The IKE and IPSec configuration that is set up on the active device must be duplicated on the standby device. That is, the crypto configuration must be identical with respect to Internet Security Association and Key Management Protocol (ISAKMP) policy, ISAKMP keys (preshared), IPSec profiles, IPSec transform sets, all crypto map sets that are used for stateful failover, all access control lists (ACLs) that are used in match address statements on the crypto map sets, all AAA configurations used for crypto, client configuration groups, ip local pools used for crypto, and ISAKMP profiles.

Note
None of the configuration information between the active and standby device is automatically transferred; the user is responsible for ensuring that the crypto configurations match on both devices. If the crypto configurations on both devices do not match, failover from the active device to the standby device will not be successful.

Device Requirements
- Stateful failover for IPSec requires that your network contains two identical routers that are available to be either the primary or secondary device. Both routers should be the same type of device, have the same CPU and memory, and have either no encryption accelerator or identical encryption accelerators.
- This feature is currently supported only on a limited number of platforms. To check the latest platform support, go to Cisco Feature Navigator at http://www.cisco.com/go/fn.

Restrictions for Stateful Failover for IPSec

When configuring redundancy for a virtual private network (VPN), the following restrictions exist:
- Both the active and standby devices must run the identical version of the Cisco IOS software, and both the active and standby devices must be connected via hub or switch.
- Only the VPN Acceleration Module (VAM), VAM2, and AIM-VPN/HPII+ hardware encryption accelerators are supported in a Cisco 3845 router, and the AIM-VPN/EPII+ hardware encryption accelerators are supported in a Cisco 3825 router.
- Only “box-to-box” failover is supported; that is, intrachassis failover is currently not supported.
- WAN interfaces between the active (primary) router and the standby (secondary) router are not supported. (HSRP requires inside interfaces and outside interfaces to be connected via LANs.)
- Load balancing is not supported; that is, no more than one device in a redundancy group can be active at any given time.
- Stateful failover of IPSec with Layer 2 Tunneling Protocol (L2TP) is not supported.
Public key infrastructure (PKI) is not supported when used with stateful failover. (Only preshared keys for IKE are supported.)

IKE keepalives are not supported. (Enabling this functionality will cause the connection to be torn down after the standby router assumes ownership control.) However, dead peer detection (DPD) and periodic DPD are supported.

IPSec idle timers are not supported when used with stateful failover.

A stateful failover crypto map applied to an interface in a virtual route forwarding (VRF) instance is not supported. However, VRF-aware IPSec features are supported when a stateful failover crypto map is applied to an interface in the global VRF.

Stateful failover is not compatible or interoperable with the State Synchronization Protocol (SSP) version of stateful failover (which is available in Cisco IOS Release 12.2YX1 and Cisco IOS Release 12.2SU).

Information About Stateful Failover for IPSec

To configure stateful failover for VPNs, you should understand the following concepts:

- Supported Deployment Scenarios: Stateful Failover for IPSec, page 3
- IPSec Stateful Failover for Remote Access Connections, page 5
- Dead Peer Detection with IPsec High Availability, page 6

Supported Deployment Scenarios: Stateful Failover for IPSec

It is recommended that you implement IPSec stateful failover in one of the following recommended deployment scenarios—a single interface scenario or a dual interface scenario.

In a single interface scenario, the VPN gateways use one LAN connection for both encrypted traffic arriving from remote peers and decrypted traffic flowing to inside hosts (see Figure 1). The single interface design allows customers to save money on router ports and subnets. This design is typically used if all traffic flowing in and out of the organization does not traverse the VPN routers.

![Figure 93 Single Interface Network Topology](image)
In a dual interface scenario, a VPN gateway has more than one interface, enabling traffic to flow in and out of the router via separate interfaces (see Figure 2). This scenario is typically used if traffic flowing in and out of a site must traverse the routers, so the VPN routers will provide the default route out of the network.

**Figure 94 Dual Interface Network Topology**

Table 1 lists the functionality available in both a single interface scenario and a dual interfaces scenario.

**Table 55 IPSec Stateful Failover: Single and Dual Interface Functionality Overview**

<table>
<thead>
<tr>
<th>Single Interface</th>
<th>Dual Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Route Injection</strong></td>
<td>If the VPN gateways are not the logical next hop for devices inside the network, the routes must be created and injected into the routing process. Thus, traffic that is returning from inside the network can be sent back to the VPN routers for IPSec services before it is sent out. A virtual IP (VIP) address cannot be used as the advertiser of routing updates, so flows must be synchronized via the injected routes. If the VPN gateways are the next hop (default route) for all devices inside the network, the VIP address that is used on the inside interfaces can be used as the next hop. Thus, injection of the VPN routes is not required. However, static routes on inside hosts must be used to direct the routes to the next hop VIP address.</td>
</tr>
</tbody>
</table>

| **HSRP Configuration** | Because each interface pair functions independently, you should configure HSRP so that multiple pairs of interfaces can be tracked. (That is, HSRP should not be configured on only one pair of interfaces or on both pairs of interfaces without each pair mutually tracking each other.) Mutual tracking means that if the outside interface does fail, the inside interface on the same router will also be deemed down, allowing for complete router failover to the secondary router. |

| **Secure State Information** | |

---
Information About Stateful Failover for IPSec

IPSec Stateful Failover for Remote Access Connections

The main difference between a remote access and a LAN-to-LAN connection is the use of Xauth and mode-config. IKE Xauth is often used to authenticate the user. IKE mode-config is often used to push security policy from the hub (concentrator) router to the user’s IPSec implementation. Mode-config is also typically used to assign an internal company network IP address to a user.

In addition to the differences between a remote access configuration and a LAN-to-LAN configuration, you should note the following remote-access-server-specific functions:

- **Assigned IP address**—The IP address can be assigned to the client via one of the following options:
  - Local IP pools. For local IP pools, the administrator must first configure identical local IP address pools on each router in the high availability (HA) pair (via the `ip local pool client-address-pool` command). This pool name can be applied in one of two places—in a group policy via the `crypto isakmp client configuration group group-name` (and the submode command `pool pool-name`) or in a client configuration via the `crypto isakmp client configuration address-pool local local-pool` command.
  - RADIUS-assigned address. If you are using RADIUS authentication and the RADIUS server returns the Framed-IP-Address attribute, the concentrator will always assign that address to the client. It is recommended that you refer to your RADIUS server vendor’s documentation, especially for vendors that allow you to configure address pools on the RADIUS server. Typically those servers require crypto accounting to work properly.

To enable accounting on the HA pair, you should issue the following commands on both Active and Standby devices: `aaa accounting network radius-accounting start-stop group radius` then apply radius-accounting either to the crypto isakmp profile or the crypto map set.

- **RADIUS NAS-IP address**—The HA pair should appear as a single device to the RADIUS server. Thus, both HA routers must communicate with the RADIUS server using the same IP address. However, when communicating with the RADIUS server, the router must use a physical IP address, not a virtual IP (VIP) address as the NAS-IP address of the router. To configure the RADIUS NAS-IP address for the HA pair, you must configure the same loopback address in the HA pair via `interface loopback ip address` command; thereafter, you must issue the `ip radius source-interface loopback` command in the HA pair. Finally, add the new loopback IP address to the RADIUS servers configuration so the RADIUS server can process requests from the HA pair.

For additional information on how to configure IPSec stateful failover for a remote access connection, see the section “Configuring IPSec Stateful Failover for an Easy VPN Server: Example” in this document.
Dead Peer Detection with IPsec High Availability

To configure Dead Peer Detection (DPD) with IPsec High Availability (HA), it is recommended that you use a value other than the default (2 seconds). A keepalive time of 10 seconds with 5 retries seems to work well with HA because of the time it takes for the router to get into active mode.

To configure DPD with IPsec HA, use the `crypto isakmp keepalive` command.

How to Use Stateful Failover for IPSec

This section contains the following procedures:

- Enabling HSRP: IP Redundancy and a Virtual IP Address, page 6 (required)
- Enabling SSO, page 9 (required)
- Configuring Reverse Route Injection on a Crypto Map, page 13 (required)
- Enabling Stateful Failover for IKE and IPSec, page 15 (required)
- Protecting SSO Traffic, page 18 (optional)
- Managing and Verifying High Availability Information, page 20 (optional)

Enabling HSRP: IP Redundancy and a Virtual IP Address

HSRP provides two services—IP redundancy and a VIP address. Each HSRP group may provide either or both of these services. IPSec stateful failover uses the IP redundancy services from only one HSRP standby group. It can use the VIP address from one or more HSRP groups. Use the following task to configure HSRP on the outside and inside interfaces of the router.

Note

Perform this task on both routers (active and standby) and of both interfaces on each router.

Prerequisites for Spanning Tree Protocol and HSRP Stability

If a switch connects the active and standby routers, you must perform one of the following steps to ensure that the correct settings are configured on that switch:

- Enable the `spanning-tree portfast` command on every switch port that connects to a HSRP-enabled router interface.
- Disable the Spanning Tree Protocol (STP) on the switch only if your switch does not connect to other switches. Disabling spanning tree in a multi-switch environment may cause network instability.
- Enable the `standby delay minimum [min-delay] reload [reload-delay]` command if you do not have access to the switch. The `reload-delay` argument should be set to a value of at least 120 seconds. This command must be applied to all HSRP interfaces on both routers.

For more information on HSRP instability, see the document *Avoiding HSRP Instability in a Switching Environment with Various Router Platforms*.

Note

You must perform at least one of these steps for correct HSRP operation.
Restrictions

- Both the inside (private) interface and the outside (public) interface must belong to separate HSRP groups, but the HSRP group number can be the same.
- The state of the inside interface and the outside interface must be the same—both interfaces must be in the active state or standby state; otherwise, the packets will not have a route out of the private network.
- Standby priorities should be equal on both active and standby routers. If the priorities are not equal, the higher priority router will unnecessarily take over as the active router, negatively affecting uptime.
- The IP addresses on the HSRP-tracked interfaces of the standby and active routers should both be either lower or higher on one router than the other. In the case of equal priorities (an HA requirement), HSRP will assign the active state on the basis of the IP address. If an addressing scheme exists so that the public IP address of Router A is lower than the public IP address of Router B, but the opposite is true for their private interfaces, an active/standby-standby/active split condition could exist which will break connectivity.

Note

Each time an active device relinquishes control to become the standby device, the active device will reload. This functionality ensures that the state of the new standby device synchronizes correctly with the new active device.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `standby standby-group-number name standby-group-name`
5. `standby standby-group-number ip ip-address`
6. `standby standby-group-number track interface-name`
7. `standby [group-number] preempt`
8. `standby [group-number] timers [msec] hellotime [msec] holdtime`
9. `standby delay minimum [min-delay] reload [reload-delay]`
10. Repeat.

<td>interface type number</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# interface Ethernet 0/0</td>
</tr>
<tr>
<td>Configures an interface type for the router and enters interface configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>standby standby-group-number name standby-group-name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# standby 1 name HA-out</td>
</tr>
<tr>
<td>Assigns a user-defined group name to the HSRP redundancy group.</td>
<td><strong>Note</strong> The <code>standby-group-number</code> argument should be the same for both routers that are on directly connected interfaces. However, the <code>standby-group-name</code> argument should be different between two (or more) groups on the same router. The <code>standby-group-number</code> argument can be the same on the other pair of interfaces as well.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>standby standby-group-number ip ip-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# standby 1 ip 209.165.201.1</td>
</tr>
<tr>
<td>Assigns an IP address that is to be “shared” among the members of the HSRP group and owned by the primary IP address.</td>
<td><strong>Note</strong> The virtual IP address must be configured identically on both routers (active and standby) that are on directly connected interfaces.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>standby standby-group-number track interface-name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# standby 1 track Ethernet1/0</td>
</tr>
<tr>
<td>Configures HSRP to monitor the second interface so that if either of the two interfaces goes down, HSRP causes failover to the standby device.</td>
<td><strong>Note</strong> Although this command is not required, it is recommended for dual interface configurations.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>standby [group-number] preempt</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# standby 1 preempt</td>
</tr>
<tr>
<td>Enables the active device to relinquish control because of an interface tracking event.</td>
<td></td>
</tr>
</tbody>
</table>
Troubleshooting Tips

To help troubleshoot possible HSRP-related configuration problems, issue any of the following HSRP-related debug commands—`debug standby errors`, `debug standby events`, and `debug standby packets [terse]`.

Examples

The following example shows how to configure HSRP on a router:

```
interface Ethernet0/0
  ip address 209.165.201.1 255.255.255.224
  standby 1 ip 209.165.201.3
  standby 1 preempt
  standby 1 name HA-out
  standby 1 track Ethernet1/0
  standby delay reload 120
```

What to Do Next

After you have successfully configured HSRP on both the inside and outside interfaces, you should enable SSO as described in the section “Enabling SSO.”

Enabling SSO

Use this task to enable SSO, which is used to transfer IKE and IPSec state information between two routers.
SSO: Interacting with IPSec and IKE

SSO is a method of providing redundancy and synchronization for many Cisco IOS applications and features. SSO is necessary for IPSec and IKE to learn about the redundancy state of the network and to synchronize their internal application state with their redundant peers.

Prerequisites

- You should configure HSRP before enabling SSO.
- To avoid losing SCTP communication between peers, be sure to include the following commands to the local address section of the SCTP section of the IPC configuration:
  - `retransmit-timeout retran-min [msec] retra-max [msec]`
  - `path-retransmit max-path-retries`
  - `assoc-retransmit retries`

SUMMARY STEPS

1. enable
2. configure terminal
3. redundancy inter-device
4. scheme standby standby-group-name
5. exit
6. ipc zone default
7. association 1
8. protocol sctp
9. local-port local-port-number
10. local-ip device-real-ip-address [device-real-ip-address2]
11. retransmit-timeout retran-min [msec] retra-max [msec]
12. path-retransmit max-path-retries
13. assoc-retransmit retries
14. exit
15. remote-port remote-port-number
16. remote-ip peer-real-ip-address [peer-real-ip-address2]
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> redundancy inter-device</td>
<td>Configures redundancy and enters inter-device configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# redundancy inter-device</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> scheme standby standby-group-name</td>
<td>Defines the redundancy scheme that is to be used. Currently, “standby” is the only supported scheme.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-red-interdevice)# scheme standby HA-out</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exits inter-device configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-red-interdevice)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ipc zone default</td>
<td>Configures the inter-device communication protocol, Inter-Process Communication (IPC), and enters IPC zone configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ipc zone default</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> association 1</td>
<td>Configures an association between the two devices and enters IPC association configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-ipczone)# association 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> protocol sctp</td>
<td>Configures Stream Control Transmission Protocol (SCTP) as the transport protocol and enters SCTP protocol configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-ipczone-assoc)# protocol sctp</td>
<td></td>
</tr>
</tbody>
</table>
## How to Use Stateful Failover for IPSec

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 9**

**local-port** *local-port-number*

**Example:**

```
Router(config-ipc-protocol-sctp)# local-port 5000
```

Defines the local SCTP port number that is used to communicate with the redundant peer and puts you in IPC transport - SCTP local configuration mode.

- *local-port-number*—There is not a default value. This argument must be configured for the local port to enable inter-device redundancy. Valid port values: 1 to 65535.

The local port number should be the same as the remote port number on the peer router.

| **Step 10**

**local-ip** *device-real-ip-address*

[device-real-ip-address2]

**Example:**

```
Router(config-ipc-local-sctp)# local-ip 10.0.0.1
```

Defines at least one local IP address that is used to communicate with the redundant peer.

The local IP addresses must match the remote IP addresses on the peer router. There can be either one or two IP addresses, which must be in the global VRF. A virtual IP address cannot be used.

| **Step 11**

**retransmit-timeout** *retran-min [msec]*

**retra-max [msec]*

**Example:**

```
Router(config-ipc-local-sctp)# retransmit-timeout 300 10000
```

Configures the maximum amount of time, in milliseconds, that SCTP will wait before retransmitting data.

- *retran-min*: 300 to 60000; default: 300
- *retra-max*: 300 to 60000; default: 600

| **Step 12**

**path-retransmit** *max-path-retries*

**Example:**

```
Router(config-ipc-local-sctp)# path-retransmit 10
```

Configures the number of consecutive retransmissions SCTP will perform before failing a path within an association.

- *max-path-retries*: 2 to 10; default: 4 retries

| **Step 13**

**assoc-retransmit** *retries*

**Example:**

```
Router(config-ipc-local-sctp)# assoc-retransmit 10
```

Configures the number of consecutive retransmissions SCTP will perform before failing an association.

- *max-association-retries*: 2 to 10; default: 4 retries

| **Step 14**

**exit**

**Example:**

```
Router(config-ipc-local-sctp)# exit
```

Exits IPC transport - SCTP local configuration mode.
To help troubleshoot possible SSO-related configuration problems, issue the `debug redundancy` command.

### Examples

The following example shows how to enable SSO:

```plaintext
! redundancy inter-device
  scheme standby HA-out
!  !
  ipc zone default
    association 1
      no shutdown
      protocol sctp
        local-port 5000
        local-ip 10.0.0.1
        retransmit-timeout 300 10000
        path-retransmit 10
        assoc-retransmit 10
        remote-port 5000
        remote-ip 10.0.0.2
!
```

### What to Do Next

After you have enabled SSO, you should configure reverse route injection (RRI) on a crypto map as shown in the following section.
Configuring Reverse Route Injection on a Crypto Map

You should configure RRI on all existing crypto maps that you want to use with stateful failover. RRI is used with stateful failover so routers on the inside network can learn about the correct path to the current active device. When failover occurs, the new active device injects the RRI routes into its IP routing table and sends out routing updates to its routing peers.

Use one of the following tasks to configure RRI on a dynamic or static crypto map.

- Configuring RRI on Dynamic Crypto Map, page 13
- Configuring RRI on a Static Crypto Map, page 14

Configuring RRI on Dynamic Crypto Map

Dynamic crypto map entries, like regular static crypto map entries, are grouped into sets. A set is a group of dynamic crypto map entries all with the same dynamic map name but each with a different dynamic sequence number. Each member of the set may be configured for RRI.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto dynamic-map map-name seq-num
4. reverse-route

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 crypto dynamic-map map-name seq-num</td>
<td>Creates a dynamic crypto map entry and enters crypto map configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# crypto dynamic-map mymap 10</td>
<td></td>
</tr>
<tr>
<td>Step 4 reverse-route</td>
<td>Enables RRI for a dynamic crypto map.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-crypto-map)# reverse-route</td>
<td></td>
</tr>
</tbody>
</table>
Configuring RRI on a Static Crypto Map

Static crypto map entries are grouped into sets. A set is a group of static crypto map entries all with the same static map name but each with a different sequence number. Each static crypto map in the map set can be configured for RRI. Use this task to configure RRI on a static crypto map.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto map map-name seq-num ipsec-isakmp
4. reverse-route

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
| **Example:**      |         |
| Router> enable    | • Enter your password if prompted. |
| Step 2 configure terminal | Enters global configuration mode. |
| **Example:**      |         |
| Router# configure terminal |         |
| Step 3 crypto map map-name seq-num ipsec-isakmp | Enters crypto map configuration mode and creates or modifies a crypto map entry. |
| **Example:**      |         |
| Router(config)# crypto map to-peer-outside 10 ipsec-isakmp |         |
| Step 4 reverse-route | Dynamically creates static routes based on crypto ACLs. |
| **Example:**      |         |
| Router(config-crypto-map)# reverse-route |         |

Examples

The following example shows how to configure RRI on the static crypto map “to-peer-outside”:

crypto map to-peer-outside redundancy replay-interval inbound 1000 outbound 10000
crypto map to-peer-outside 10 ipsec-isakmp
set peer 209.165.200.225
set transform-set trans1
match address peer-outside
reverse-route

What to Do Next

After you have configured RRI, you can enable stateful failover for IPSec and IKE.
Enabling Stateful Failover for IKE and IPSec

Use the following tasks to configure stateful failover for IPSec, IKE, and tunnel protection:

- Enabling Stateful Failover for IKE, page 15
- Enabling Stateful Failover for IPSec, page 15
- Enabling Stateful Failover for Tunnel Protection, page 17

Enabling Stateful Failover for IKE

There is no specific command-line interface (CLI) necessary to enable stateful failover for IKE. It is enabled for a particular VIP address when a stateful failover crypto map is applied to an interface.

Enabling Stateful Failover for IPSec

Use this task to enable stateful failover for IPSec. All IPSec state information is transferred from the active router to the standby router via the SSO redundancy channel that was specified in the task “Enabling SSO.”

SUMMARY STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>interface type number</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>crypto map map-name [redundancy standby-group-name [stateful]]</td>
<td></td>
</tr>
</tbody>
</table>

DETAILED STEPS

**Example:**

Router> enable

Router# configure terminal

---

16
### Troubleshooting Tips

To help troubleshoot possible IPSec HA-related problems, issue the `debug crypto ipsec ha [detail] [update]` command.

### Examples

The following example shows how to configure IPSec stateful failover on the crypto map “to-peer-outside”:

```bash
interface Ethernet0/0
ip address 209.165.201.1 255.255.255.224
standby 1 ip 209.165.201.3
standby 1 preempt
standby 1 name HA-out
standby 1 track Ethernet1/0
crypto map to-peer-outside redundancy HA-out stateful
```

### Enabling Stateful Failover for Tunnel Protection

Use an existing IPSec profile to configure stateful failover for tunnels using IPSec. (You do not configure the tunnel interface as you would with a crypto map configuration.)

### Restrictions

The tunnel source address must be a VIP address, and it must not be an interface name.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto ipsec profile name`
4. `redundancy standby-group-name stateful`
5. `exit`
6. `interface tunnel number`
7. tunnel protection ipsec profile name
8. tunnel source virtual-ip-address

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 crypto ipsec profile name</td>
<td>Defines the IPSec parameters that are to be used for IPSec encryption between two routers and enters crypto map configuration mode.</td>
</tr>
<tr>
<td>Example: Router(config)# crypto ipsec profile peer-profile</td>
<td></td>
</tr>
<tr>
<td>Step 4 redundancy standby-group-name stateful</td>
<td>Configures stateful failover for tunnels using IPSec.</td>
</tr>
<tr>
<td>Example: Router(config-crypto-map)# redundancy HA-out stateful</td>
<td></td>
</tr>
<tr>
<td>Step 5 exit</td>
<td>Exits crypto map configuration mode.</td>
</tr>
<tr>
<td>Example: Router(config-crypto-map)# exit</td>
<td></td>
</tr>
<tr>
<td>Step 6 interface tunnel number</td>
<td>Configures a tunnel interface and enters interface configuration mode</td>
</tr>
<tr>
<td>Example: Router(config)# interface tunnel 5</td>
<td></td>
</tr>
<tr>
<td>Step 7 tunnel protection ipsec profile name</td>
<td>Associates a tunnel interface with an IPSec profile.</td>
</tr>
<tr>
<td>Example: Router(config-if)# tunnel protection ipsec profile catprofile</td>
<td></td>
</tr>
<tr>
<td>Step 8 tunnel source virtual-ip-address</td>
<td>Sets source address for a tunnel interface.</td>
</tr>
<tr>
<td>Example: Router(config-if)# tunnel source 10.1.1.1</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>Do not use the interface name as the tunnel source.</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure stateful failover for tunnel protection:

crypto ipsec profile peer-profile
redundancy HA-out stateful

interface Tunnel1
  ip unnumbered Loopback0
  tunnel source 209.165.201.3
  tunnel destination 10.0.0.5
  tunnel protection ipsec profile peer-profile

! interface Ethernet0/0
  ip address 209.165.201.1 255.255.255.224
  standby 1 ip 209.165.201.3
  standby 1 name HA-out

What to Do Next

After you have configured stateful failover, you can use the CLI to protect, verify, and manage your configurations. For more information on completing these tasks, see the sections “Protecting SSO Traffic” and “Managing and Verifying High Availability Information.”

Protecting SSO Traffic

Use this task to secure a redundancy group via an IPSec profile. To configure SSO traffic protection, the active and standby devices must be directly connected to each other via Ethernet networks.

The crypto maps that are automatically generated when protecting SSO traffic are applied to each interface, which corresponds to an IP address that was specified via the local-ip command. Traffic that is destined for an IP address that was specified via the remote-ip command is forced out of the crypto-map-configured interface via an automatically created static host route.

Note

If you are certain that the SSO traffic between the redundancy group runs on a physically secure interface, you do not have to configure SSO traffic protection.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto isakmp key keystring address peer-address
4. crypto ipsec transform-set transform-set-name transform-set-list
5. crypto ipsec profile profile-name
6. set transform-set transform-set-name
7. exit
8. redundancy inter-device
9. security ipsec profile-name

</tbody>
</table>
Examples

The following example shows how to configure SSO traffic protection:

```
crypto isakmp key cisco123 address 0.0.0.0 0.0.0.0 no-xauth
!
crypto ipsec transform-set trans2 ah-md5-hmac esp-aes
!
crypto ipsec profile sso-secure
  set transform-set trans2
!
redundancy inter-device
  scheme standby HA-out
  security ipsec sso-secure
```

Managing and Verifying High Availability Information

Use any of the following optional tasks to secure and manage your high availability configurations:

- Managing Anti-Replay Intervals, page 21
- Managing and Verifying HA Configurations, page 22

Managing Anti-Replay Intervals

Use this optional task to modify the interval in which an IP redundancy-enabled crypto map forwards anti-replay updates from the active router to the standby router.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto map map-name redundancy replay-interval inbound in-value outbound out-value`
How to Use Stateful Failover for IPSec

</table>

Examples

The following example shows how to modify replay counter intervals between the active and standby devices on the crypto map “to-peer-outside”:

crypto map to-peer-outside redundancy replay-interval inbound 1000 outbound 10000
crypto map to-peer-outside 10 ipsec-isakmp
set peer 209.165.200.225
set transform-set trans1
match address peer-outside

Managing and Verifying HA Configurations

Use any of the steps within this optional task to display and verify the high availability configurations.

SUMMARY STEPS

1. enable
2. show redundancy [states | inter-device]
3. show crypto isakmp sa [active | standby]
4. show crypto ipsec sa [active | standby]
5. show crypto session [active | standby]
6. show crypto ha
7. clear crypto isakmp [active | standby]
8. clear crypto sa [active | standby]
9. clear crypto session [active | standby]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
                   | • Enter your password if prompted. |
| Example:          | Router> enable                   |
| Step 2 show redundancy [states | inter-device] | Displays the current state of SSO on the configured device.  
                  | After the two devices have negotiated with each other, one device should show an “ACTIVE” state and the other device should show a “STANDBY HOT” state. |
| Example:          | Router# show redundancy states   |
| Step 3 show crypto isakmp sa [active | standby] | Displays IKE SAs present on the device.  
                   | An “ACTIVE” or “STDBY” state is shown for each SA.  
                   | • The active keyword displays only ACTIVE, HA-enabled SAs; The standby keyword displays only STDBY, HA-enabled SAs. |
| Example:          | Router# show crypto isakmp sa active |
| Step 4 show crypto ipsec sa [active | standby] | Displays IPSec SAs present on the device.  
                   | An “ACTIVE” or “STDBY” state is shown for each SA.  
                   | • The active keyword displays only ACTIVE, HA-enabled SAs; The standby keyword displays only STDBY, HA-enabled SAs. |
| Example:          | Router# show crypto ipsec sa active |
| Step 5 show crypto session [active | standby] | Displays crypto sessions that are currently present on the device.  
                   | An “ACTIVE” or “STANDBY” state is shown as part of the state of each session, such as “UP-STANDBY.”  
                   | Only HA-enabled SAs are shown. |
| Example:          | Router# show crypto session active |
| Step 6 show crypto ha | Displays all virtual IP addresses that are currently in use by IPSec and IKE. |
| Example:          | Router# show crypto ha           |
| Step 7 clear crypto isakmp [active | standby] | Clears IKE SAs.  
                   | When this command is issued on the standby device, all standby IKE SAs are resynchronized from the active device.  
                   | • The active keyword clears only IKE HA-enabled SAs in the active state; the standby keyword clears only IKE HA-enabled SAs in the standby state. |
| Example:          | Router# clear crypto isakmp active |
Stateful Failover for IPSec

How to Use Stateful Failover for IPSec

Examples

Verifying the Active Device: Examples

Router# show redundancy states

    my state = 13 -ACTIVE
    peer state = 8 -STANDBY HOT
        Mode = Duplex
        Unit ID = 0

    Split Mode = Disabled
    Manual Swact = Enabled
    Communications = Up

    client count = 7
    client_notification_TMR = 30000 milliseconds
    keep_alive TMR = 4000 milliseconds
    keep_alive count = 0
    keep_alive threshold = 7
    RF debug mask = 0x0

Router# show crypto isakmp sa active

dst     src             state          conn-id slot status
209.165.201.3   209.165.200.225 QM_IDLE              5    0 ACTIVE

Router# show crypto ipsec sa active

interface: Ethernet0/0
    Crypto map tag: to-peer-outside, local addr 209.165.201.3
        protected vrf:(none)
        local ident (addr/mask/prot/port):(192.168.0.1/255.255.255.255/0/0)
        remote ident (addr/mask/prot/port):(172.16.0.1/255.255.255.255/0/0)
        current_peer 209.165.200.225 port 500
        PERMIT, flags=(origin_is_acl,)
        #pkts encaps:3, #pkts encrypt:3, #pkts digest:3
        #pkts decaps:4, #pkts decrypt:4, #pkts verify:4
        #pkts compressed:0, #pkts decompressed:0
        #pkts not compressed:0, #pkts compr. failed:0
        #pkts not decompressed:0, #pkts decompress failed:0
        #send errors 0, #recv errors 0

Step 8

clear crypto sa [active | standby]

Example:
Router# clear crypto sa active

Clears IPSec SAs.
When this command is issued on the standby device, all standby IPSec SAs are resynchronized from the active device.
- The **active** keyword clears only IPSec HA-enabled SAs in the active state; the **standby** keyword clears only IPSec HA-enabled SAs in the standby state.

Step 9

clear crypto session [active | standby]

Example:
Router# clear crypto session active

Clears both IKE and IPSec SAs.
Any standby SAs will resynchronize from the active device after they are cleared on the standby. Only HA-enabled SAs are cleared from the device.

Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html. For information about all Cisco IOS commands, use the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or a Cisco IOS master commands list.

**New Commands**

- `crypto map redundancy replay-interval`
- `debug crypto ha`
- `debug crypto ipsec ha`
- `debug crypto isakmp ha`
- `local-ip (IPC transport-SCTP local)`
- `local-port`
- `redundancy inter-device`
- `redundancy stateful`
- `remote-ip (IPC transport-SCTP remote)`
- `remote-port`
- `scheme`
- `security ipsec`
- `show crypto ha`

**Modified Commands**

- `clear crypto isakmp`
- `clear crypto sa`
- `clear crypto session`
• crypto map (interface IPSec)
• show crypto ipsec sa
• show crypto isakmp sa
• show crypto session
• show redundancy
VRF-Aware IPSec

The VRF-Aware IPSec feature introduces IP Security (IPSec) tunnel mapping to Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). Using the VRF-Aware IPSec feature, you can map IPSec tunnels to Virtual Routing and Forwarding (VRF) instances using a single public-facing address.

Restrictions for VRF-Aware IPSec

- If you are configuring VRF-Aware IPSec using a crypto map configuration and the Inside VRF (IVRF) is not the same as the Front Door VRF (FVRF), this feature is not interoperable with unicast reverse path forwarding (uRPF) if uRPF is enabled on the crypto map interface. If your network requires uRPF, it is recommended that you use Virtual Tunnel Interface (VTI) for IPSec instead of crypto maps.
- The VRF-Aware IPSec feature does not allow IPSec tunnel mapping between VRFs. For example, it does not allow IPSec tunnel mapping from VRF vpn1 to VRF vpn2.

Information About VRF-Aware IPSec

The VRF-Aware IPSec feature maps an IPSec tunnel to an MPLS VPN. To configure and use the feature, you need to understand the following concepts:

- VRF Instance, page 2
- MPLS Distribution Protocol, page 2
- VRF-Aware IPSec Functional Overview, page 2

VRF Instance

A VRF instance is a per-VPN routing information repository that defines the VPN membership of a customer site attached to the Provider Edge (PE) router. A VRF comprises an IP routing table, a derived Cisco Express Forwarding (CEF) table, a set of interfaces that use the forwarding table, and a set of rules and routing protocol parameters that control the information that is included in the routing table. A separate set of routing and CEF tables is maintained for each VPN customer.

MPLS Distribution Protocol

The MPLS distribution protocol is a high-performance packet-forwarding technology that integrates the performance and traffic management capabilities of data link layer switching with the scalability, flexibility, and performance of network-layer routing.

VRF-Aware IPSec Functional Overview

Front Door VRF (FVRF) and Inside VRF (IVRF) are central to understanding the feature.

Each IPSec tunnel is associated with two VRF domains. The outer encapsulated packet belongs to one VRF domain, which we shall call the FVRF, while the inner, protected IP packet belongs to another domain called the IVRF. Another way of stating the same thing is that the local endpoint of the IPSec tunnel belongs to the FVRF while the source and destination addresses of the inside packet belong to the IVRF.

One or more IPSec tunnels can terminate on a single interface. The FVRF of all these tunnels is the same and is set to the VRF that is configured on that interface. The IVRF of these tunnels can be different and depends on the VRF that is defined in the Internet Security Association and Key Management Protocol (ISAKMP) profile that is attached to a crypto map entry.
Figure 96 is an illustration of a scenario showing IPSec to MPLS and Layer 2 VPNs.

Packet Flow into the IPSec Tunnel

- A VPN packet arrives from the Service Provider MPLS backbone network to the PE and is routed through an interface facing the Internet.
- The packet is matched against the Security Policy Database (SPD), and the packet is IPSec encapsulated. The SPD includes the IVRF and the access control list (ACL).
- The IPSec encapsulated packet is then forwarded using the FVRF routing table.

Packet Flow from the IPSec Tunnel

- An IPSec-encapsulated packet arrives at the PE router from the remote IPSec endpoint.
- IPSec performs the Security Association (SA) lookup for the Security Parameter Index (SPI), destination, and protocol.
- The packet is decapsulated using the SA and is associated with IVRF.
- The packet is further forwarded using the IVRF routing table.
How to Configure VRF-Aware IPSec

This section contains the following procedures:

- Configuring Crypto Keyrings, page 4 (Optional)
- Configuring ISAKMP Profiles, page 6 (Required)
- Configuring an ISAKMP Profile on a Crypto Map, page 10 (Required)
- Configuring to Ignore Extended Authentication During IKE Phase 1 Negotiation, page 11 (Optional)
- Verifying VRF-Aware IPSec, page 12
- Clearing Security Associations, page 13
- Troubleshooting VRF-Aware IPSec, page 13

Configuring Crypto Keyrings

A crypto keyring is a repository of preshared and Rivest, Shamir, and Adelman (RSA) public keys. There can be zero or more keyrings on the Cisco IOS router.

Perform the following optional task to configure a crypto keyring.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto keyring keyring-name [vrf fvrf-name]`
4. `description string` (Optional)
5. `pre-shared-key {address address [mask] | hostname hostname} key key` (Optional)
6. `rsa-pubkey {address address | name fqdn} [encryption | signature]` (Optional)
7. `address ip-address` (Optional)
8. `serial-number serial-number` (Optional)
9. `key-string`
10. `text`
11. `quit`
12. `exit`
13. `exit`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`          | Enables privileged EXEC mode.  
  * Enter your password if prompted.  
|      | `Router> enable`  |         |
| 2    | `configure terminal` | Enters global configuration mode.  
|      | `Router# configure terminal` |         |
| 3    | `crypto keyring keyring-name [vrf fvrf-name]` | Defines a keyring with `keyring-name` as the name of the keyring and enters keyring configuration mode.  
    * (Optional) The `vrf` keyword and `fvrf-name` argument imply that the keyring is bound to Front Door Virtual Routing and Forwarding (FVRF). The key in the keyring is searched if the local endpoint is in FVRF. If `vrf` is not specified, the keyring is bound to the global.  
|      | `Router (config)# crypto keyring VPN1` |         |
| 4    | `description string` | (Optional) Specifies a one-line description of the keyring.  
|      | `Router (config-keyring)# description The keys for VPN1` |         |
| 5    | `pre-shared-key {address address [mask] | hostname hostname} key key` | (Optional) Defines a preshared key by address or host name.  
|      | `Router (config-keyring)# pre-shared-key address 10.72.23.11 key VPN1` |         |
| 6    | `rsa-pubkey {address address | name fqdn} [encryption | signature]` | (Optional) Defines a Rivest, Shamir, and Adelman (RSA) public key by address or host name and enters rsa-pubkey configuration mode.  
    * By default, the key is used for signature.  
    * The optional `encryption` keyword specifies that the key should be used for encryption. The optional `signature` keyword specifies that the key should be used for signature. By default, the key is used for signature.  
|      | `Router(config-keyring)# rsa-pubkey name host.vpn.com` |         |
| 7    | `address ip-address` | (Optional) Defines the RSA public key IP address.  
|      | `Router(config-pubkey-key)# address 10.5.5.1` |         |
| 8    | `serial-number serial-number` | (Optional) Specifies the serial number of the public key. The value is from 0 through infinity.  
|      | `Router(config-pubkey-key)# serial-number 1000000` |         |
Configuring ISAKMP Profiles

An ISAKMP profile is a repository for IKE Phase 1 and IKE Phase 1.5 configuration for a set of peers. An ISAKMP profile defines items such as keepalive, trustpoints, peer identities, and XAUTH AAA list during the IKE Phase 1 and Phase 1.5 exchange. There can be zero or more ISAKMP profiles on the Cisco IOS router.

- **Note** If traffic from the router to a certification authority (CA) (for authentication, enrollment, or for obtaining a certificate revocation list [CRL]) or to an Lightweight Directory Access Protocol (LDAP) server (for obtaining a CRL) needs to be routed via a VRF, the `vrf` command must be added to the trustpoint. Otherwise, such traffic will use the default routing table.
- **Note** If a profile does not specify one or more trustpoints, all trustpoints in the router will be used to attempt to validate the certificate of the peer (Internet Key Exchange (IKE) main mode or signature authentication). If one or more trustpoints are specified, only those trustpoints will be used.

Restriction

A router initiating IKE and a router responding to the IKE request should have symmetrical trustpoint configurations. For example, a responding router (in IKE Main Mode) performing RSA signature encryption and authentication might use trustpoints that were defined in the global configuration when sending the CERT-REQ payloads. However, the router might use a restricted list of trustpoints that were defined in the ISAKMP profile for the certificate verification. If the peer (the IKE initiator) is configured...
to use a certificate whose trustpoint is in the global list of the responding router but not in ISAKMP profile of the responding router, the certificate will be rejected. (However, if the initiating router does not know about the trustpoints in the global configuration of the responding router, the certificate can still be authenticated.)

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `crypto isakmp profile profile-name`
4. `description string` (Optional)
5. `vrf ivrf-name` (Optional)
6. `keepalive seconds retry retry-seconds` (Optional)
7. `self-identity {address | fqdn | user-fqdn}` (Optional)
8. `keyring keyring-name` (Optional)
9. `ca trust-point trustpoint-name` (Optional)
10. `match identity {group group-name | address address [mask] [fvrf] | host host-name | host domain domain-name | user user-fqdn | user domain domain-name}`
11. `client configuration address {initiate | respond}` (Optional)
12. `client authentication list list-name` (Optional)
13. `isakmp authorization list list-name` (Optional)
14. `initiate mode aggressive`
15. `exit`

### Command or Action

| Step 10 | match identity {group group-name | address address [mask] [fvr] | host host-name | host domain domain-name | user user-fqdn | user domain domain-name} |
|---------|---------------------------------------------------------------|
| Purpose | Specifies the client IKE Identity (ID) that is to be matched. |
|         | • **group group-name**—Matches the *group-name* with the ID type ID_KEY_ID. It also matches the *group-name* with the Organizational Unit (OU) field of the Distinguished Name (DN). |
|         | • **address address [mask] fvr**—Matches the *address* with the ID type ID_IPV4_ADDR. The *mask* argument can be used to specify a range of addresses. The *fvr* argument specifies that the address is in Front Door Virtual Routing and Forwarding (FVRF) |
|         | • **host host-name**—Matches the *host-name* with the ID type ID_FQDN. |
|         | • **host domain domainname**—Matches the *domainname* to the ID type ID_FQDN whose domain name is the same as the *domainname*. Use this command to match all the hosts in the domain. |
|         | • **user username**—Matches the *username* with the ID type ID_USER_FQDN. |
|         | • **user domain domainname**—Matches the ID type ID_USER_FQDN whose domain name matches the *domainname*. |
| **Example:** | Router (conf-isa-prof)# match identity address 10.1.1.1 |

| Step 11 | client configuration address {initiate | respond} |
|---------|--------------------------------------------------|
| Purpose | (Optional) Specifies whether to initiate the mode configuration exchange or responds to mode configuration requests. |
| **Example:** | Router (conf-isa-prof)# client configuration address initiate |

<table>
<thead>
<tr>
<th>Step 12</th>
<th>client authentication list list-name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>(Optional) Authentication, authorization, and accounting (AAA) to use for authenticating the remote client during the extended authentication (XAUTH) exchange.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (conf-isa-prof)# client authentication list xauthlist</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 13</th>
<th>isakmp authorization list list-name</th>
</tr>
</thead>
<tbody>

<tr>
<td></td>
<td>• If not specified, IKE always initiates Main Mode exchange.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (conf-isa-prof)# initiate mode aggressive</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 15</th>
<th>exit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Exits to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (conf-isa-prof)# exit</td>
</tr>
</tbody>
</table>
### What to Do Next

Go to the section “Configuring an ISAKMP Profile on a Crypto Map.”

### Configuring an ISAKMP Profile on a Crypto Map

An ISAKMP profile must be applied to the crypto map. The IVRF on the ISAKMP profile is used as a selector when matching the VPN traffic. If there is no IVRF on the ISAKMP profile, the IVRF will be equal to the FVRF. Perform this required task to configure an ISAKMP profile on a crypto map.

### Prerequisites

Before configuring an ISAKMP profile on a crypto map, you must first have configured your router for basic IPSec.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto map map-name isakmp-profile isakmp-profile-name` (Optional)
4. `set isakmp-profile profile-name` (Optional)
5. `exit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>crypto map map-name isakmp-profile isakmp-profile-name</code></td>
<td>(Optional) Specifies the Internet Key Exchange and Key Management Protocol (ISAKMP) profile for the crypto map set and enters crypto map configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router (config)# crypto map vpnmap isakmp-profile vpnprofile</code></td>
<td>• The ISAKMP profile will be used during IKE exchange.</td>
</tr>
</tbody>
</table>
To ignore XAUTH during an IKE Phase 1 negotiation, use the `no crypto xauth` command. Use the `no crypto xauth` command if you do not require extended authentication for the Unity clients.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no crypto xauth interface`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no crypto xauth interface</code></td>
<td><code>no crypto xauth interface</code></td>
<td>Ignores XAUTH proposals for requests that are destined to the IP address of the interface. By default, Internet Key Exchange (IKE) processes XAUTH proposals.</td>
</tr>
<tr>
<td></td>
<td>Example: Router(config)# no crypto xauth ethernet0</td>
<td></td>
</tr>
</tbody>
</table>
Verifying VRF-Aware IPSec

To verify your VRF-Aware IPSec configurations, use the following `show` commands. These `show` commands allow you to list configuration information and security associations (SAs):

**SUMMARY STEPS**

- `enable`
- `show crypto ipsec sa [map map-name | address | identity | interface interface | peer [vrf fvrf-name] address | vrf ivrf-name] [detail]`
- `show crypto isakmp key`
- `show crypto isakmp profile`
- `show crypto key pubkey-chain rsa`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> `show crypto ipsec sa [map map-name</td>
<td>address</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show crypto ipsec sa vrf vpn1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>show crypto isakmp key</code></td>
<td>Lists all the keyrings and their preshared keys.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show crypto isakmp key</td>
<td>- Use this command to verify your crypto keyring configuration.</td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>show crypto isakmp profile</code></td>
<td>Lists all ISAKMP profiles and their configurations.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show crypto isakmp profile</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>show crypto key pubkey-chain rsa</code></td>
<td>Views the Rivest, Shamir, and Adelman (RSA) public keys of the peer that are stored on your router.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show crypto key pubkey-chain rsa</td>
<td>- The output is extended to show the keyring to which the public key belongs.</td>
</tr>
</tbody>
</table>
Clearing Security Associations

The following `clear` commands allow you to clear SAs.

**SUMMARY STEPS**

- `enable`
- `clear crypto sa [counters | map map-name | peer [vrf fvrf-name] address | spi address {ah | esp} spi | vrf ivrf-name]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> clear crypto sa</td>
<td>Clears the IPSec security associations (SAs).</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# clear crypto sa vrf VPN1</td>
<td></td>
</tr>
</tbody>
</table>

Troubleshooting VRF-Aware IPSec

To troubleshoot VRF-Aware IPSec, use the following `debug` commands:

**SUMMARY STEPS**

1. `enable`
2. `debug crypto ipsec`
3. `debug crypto isakmp`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
                      - Enter your password if prompted. |

**Example:**

```
Router> enable
```

<table>
<thead>
<tr>
<th>Step 2 debug crypto ipsec</th>
<th>Displays IP security (IPSec) events.</th>
</tr>
</thead>
</table>

**Example:**

```
Router# debug crypto ipsec
```

<table>
<thead>
<tr>
<th>Step 3 debug crypto isakmp</th>
<th>Displays messages about Internet Key Exchange (IKE) events.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# debug crypto isakmp</td>
<td></td>
</tr>
</tbody>
</table>

**Debug Examples for VRF-Aware IPSec**

The following sample debug outputs are for a VRF-aware IPSec configuration:

**IPSec PE**

```
Router# debug crypto ipsec
```

Cryto IPSec debugging is on
IPSEC-PE#debug crypto isakmp
Cryto ISAKMP debugging is on
IPSEC-PE#debug crypto isakmp

Configuration Examples for VRF-Aware IPSec

The following examples show how to configure VRF-Aware IPSec:

- Static IPSec-to-MPLS VPN Example, page 22
- IPSec-to-MPLS VPN Using RSA Encryption Example, page 24
- IPSec-to-MPLS VPN with RSA Signatures Example, page 25
- Upgrade from Previous Versions of the Cisco Network-Based IPSec VPN Solution, page 28

Static IPSec-to-MPLS VPN Example

The following sample shows a static configuration that maps IPSec tunnels to MPLS VPNs. The configurations map IPSec tunnels to MPLS VPNs “VPN1” and “VPN2.” Both of the IPSec tunnels terminate on a single public-facing interface.

**IPSec PE Configuration**

IPSec Remote Access-to-MPLS VPN Example

The following shows an IPSec remote access-to-MPLS VPN configuration. The configuration maps IPSec tunnels to MPLS VPNs. The IPSec tunnels terminate on a single public-facing interface.

**PE Router Configuration**

```plaintext

Upgrade from Previous Versions of the Cisco Network-Based IPSec VPN Solution

The VRF-Aware IPSec feature in the Cisco network-based IPSec VPN solution release 1.5 requires that you change your existing configurations.

The sample configurations that follow indicate the changes you must make to your existing configurations. These samples include the following:

- Site-to-Site Configuration Upgrade, page 28
- Remote Access Configuration Upgrade, page 29
- Combination Site-to-Site and Remote Access Configuration Upgrade, page 31

Site-to-Site Configuration Upgrade

The following configurations show the changes that are necessary for a site-to-site configuration upgrade from a previous version of the network-based IPSec VPN solution to the Cisco network-based IPSec VPN solution release 1.5:

Previous Version Site-to-Site Configuration

crypto isakmp key VPN1 address 172.21.25.74
  crypto isakmp key VPN2 address 172.21.21.74
  
crypto ipsec transform-set VPN1 esp-des esp-sha-hmac
  crypto ipsec transform-set VPN2 esp-3des esp-sha-hmac
  
crypto map VPN1 10 ipsec-isakmp
  set peer 172.21.25.74
  set transform-set VPN1
  match address 101
  
crypto map VPN2 10 ipsec-isakmp
  set peer 172.21.21.74
  set transform-set VPN2
  match address 102
  
interface FastEthernet0/0.1
  encapsulation dot1Q 1 native
  ip vrf forwarding VPN1
  ip address 172.21.25.73 255.255.255.0
  crypto map VPN1
  
interface FastEthernet0/0.2
  encapsulation dot1Q 2 native
  ip vrf forwarding VPN2
  ip address 172.21.21.74 255.255.255.0
  crypto map VPN2
New Version Site-to-Site Configuration

The following is an upgraded version of the same site-to-site configuration to the Cisco network-based IPSec VPN solution release 1.5 solution:

Note: You must change to keyrings. The VRF-Aware IPSec feature requires that keys be associated with a VRF if the IKE local endpoint is in the VRF.

```plaintext
crypto keyring VPN1-KEYS vrf VPN1
    pre-shared-key address 172.21.25.74 key VPN1
!  
crypto keyring VPN2-KEYS vrf VPN2
    pre-shared-key address 172.21.21.74 key VPN2
!  
crypto ipsec transform-set VPN1 esp-des esp-sha-hmac

crypto ipsec transform-set VPN2 esp-3des esp-sha-hmac
!  
crypto map VPN1 10 ipsec-isakmp
    set peer 172.21.25.74
    set transform-set VPN1
    match address 101
!  
crypto map VPN2 10 ipsec-isakmp
    set peer 172.21.21.74
    set transform-set VPN2
    match address 102
!  
interface FastEthernet0/0.1

!
crypto dynamic-map VPN2-RA 1
set transform-set VPN2-RA
reverse-route
!
crypto map VPN1 client authentication list VPN1-RA-LIST
crypto map VPN1 isakmp authorization list VPN1-RA-LIST
crypto map VPN1 client configuration address initiate
VRF-Aware IPSec

Configuration Examples for VRF-Aware IPSec

```bash
crypto map VPN1 client configuration address respond
crypto map VPN1 10 ipsec-isakmp
set peer 172.21.25.74
set transform-set VPN1
match address 101
crypto map VPN1 20 ipsec-isakmp dynamic VPN1-RA

crypto map VPN2 client authentication list VPN2-RA-LIST
crypto map VPN2 isakmp authorization list VPN2-RA-LIST
crypto map VPN2 client configuration address initiate
crypto map VPN2 client configuration address respond
crypto map VPN2 10 ipsec-isakmp
set peer 172.21.21.74
set transform-set VPN2
match address 102
crypto map VPN2 20 ipsec-isakmp dynamic VPN2-RA
```

```bash
interface FastEthernet0/0.1
  encapsulation dot1Q 1 native
  ip vrf forwarding VPN1
  ip address 172.21.25.73 255.255.255.0
crypto map VPN1
```

```bash
interface FastEthernet0/0.2
  encapsulation dot1Q 2 native
  ip vrf forwarding VPN2
  ip address 172.21.21.74 255.255.255.0
crypto map VPN2
```

New Version Site-to-Site and Remote Access Configuration

You must upgrade to this configuration:

---

Note

For site-to-site configurations that do not require XAUTH, configure an ISAKMP profile without XAUTH configuration. For remote access configurations that require XAUTH, configure an ISAKMP profile with XAUTH.

---

```bash
crypto keyring VPN1-KEYS vrf VPN1
  pre-shared-key address 172.21.25.74 key VPN1

crypto keyring VPN2-KEYS vrf VPN2
  pre-shared-key address 172.21.21.74 key VPN2

crypto isakmp client configuration group VPN1-RA-GROUP
  key VPN1-RA
  pool VPN1-RA

crypto isakmp client configuration group VPN2-RA-GROUP
  key VPN2-RA
  pool VPN2-RA

crypto isakmp profile VPN1
  keyring VPN1-KEYS
  match identity address 172.21.25.74 VPN1

crypto isakmp profile VPN2
  keyring VPN2-KEYS
  match identity address 172.21.21.74 VPN2

crypto isakmp profile VPN1-RA
```
match identity group VPN1-RA-GROUP
client authentication list VPN1-RA-LIST
isakmp authorization list VPN1-RA-LIST
client configuration address initiate
client configuration address respond
!
crypto isakmp profile VPN2-RA

Command Reference

The following commands are introduced or modified in the feature or features documented in this module:

New Commands

- address
- ca trust-point
- client authentication list
- client configuration address
- crypto isakmp profile
- crypto keyring
- crypto map isakmp-profile
- initiate-mode
- isakmp authorization list
- keepalive (isakmp profile)
- keyring
- key-string
- match identity
- no crypto xauth
- pre-shared-key
- quit
- rsa-pubkey
- self-identity
- serial-number
- set isakmp-profile
- show crypto isakmp key
- show crypto isakmp profile
- vrf

**Modified Commands**
- clear crypto sa
- crypto isakmp peer
- crypto map isakmp-profile
- show crypto dynamic-map
- show crypto ipsec sa
- show crypto isakmp sa
- show crypto map (IPSec)

For information about all Cisco IOS commands, see the Command Lookup Tool at [http://tools.cisco.com/Support/CLILookup](http://tools.cisco.com/Support/CLILookup) or the Master Command List.
Glossary

CA—certification authority. CA is an entity that issues digital certificates (especially X.509 certificates) and vouches for the binding between the data items in a certificate.

CLI—command-line-interface. CLI is an interface that allows the user to interact with the operating system by entering commands and optional arguments. The UNIX operating system and DOS provide CLIs.

client—Corresponding IPSec IOS peer of the UUT in the Multi Protocol Label Switching (MPLS) network.

dead peer—IKE peer that is no longer reachable.

DN—Distinguished Name. A DN is the global, authoritative name of an entry in the Open System Interconnection (OSI Directory [X.500]).

FQDN—fully qualified domain name. A FQDN is the full name of a system rather than just its host name. For example, aldebaran is a host name, and aldebaran.interop.com is an FQDN.

FR—Frame Relay. FR is an industry-standard, switch-data-link-layer protocol that handles multiple virtual circuits using high-level data link (HDL C) encapsulation between connected devices. Frame Relay is more efficient than X.25, the protocol for which it generally is considered a replacement.

FVRF—Front Door Virtual Routing and Forwarding (VRF) repository. FVRF is the VRF used to route the encrypted packets to the peer.

IDB—Interface descriptor block. An IDB subblock is an area of memory that is private to an application. This area stores private information and states variables that an application wants to associate with an IDB or an interface. The application uses the IDB to register a pointer to its subblock, not to the contents of the subblock itself.

IKE—Internet Key Exchange. IKE establishes a shared security policy and authenticates keys for services (such as IPSec) that require keys. Before any IPSec traffic can be passed, each router, firewall, and host must verify the identity of its peer. This can be done by manually entering preshared keys into both hosts or by a CA service.

IKE keepalive—Bidirectional mechanism for determining the liveness of an IKE peer.

IPSec—Security protocol for IP.

IVRF—Inside Virtual Routing and Forwarding. IVRF is the VRF of the plaintext packets.

MPLS—Multiprotocol Label Switching. MPLS is a switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets based on preestablished IP routing information.

RSA—Rivest, Shamir, and Adelman are the inventors of the RSA technique. The RSA technique is a public-key cryptographic system that can be used for encryption and authentication.

SA—Security Association. SA is an instance of security policy and keying material applied to a data flow.

VPN—Virtual Private Network. A VPN enables IP traffic to travel securely over a public TCP or IP network by encrypting all traffic from one network to another. A VPN uses "tunneling" to encrypt all information at the IP level.

VRF—Virtual Route Forwarding. VRF is A VPN routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.
**XAUTH**—Extended authentication. XAUTH is an optional exchange between IKE Phase 1 and IKE Phase 2, in which the router demands additional authentication information in an attempt to authenticate the actual user (as opposed to authenticating the peer).

---

**Note**

Refer to the *Internetworking Terms and Acronyms* for terms not included in this glossary.
Implementing and Managing PKI Features
Roadmap

This roadmap lists the features documented in the *Cisco IOS Security Configuration Guide* and maps them to the modules in which they appear.

Roadmap History
This roadmap was first published on May 2, 2005, and last updated on May 2, 2005.

Feature and Release Support
Table 56 lists public key infrastructure (PKI) feature support for the following Cisco IOS software release trains:

- Cisco IOS Releases 12.2T, 12.3, and 12.3T

Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table. *Not all features may be supported in your Cisco IOS software release.*

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at [http://www.cisco.com/go/fn](http://www.cisco.com/go/fn). You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Table 56 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.
<table>

<th>Feature Description</th>
<th>Where Documented</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3(14)T</td>
<td>Administrative Secure Device Provisioning Introducer</td>
<td>This feature allows you to act as an administrative introducer to introduce a device into a PKI network and then provide a username as the device name for the record locator in the AAA database.</td>
<td>“Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”</td>
</tr>
<tr>
<td>12.3(14)T</td>
<td>Persistent Self-Signed Certificates</td>
<td>This feature allows users the HTTPS server to generate and save a self-signed certificate in the router’s startup configuration. Thus, future SSL handshakes between the client and the HTTPS server can use the same self-signed certificate without user intervention.</td>
<td>“Configuring Certificate Enrollment for a PKI”</td>
</tr>
<tr>
<td>12.3(14)T</td>
<td>Secure Device Provisioning Certificate-Based Authorization</td>
<td>This feature allows certificates issued by other authority (CA) servers to be used for SDP introductions.</td>
<td>“Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”</td>
</tr>
<tr>
<td>12.3(14)T</td>
<td>Subordinate Certificate Server</td>
<td>This enhancement allows you to configure a subordinate certificate server to grant all or certain SCEP or manual certificate requests.</td>
<td>“Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment”</td>
</tr>
<tr>
<td>12.3(14)T</td>
<td>USB Storage</td>
<td>This feature explains how to store RSA keys on a device external to the router via a USB eToken. The SmartCard technology (which is owned by Aladdin Knowledge Systems) in a USB key form factor (also referred to as a USB eToken) provides secure configuration distribution and allows users to store PKI credentials, such as RSA keys, for deployment.</td>
<td>“Storing PKI Credentials External to the Router”</td>
</tr>
<tr>
<td>12.3(11)T</td>
<td>The Certificate Server Auto Archive enhancement</td>
<td>This enhancement enables the CA certificate and CA key to be backed up automatically just once after they are generated by the certificate server. As a result, it is not necessary to generate an exportable CA key if CA backup is desirable.</td>
<td>“Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment”</td>
</tr>
<tr>
<td>12.3(11)T</td>
<td>PKI AAA Authorization Using the Entire Subject Name</td>
<td>This feature provides users with the ability to query the AAA server using the entire subject name from the certificate as a unique AAA username.</td>
<td>“Configuring Revocation and Authorization of Certificates in a PKI”</td>
</tr>
<tr>
<td>12.3(11)T</td>
<td>PKI Status</td>
<td>This enhancement added the status keyword to the show crypto pki trustpoints command, which allows you to view the current status of the trustpoint. Prior to this enhancement, you had to issue the show crypto pki certificates and the show crypto pki timers commands for the current status.</td>
<td>“Configuring Certificate Enrollment for a PKI” and “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment”</td>
</tr>
<tr>
<td>12.3(11)T</td>
<td>Reenroll Using Existing Certificates</td>
<td>This feature allows users to reenroll a router with a Cisco IOS CA via existing certificates from a third-party vendor CA.</td>
<td>“Configuring Certificate Enrollment for a PKI”</td>
</tr>
<tr>
<td>12.3(8)T</td>
<td>Easy Secure Device Deployment</td>
<td>This feature introduces support for SDP (formerly called EzSDD), which offers a web-based enrollment interface that enables network administrators to deploy new devices in large networks.</td>
<td>“Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”</td>
</tr>
<tr>
<td>Release</td>
<td>Feature Name</td>
<td>Feature Description</td>
<td>Where Documented</td>
</tr>
<tr>
<td>---------</td>
<td>--------------</td>
<td>---------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>12.3(8)T</td>
<td>Easy Secure Device Deployment AAA Integration</td>
<td>This feature integrates an external AAA database, allowing the introducer to be authenticated against a AAA database instead of having to use the enable password of the local Cisco certificate server.</td>
<td>“Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI”</td>
</tr>
<tr>
<td>12.3(7)T</td>
<td>The Certificate Server Registration Authority (RA) Mode enhancement</td>

Cisco IOS PKI Overview: Understanding and Planning a PKI

Cisco IOS public key infrastructure (PKI) provides certificate management to support security protocols such as IP Security (IPSec), secure shell (SSH), and secure socket layer (SSL).

This module identifies and describes concepts that are needed to understand, plan for, and implement a PKI.

Module History
This module was first published on May 2, 2005, and last updated on July 17, 2008.

Information About Cisco IOS PKI

Before implementing a basic PKI, you should understand the following concepts:

- What Is Cisco IOS PKI?, page 2
- RSA Keys Overview, page 3
- What Are CAs?, page 3
- Certificate Enrollment: How It Works, page 4
What Is Cisco IOS PKI?

A PKI is composed of the following entities:

- Peers communicating on a secure network
- At least one certification authority (CA) that grants and maintains certificates
- Digital certificates, which contain information such as the certificate validity period, peer identity information, encryptions keys that are used for secure communications, and the signature of the issuing CA
- An optional registration authority (RA) to offload the CA by processing enrollment requests
- A distribution mechanism (such as Lightweight Directory Access Protocol [LDAP] or HTTP) for certificate revocation lists (CRLs)

PKI provides customers with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secured data network. Every entity (a person or a device) participating in the secured communicated is enrolled in the PKI in a process where the entity generates an Rivest, Shamir, and Adelman (RSA) key pair (one private key and one public key) and has their identity validated by a trusted entity (also known as a CA or trustpoint).

After each entity enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA. When peers must negotiate a secured communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

Although you can plan for and set up your PKI in a number of different ways, Figure 97 shows the major components that make up a PKI and suggests an order in which each decision within a PKI can be made. Figure 97 is a suggested approach; you can choose to set up your PKI from a different perspective.

**Figure 97  Deciding How to Set Up Your PKI**

- Decision #1: RSA keys (storage, configuration, and size of keys)
- Decision #2: Protocol to be used with PKI (such as IPSec, SSL OSP, etc.)
- Decision #3: Communication between CA and storage database
- Decision #4: Storage and distribution
- Decision #5: Communication between CA and storage database
- Decision #6: CA hierarchy definition
- Decision #7: Enrollment strategy
- Decision #8: Certificate management

RSA Keys Overview

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key will be included in the certificate so that peers can use it to encrypt data that is sent to the router. The private key is kept on the router and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.

RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

What Are CAs?

A CA, also known as a trustpoint, manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use a CA provided by a third-party CA vendor, or you can use an “internal” CA, which is the Cisco IOS Certificate Server.

Hierarchical PKI: Multiple CAs

PKI can be set up in a hierarchical framework to support multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. The subordinate CAs within the hierarchy can be enrolled with either the root CA or with another subordinate CA. These enrollment options are how multiple tiers of CAs are configured. Within a hierarchical PKI, all enrolled peers, can validate the certificate of one another if the peers share a trusted root CA certificate or a common subordinate CA.

Figure 98 shows the enrollment relationships among CAs within a three-tiered hierarchy.
Each CA corresponds to a trustpoint. For example, CA11 and CA12 are subordinate CAs, holding CA certificates that have been issued by CA1; CA111, CA112, and CA113 are also subordinate CAs, but their CA certificates have been issued by CA11.

**When to Use Multiple CAs**

Multiple CAs provide users with added flexibility and reliability. For example, subordinate CAs can be placed in branch offices while the root CA is at the office headquarters. Also, different granting policies can be implemented per CA, so you can set up one CA to automatically grant certificate requests while another CA within the hierarchy requires each certificate request to be manually granted.

Scenarios in which at least a two-tier CA is recommended are as follows:

- Large and very active networks in which a large number of certificates are revoked and reissued. A multiple tier CA helps to control the size of the CRLs.
- When online enrollment protocols are used, the root CA can be kept offline with the exception of issuing subordinate CA certificates. This scenario provides added security for the root CA.

**Certificate Enrollment: How It Works**

Certificate enrollment is the process of obtaining a certificate from a CA. Each end host that wants to participate in the PKI must obtain a certificate. Certificate enrollment occurs between the end host requesting the certificate and the CA. Figure 99 and the following steps describe the certificate enrollment process.

**Figure 99 Certificate Enrollment Process**

1. The end host generates an RSA key pair.
2. The end host generates a certificate request and forwards it to the CA (or the RA, if applicable).
3. The CA receives the certificate enrollment request, and, depending on your network configuration, one of the following options occurs:
   - Manual intervention is required to approve the request.
   - The end host is configured to automatically request a certificate from the CA. Thus, operator intervention is no longer required at the time the enrollment request is sent to the CA server.
Cisco IOS PKI Overview: Understanding and Planning a PKI

Planning for a PKI

Note

If you configure the end host to automatically request certificates from the CA, you should have an additional authorization mechanism.

4. After the request is approved, the CA signs the request with its private key and returns the completed certificate to the end host.

5. The end host writes the certificate to a storage area such as NVRAM.

Certificate Enrollment Via Secure Device Provisioning

Secure Device Provisioning (SDP) is a web-based certificate enrollment interface that can be used to easily deploy PKI between two end devices, such as a Cisco IOS client and a Cisco IOS certificate server. SDP (also referred to as Trusted Transitive Introduction [TTI]) is a communication protocol that provides a bidirectional introduction between two end entities, such as a new network device and a Virtual Private Network (VPN). SDP involves the following three entities:

- **Introducer**—A mutually trusted device that introduces the petitioner to the registrar. The introducer can be a device user, such as a system administrator.
- **Petitioner**—A new device that is joined to the secure domain.
- **Registrar**—A certificate server or other server that authorizes the petitioner.

SDP is implemented over a web browser in three phases—welcome, introduction, and completion. Each phase is shown to the user via a web page. For more information on each phase and how SDP works, see the “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI” module.

Certificate Revocation: Why It Occurs

After each participant has successfully enrolled in the PKI, the peers are ready to begin negotiations for a secure connection with each other. Thus, the peers present their certificates for validation followed by a revocation check. After the peer verifies that the other peer’s certificate was issued by an authenticated CA, the CRL or Online Certificate Status Protocol (OCSP) server is checked to ensure that the certificate has not been revoked by the issuing CA. The certificate usually contains a certificate distribution point (CDP) in the form of a URL. Cisco IOS software uses the CDP to locate and retrieve the CRL. If the CDP server does not respond, the Cisco IOS software reports an error, which may result in the peer’s certificate being rejected.

Planning for a PKI

Planning for a PKI requires evaluating the requirements and expected use for each of the PKI components shown in Figure 97. It is recommended that you (or the network administrator) thoroughly plan the PKI before beginning any PKI configuration.

Although there are a number of approaches to consider when planning the PKI, this document begins with peer-to-peer communication and proceeds as shown in Figure 97. However you or the network administrator choose to plan the PKI, understand that certain decisions influence other decisions within the PKI. For example, the enrollment and deployment strategy could influence the planned CA hierarchy. Thus, it is important to understand how each component functions within the PKI and how certain component options are dependent upon decisions made earlier in the planning process.
Where to Go Next

As suggested in Figure 97, you begin to configure a PKI by setting up and deploying RSA keys. For more information, see the module “Deploying RSA Keys Within a PKI.”

Glossary

CDP—certificate distribution point. Field within a digital certificate containing information that describes how to retrieve the CRL for the certificate. The most common CDPs are HTTP and LDAP URLs. A CDP may also contain other types of URLs or an LDAP directory specification. Each CDP contains one URL or directory specification.

certificates—Electronic documents that bind a user’s or device’s name to its public key. Certificates are commonly used to validate a digital signature.

CRL—certificate revocation list. Electronic document that contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when the certificate was issued and when it expires. A new CRL is issued when the current CRL expires.

CA—certification authority. Service responsible for managing certificate requests and issuing certificates to participating IPSec network devices. This service provides centralized key management for the participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates.

peer certificate—Certificate presented by a peer, which contains the peer’s public key and is signed by the trustpoint CA.

PKI—public key infrastructure. System that manages encryption keys and identity information for components of a network that participate in secured communications.

RA—registration authority. Server that acts as a proxy for the CA so that CA functions can continue when the CA is offline. Although the RA is often part of the CA server, the RA could also be an additional application, requiring an additional device to run it.

RSA keys—Public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. An RSA key pair (a public and a private key) is required before you can obtain a certificate for your router.

Deploying RSA Keys Within a PKI

First Published: May 2, 2005
Last Updated: November 17, 2006

This module explains how to set up and deploy Rivest, Shamir, and Adelman (RSA) keys within a public key infrastructure (PKI). An RSA key pair (a public and a private key) is required before you can obtain a certificate for your router; that is, the end host must generate a pair of RSA keys and exchange the public key with the certification authority (CA) to obtain a certificate and enroll in a PKI.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for RSA Keys Within a PKI” section on page 20.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring RSA Keys for a PKI

- Before setting up and deploying RSA keys for a PKI, you should be familiar with the module “Cisco IOS PKI Overview: Understanding and Planning a PKI.”
- As of Cisco IOS Release 12.3(7)T, all commands that begin as “crypto ca” have been changed to begin as “crypto pki.” Although the router will still accept crypto ca commands, all output will be read back as crypto pki.

Information About RSA Keys Configuration

To deploy RSA keys within a PKI, you should understand the following concepts:

- RSA Keys Overview, page 2
- Reasons to Store Multiple RSA Keys on a Router, page 3
- Benefits of Exportable RSA Keys, page 3
- Passphrase Protection While Importing and Exporting RSA Keys, page 4

RSA Keys Overview

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key will be included in the certificate so that peers can use it to encrypt data that is sent to the router. The private key is kept on the router and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.

RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

If you want a modulus value between 512 and 1024, enter an integer value that is a multiple of 64. If you want a value higher than 1024, enter 1536 or 2048. If you enter a value greater than 512, key generation may take a minute or longer.

As of Cisco IOS Release 12.4(11)T, peer public RSA key modulus values up to 4096 bits are automatically supported.

The largest private RSA key modulus is 2048 bits. Therefore, the largest RSA private key a router may generate or import is 2048 bits.

The recommended modulus value for a CA is 2048 bits; the recommended modulus value for a client is 1024 bits.

Usage RSA Keys Versus General-Purpose RSA Keys

There are two mutually exclusive types of RSA key pairs—usage keys and general-purpose keys. When you generate RSA key pairs (via the `crypto key generate rsa` command), you will be prompted to select either usage keys or general-purpose keys.
Usage RSA Keys

Usage keys consist of two RSA key pairs—one RSA key pair is generated and used for encryption and one RSA key pair is generated and used for signatures. With usage keys, each key is not unnecessarily exposed. (Without usage keys, one key is used for both authentication methods, increasing the exposure of that key.)

General-Purpose RSA Keys

General-purpose keys consist of only one RSA key pair that used for both encryption and signatures. General-purpose key pairs are used more frequently than usage key pairs.

Reasons to Store Multiple RSA Keys on a Router

Configuring multiple RSA key pairs allows the Cisco IOS software to maintain a different key pair for each CA with which it is dealing or the software can maintain multiple key pairs and certificates with the same CA. Thus, the Cisco IOS software can match policy requirements for each CA without compromising the requirements specified by the other CAs, such as key length, key lifetime, and general-purpose versus usage keys.

Named key pairs (which are specified via the `label key-label` option) allow you to have multiple RSA key pairs, enabling the Cisco IOS software to maintain a different key pair for each identity certificate.

Benefits of Exportable RSA Keys

Caution

Exportable RSA keys should be carefully evaluated before use because using exportable RSA keys introduces the risk that these keys might be exposed.

Any existing RSA keys are not exportable. New keys are generated as nonexportable by default. It is not possible to convert an existing nonexportable key to an exportable key.

As of Cisco IOS Release 12.2(15)T, users can share the private RSA key pair of a router with standby routers, therefore transferring the security credentials between networking devices. The key pair that is shared between two routers will allow one router to immediately and transparently take over the functionality of the other router. If the main router were to fail, the standby router could be dropped into the network to replace the failed router without the need to regenerate keys, reenroll with the CA, or manually redistribute keys.

Exporting and importing an RSA key pair also enables users to place the same RSA key pair on multiple routers so that all management stations using Secure Shell (SSH) can be configured with a single public RSA key.

Exportable RSA Keys in PEM-Formatted Files

Using privacy-enhanced mail (PEM)-formatted files to import or export RSA keys can be helpful for customers who are running Cisco IOS software Release 12.3(4)T or later and who are using secure socket layer (SSL) or secure shell (SSH) applications to manually generate RSA key pairs and import the keys back into their PKI applications. PEM-formatted files allow customers to directly use existing RSA key pairs on their Cisco IOS routers instead of generating new keys.
Passphrase Protection While Importing and Exporting RSA Keys

You have to include a passphrase to encrypt the PKCS12 file or the PEM file that will be exported, and when the PKCS12 or PEM file is imported, the same passphrase has to be entered to decrypt it. Encrypting the PKCS12 or PEM file when it is being exported, deleted, or imported protects the file from unauthorized access and use while it is being transported or stored on an external device.

The passphrase can be any phrase that is at least eight characters in length; it can include spaces and punctuation, excluding the question mark (?), which has special meaning to the Cisco IOS parser.

How to Convert an Exportable RSA Key Pair to a Nonexportable RSA Key Pair

Passphrase protection protects the external PKCS12 or PEM file from unauthorized access and use. To prevent an RSA key pair from being exported, it must be labeled “nonexportable.” To convert an exportable RSA key pair into a nonexportable key pair, the key pair must be exported and then reimported without specifying the “exportable” keyword.

How to Set Up and Deploy RSA Keys Within a PKI

This section contains the following procedures:

- Generating an RSA Key Pair, page 4
- Generating and Storing Multiple RSA Key Pairs, page 5
- Exporting and Importing RSA Keys, page 6
- Encrypting and Locking Private Keys on a Router, page 10
- Removing RSA Key Pair Settings, page 13

Generating an RSA Key Pair

Perform this task to manually generate an RSA key pair.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto key generate rsa {general-keys | usage-keys} [label key-label] [modulus modulus-size] [exportable]`
4. `exit`
5. `show crypto key mypubkey rsa`

</table>

### What to Do Next

After you have successfully generated an RSA key pair, you can proceed to any of the additional tasks in this module to generate additional RSA key pairs, perform export and import of RSA key pairs, or configure additional security parameters for the RSA key pair (such as encrypting or locking the private key).

### Generating and Storing Multiple RSA Key Pairs

Perform this task to configure the router to generate and store multiple RSA key pairs and associate the key pairs with a trustpoint.

A trustpoint (also known as a CA) manages certificate requests and issues certificates to participating network devices. These services provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

### Prerequisites

You must have already generated an RSA key pair as shown in the task “Generating an RSA Key Pair.”
SUMMARY STEPS

1. crypto pki trustpoint name
2. rsakeypair key-label [key-size [encryption-key-size]]
3. exit
4. exit
5. show crypto key mypubkey rsa

DETAILED STEPS

<table>

Exporting and Importing RSA Keys

This section contains the following tasks that can be used for exporting and importing RSA keys. Whether you are using PKCS12 files or PEM files, exportable RSA keys allow you to use existing RSA keys on Cisco IOS routers instead of having to generate new RSA keys if the main router were to fail.

- Exporting and Importing RSA Keys in PKCS12 Files, page 7
- Exporting and Importing RSA Keys in PEM-Formatted Files, page 8
Exporting and Importing RSA Keys in PKCS12 Files

Exporting and importing RSA key pairs enables users to transfer security credentials between devices. The key pair that is shared between two devices allows one device to immediately and transparently take over the functionality of the other router.

Prerequisites for Exporting and Importing RSA Key in PKCS12 Files

You must generate an RSA key pair and mark it “exportable” as specified in the task “Generating an RSA Key Pair.”

Restrictions for Exporting and Importing RSA Keys in PKCS12 Files

- You cannot export RSA keys that existed on the router before your system was upgraded to Cisco IOS Release 12.2(15)T or later. You have to generate new RSA keys and label them as “exportable” after you upgrade the Cisco IOS software.
- When you import a PKCS12 file that was generated by a third-party application, the PKCS12 file must include a CA certificate.
- If you want to reexport an RSA key pair after you have already exported the key pair and imported them to a target router, you must specify the exportable keyword when you are importing the RSA key pair.
- The largest RSA key a router may import is 2048-bits.

SUMMARY STEPS

1. crypto pki trustpoint name
2. rsakeypair key-label [key-size [encryption-key-size]]
3. exit
4. crypto pki export trustpointname pkcs12 destination-url passphrase
5. crypto pki import trustpointname pkcs12 source-url passphrase
6. exit
7. show crypto key mypubkey rsa
## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> crypto pki trustpoint name</td>
<td>Creates the trustpoint name that is to be associated with the RSA key pair and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto pki trustpoint my-ca</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> rsakeypair key-label [key-size [encryption-key-size]]</td>
<td>Specifies the key pair that is to be used with the trustpoint.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(ca-trustpoint)# rsakeypair my-keys</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> exit</td>
<td>Exits ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(ca-trustpoint)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> crypto pki export trustpointname pkcs12 destination-url passphrase</td>
<td>Exports the RSA keys via the trustpoint name.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto pki export my-ca pkcs12 tftp://tftpserver/my-keys PASSWORD</td>
<td><strong>Note</strong> You can export the trustpoint using any of the following file system types: flash, FTP, null, NVRAM, remote file copying (RCP), SCP, system, TFTP, Webflash, Xmodem, or Ymodem.</td>
</tr>
<tr>
<td><strong>Step 5</strong> crypto pki import trustpointname pkcs12 source-url passphrase</td>
<td>Imports the RSA keys to the target router.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto pki import my-ca pkcs12 tftp://tftpserver/my-keys PASSWORD</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> show crypto key mypubkey rsa</td>
<td>(Optional) Displays the RSA public keys of your router.</td>

</table>

### Exporting and Importing RSA Keys in PEM-Formatted Files

Perform this task to export or import RSA key pairs in PEM files.

### Prerequisites for Exporting and Importing RSA Keys in PEM-Formatted Files

You must generate an RSA key pair and mark it “exportable” as specified in the task “Generating an RSA Key Pair.”
Restrictions for Exporting and Importing RSA Keys in PEM Formatted Files

- You cannot export and import RSA keys that were generated without an exportable flag before your system was upgraded to Cisco IOS Release 12.3(4)T or a later release. You have to generate new RSA keys after you upgrade the Cisco IOS software.
- The largest RSA key a router may import is 2048 bits.

SUMMARY STEPS

1. `crypto key generate rsa {usage-keys | general-keys} label key-label [exportable]`
2. `crypto key export rsa key-label pem {terminal | url url} {3des | des} passphrase`
3. `crypto key import rsa key-label pem [usage-keys] {terminal | url url} [exportable] passphrase`
How to Set Up and Deploy RSA Keys Within a PKI

4. exit
5. show crypto key mypubkey rsa

**DETAILED STEPS**

<table>
<thead>
<tr>

</table>

**Encrypting and Locking Private Keys on a Router**

Digital signatures are used to authenticate one device to another device. To use digital signatures, private information (the private key) must be stored on the device that is providing the signature. The stored private information may aid an attacker who steals the hardware device that contains the private key; for example, a thief might be able to use the stolen router to initiate a secure connection to another site by using the RSA private keys stored in the router.

**Note** RSA keys are lost during password recovery operations. If you lose your password, the RSA keys will be deleted when you perform the password recovery operation. (This function prevents an attacker from performing password recovery and then using the keys.)
To protect the private RSA key from an attacker, a user can encrypt the private key that is stored in NVRAM via a passphrase. Users can also “lock” the private key, which blocks new connection attempts from a running router and protects the key in the router if the router is stolen by an attempted attacker. Perform this task to encrypt and lock the private key that is saved to NVRAM.

**Prerequisites**

Before encrypting or locking a private key, you should perform the following tasks:

- Generate an RSA key pair as shown in the task “Generating an RSA Key Pair.”
- Optionally, you can authenticate and enroll each router with the CA server.

**Note**

The RSA keys must be unlocked while enrolling the CA. The keys can be locked while authenticating the router with the CA because the private key of the router is not used during authentication.

**Restrictions for Encrypting and Locking Private Keys**

**Backward Compatibility Restriction**

Any image prior to Cisco IOS Release 12.3(7)T does not support encrypted keys. To prevent your router from losing all encrypted keys, ensure that only unencrypted keys are written to NVRAM before booting an image prior to Cisco IOS Release 12.3(7)T.

If you must download an image prior to Cisco IOS Release 12.3(7)T, decrypt the key and immediately save the configuration so the downloaded image does not overwrite the configuration.

**Interaction with Applications**

An encrypted key is not effective after the router boots up until you manually unlock the key (via the `crypto key unlock rsa` command). Depending on which key pairs are encrypted, this functionality may adversely affect applications such as IP security (IPsec), SSH, and SSL; that is, management of the router over a secure channel may not be possible until the necessary key pair is unlocked.

**SUMMARY STEPS**

1. `crypto key encrypt [write] rsa [name key-name] passphrase passphrase`
2. `exit`
3. `show crypto key mypubkey rsa`
4. `crypto key lock rsa [name key-name] passphrase passphrase`
5. `show crypto key mypubkey rsa`
6. `crypto key unlock rsa [name key-name] passphrase passphrase`
7. `configure terminal`
8. `crypto key decrypt [write] rsa [name key-name] passphrase passphrase`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> crypto key encrypt [write] rsa [name key-name] passphrase passphrase</td>
<td>Encrypts the RSA keys. After this command is issued, the router can continue to use the key; the key remains unlocked. <strong>Note</strong> If the <code>write</code> keyword is not issued, the configuration must be manually written to NVRAM; otherwise, the encrypted key will be lost next time the router is reloaded.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto key encrypt write rsa name pki.company.com passphrase password</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> show crypto key mypubkey rsa</td>
<td>(Optional) Shows that the private key is encrypted (protected) and unlocked. <strong>Note</strong> You can also use this command to verify that applications such as Internet Key Exchange (IKE) and SSH are properly working after the key has been encrypted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show crypto key mypubkey rsa</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> crypto key lock rsa [name key-name] passphrase passphrase</td>
<td>(Optional) Locks the encrypted private key on a running router. <strong>Note</strong> After the key is locked, it cannot be used to authenticate the router to a peer device. This behavior disables any IPSec or SSL connections that use the locked key. Any existing IPSec tunnels created on the basis of the locked key will be closed. If all RSA keys are locked, SSH will automatically be disabled.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# crypto key lock rsa name pki.company.com passphrase password</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show crypto key mypubkey rsa</td>
<td>(Optional) Shows that the private key is protected and locked. The output will also show failed connection attempts via applications such as IKE, SSH, and SSL.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show crypto key mypubkey rsa</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> crypto key unlock rsa [name key-name] passphrase passphrase</td>
<td>(Optional) Unlocks the private key. <strong>Note</strong> After this command is issued, you can continue to establish IKE tunnels.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# crypto key unlock rsa name pki.company.com passphrase password</td>
<td></td>
</tr>
</tbody>
</table>
### Removing RSA Key Pair Settings

You might want to remove an RSA key pair for one of the following reasons:

- During manual PKI operations and maintenance, old RSA keys can be removed and replaced with new keys.
- An existing CA is replaced and the new CA requires newly generated keys; for example, the required key size might have changed in an organization so you would have to delete the old 1024-bit keys and generate new 2048-bit keys.

Perform this task to remove all RSA keys or the specified RSA key pair that has been generated by your router.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto key zeroize rsa [key-pair-label]`
4. `exit`
5. `show crypto key mypubkey rsa`

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>crypto key decrypt [write] rsa [name key-name] passphrase passphrase</code></td>
<td>(Optional) Deletes the encrypted key and leaves only the unencrypted key. <strong>Note</strong> The <code>write</code> keyword immediately saves the unencrypted key to NVRAM. If the <code>write</code> keyword is not issued, the configuration must be manually written to NVRAM; otherwise, the key will remain encrypted the next time the router is reloaded.</td>

### How to Set Up and Deploy RSA Keys Within a PKI
Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
| Example:          | • Enter your password if prompted. |
| Router> enable    |         |
| Step 2 configure terminal | Enters global configuration mode. |
| Example:          |         |
| Router# configure terminal |         |
| Step 3 crypto key zeroize rsa [key-pair-label] | Deletes RSA key pairs from your router.  
| Example:          | • If the key-pair-label argument is not specified, all RSA keys that have been generated by your router will be deleted. |
| Router(config)# crypto key zeroize rsa fancy-keys |         |
| Step 4 exit       | Exits global configuration mode. |
| Example:          |         |
| Router(config)# exit |         |
| Step 5 show crypto key mypubkey rsa | (Optional) Displays the RSA public keys of your router. This step allows you to verify that the RSA key pair has been successfully generated. |
| Example:          |         |
| Router# show crypto key mypubkey rsa |         |

Configuration Examples for RSA Key Pair Deployment

This section contains the following configuration examples:

- Generating and Specifying RSA Keys: Example, page 14
- Exporting and Importing RSA Keys: Examples, page 14
- Encrypting and Locking Private Keys on a Router: Examples, page 18

Generating and Specifying RSA Keys: Example

The following example is a sample trustpoint configuration that shows how to generate and specify the RSA key pair “exampleCAkeys”:

```
crypto key generate rsa general-purpose exampleCAkeys
crypto ca trustpoint exampleCAkeys
enroll url http://exampleCAkeys/certsrv/mscep/mscep.dll
rsakeypair exampleCAkeys 1024 1024
```

Exporting and Importing RSA Keys: Examples

This section contains the following configuration examples:
Exporting and Importing RSA Keys in PKCS12 Files: Example

In the following example, an RSA key pair “mynewkp” is generated on Router A, and a trustpoint name “mynewtp” is created and associated with the RSA key pair. The trustpoint is exported to a TFTP server, so that it can be imported on Router B. By importing the trustpoint “mynewtp” to Router B, the user has imported the RSA key pair “mynewkp” to Router B.

**Router A**

```plaintext
crypto key generate rsa general label mykeys exportable
! The name for the keys will be: mynewkp
Choose the size of the key modulus in the range of 360 to 2048 for your General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes.
How many bits in the modulus [512]:
% Generating 512 bit RSA keys ...[OK]
!
crypto pki trustpoint mynewtp
rsakeypair mykeys
exit

crypto pki export mytp pkcs12 flash:myexport companyname
Destination filename [myexport]?
Writing pkcs12 file to tftp:/mytftpserver/myexport
CRYPTO_PKI:Exported PKCS12 file successfully.
Verifying checksum... OK (0x3307)
!
Feb 18 17:30:09 GMT:%CRYPTO-6-PKCS12EXPORT_SUCCESS:PKCS #12 Successfully Exported.
```

**Router B**

```plaintext
crypto pki import mynewtp pkcs12 flash:myexport companyname
Source filename [myexport]?
CRYPTO_PKI:Imported PKCS12 file successfully.
!
Feb 18 18:07:50 GMT:%CRYPTO-6-PKCS12IMPORT_SUCCESS:PKCS #12 Successfully Imported.
```

Generating, Exporting, Importing, and Verifying RSA Keys in PEM Files: Example

The following example shows how to generate, export, bring the key back (import), and verify the status of the RSA key pair “mycs”:

```plaintext
! Generate the key pair
!
Router(config)# crypto key generate rsa general-purpose label mycs exportable
The name for the keys will be: mycs

Choose the size of the key modulus in the range of 360 to 2048 for your General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes.

How many bits in the modulus [512]: 1024
% Generating 1024 bit RSA keys ...[OK]
!
```
Deploying RSA Keys Within a PKI

Configuration Examples for RSA Key Pair Deployment

! Archive the key pair to a remote location, and use a good password.
!
Router(config)# crypto key export rsa mycs pem url nvram:3des PASSWORD

% Key name:mycs
Usage:General Purpose Key
Exporting public key...
Destination filename [mycs.pub]?
Writing file to nvram:mycs.pub
Exporting private key...
Destination filename [mycs.prv]?
Writing file to nvram:mycs.prv
!
! Import the key as a different name.
!
Router(config)# crypto key import rsa mycs2 pem url nvram:mycs PASSWORD

% Importing public key or certificate PEM file...
Source filename [mycs.pub]?
Reading file from nvram:mycs.pub
% Importing private key PEM file...
Source filename [mycs.prv]?
Reading file from nvram:mycs.prv% Key pair import succeeded.
!
! After the key has been imported, it is no longer exportable.
!
! Verify the status of the key.
!
Router# show crypto key mypubkey rsa

Exporting Router RSA Key Pairs and Certificates from PEM Files: Example

The following example shows how to generate and export the RSA key pair “aaa” and certificates of the router in PEM files that are associated with the trustpoint “mycs.” This example also shows PEM-formatted files, which include PEM boundaries before and after the base64-encoded data, that are used by other SSL and SSH applications.

Router(config)# crypto key generate rsa general-keys label aaa exportable

The name for the keys will be:aaa
Choose the size of the key modulus in the range of 360 to 2048 for your General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes.

How many bits in the modulus [512]:
% Generating 512 bit RSA keys ...[OK]

Router(config)# crypto pki trustpoint mycs
Router(ca-trustpoint)# enrollment url http://mycs
Router(ca-trustpoint)# rsakeypair aaa
Router(ca-trustpoint)# exit
Router(config)# crypto pki authenticate mycs
Certificate has the following attributes:
Fingerprint:C21514AC 12815946 09F6365ED FBB6CF31
% Do you accept this certificate? [yes/no]: y
Trustpoint CA certificate accepted.

Router(config)# crypto pki enroll mycs
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this password to the CA Administrator in order to revoke your certificate.
For security reasons your password will not be saved in the configuration.
Please make a note of it.
Password:
Re-enter password:
% The fully-qualified domain name in the certificate will be: Router
% The subject name in the certificate will be:host.company.com
% Include the router serial number in the subject name? [yes/no]: n
% Include an IP address in the subject name? [no]: n
Request certificate from CA? [yes/no]: y
% Certificate request sent to Certificate Authority
% The certificate request fingerprint will be displayed.
% The 'show crypto ca certificate' command will also show the fingerprint.

Router(config)# Fingerprint:8DA777BC 08477073 A5BE2403 812DD157

Router(config)#

Encrypting and Locking Private Keys on a Router: Examples

This section contains the following configuration examples:

- Configuring and Verifying an Encrypted Key: Example, page 18
- Configuring and Verifying a Locked Key: Example, page 19

Configuring and Verifying an Encrypted Key: Example

The following example shows how to encrypt the RSA key “pki-123.company.com.” Thereafter, the show crypto key mypubkey rsa command is issued to verify that the RSA key is encrypted (protected) and unlocked.

Router(config)# crypto key encrypt rsa name pki-123.company.com passphrase password
Router(config)# exit
Router# show crypto key mypubkey rsa

% Key pair was generated at: 00:15:32 GMT Jun 25 2003
Key name: pki-123.company.com
Usage: General Purpose Key
*** The key is protected and UNLOCKED. ***
Key is not exportable.
Key Data:
305C300D 06092A86 4886F70D 01010105 00034B00 30480241 00E0CC9A 1D23B52C

03018B98 E0C07B42 3CFD1A32 2A3A13C0 1FF919C5 8DE9565F 1F020301 0001
Configuring and Verifying a Locked Key: Example

The following example shows how to lock the key “pki-123.company.com.” Thereafter, the `show crypto key mypubkey rsa` command is issued to verify that the key is protected (encrypted) and locked.

Router# crypto key lock rsa name pki-123.company.com passphrase password
!
Router# show crypto key mypubkey rsa

Where to Go Next

After you have generated an RSA key pair, you should set up the trustpoint. If you have already set up the trustpoint, you should authenticate and enroll the routers in a PKI. For information on enrollment, see the module “Configuring Certificate Enrollment for a PKI.”

Feature Information for RSA Keys Within a PKI

Table 57 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “Implementing and Managing PKI Features Roadmap”.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

Table 57 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

| Cisco IOS 4096-Bit Public Key Support            | 12.4(12)T         | This feature introduces Cisco IOS 4096-bit public key support. The following section provides information about this feature:  
- RSA Keys Overview                                                                                     |
| Exporting and Importing RSA Keys                 | 12.2(15)T         | This feature allows you to transfer security credentials between devices by exporting and importing RSA keys. The key pair that is shared between two devices will allow one device to immediately and transparently take over the functionality of the other router.  
In Cisco IOS XE Release 2.1, this feature was introduced on Cisco ASR 1000 Series Routers.  
The following sections provide information about this feature:  
- Benefits of Exportable RSA Keys  
- Exporting and Importing RSA Keys in PKCS12 Files  
The following commands were introduced or modified by this feature: crypto ca export pkcs12, crypto ca import pkcs12, crypto key generate rsa (IKE) |
| Import of RSA Key Pair and Certificates in PEM Format | 12.3(4)T         | This feature allows customers to use PEM-formatted files to import or export RSA key pairs. PEM-formatted files allow customers to directly use existing RSA key pairs on their Cisco IOS routers instead of generating new keys.  
In Cisco IOS XE Release 2.1, this feature was introduced on Cisco ASR 1000 Series Routers.  
The following sections provide information about this feature:  
- Benefits of Exportable RSA Keys  
- Exporting and Importing RSA Keys in PEM-Formatted Files  
The following commands were introduced by this feature: crypto ca export pem, crypto ca import pem, crypto key export pem, crypto key import pem |

| Protected Private Key Storage    | 12.3(7)T Cisco IOS XE Release 2.1 | This feature allows a user to encrypt and lock the RSA private keys that are used on a Cisco IOS router, thereby, preventing unauthorized use of the private keys. In Cisco IOS XE Release 2.1, this feature was introduced on Cisco ASR 1000 Series Routers. The following section provides information about this feature:  
  - Encrypting and Locking Private Keys on a Router  
  The following commands were introduced or modified by this feature: crypto key decrypt rsa, crypto key encrypt rsa, crypto key lock rsa, crypto key unlock rsa, show crypto key mypubkey rsa |
Configuring Authorization and Revocation of Certificates in a PKI

First Published: May 2, 2005
Last Updated: June 19, 2006

This module describes how to configure authorization and revocation of certificates in a public key infrastructure (PKI).

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Certificate Authorization and Revocation” section on page 40.

Finding Support Information for Platforms and Cisco IOS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Prerequisites for Authorization and Revocation of Certificates

Plan Your PKI Strategy

Tip

It is strongly recommended that you plan your entire PKI strategy before you begin to deploy actual certificates.

Authorization and revocation can occur only after you or a network administrator have completed the following tasks:

- Configured the CA.
- Enrolled peer devices with the CA.
- Identified and configured the protocol (such as IP Security [IPsec] or secure socket layer [SSL]) that is to be used for peer-to-peer communication.

You should decide which authorization and revocation strategy you are going to configure before enrolling peer devices because the peer device certificates might have to contain authorization and revocation-specific information.

“crypto ca” to “crypto pki” CLI Change

As of Cisco IOS Release 12.3(7)T, all commands that begin as “crypto ca” have been changed to begin as “crypto pki.” Although the router will still accept crypto ca commands, all output will be read back as crypto pki.

Information About Authorization and Revocation of Certificates

Before configuring certificate authorization and revocation, you should understand the following concepts:

- PKI Authorization, page 2
- PKI and AAA Server Integration for Certificate Status, page 3
- CRLs or OCSP Server: Choosing a Certificate Revocation Mechanism, page 4
- When to Use Certificate-Based ACLs for Authorization or Revocation, page 7
- PKI Certificate Chain Validation, page 8

PKI Authorization

PKI authentication does not provide authorization. Current solutions for authorization are specific to the router that is being configured, although a centrally managed solution is often required.

There is not a standard mechanism by which certificates are defined as authorized for some tasks and not for others. This authorization information can be captured in the certificate itself if the application is aware of the certificate-based authorization information. But this solution does not provide a simple mechanism for real-time updates to the authorization information and forces each application to be aware of the specific authorization information embedded in the certificate.
When the certificate-based ACL mechanism is configured as part of the trustpoint authentication, the application is no longer responsible for determining this authorization information, and it is no longer possible to specify for which application the certificate is authorized. In some cases, the certificate-based ACL on the router gets so large that it cannot be managed. Additionally, it is beneficial to retrieve certificate-based ACL indications from an external server. (For more information on using certificate-based ACLs for authentication, see the section “When to Use Certificate-Based ACLs for Authorization or Revocation.”)

Current solutions to the real-time authorization problem involve specifying a new protocol and building a new server (with associated tasks, such as management and data distribution).

PKI and AAA Server Integration for Certificate Status

Integrating your PKI with an authentication, authorization, and accounting (AAA) server provides an alternative online certificate status solution that leverages the existing AAA infrastructure. Certificates can be listed in the AAA database with appropriate levels of authorization. For components that do not explicitly support PKI-AAA, a default label of “all” from the AAA server provides authorization. Likewise, a label of “none” from the AAA database indicates that the specified certificate is not valid. (The absence of any application label is equivalent, but “none” is included for completeness and clarity).

If the application component does support PKI-AAA, the component may be specified directly; for example, the application component could be “ipsec,” “ssl,” or “osp.” (ipsec=IP Security, ssl=Secure Sockets Layer, and osp=Open Settlement Protocol.)

Note

- Currently, no application component supports specification of the application label.
- There may be a time delay when accessing the AAA server. If the AAA server is not available, the authorization fails.

RADIUS or TACACS+: Choosing a AAA Server Protocol

The AAA server can be configured to work with either the RADIUS or TACACS+ protocol. When you are configuring the AAA server for the PKI integration, you must set the RADIUS or TACACS attributes that are required for authorization.

If the RADIUS protocol is used, the password that is configured for the username in the AAA server should be set to “cisco,” which is acceptable because the certificate validation provides authentication and the AAA database is only being used for authorization. When the TACACS protocol is used, the password that is configured for the username in the AAA server is irrelevant because TACACS supports authorization without requiring authentication (the password is used for authentication).

In addition, if you are using TACACS, you must add a PKI service to the AAA server. The custom attribute “cert-application=all” is added under the PKI service for the particular user or usergroup to authorize the specific username.

Attribute-Value Pairs for PKI and AAA Server Integration

Table 1 lists the attribute-value (AV) pairs that are to be used when setting up PKI integration with a AAA server. (Note the values shown in the table are possible values.) The AV pairs must match the client configuration. If they do not match, the peer certificate is not authorized.
Users can sometimes have AV pairs that are different from those of every other user. As a result, a unique username is required for each user. The `all` parameter (within the `authorization username` command) specifies that the entire subject name of the certificate will be used as the authorization username.

### Table 1 AV Pairs That Must Match

<table>
<thead>
<tr>
<th>AV Pair</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cisco-avpair=pki:cert-application=all</code></td>
<td>Valid values are “all” and “none.”</td>
</tr>
<tr>
<td><code>cisco-avpair=pki:cert-trustpoint=msca</code></td>
<td>The value is a Cisco IOS command-line interface (CLI) configuration trustpoint label.</td>
</tr>
<tr>
<td></td>
<td>Note: The cert-trustpoint AV pair is normally optional.</td>
</tr>
<tr>
<td></td>
<td>If it is specified, the Cisco IOS router query must be coming from a certificate trustpoint that has a matching label, and the certificate that is authenticated must have the specified certificate serial number.</td>
</tr>
<tr>
<td><code>cisco-avpair=pki:cert-serial=16318DB7000100001671</code></td>
<td>The value is a certificate serial number.</td>
</tr>
<tr>
<td></td>
<td>Note: The cert-serial AV pair is normally optional.</td>
</tr>
<tr>
<td></td>
<td>If it is specified, the Cisco IOS router query must be coming from a certificate trustpoint that has a matching label, and the certificate that is authenticated must have the specified certificate serial number.</td>
</tr>
<tr>
<td><code>cisco-avpair=pki:cert-lifetime-end=1:00jan 1, 2003</code></td>
<td>The cert-lifetime-end AV pair is available to artificially extend a certificate lifetime beyond the time period that is indicated in the certificate itself. If the cert-lifetime-end AV pair is used, the cert-trustpoint and cert-serial AV pairs must also be specified. The value must match the following form: hours:minutes month day, year.</td>
</tr>
<tr>
<td></td>
<td>Note: Only the first three characters of a month are used: Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec. If more than three characters are entered for the month, the remaining characters are ignored (for example Janxxxx).</td>
</tr>
</tbody>
</table>

**CRLs or OCSP Server: Choosing a Certificate Revocation Mechanism**

After a certificate is validated as a properly signed certificate, a certificate revocation method is performed to ensure that the certificate has not been revoked by the issuing CA. Cisco IOS software supports two revocation mechanisms—Certificate Revocation Lists (CRLs) and Online Certificate Status Protocol (OCSP). (Cisco IOS software also supports AAA integration for certificate checking; however, additional authorization functionality is included. For more information on PKI and AAA certificate authorization and status check, see the section “PKI and AAA Server Integration for Certificate Status.”)
The following sections explain how each revocation mechanism works:

- What Is a CRL?, page 5
- What Is OCSP?, page 6

**What Is a CRL?**

A certificate revocation list (CRL) contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when each certificate was issued and when it expires.

CAs publish new CRLs periodically or when a certificate for which the CA is responsible has been revoked. By default, a new CRL will be downloaded after the currently cached CRL expires. An administrator may also configure the duration for which CRLs are cached in router memory or disable CRL caching completely. The CRL caching configuration will apply to all CRLs associated with a trustpoint.

When the CRL expires, the router deletes it from its cache. A new CRL is downloaded when a certificate is presented for verification; however, if a newer version of the CRL that lists the certificate under examination is on the server but the router is still using the CRL in its cache, the router will not know that the certificate has been revoked. The certificate will pass the revocation check even though it should have been denied.

When a CA issues a certificate, the CA can include in the certificate the CRL distribution point (CDP) for that certificate. Cisco IOS client devices use CDPs to locate and load the correct CRL. The Cisco IOS client supports multiple CDPs, but the Cisco IOS CA currently supports only one CDP; however, third-party vendor CAs may support multiple CDPs or different CDPs per certificate. If a CDP is not specified in the certificate, the client device will use the default Simple Certificate Enrollment Protocol (SCEP) method to retrieve the CRL. (The CDP location can be specified via the `cdp-url` command.)

When implementing CRLs, you should consider the following design considerations:

- CRL lifetimes and the security association (SA) and Internet Key Exchange (IKE) lifetimes
  
The CRL lifetime determines the length of time between CA-issued updates to the CRL. (The default CRL lifetime value, which is 168 hours [1 week], can be changed via the `lifetime crl` command.)

- The method and location of the CDP
  
  - The method determines how the CRL is retrieved; some possible choices include HTTP, Lightweight Directory Access Protocol (LDAP), SCEP, or TFTP.
    
    HTTP, TFTP, and LDAP are the most commonly used methods. Although Cisco IOS software defaults to SCEP, an HTTP CDP is recommended for large installations using CRLs because HTTP can be made highly scalable.

    - The location determines from where the CRL is retrieved; for example, you can specify the server and file path from which to retrieve the CRL.

**Querying All CDPs During Revocation Check**

When a CDP server does not respond to a request, the Cisco IOS software reports an error, which may result in the peer’s certificate being rejected. To prevent a possible certificate rejection and if there are multiple CDPs in a certificate, the Cisco IOS software will attempt to use the CDPs in the order in which they appear in the certificate. The router will attempt to retrieve a CRL using each CDP URL or directory specification. If an error occurs using a CDP, an attempt will be made using the next CDP.
Prior to Cisco IOS Release 12.3(7)T, the Cisco IOS software makes only one attempt to retrieve the CRL, even when the certificate contains more than one CDP.

Although the Cisco IOS software will make every attempt to obtain the CRL from one of the indicated CDPs, it is recommended that you use an HTTP CDP server with high-speed redundant HTTP servers to avoid application timeouts because of slow CDP responses.

What Is OCSP?

OCSP is an online mechanism that is used to determine certificate validity and provides the following flexibility as a revocation mechanism:

1. OCSP can provide real-time certificate status checking.
2. OCSP allows the network administrator to specify a central OCSP server, which can service all devices within a network.
3. OCSP also allows the network administrator the flexibility to specify multiple OCSP servers, either per client certificate or per group of client certificates.
4. OCSP server validation is usually based on the root CA certificate or a valid subordinate CA certificate, but may also be configured so that external CA certificates or self-signed certificates may be used. Using external CA certificates or self-signed certificates allows the OCSP servers certificate to be issued and validated from an alternative PKI hierarchy.

A network administrator can configure an OCSP server to collect and update CRLs from different CA servers. The devices within the network can rely on the OCSP server to check the certificate status without retrieving and caching each CRL for every peer. When peers have to check the revocation status of a certificate, they send a query to the OCSP server that includes the serial number of the certificate in question and an optional unique identifier for the OCSP request, or a nonce. The OCSP server holds a copy of the CRL to determine if the CA has listed the certificate as being revoked; the server then responds to the peer including the nonce. If the nonce in the response from the OCSP server does not match the original nonce sent by the peer, the response is considered invalid and certificate verification fails. The dialog between the OCSP server and the peer consumes less bandwidth than most CRL downloads.

If the OCSP server is using a CRL, CRL time limitations will be applicable; that is, a CRL that is still valid might be used by the OCSP server although a new CRL has been issued by the CRL containing additional certificate revocation information. Because fewer devices are downloading the CRL information on a regular basis, you can decrease the CRL lifetime value or configure the OCSP server not to cache the CRL. For more information, check your OCSP server documentation.

When to Use an OCSP Server

OCSP may be more appropriate than CRLs if your PKI has any of the following characteristics:

1. Real-time certificate revocation status is necessary. CRLs are updated only periodically and the latest CRL may not always be cached by the client device. For example, if a client does not yet have the latest CRL cached and a newly revoked certificate is being checked, that revoked certificate will successfully pass the revocation check.
There are a large number of revoked certificates or multiple CRLs. Caching a large CRL consumes large portions of Cisco IOS memory and may reduce resources available to other processes.

CRLs expire frequently, causing the CDP to handle a larger load of CRLs.

**Note**  
As of Cisco IOS Release 12.4(9)T or later, an administrator may configure CRL caching, either by disabling CRL caching completely or setting a maximum lifetime for a cached CRL per trustpoint.

### When to Use Certificate-Based ACLs for Authorization or Revocation

Certificates contain several fields that are used to determine whether a device or user is authorized to perform a specified action.

Because certificate-based ACLs are configured on the device, they do not scale well for large numbers of ACLs; however, certificate-based ACLs do provide very granular control of specific device behavior. Certificate-based ACLs are also leveraged by additional features to help determine when PKI components such as revocation, authorization, or a trustpoint should be used. They provide a general mechanism allowing users to select a specific certificate or a group of certificates that are being validated for either authorization or additional processing.

Certificate-based ACLs specify one or more fields within the certificate and an acceptable value for each specified field. You can specify which fields within a certificate should be checked and which values those fields may or may not have.

There are six logical tests for comparing the field with the value—equal, not equal, contains, does not contain, less than, and greater than or equal. If more than one field is specified within a single certificate-based ACL, the tests of all of the fields within the ACL must succeed to match the ACL. The same field may be specified multiple times within the same ACL. More than one ACL may be specified, and ACL will be processed in turn until a match is found or all of the ACLs have been processed.

### Ignore Revocation Checks Using a Certificate-Based ACL

Certificate-based ACLs can be configured to instruct your router to ignore the revocation check and expired certificates of a valid peer. Thus, a certificate that meets the specified criteria can be accepted regardless of the validity period of the certificate, or if the certificate meets the specified criteria, revocation checking does not have to be performed. You can also use a certificate-based ACL to ignore the revocation check when the communication with a AAA server is protected with a certificate.

#### Ignoring Revocation Lists

To allow a trustpoint to enforce CRLs except for specific certificates, enter the `match certificate` command with the `skip revocation-check` keyword. This type of enforcement is most useful in a hub-and-spoke configuration in which you also want to allow direct spoke-to-spoke connections. In pure hub-and-spoke configurations, all spokes connect only to the hub, so CRL checking is necessary only on the hub. For one spoke to communicate directly with another spoke, the `match certificate` command with the `skip revocation-check` keyword can be used for neighboring peer certificates instead of requiring a CRL on each spoke.

#### Ignoring Expired Certificates

To configure your router to ignore expired certificates, enter the `match certificate` command with the `allow expired-certificate` keyword. This command has the following purposes:
• If the certificate of a peer has expired, this command may be used to “allow” the expired certificate until the peer can obtain a new certificate.

• If your router clock has not yet been set to the correct time, the certificate of a peer will appear to be not yet valid until the clock is set. This command may be used to allow the certificate of the peer even though your router clock is not set.

Note

• If Network Time Protocol (NTP) is available only via the IPSec connection (usually via the hub in a hub-and-spoke configuration), the router clock can never be set. The tunnel to the hub cannot be “brought up” because the certificate of the hub is not yet valid.

• “Expired” is a generic term for a certificate that is expired or that is not yet valid. The certificate has a start and end time. An expired certificate, for purposes of the ACL, is one for which the current time of the router is outside the start and end times specified in the certificate.

Skipping the AAA Check of the Certificate

If the communication with an AAA server is protected with a certificate, and you want to skip the AAA check of the certificate, use the `match certificate` command with the `skip authorization-check` keyword. For example, if a virtual private network (VPN) tunnel is configured so that all AAA traffic goes over that tunnel, and the tunnel is protected with a certificate, you can use the `match certificate` command with the `skip authorization-check` keyword to skip the certificate check so that the tunnel can be established.

The `match certificate` command and the `skip authorization-check` keyword should be configured after PKI integration with an AAA server is configured.

Note

If the AAA server is available only via an IPSec connection, the AAA server cannot be contacted until after the IPSec connection is established. The IPSec connection cannot be “brought up” because the certificate of the AAA server is not yet valid.

PKI Certificate Chain Validation

A certificate chain establishes a sequence of trusted certificates —from a peer certificate to the root CA certificate. Within a PKI hierarchy, all enrolled peers can validate the certificate of one another if the peers share a trusted root CA certificate or a common subordinate CA. Each CA corresponds to a trustpoint.

When a certificate chain is received from a peer, the default processing of a certificate chain path continues until the first trusted certificate, or trustpoint, is reached. In Cisco IOS Release 12.4(6)T and later releases, an administrator may configure the level to which a certificate chain is processed on all certificates including subordinate CA certificates.

Configuring the level to which a certificate chain is processed allows for the reauthentication of trusted certificates, the extension of a trusted certificate chain, and the completion of a certificate chain that contains a gap.

Reauthentication of Trusted Certificates

The default behavior is for the router to remove any trusted certificates from the certificate chain sent by the peer before the chain is validated. An administrator may configure certificate chain path processing so that the router does not remove CA certificates that are already trusted before chain validation, so that all certificates in the chain are re-authenticated for the current session.
Extending the Trusted Certificate Chain
The default behavior is for the router to use its trusted certificates to extend the certificate chain if there are any missing certificates in the certificate chain sent by the peer. The router will validate only certificates in the chain sent by the peer. An administrator may configure certificate chain path processing so that the certificates in the peer’s certificate chain and the router’s trusted certificates are validated to a specified point.

Completing Gaps in a Certificate Chain
An administrator may configure certificate chain processing so that if there is a gap in the configured Cisco IOS trustpoint hierarchy, certificates sent by the peer can be used to complete the set of certificates to be validated.

**Note**
If the trustpoint is configured to require parent validation and the peer does not provide the full certificate chain, the gap cannot be completed and the certificate chain is rejected and invalid.

**Note**
It is a configuration error if the trustpoint is configured to require parent validation and there is no parent trustpoint configured. The resulting certificate chain gap cannot be completed and the subordinate CA certificate cannot be validated. The certificate chain is invalid.

How to Configure Authorization and Revocation of Certificates for Your PKI
This section contains the following procedures:
- Configuring PKI Integration with a AAA Server, page 9
- Configuring a Revocation Mechanism for PKI Certificate Status Checking, page 13
- Configuring Certificate Authorization and Revocation Settings, page 16
- Configuring Certificate Chain Validation, page 25

Configuring PKI Integration with a AAA Server
Perform this task to generate a AAA username from the certificate presented by the peer and specify which fields within a certificate should be used to build the AAA database username.

Restrictions When Using the Entire Subject Name for PKI Authorization
The following restrictions should be considered when using the `all` keyword as the subject name for the `authorization username` command:
- Some AAA servers limit the length of the username (for example, to 64 characters). As a result, the entire certificate subject name cannot be longer than the limitation of the server.
- Some AAA servers limit the available character set that may be used for the username (for example, a space [ ] and an equal sign [=] may not be acceptable). You cannot use the `all` keyword for a AAA server having such a character-set limitation.
The subject-name command in the trustpoint configuration may not always be the final AAA subject name. If the fully qualified domain name (FQDN), serial number, or IP address of the router are included in a certificate request, the subject name field of the issued certificate will also have these components. To turn off the components, use the fqdn, serial-number, and ip-address commands with the none keyword.

CA servers sometimes change the requested subject name field when they issue a certificate. For example, CA servers of some vendors switch the relative distinguished names (RDNs) in the requested subject names to the following order: CN, OU, O, L, ST, and C. However, another CA server might append the configured LDAP directory root (for example, O=cisco.com) to the end of the requested subject name.

Depending on the tools you choose for displaying a certificate, the printed order of the RDNs in the subject name could be different. Cisco IOS software always displays the least significant RDN first, but other software, such as Open Source Secure Socket Laye r (OpenSSL), does the opposite. Therefore, if you are configuring a AAA server with a full distinguished name (DN) (subject name) as the corresponding username, ensure that the Cisco IOS software style (that is, with the least significant RDN first) is used.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa new-model
4. aaa authorization network listname [method]
5. crypto pki trustpoint name
6. enrollment url url
7. revocation-check method
8. exit
9. authorization username {subjectname subjectname}
10. authorization list listname
11. tacacs-server host hostname [key string]
    or
    radius-server host hostname [key string]

**DETAILED STEPS**

## Configuring Authorization and Revocation of Certificates in a PKI

### How to Configure Authorization and Revocation of Certificates for Your PKI

**Troubleshooting Tips**

To display debug messages for the trace of interaction (message type) between the CA and the router, use the `debug crypto pki transactions` command. (See the sample output, which shows a successful PKI integration with AAA server exchange and a failed PKI integration with AAA server exchange.)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 9</strong></td>
<td>Sets parameters for the different certificate fields that are used to build the AAA username. The <code>subjectname</code> argument can be any of the following:</td>
</tr>
</tbody>
</table>
| `authorization username (subjectname subjectname)` | - `all`—Entire distinguished name (subject name) of the certificate.  
- `commonname`—Certification common name.  
- `country`—Certificate country.  
- `email`—Certificate e-mail.  
- `ipaddress`—Certificate IP address.  
- `locality`—Certificate locality.  
- `organization`—Certificate organization.  
- `organizationalunit`—Certificate organizational unit.  
- `postalcode`—Certificate postal code.  
- `serialnumber`—Certificate serial number.  
- `state`—Certificate state field.  
- `streetaddress`—Certificate street address.  
- `unstructuredname`—Certificate unstructured name. |
| **Example:** | Router (config)# authorization username subjectname serialnumber |
| **Step 10** | Specifies the AAA authorization list. |
| `authorization list listname` |  |
| **Example:** | Route (config)# authorization list maxaaa |
| **Step 11** | Specifies a TACACS+ host. |
| `tacacs-server host hostname [key string]` |  |
| **Example:** | Router(config)# tacacs-server host 192.0.2.2 key a_secret_key  
or  
`radius-server host hostname [key string]` |  |
| **Example:** | Router(config)# radius-server host 192.0.2.1 key another_secret_key |
Configuring Authorization and Revocation of Certificates in a PKI

Successful Exchange

Router# debug crypto pki transactions

Apr 22 23:15:03.695: CRYPTO_PKI: Found a issuer match
Apr 22 23:15:03.955: CRYPTO_PKI: cert revocation status unknown.
Apr 22 23:15:03.955: CRYPTO_PKI: Certificate validated without revocation check

Each line that shows “CRYPTO_PKI_AAA” indicates the state of the AAA authorization checks. Each of the AAA AV pairs is indicated, and then the results of the authorization check are shown.

Apr 22 23:15:04.019: CRYPTO_PKI_AAA: checking AAA authorization (ipseccca_script_alsaist, PKIAAA-L, <all>)
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute (“cert-application” = “all”)
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute (“cert-trustpoint” = “CA1”)
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute (“cert-serial” = “15DE”)
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: authorization passed

Failed Exchange

Router# debug crypto pki transactions

Apr 22 23:11:13.703: CRYPTO_PKI_AAA: checking AAA authorization =
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: reply attribute (“cert-application” = “all”)
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: parsed cert-lifetime-end as: 21:30:00
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: cert-lifetime-end is expired

In the above failed exchange, the certificate has expired.

Configuring a Revocation Mechanism for PKI Certificate Status Checking

Perform this task to set up a CRL as the certificate revocation mechanism—CRLs or OCSP—that is used to check the status of certificates in a PKI.

The revocation-check Command

Use the revocation-check command to specify at least one method (OCSP, CRL, or skip the revocation check) that is to be used to ensure that the certificate of a peer has not been revoked. For multiple methods, the order in which the methods are applied is determined by the order specified via this command.

If your router does not have the applicable CRL and is unable to obtain one or if the OCSP server returns an error, your router will reject the peer’s certificate—unless you include the none keyword in your configuration. If the none keyword is configured, a revocation check will not be performed and the certificate will always be accepted.

Nonces and Peer Communications with OCSP Servers

When using OCSP, nonces, unique identifiers for OCSP requests, are sent by default during peer communications with your OCSP server. The use of nonces offers a more secure and reliable communication channel between the peer and OCSP server.
If your OCSP server does not support nonces, you may disable the sending of nonces. For more information, check your OCSP server documentation.

Prerequisites

- Before issuing any client certificates, the appropriate settings on the server (such as setting the CDP) should be configured.
- When configuring an OCSP server to return the revocation status for a CA server, the OCSP server must be configured with an OCSP response signing certificate that is issued by that CA server. Ensure that the signing certificate is in the correct format, or the router will not accept the OCSP response. See your OCSP manual for additional information.

Restrictions

- OCSP transports messages over HTTP, so there may be a time delay when you access the OCSP server.
- If the OCSP server depends on normal CRL processing to check revocation status, the same time delay that affects CRLs will also apply to OCSP.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. ocsp url url
5. revocation-check method1 [method2 [method3]]
6. ocsp disable-nonce
7. exit
8. exit
9. show crypto pki certificates
10. show crypto pki trustpoints [status | label [status]]
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`         | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| 2    | `configure terminal` | Enters global configuration mode. |
| 3    | `crypto pki trustpoint name` | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode. |
|      | **Example:**     |         |
|      | `Router> enable` |         |
| 4    | `ocsp url url`  | (Optional) Specifies the URL of an OCSP server so that the trustpoint can check the certificate status. This URL will override the URL of the OCSP server (if one exists) in the Authority Info Access (AIA) extension of the certificate. |
|      | **Example:**     |         |
|      | `Router(config)# crypto pki trustpoint hazel` |         |
| 5    | `revocation-check method1 [method2 [method3]]` | Checks the revocation status of a certificate.  
• `crl`—Certificate checking is performed by a CRL. This is the default option.  
• `none`—Certificate checking is ignored.  
• `ocsp`—Certificate checking is performed by an OCSP server.  
If a second and third method are specified, each method will be used only if the previous method returns an error, such as a server being down. |
|      | **Example:**     |         |
|      | `Router(ca-trustpoint)# revocation-check ocsp none` |         |
| 6    | `ocsp disable-nonce` | (Optional) Specifies that a nonce, or an OCSP request unique identifier, will not be sent during peer communications with the OCSP server. |
|      | **Example:**     |         |
|      | `Router(ca-trustpoint)# ocsp disable-nonce` |         |
| 7    | `exit`           | Returns to global configuration mode. |
|      | **Example:**     |         |
|      | `Router(ca-trustpoint)# exit` |         |
| 8    | `exit`           | Returns to privileged EXEC mode. |
|      | **Example:**     |         |
|      | `Router(config)# exit` |         |
How to Configure Authorization and Revocation of Certificates for Your PKI

Configuring Certificate Authorization and Revocation Settings

Perform this task to specify a certificate-based ACL, to ignore revocation checks or expired certificates, to manually override the default CDP location, to manually override the OCSP server setting, to configure CRL caching, or to set session acceptance or rejection based on a certificate serial number, as appropriate.

Configuring Certificate-Based ACLs to Ignore Revocation Checks

To configure your router to use certificate-based ACLs to ignore revocation checks and expired certificates, perform the following steps:

- Identify an existing trustpoint or create a new trustpoint to be used when verifying the certificate of the peer. Authenticate the trustpoint if it has not already been authenticated. The router may enroll with this trustpoint if you want. Do not set optional CRLs for the trustpoint if you plan to use the `match certificate` command and `skip revocation-check` keyword.
- Determine the unique characteristics of the certificates that should not have their CRL checked and of the expired certificates that should be allowed.
- Define a certificate map to match the characteristics identified in the prior step.
- You can add the `match certificate` command and `skip revocation-check` keyword and the `match certificate` command and `allow expired-certificate` keyword to the trustpoint that was created or identified in the first step.

Manually Overriding CDPs in a Certificate

Users can override the CDPs in a certificate with a manually configured CDP. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate’s CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP.

Manually Overriding the OCSP Server Setting in a Certificate

Administrators can override the OCSP server setting specified in the Authority Information Access (AIA) field of the client certificate or set by the issuing the `ocsp url` command. One or more OCSP servers may be manually specified, either per client certificate or per group of client certificates by the command:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 9&lt;br&gt;<code>show crypto pki certificates</code></td>
<td>(Optional) Displays information about your certificates.</td>
</tr>
<tr>
<td>Example:&lt;br&gt;<code>Router# show crypto pki certificates</code></td>
<td></td>
</tr>
<tr>
<td>Step 10&lt;br&gt;`show crypto pki trustpoints [status</td>
<td>label [status]]`</td>
</tr>
<tr>
<td>Example:&lt;br&gt;<code>Router# show crypto pki trustpoints</code></td>
<td></td>
</tr>
</tbody>
</table>
match certificate override ocsp command. The match certificate override ocsp command overrides the client certificate AIA field or the ocsp url command setting if a client certificate is successfully matched to a certificate map during the revocation check.

**Note**

Only one OCSP server can be specified per client certificate.

### Configuring CRL Cache Control

By default, a new CRL will be downloaded after the currently cached CRL expires. Administrators can either configure the maximum amount of time in minutes a CRL remains in the cache by issuing the `crl cache delete-after` command or disable CRL caching by issuing the `crl cache none` command. Only the `crl-cache delete-after` command or the `crl-cache none` command may be specified. If both commands are entered for a trustpoint, the last command executed will take effect and a message will be displayed.

Neither the `crl-cache none` command nor the `crl-cache delete-after` command affects the currently cached CRL. If you configure the `crl-cache none` command, all CRLs downloaded after this command is issued will not be cached. If you configure the `crl-cache delete-after` command, the configured lifetime will only affect CRLs downloaded after this command is issued.

This functionality is useful when a CA issues CRLs with no expiration date or with expiration dates days or weeks ahead.

### Configuring Certificate Serial Number Session Control

A certificate serial number can be specified to allow a certificate validation request to be accepted or rejected by the trustpoint for a session. A session may be rejected, depending on certificate serial number session control, even if a certificate is still valid. Certificate serial number session control may be configured by using either a certificate map with the `serial-number` field or an AAA attribute, with the `cert-serial-not` command.

Using certificate maps for session control allows an administrator to specify a single certificate serial number. Using the AAA attribute allows an administrator to specify one or more certificate serial numbers for session control.

### Prerequisites

- The trustpoint should be defined and authenticated before attaching certificate maps to the trustpoint.
- The certificate map must be configured before the CDP override feature can be enabled or the `serial-number` command is issued.
- The PKI and AAA server integration must be successfully completed to use AAA attributes as described in “PKI and AAA Server Integration for Certificate Status.”

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto pki certificate map label sequence-number`
4. `field-name match-criteria match-value`
5. exit
6. crypto pki trustpoint name
7. crl-cache none
8. crl-cache delete-after time
9. match certificate certificate-map-label [allow expired-certificate | skip revocation-check | skip authorization-check]
10. match certificate certificate-map-label override cdp {url | directory} string
11. match certificate certificate-map-label override ocsp [trustpoint trustpoint-label]
    sequence-number url ocsp-url
12. exit
13. aaa new-model
14. aaa attribute list list-name
15. attribute type {name} {label}
16. exit
17. exit
18. show crypto pki certificates
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **enable** | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:** |  
  Router> enable | |
| **Step 2** | **configure terminal** | Enters global configuration mode. |
| **Example:** |  
  Router# configure terminal | |
| **Step 3** | **crypto pki certificate map label**  
  **sequence-number** | Defines values in a certificate that should be matched or not matched and enters ca-certificate-map configuration mode. |
| **Example:** |  
  Router(config)# crypto pki certificate map  
  Group 10 | |
### Command or Action

**Step 4**

```
field-name match-criteria match-value
```

**Example:**

Router(config)# subject-name co MyCompany

**Purpose**

Specifies one or more certificate fields together with their matching criteria and the value to match.

The *field-name* is one of the following case-insensitive name strings or a date:

- **alt-subject-name**
- **expires-on**
- **issuer-name**
- **name**
- **serial-number**
- **subject-name**
- **unstructured-subject-name**
- **valid-start**

**Note**

Date field format is dd mm yyyy hh:mm:ss or mmm dd yyyy hh:mm:ss.

The *match-criteria* is one of the following logical operators:

- **co** —contains (valid only for name fields and serial number field)
- **eq** —equal (valid for name, serial number, and date fields)
- **ge** —greater than or equal (valid only for date fields)
- **lt** —less than (valid only for date fields)
- **nc** —does not contain (valid only for name fields and serial number field)
- **ne** —not equal (valid for name, serial number, and date fields)

The *match-value* is the name or date to test with the logical operator assigned by *match-criteria*.

**Note**

Use this command only when setting up a certificate-based ACL—not when setting up a certificate-based ACL to ignore revocation checks or expired certificates.

### Step 5

```
exit
```

**Example:**

Router(config)# exit

**Purpose**

Returns to global configuration mode.

### Step 6

```
crypto pki trustpoint name
```

**Example:**

Router(config)# crypto pki trustpoint Access2

**Purpose**

Declares the trustpoint, given name and enters ca-trustpoint configuration mode.
**Command or Action** | **Purpose**
--- | ---
**Step 7** | crl-cache none
- Example: Router(ca-trustpoint)# crl-cache none
  (Optional) Disables CRL caching completely for all CRLs associated with the trustpoint.
- The crl-cache none command does not affect any currently cached CRLs. All CRLs downloaded after this command is configured will not be cached.

**Step 8** | crl-cache delete-after time
- Example: Router(ca-trustpoint)# crl-cache delete-after 2
  (Optional) Specifies the maximum time CRLs will remain in the cache for all CRLs associated with the trustpoint.
  - time—The amount of time in minutes before the CRL is deleted.
  - The crl-cache delete-after command does not affect any currently cached CRLs. The configured lifetime will only affect CRLs downloaded after this command is configured.

**Step 9** | match certificate certificate-map-label [allow expired-certificate | skip revocation-check | skip authorization-check]
- Example: Router(ca-trustpoint)# match certificate Group skip revocation-check
  (Optional) Associates the certificate-based ACL (that was defined via the crypto pki certificate map command) to a trustpoint.
  - certificate-map-label—Must match the label argument specified via the crypto pki certificate map command.
  - allow expired-certificate—Ignores expired certificates.
  - skip revocation-check—Allows a trustpoint to enforce CRLs except for specific certificates.
  - skip authorization-check—Skips the AAA check of a certificate when PKI integration with an AAA server is configured.

**Step 10** | match certificate certificate-map-label override cdp {url | directory} string
- Example: Router(ca-trustpoint)# match certificate Group1 override cdp url http://server.cisco.com
  (Optional) Manually overrides the existing CDP entries for a certificate with a URL or directory specification.
  - certificate-map-label—A user-specified label that must match the label argument specified in a previously defined crypto pki certificate map command.
  - url—Specifies that the certificate’s CDPs will be overridden with an HTTP or LDAP URL.
  - directory—Specifies that the certificate’s CDPs will be overridden with an LDAP directory specification.
  - string—The URL or directory specification.
- Note Some applications may time out before all CDPs have been tried and will report an error message. The error message will not affect the router, and the Cisco IOS software will continue attempting to retrieve a CRL until all CDPs have been tried.
### How to Configure Authorization and Revocation of Certificates for Your PKI

**Command or Action**

<table>
<thead>
<tr>
<th>Step 11</th>
<th>match certificate certificate-map-label override ocsp [trustpoint trustpoint-label] sequence-number url ocsp-url</th>
</tr>
</thead>
</table>

**Example:**

```
Router(ca-trustpoint)# match certificate mycertmapname override ocsp trustpoint mytp 15 url http://192.0.2.2
```

(Optional) Specifies an OCSP server, either per client certificate or per group of client certificates, and may be issued more than once to specify additional OCSP servers and client certificate settings including alternative PKI hierarchies.

- **certificate-map-label** — The name of an existing certificate map.
- **trustpoint** — The trustpoint to be used when validating the OCSP server certificate.
- **sequence-number** — The order the `match certificate override ocsp` command statements apply to the certificate being verified. Matches are performed from the lowest sequence number to the highest sequence number. If more than one command is issued with the same sequence number, it overwrites the previous OCSP server override setting.
- **url** — The URL of the OCSP server.

When the certificate matches a configured certificate map, the AIA field of the client certificate and any previously issued `ocsp url` command settings are overwritten with the specified OCSP server.

If no map-based match occurs, one of the following two cases will continue to apply to the client certificate.

- If OCSP is specified as the revocation method, the AIA field value will continue to apply to the client certificate.
- If the `ocsp url` configuration exists, the `ocsp url` configuration settings will continue to apply to the client certificates.

<table>
<thead>
<tr>
<th>Step 12</th>
<th>exit</th>
</tr>
</thead>
</table>

**Example:**

```
Router(ca-trustpoint)# exit
```

Returns to global configuration mode.

<table>
<thead>
<tr>
<th>Step 13</th>
<th>aaa new-model</th>
</tr>
</thead>
</table>

**Example:**

```
Router(config)# aaa new-model
```

(Optional) Enables the AAA access control model.

<table>
<thead>
<tr>
<th>Step 14</th>
<th>aaa attribute list list-name</th>
</tr>
</thead>
</table>

**Example:**

```
Router(config)# aaa attribute list crl
```

(Optional) Defines an AAA attribute list locally on a router and enters config-attr-list configuration mode.
Configuring Authorization and Revocation of Certificates in a PKI

How to Configure Authorization and Revocation of Certificates for Your PKI

### Examples

The following is a sample OCSP response when signing a certificate. The OCSP-related extensions are in bold.

**Certificate:**

```
Certificate:
    Data:
        Version: v3
        Serial Number:0x14
        Signature Algorithm:MD5withRSA - 1.2.840.113549.1.1.4
        Issuer:CN=CA server,OU=PKI,O=Cisco Systems
        Validity:
            Not Before:Thursday, August 8, 2002 4:38:05 PM PST
            Not After:Tuesday, August 7, 2003 4:38:05 PM PST
        Subject:CN=OCSP server,OU=PKI,O=Cisco Systems
        Subject Public Key Info:
            Algorithm:RSA - 1.2.840.113549.1.1.1
            Public Key:
                Exponent:65537
                Public Key Modulus:(1024 bits) :
                    <snip>
        Extensions:
            Identifier:Subject Key Identifier - 2.5.29.14
            Critical:no
```
Key Identifier:
   <snip>
Identifier:Authority Key Identifier - 2.5.29.35
   Critical: no
Key Identifier:
   <snip>

   Critical: no
Identifier:Extended Key Usage:- 2.5.29.37
   Critical: no
   Extended Key Usage: OCSPSigning
Identifier:CRL Distribution Points - 2.5.29.31
   Critical: no
   Number of Points: 1
   Point 0
   Distribution Point:
   [URIName:ldap://CA-server/CN=CA server,OU=PKI,O=Cisco Systems]
Signature:
   Algorithm:MD5withRSA - 1.2.840.113549.1.1.4
Signature:
   <snip>

The following example shows an excerpt of the running configuration output when adding a `match certificate override ocsp` command to the beginning of an existing sequence:

```
match certificate map3 override ocsp 5 url http://192.0.2.3/
show running-configuration
```

```
match certificate map3 override ocsp 5 url http://192.0.2.3/
machine certificate map1 override ocsp 10 url http://192.0.2.1/
machine certificate map2 override ocsp 15 url http://192.0.2.2/
```

The following example shows an excerpt of the running configuration output when an existing `match certificate override ocsp` command is replaced and a trustpoint is specified to use an alternative PKI hierarchy:

```
match certificate map4 override ocsp trustpoint tp4 10 url http://192.0.2.4/newvalue
show running-configuration
```

```
match certificate map3 override ocsp trustpoint tp3 5 url http://192.0.2.3/
machine certificate map1 override ocsp trustpoint tp1 10 url http://192.0.2.1/
machine certificate map4 override ocsp trustpoint tp4 10 url http://192.0.2.4/newvalue
match certificate map2 override ocsp trustpoint tp2 15 url http://192.0.2.2/
```

**Troubleshooting Tips**

If you ignored revocation check or expired certificates, you should carefully check your configuration. Verify that the certificate map properly matches either the certificate or certificates that should be allowed or the AAA checks that should be skipped. In a controlled environment, try modifying the certificate map and determine what is not working as expected.
Configuring Certificate Chain Validation

Perform this task to configure the processing level for the certificate chain path of your peer certificates.

Prerequisites

- The device must be enrolled in your PKI hierarchy.
- The appropriate key pair must be associated with the certificate.

Restrictions

- A trustpoint associated with the root CA cannot be configured to be validated to the next level.

The `chain-validation` command is configured with the `continue` keyword for the trustpoint associated with the root CA, an error message will be displayed and the chain validation will revert to the default `chain-validation` command setting.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto pki trustpoint name`
4. `chain-validation [{stop | continue} [parent-trustpoint]]`
5. `exit`
DETAILED STEPS

| Router(ca-trustpoint)# chain-validation continue ca-sub1 |● Use the stop keyword to specify that the certificate is already trusted. This is the default setting.  
|                  |● Use the continue keyword to specify that the that the subordinate CA certificate associated with the trustpoint must be validated.  
|                  |● The parent-trustpoint argument specifies the name of the parent trustpoint the certificate must be validated against. |
| Step 5 exit       | Returns to global configuration mode |
| **Example:**      |         |
| Router(ca-trustpoint)# exit |         |

Configuration Examples for Setting Up Authorization and Revocation of Certificates

This section contains the following configuration examples:

- Configuring and Verifying PKI AAA Authorization: Examples, page 27
- Configuring a Revocation Mechanism: Examples, page 31
- Configuring a Hub Router at a Central Site for Certificate Revocation Checks: Example, page 32
- Configuring Certificate Authorization and Revocation Settings: Examples, page 36
- Configuring Certificate Chain Validation: Examples, page 38
**Configuring and Verifying PKI AAA Authorization: Examples**

This section provides configuration examples of PKI AAA authorizations:

- **Router Configuration: Example**, page 27
- **Debug of a Successful PKI AAA Authorization: Example**, page 29
- **Debugs of a Failed PKI AAA Authorization: Example**, page 30

**Router Configuration: Example**

The following `show running-config` command output shows the working configuration of a router that is set up to authorize VPN connections using the PKI Integration with AAA Server feature:

```
Router# show running-config

**Debug of a Successful PKI AAA Authorization: Example**

The following *show debugging* command output shows a successful authorization using the PKI Integration with AAA Server feature:

```
Router# show debugging

General OS:
 TACACS access control debugging is on
 AAA Authentication debugging is on
 AAA Authorization debugging is on

Cryptographic Subsystem:
 Crypto PKI Trans debugging is on

Router# show crypto isakmp sa
```

```
dst    src          state       conn-id slot
192.0.2.22 192.0.2.102  QM_IDLE    84  0
```
Debugs of a Failed PKI AAA Authorization: Example

The following `show debugging` command output shows that the router is not authorized to connect using VPN. The messages are typical of those that you might see in such a situation.

In this example, the peer username was configured as not authorized, by moving the username to a Cisco Secure ACS group called VPN_Router_Disabled in Cisco Secure ACS. The router, router7200.company.com, has been configured to check with a Cisco Secure ACS AAA server prior to establishing a VPN connection to any peer.

```
Router# show debugging

General OS:
   TACACS access control debugging is on
   AAA Authentication debugging is on
   AAA Authorization debugging is on
Cryptographic Subsystem:
   Crypto PKI Trans debugging is on

Router# show debugging

Configuring a Revocation Mechanism: Examples

This section contains the following configuration examples that can be used when specifying a revocation mechanism for your PKI:

- Configuring an OCSP Server: Example, page 31
- Specifying a CRL and Then an OCSP Server: Example, page 31
- Specifying an OCSP Server: Example, page 31
- Disabling Nonces in Communications with the OCSP Server: Example, page 32

Configuring an OCSP Server: Example

The following example shows how to configure the router to use the OCSP server that is specified in the AIA extension of the certificate:

Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# revocation-check ocsp

Specifying a CRL and Then an OCSP Server: Example

The following example shows how to configure the router to download the CRL from the CDP. If the CRL is unavailable, the OCSP server that is specified in the AIA extension of the certificate will be used. If both options fail, certificate verification will also fail.

Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# revocation-check crl ocsp

Specifying an OCSP Server: Example

The following example shows how to configure your router to use the OCSP server at the HTTP URL “http://myocspserver:81.” If the server is down, the revocation check will be ignored.
Disabling Nonces in Communications with the OCSP Server: Example

The following example shows communications when a nonce, or a unique identifier for the OCSP request, is disabled for communications with the OCSP server:

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# ocsp url http://myocspserver:81
Router(ca-trustpoint)# revocation-check ocsp none
```

Configuring a Hub Router at a Central Site for Certificate Revocation Checks: Example

The following example shows a hub router at a central site that is providing connectivity for several branch offices to the central site. The branch offices are also able to communicate directly with each other using additional IPSec tunnels between the branch offices. The CA publishes CRLs on an HTTP server at the central site. The central site checks CRLs for each peer when setting up an IPSec tunnel with that peer. The example does not show the IPSec configuration—only the PKI-related configuration is shown.

**Home Office Hub Configuration**

```
crypto pki trustpoint VPN-GW
  enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
  serial-number none
  fqdn none
  ip-address none
  subject-name o=Home Office Inc,cn=Central VPN Gateway
  revocation-check crl
```

**Central Site Hub Router**

```
Router# show crypto ca certificate
Certificate
  Status: Available
  Certificate Serial Number: 2F62BE14000000000CA0
  Certificate Usage: General Purpose
  Issuer:
    cn=Central Certificate Authority
    o=Home Office Inc
  Subject:
    Name: Central VPN Gateway
cn=Central VPN Gateway
    o=Home Office Inc
  CRL Distribution Points:
    http://ca.home-office.com/CertEnroll/home-office.crl
  Validity Date:
    start date: 00:43:26 GMT Sep 26 2003
    end date: 00:53:26 GMT Sep 26 2004
    renew date: 00:00:00 GMT Jan 1 1970
  Associated Trustpoints: VPN-GW
```
CA Certificate
Status: Available
Certificate Serial Number: 1244325DE0369880465F977A18F61CA8
Certificate Usage: Signature
Issuer:
  cn=Central Certificate Authority
  o=Home Office Inc
Subject:
  cn=Central Certificate Authority
  o=Home Office Inc
CRL Distribution Points:
  http://ca.home-office.com/CertEnroll/home-office.crl
Validity Date:
  start date: 22:19:29 GMT Oct 31 2002
  end date: 22:27:27 GMT Oct 31 2017
Associated Trustpoints: VPN-GW

Trustpoint on the Branch Office Router
crypto pki trustpoint home-office
enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
serial-number none
fqdn none
ip-address none
subject-name o=Home Office Inc,cn=Branch 1
revocation-check crl

A certificate map is entered on the branch office router.

Router(config)# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
branch1(config)# crypto pki certificate map central-site 10
branch1(config)#

The output from the show certificate command on the central site hub router shows that the certificate was issued by the following:
cn=Central Certificate Authority
o=Home Office Inc

These two lines are combined into one line using a comma (,) to separate them, and the original lines are added as the first criteria for a match.

Router (ca-certificate-map)# issuer-name co cn=Central Certificate Authority, ou=Home Office Inc
!The above line wrapped but should be shown on one line with the line above it.

The same combination is done for the subject name from the certificate on the central site router (note that the line that begins with “Name:” is not part of the subject name and must be ignored when creating the certificate map criteria). This is the subject name to be used in the certificate map.

cn=Central VPN Gateway
o=Home Office Inc

Router (ca-certificate-map)# subject-name eq cn=central vpn gateway, o=home office inc

Now the certificate map is added to the trustpoint that was configured earlier.

Router (ca-certificate-map)# crypto pki trustpoint home-office
Router (ca-trustpoint)# match certificate central-site skip revocation-check
Router (ca-trustpoint)#
Router (config)# exit
The configuration is checked (most of configuration is not shown).

Router# write term
!Many lines left out
.
.
.
crypto pki trustpoint home-office
  enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
  serial-number none
  fqdn none
  ip-address none
  subject-name o=Home Office Inc,cn=Branch 1
  revocation-check crl
  match certificate central-site skip revocation-check
!
!
crypto pki certificate map central-site 10
  issuer-name co cn = Central Certificate Authority, ou = Home Office Inc
  subject-name eq cn = central vpn gateway, o = home office inc
  !many lines left out

Note that the issuer-name and subject-name lines have been reformatted to make them consistent for later matching with the certificate of the peer.

If the branch office is checking the AAA, the trustpoint will have lines similar to the following:

crypto pki trustpoint home-office
  auth list allow_list
  auth user subj commonname

After the certificate map has been defined as was done above, the following command is added to the trustpoint to skip AAA checking for the central site hub.

match certificate central-site skip authorization-check

In both cases, the branch site router has to establish an IPSec tunnel to the central site to check CRLs or to contact the AAA server. However, without the match certificate command and central-site skip authorization-check (argument and keyword), the branch office cannot establish the tunnel until it has checked the CRL or the AAA server. (The tunnel will not be established unless the match certificate command and central-site skip authorization-check argument and keyword are used.)

The match certificate command and allow expired-certificate keyword would be used at the central site if the router at a branch site had an expired certificate and it had to establish a tunnel to the central site to renew its certificate.

Trustpoint on the Central Site Router

crypto pki trustpoint VPN-GW
  enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
  serial-number none
  fqdn none
  ip-address none
  subject-name o=Home Office Inc,cn=Central VPN Gateway
  revocation-check crl

Trustpoint on the Branch 1 Site Router

Router# show crypto ca certificate

Certificate
  Status: Available
  Certificate Serial Number: 2F62BE14000000000CA0
Certificate Usage: General Purpose
Issuer:
  cn=Central Certificate Authority
  o=Home Office Inc

Subject:
  cn=Central Certificate Authority
  o=Home Office Inc
CRL Distribution Points:
  http://ca.home-office.com/CertEnroll/home-office.crl
Validity Date:
  start date: 22:19:29 GMT Oct 31 2002
  end   date: 22:27:27 GMT Oct 31 2017
Associated Trustpoints: home-office

A certificate map is entered on the central site router.

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router (config)# crypto pki certificate map branch1 10
Router (ca-certificate-map)# issuer-name co cn=Central Certificate Authority, ou=Home Office Inc
  !The above line wrapped but should be part of the line above it.
Router (ca-certificate-map)# subject-name eq cn=Branch 1 Site, o=home office inc

The certificate map is added to the trustpoint.

Router (ca-certificates-map)# crypto pki trustpoint VPN-GW
Router (ca-trustpoint)# match certificate branch1 allow expired-certificate
Router (ca-trustpoint)# exit
Router (config) #exit

The configuration should be checked (most of the configuration is not shown).

Router# write term
!many lines left out

crypto pki trustpoint VPN-GW
  enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
  serial-number none
  fqdn none
  ip-address none
  subject-name o=Home Office Inc, cn=Central VPN Gateway
  revocation-check crl
  match certificate branch1 allow expired-certificate
  !
crypto pki certificate map central-site 10
    issuer-name co cn = Central Certificate Authority, ou = Home Office Inc
    subject-name eq cn = central vpn gateway, o = home office inc
    ! many lines left out

The **match certificate** command and **branch1 allow expired-certificate** (argument and keyword) and the certificate map should be removed as soon as the branch router has a new certificate.

### Configuring Certificate Authorization and Revocation Settings: Examples

This section contains the following configuration examples that can be used when specifying a CRL cache control setting or certificate serial number session control:

- Configuring CRL Cache Control, page 36
- Configuring Certificate Serial Number Session Control, page 37

#### Configuring CRL Cache Control

The following example shows how to disable CRL caching for all CRLs associated with the CA1 trustpoint:

```plaintext
crypto pki trustpoint CA1
   enrollment url http://CA1:80
   ip-address FastEthernet0/0
   crl query ldap://ldap_CA1
   revocation-check crl
   crl-cache none
```

The current CRL is still cached immediately after executing the example configuration shown above:

```plaintext
Router# show crypto pki crls
CRL Issuer Name:
    cn=name Cert Manager,ou=pki,o=company.com,c=US
LastUpdate: 18:57:42 GMT Nov 26 2005
NextUpdate: 22:57:42 GMT Nov 26 2005
Retrieved from CRL Distribution Point:
    ldap://ldap.company.com/CN=name Cert Manager,O=company.com
```

When the current CRL expires, a new CRL is then downloaded to the router at the next update. The **crl-cache none** command takes effect and all CRLs for the trustpoint are no longer cached; caching is disabled. You can verify that no CRL is cached by executing the `show crypto pki crls` command. No output will be shown because there are no CRLs cached.

The following example shows how to configure the maximum lifetime of 2 minutes for all CRLs associated with the CA1 trustpoint:

```plaintext
crypto pki trustpoint CA1
   enrollment url http://CA1:80
   ip-address FastEthernet0/0
   crl query ldap://ldap_CA1
   revocation-check crl
   crl-cache delete-after 2
```

The current CRL is still cached immediately after executing the example configuration above for setting the maximum lifetime of a CRL:

```plaintext
Router# show crypto pki crls
CRL Issuer Name:
    cn=name Cert Manager,ou=pki,o=company.com,c=US
```
Configuring Certificate Serial Number Session Control

The following example shows the configuration of certificate serial number session control using a certificate map for the CA1 trustpoint:

```
crypto pki trustpoint CA1
enrollment url http://CA1
chain-validation stop
crl query ldap://ldap_server
revocation-check crl
match certificate crl
!
crypto pki certificate map crl 10
  serial-number co 279d
```

Note: If the `match-criteria` value is set to `eq` (equal) instead of `co` (contains), the serial number must match the certificate map serial number **exactly**, including any spaces.

The following example shows the configuration of certificate serial number session control using AAA attributes. In this case, all valid certificates will be accepted if the certificate does not have the serial number “4ACA.”

```
crypto pki trustpoint CA1
enrollment url http://CA1
ip-address FastEthernet0/0
crl query ldap://ldap_CA1
revocation-check crl
aaa new-model
!
aaa attribute list crl
attribute-type aaa-cert-serial-not 4ACA
```

The server log shows that the certificate with the serial number “4ACA” was rejected. The certificate rejection is shown in bold.

```
```
```

Dec 3 04:24:39.175: CRYPTO_PKI_AAA: cert-serial doesn't match ('4ACA' != "4ACA")
Dec 3 04:24:39.175: CRYPTO_PKI_AAA: post-authorization chain validation status (0x7)
Dec 3 04:24:39.175: CRYPTO_PKI: chain cert was anchored to trustpoint CA1, and chain validation result was: CRYPTO_PKI_CERT_NOT_AUTHORIZED
Dec 3 04:24:39.175: %CRYPTO-5-IKMP_INVAL_CERT: Certificate received from 192.0.2.43 is bad: certificate invalid
Dec 3 04:24:39.175: %CRYPTO-6-IKMP_MODE_FAILURE: Processing of Main mode failed with peer at 192.0.2.43

Configuring Certificate Chain Validation: Examples

This section contains the following configuration examples that can be used to specify the level of certificate chain processing for your device certificates:

- Configuring Certificate Chain Validation from Peer to Root CA, page 38
- Configuring Certificate Chain Validation from Peer to Subordinate CA, page 39
- Configuring Certificate Chain Validation Through a Gap, page 39

Configuring Certificate Chain Validation from Peer to Root CA

In the following configuration example, all of the certificates will be validated—the peer, SubCA11, SubCA1, and RootCA certificates.

```
crypto pki trustpoint RootCA
  enrollment terminal
  chain-validation stop
  revocation-check none
  rsakeypair RootCA

crypto pki trustpoint SubCA1
  enrollment terminal
  chain-validation continue RootCA
  revocation-check none
```
rsakeypair SubCA1

crypto pki trustpoint SubCA11
enrollment terminal
chain-validation continue SubCA1
revocation-check none
rsakeypair SubCA11

Configuring Certificate Chain Validation from Peer to Subordinate CA

In the following configuration example, the following certificates will be validated—the peer and SubCA1 certificates.

crypto pki trustpoint RootCA
enrollment terminal
chain-validation stop
revocation-check none
rsakeypair RootCA

crypto pki trustpoint SubCA1
enrollment terminal
chain-validation continue RootCA
revocation-check none
rsakeypair SubCA1

crypto pki trustpoint SubCA11
enrollment terminal
chain-validation continue SubCA1
revocation-check none
rsakeypair SubCA11

Configuring Certificate Chain Validation Through a Gap

In the following configuration example, SubCA1 is not in the configured Cisco IOS hierarchy but is expected to have been supplied in the certificate chain presented by the peer.

If the peer supplies the SubCA1 certificate in the presented certificate chain, the following certificates will be validated—the peer, SubCA11, and SubCA1 certificates.

If the peer does not supply the SubCA1 certificate in the presented certificate chain, the chain validation will fail.

crypto pki trustpoint RootCA
enrollment terminal
chain-validation stop
revocation-check none
rsakeypair RootCA

crypto pki trustpoint SubCA11
enrollment terminal
chain-validation continue RootCA
revocation-check none
rsakeypair SubCA11

Feature Information for Certificate Authorization and Revocation

Table 2 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For details on when support for a specific command was introduced, see the command reference documentation. For information on a feature in this technology that is not documented here, see the Implementing and Managing PKI Features Roadmap.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Note
### Table 2 Feature Information for PKI Certificate Authorization and Revocation

</table>
| Cache Control Enhancements for Certification Revocation Lists | 12.4(9)T | This feature provides users the ability to disable CRL caching or to specify the maximum lifetime for which a CRL will be cached in router memory. It also provides functionality to configure certificate serial number session control. The following sections provide information about this feature:  
- What Is a CRL?  
- Configuring Certificate Authorization and Revocation Settings  
- Configuring Certificate Authorization and Revocation Settings: Examples  
The following commands were introduced or modified by this feature: `crl-cache delete-after, crl-cache none, crypto pki certificate map` |
| Certificate-Complete Chain Validation | 12.4(6)T | This feature provides users the ability to configure the level to which a certificate chain is processed on all certificates including subordinate CA certificates. The following sections provide information about this feature:  
- PKI Certificate Chain Validation  
- Configuring Certificate Chain Validation  
- Configuring Certificate Chain Validation: Examples  
The following command was introduced by this feature: `chain-validation` |
| OCSP - Server Certification from Alternate Hierarchy | 12.4(6)T | This feature provides users with the flexibility to specify multiple OCSP servers, either per client certificate or per group of client certificates, and provides the capability for OCSP server validation based on external CA certificates or self-signed certificates. The following sections provide information about this feature:  
- What Is OCSP?  
- Configuring Certificate Authorization and Revocation Settings  
The following command was introduced by this feature: `match certificate override ocsp` |
### Table 2  Feature Information for PKI Certificate Authorization and Revocation (continued)

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Software Releases</th>
<th>Feature Configuration Information</th>
</tr>
</thead>
</table>
| Optional OCSP Nonce                               | 12.2(33)SR, 12.4(4)T | This feature provides users with the ability to configure the sending of a nonce, or unique identifier for an OCSP request, during OCSP communications. The following sections provide information about this feature:  
  - What Is OCSP?  
  - Configuring a Revocation Mechanism for PKI Certificate Status Checking  
  - Disabling Nonces in Communications with the OCSP Server: Example |
| Certificate Security Attribute-Based Access Control | 12.2(15)T         | Under the IPsec protocol, CA interoperability permits Cisco IOS devices and a CA to communicate so that the Cisco IOS device can obtain and use digital certificates from the CA. Certificates contain several fields that are used to determine whether a device or user is authorized to perform a specified action. This feature adds fields to the certificate that allow specifying an ACL, creating a certificate-based ACL. The following sections provide information about this feature:  
  - When to Use Certificate-Based ACLs for Authorization or Revocation  
  - Configuring Certificate Authorization and Revocation Settings  
  The following commands were introduced or modified by this feature: `crypto pki certificate map`, `crypto pki trustpoint`, `match certificate` |
| Online Certificate Status Protocol (OCSP)          | 12.3(2)T          | This feature allows users to enable OCSP instead of CRLs to check certificate status. Unlike CRLs, which provide only periodic certificate status, OCSP can provide timely information regarding the status of a certificate. The following sections provide information about this feature:  
  - CRLs or OCSP Server: Choosing a Certificate Revocation Mechanism  
  - Configuring a Revocation Mechanism for PKI Certificate Status Checking  
  The following commands were introduced by this feature: `ocsp url`, `revocation-check` |
### Table 2  Feature Information for PKI Certificate Authorization and Revocation (continued)

<table>
<thead>
<tr>

</tr>
</thead>
</table>
| PKI AAA Authorization Using the Entire Subject Name | 12.3(11)T         | This feature provides users with the ability to query the AAA server using the entire subject name from the certificate as a unique AAA username. The following sections provide information about this feature:  
  - Attribute-Value Pairs for PKI and AAA Server Integration  
  - Configuring PKI Integration with a AAA Server  
    The following command was modified by this feature: authorization username |
| PKI Integration with AAA Server                    | 12.3(1)           | This feature provides additional scalability for authorization by generating a AAA username from the certificate presented by the peer. A AAA server is queried to determine whether the certificate is authorized for use by the internal component. The authorization is indicated by a component-specified label that must be present in the AV pair for the user.  
    The following sections provide information about this feature:  
    - PKI and AAA Server Integration for Certificate Status  
    - Configuring PKI Integration with a AAA Server  
    The following commands were introduced by this feature: authorization list, authorization username |
| PKI: Query Multiple Servers During Certificate Revocation Check | 12.3(7)T         | This feature introduces the ability for Cisco IOS software to make multiple attempts to retrieve the CRL, allowing operations to continue when a particular server is not available. In addition, the ability to override the CDPs in a certificate with a manually configured CDP has been introduced. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate's CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP.  
    The following sections provide information about this feature:  
    - Querying All CDPs During Revocation Check  
    - Manually Overriding CDPs in a Certificate  
    The following command was introduced by this feature: match certificate override cdp |
### Feature Information for PKI Certificate Authorization and Revocation (continued)

<table>
<thead>

</table>
| PKI: Query Multiple Servers During Certificate Revocation    | 12.3(7)T          | This feature introduces the ability for Cisco IOS software to make multiple attempts to retrieve the CRL, allowing operations to continue when a particular server is not available. In addition, the ability to override the CDPs in a certificate with a manually configured CDP has been introduced. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate’s CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP. The following sections provide information about this feature:  
  - Querying All CDPs During Revocation Check
  - Manually Overriding CDPs in a Certificate

  The following command was introduced by this feature:  
  ```
  match certificate override cdp
  ```

| Using Certificate ACLs to Ignore Revocation Check and Expired Certificates | 12.3(4)T          | This feature allows a certificate that meets specified criteria to be accepted regardless of the validity period of the certificate, or if the certificate meets the specified criteria, revocation checking does not have to be performed. Certificate ACLs are used to specify the criteria that the certificate must meet to be accepted or to avoid revocation checking. In addition, if AAA communication is protected by a certificate, this feature provides for the AAA checking of the certificate to be ignored. The following sections provide information about this feature:  
  - Ignore Revocation Checks Using a Certificate-Based ACL
  - Configuring Certificate-Based ACLs to Ignore Revocation Checks

  The following command was introduced by this feature:  
  ```
  match certificate
  ```

Configuring Certificate Enrollment for a PKI

First Published: May 2, 2005
Last Updated: August 21, 2007

Certificate enrollment, which is the process of obtaining a certificate from a certification authority (CA), occurs between the end host that requests the certificate and the CA. Each peer that participates in the public key infrastructure (PKI) must enroll with a CA. This module describes the different methods available for certificate enrollment and how to set up each method for a participating PKI peer.

Finding Feature Information in This Module

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for PKI Certificate Enrollment” section on page 33.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Contents

- Prerequisites for PKI Certificate Enrollment, page 2
- Information About Certificate Enrollment for a PKI, page 2
- How to Configure Certificate Enrollment for a PKI, page 6
- Configuration Examples for PKI Certificate Enrollment Requests, page 24
- Additional References, page 31
- Feature Information for PKI Certificate Enrollment, page 33
Prerequisites for PKI Certificate Enrollment

Before configuring peers for certificate enrollment, you should have the following items:

- A generated Rivest, Shamir, and Adelman (RSA) key pair to enroll and a PKI in which to enroll.
- Your CA should be authenticated.
- Familiarity with the module “Cisco IOS PKI Overview: Understanding and Planning a PKI.”

Note

As of Cisco IOS Release 12.3(7)T, all commands that begin with “crypto ca” have been changed to begin with “crypto pki.” Although the router will still accept crypto ca commands, all output will be read back as crypto pki.

Information About Certificate Enrollment for a PKI

Before configuring peers to request a certificate and enroll in the PKI, you should understand the following concepts:

- What Are CAs?, page 2
- Authentication of the CA, page 3
- Supported Certificate Enrollment Methods, page 3
- Registration Authorities (RA), page 4
- Automatic Certificate Enrollment, page 4
- Certificate Enrollment Profiles, page 5

What Are CAs?

A CA manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use the Cisco IOS certificate server or a CA provided by a third-party CA vendor.

Hierarchical PKI: Multiple CAs

A PKI can be set up in a hierarchical framework to support multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. The subordinate CAs within the hierarchy can be enrolled with either the root CA or with another subordinate CA. Multiple tiers of CAs are configured by either the root CA or with another subordinate CA. Within a hierarchical PKI, all enrolled peers, can validate the certificate of one another if the peers share a trusted root CA certificate or a common subordinate CA.
When to Use Multiple CAs

Multiple CAs provide users with added flexibility and reliability. For example, subordinate CAs can be placed in branch offices while the root CA is at the office headquarters. Also, different granting policies can be implemented per CA, so you can set up one CA to automatically grant certificate requests while another CA within the hierarchy requires each certificate request to be manually granted.

Scenarios in which at least a two-tier CA is recommended are as follows:

- Large and very active networks in which a large number of certificates are revoked and reissued. A multiple tier CA helps to control the size of the certificate revocation lists (CRLs).
- When online enrollment protocols are used, the root CA can be kept offline except to issue subordinate CA certificates. This scenario provides added security for the root CA.

Authentication of the CA

The certificate of the CA must be authenticated before the device will be issued its own certificate and before certificate enrollment can occur. Authentication of the CA typically occurs only when you initially configure PKI support at your router. To authenticate the CA, issue the `crypto pki authenticate` command, which authenticates the CA to your router by obtaining the self-signed certificate of the CA that contains the public key of the CA.

Authentication via the fingerprint Command

After Cisco IOS Release 12.3(12), you can issue the `fingerprint` command to preenter a fingerprint that can be matched against the fingerprint of a CA certificate during authentication.

If a fingerprint is not preentered for a trustpoint, and if the authentication request is interactive, you must verify the fingerprint that is displayed during authentication of the CA certificate. If the authentication request is noninteractive, the certificate will be rejected without a preentered fingerprint.

**Note**

If the authentication request is made using the command-line interface (CLI), the request is an interactive request. If the authentication request is made using HTTP or another management tool, the request is a noninteractive request.

Supported Certificate Enrollment Methods

Cisco IOS software supports the following methods to obtain a certificate from a CA:

- Simple Certificate Enrollment Protocol (SCEP)—A Cisco developed enrollment protocol that uses HTTP to communicate with the CA or registration authority (RA). SCEP is the most commonly used method for sending and receiving requests and certificates.

**Note**

To take advantage of automated certificate and key rollover functionality, you must be running a CA that supports rollover and SCEP must be used as your client enrollment method.

If you are running a Cisco IOS CA, you must be running Cisco IOS Release 12.4(2)T or a later release for rollover support.
• PKCS12—The router imports certificates in PKCS12 format from an external server.
• IOS File System (IFS)—The router uses any file system that is supported by Cisco IOS software (such as TFTP, FTP, flash, and NVRAM) to send a certificate request and to receive the issued certificate. Users may enable IFS certificate enrollment when their CA does not support SCEP.

**Note** Prior to Cisco IOS Release 12.3(4)T, only the TFTP file system is supported within IFS.

• Manual cut-and-paste—The router displays the certificate request on the console terminal, allowing the user to enter the issued certificate on the console terminal. A user may manually cut-and-paste certificate requests and certificates when there is no network connection between the router and CA.
• Enrollment profiles—The router sends HTTP-based enrollment requests directly to the CA server instead of to the RA-mode CS. Enrollment profiles can be used if a CA server does not support SCEP.
• Self-signed certificate enrollment for a trustpoint—The secure HTTP (HTTPS) server generates a self-signed certificate that is to be used during the secure socket layer (SSL) handshake, establishing a secure connection between the HTTPS server and the client. The self-signed certificate is then saved in the router’s startup configuration (NVRAM). The saved, self-signed certificate can then be used for future SSL handshakes, eliminating the user intervention that was necessary to accept the certificate every time the router reloaded.

**Note** To take advantage of autoenrollment and auto reenrollment, do not use either TFTP or manual cut-and-paste enrollment as your enrollment method. Both TFTP and manual cut-and-paste enrollment methods are manual enrollment processes, requiring user input.

**Registration Authorities (RA)**

A Cisco IOS certificate server can be configured to run in RA mode. An RA offloads authentication and authorization responsibilities from a CA. When the RA receives a SCEP or manual enrollment request, the administrator can either reject or grant it on the basis of local policy. If the request is granted, it will be forwarded to the issuing CA, and the CA can be configured to automatically generate the certificate and return it to the RA. The client can later retrieve the granted certificate from the RA.

**Automatic Certificate Enrollment**

Certificate autoenrollment allows the CA client to automatically request a certificate from its CA sever. This automatic router request eliminates the need for operator intervention when the enrollment request is sent to the CA server. Automatic enrollment is performed on startup for any trustpoint CA that is configured and that does not have a valid client certificate. When the certificate expires, a new certificate is automatically requested.

**Note** When automatic enrollment is configured, clients automatically request client certificates. The CA server performs its own authorization checks; if these checks include a policy to automatically issue certificates, all clients will automatically receive certificates, which is not very secure. Thus, automatic certificate enrollment should be combined with additional authentication and authorization mechanisms (such as Secure Device Provisioning (SDP), leveraging existing certificates, and one-time passwords).
Automated Client Certificate and Key Rollover

By default, the automatic certificate enrollment function requests a new client certificate and keys from the CS before the client’s current certificate expires. Certificate and key rollover allows the certificate renewal rollover request to be made before the certificate expires by retaining the current key and certificate until the new, or rollover, certificate is available. After a specified amount of time, the rollover certificate and keys will become the active certificate and keys. The expired certificate and keys are immediately deleted upon rollover and removed from the certificate chain and CRL.

The setup for automatic rollover is twofold: CA clients must be automatically enrolled and the client’s CAs must be automatically enrolled and have the auto-rollover command enabled. For more information on configuring your CA servers for automatic certificate rollover see the section “Automatic CA Certificate and Key Rollover” in the chapter “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment.”

An optional renewal percentage parameter can be used with the auto-enroll command to allow a new certificate to be requested when a specified percentage of the lifetime of the certificate has passed. For example, if the renewal percentage is configured as 90 and the certificate has a lifetime of one year, a new certificate is requested 36.5 days before the old certificate expires. In order for automatic rollover to occur, the renewal percentage must be less than 100.

Tip

If CA autoenrollment is not enabled, you may manually initiate rollover on an existing client with the crypto pki enroll command if the expiration time of the current client certificate is equal to or greater than the expiration time of the corresponding CA certificate.

The client will initiate the rollover process, which only occurs if the server is configured for automated rollover and has an available rollover server certificate.

Note

A key pair is also sent if configured by the auto-enroll re-generate command and keyword. It is recommended that a new key pair be issued for security reasons.

Certificate Enrollment Profiles

Enrollment profiles allow users to specify certificate authentication, enrollment, and reenrollment parameters when prompted. The values for these parameters are referenced by two templates that make up the profile. One template contains parameters for the HTTP request that is sent to the CA server to obtain the certificate of the CA (also known as certificate authentication); the other template contains parameters for the HTTP request that is sent to the CA for certificate enrollment.

Configuring two templates enables users to specify different URLs or methods for certificate authentication and enrollment; for example, authentication (getting the certificate of the CA) can be performed via TFTP (using the authentication url command) while enrollment can be performed manually (using the enrollment terminal command).

Prior to Cisco IOS Release 12.3(11)T, certificate requests could be sent only in a PKCS10 format; however, an additional parameter has now been added to the profile, allowing users to specify the PKCS7 format for certificate renewal requests.

Note

A single enrollment profile can have up to three separate sections for each task—certificate authentication, enrollment, and reenrollment.
How to Configure Certificate Enrollment for a PKI

This section contains the following enrollment option procedures. If you configure enrollment or autoenrollment (the first task), you cannot configure manual certificate enrollment. Also, if you configure TFTP or manual cut-and-paste certificate enrollment, you cannot configure autoenrollment, auto reenrollment, an enrollment profile, nor can you utilize the automated CA certificate rollover capability.

- Configuring Certificate Enrollment or Autoenrollment, page 6
- Configuring Manual Certificate Enrollment, page 11
- Configuring a Persistent Self-Signed Certificate for Enrollment via SSL, page 16
- Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment, page 20

Configuring Certificate Enrollment or Autoenrollment

Perform this task to configure certificate enrollment for clients participating in your PKI.

Prerequisites for Autoenrollment

Before configuring automatic certificate enrollment requests, you should ensure that all necessary enrollment information is configured.

Prerequisites for Enabling Automated Client Certificate and Key Rollover

CA client support for certificate rollover is automatically enabled when using autoenrollment. For automatic CA certificate rollover to run successfully, the following prerequisites are applicable:

- Your network devices must support shadow PKI.
- Your clients must be running Cisco IOS Release 12.4(2)T or a later release.
- The client’s CS must support automatic rollover. See the section “Automatic CA Certificate and Key Rollover” in the chapter “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment” for more information on CA server automatic rollover configuration.

Prerequisites for Specifying Autoenrollment Initial Key Generation Location

To specify the location of the autoenrollment initial key generation, you must be running Cisco IOS Release 12.4(11)T or a later release.

Restrictions for Autoenrollment

RSA Key Pair Restriction for Autoenrollment

Trustpoints configured to generate a new key pair using the regenerate command or the regenerate keyword of the auto-enroll command must not share key pairs with other trustpoints. To give each trustpoint its own key pair, use the rsakeypair command in ca-trustpoint configuration mode. Sharing key pairs among regenerating trustpoints is not supported and will cause loss of service on some of the trustpoints because of key and certificate mismatches.

Restrictions for Automated Client Certificate and Key Rollover

In order for clients to run automatic CA certificate rollover successfully, the following restrictions are applicable:
SCEP must be used to support rollover. Any device that enrolls with the PKI using an alternative to SCEP as the certificate management protocol or mechanism (such as enrollment profiles, manual enrollment, or TFTP enrollment) will not be able to take advantage of the rollover functionality provided by SCEP.

If the configuration cannot be saved to the startup configuration after a shadow certificate is generated, rollover will not occur.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. enrollment [mode] [retry period minutes] [retry count number] url url [pem]
5. subject-name [x.500-name]
6. ip address {ip address | interface | none}
7. serial-number [none]
8. auto-enroll [percent] [regenerate]
9. usage method1 [method2 [method3]]
10. password string
11. rsakeypair key-label [key-size [encryption-key-size]]
12. fingerprint ca-fingerprint
13. on devicename:
14. exit
15. crypto pki authenticate name
16. exit
17. copy system:running-config nvram:startup-config
18. show crypto pki certificates
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:** | Router> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | Router# configure terminal |
| **Step 3** crypto pki trustpoint name | Declares the trustpoint and a given name and enters ca-trustpoint configuration mode. |
| **Example:** | Router(config)# crypto pki trustpoint mytp |
| **Step 4** enrollment [mode] [retry period minutes] [retry count number] url url [pem] | Specifies the URL of the CA on which your router should send certificate requests.  
- **mode**—Specifies RA mode if your CA system provides an RA.  
- **retry period minutes**—Specifies the wait period between certificate request retries. The default is 1 minute between retries.  
- **retry count number**—Specifies the number of times a router will resend a certificate request when it does not receive a response from the previous request. (Specify from 1 to 100 retries.)  
- **url url**—URL of the file system where your router should send certificate requests. For enrollment method options, see the enrollment command in the Cisco IOS Security Command Reference.  
- **pem**—Adds privacy-enhanced mail (PEM) boundaries to the certificate request.  
**Note** An enrollment method other than TFTP or manual cut-and-paste must be configured to support autoenrollment. |
| **Example:** | Router(ca-trustpoint)# enrollment url http://cat.example.com |
| **Step 5** subject-name [x.500-name] | (Optional) Specifies the requested subject name that will be used in the certificate request.  
- **x.500-name**—If it is not specified, the fully qualified domain name (FQDN), which is the default subject name, will be used. |
| **Example:** | Router(ca-trustpoint)# subject-name cat |
| **Step 6** ip address (ip address | interface | none) | (Optional) Includes the IP address of the specified interface in the certificate request.  
Issue the none keyword if no IP address should be included.  
**Note** If this command is enabled, you will not be prompted for an IP address during enrollment for this trustpoint. |
| **Example:** | Router(ca-trustpoint)# ip address 192.168.1.66 |
### Configuring Certificate Enrollment for a PKI

#### How to Configure Certificate Enrollment for a PKI

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 7    | `serial-number [none]` | (Optional) Specifies the router serial number in the certificate request, unless the `none` keyword is issued.  
**Example:**  
Router(ca-trustpoint)# serial-number |
| 8    | `auto-enroll [percent] [regenerate]` | (Optional) Enables autoenrollment, allowing the client to automatically request a rollover certificate from the CA. If autoenrollment is not enabled, the client must be manually reenrolled in your PKI upon certificate expiration.  
- By default, only the Domain Name System (DNS) name of the router is included in the certificate.  
- Use the `percent` argument to specify that a new certificate will be requested after the percentage of the lifetime of the current certificate is reached.  
- Use the `regenerate` keyword to generate a new key for the certificate even if a named key already exists.  
**Note** If the key pair being rolled over is exportable, the new key pair will also be exportable. The following comment will appear in the trustpoint configuration to indicate whether the key pair is exportable: “! RSA key pair associated with trustpoint is exportable.”  
**Note** It is recommended that a new key pair be generated for security reasons.  
**Example:**  
Router(ca-trustpoint)# auto-enroll regenerate |
| 9    | `usage method1 [method2 [method3]]` | (Optional) Specifies the intended use for the certificate.  
Available options are `ike`, `ssl-client`, and `ssl-server`; the default is `ike`.  
**Example:**  
Router(ca-trustpoint)# usage ssl-client |
| 10   | `password string` | (Optional) Specifies the revocation password for the certificate. If this command is enabled, you will not be prompted for a password during enrollment for this trustpoint.  
**Note** When SCEP is used, this password can be used to authorize the certificate request—often via a one-time password or similar mechanism.  
**Example:**  
Router(ca-trustpoint)# password meow |
| 11   | `rsakeypair key-label [key-size [encryption-key-size]]` | (Optional) Specifies which key pair to associate with the certificate.  
- A key pair with `key-label` will be generated during enrollment if it does not already exist or if the `auto-enroll regenerate` command was issued.  
- Specify the `key-size` argument for generating the key, and specify the `encryption-key-size` argument to request separate encryption, signature keys, and certificates.  
**Note** If this command is not enabled, the FQDN key pair is used.  
**Example:**  
Router(ca-trustpoint)# rsakeypair cat |
### How to Configure Certificate Enrollment for a PKI

#### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>fingerprint ca-fingerprint</td>
<td>(Optional) Specifies a fingerprint that can be matched against the fingerprint of a CA certificate during authentication. <strong>Note</strong> If the fingerprint is not provided and authentication of the CA certificate is interactive, the fingerprint will be displayed for verification.</td>
</tr>
<tr>
<td>13</td>
<td>on devicename:</td>
<td>(Optional) Specifies that RSA keys will be created on the specified device upon autoenrollment initial key generation. Devices that may be specified include NVRAM, local disks, and USB tokens. USB tokens may be used as cryptographic devices in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication to be performed on the token.</td>
</tr>
<tr>
<td>14</td>
<td>exit</td>
<td>Exits ca-trustpoint configuration mode and returns to global configuration mode.</td>
</tr>
<tr>
<td>15</td>
<td>crypto pki authenticate name</td>
<td>Retrieves the CA certificate and authenticates it. <strong>Note</strong> This command is optional if the CA certificate is already loaded into the configuration.</td>
</tr>
<tr>
<td>16</td>
<td>exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>17</td>
<td>copy system:running-config nvram:startup-config</td>
<td>(Optional) Copies the running configuration to the NVRAM startup configuration. <strong>Note</strong> Autoenrollment will not update NVRAM if the running configuration has been modified but not written to NVRAM.</td>
</tr>
<tr>
<td>18</td>
<td>show crypto pki certificates</td>
<td>(Optional) Displays information about your certificates, including any rollover certificates.</td>
</tr>
</tbody>
</table>

#### Examples

The following example shows the configuration for the “mytp-A” certificate server and its associated trustpoint, where RSA keys generated by the initial autoenrollment for the trustpoint will be stored on a USB token, “usbtoken0”:

```
crypto pki server mytp-A
database level complete
issuer-name CN=company, L=city, C=country
grant auto
! Specifies that certificate requests will be granted automatically.
```

Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E

Router(ca-trustpoint)# on usbtoken0:

Router(config)# crypto pki authenticate mytp

Router(config)# exit

Router# show crypto pki certificates
Configuring Certificate Enrollment for a PKI

How to Configure Certificate Enrollment for a PKI

crypto pki trustpoint mytp-A
  revocation-check none
  rsa keypair myTP-A
  storage usbtoken0:
    ! Specifies that keys will be stored on usbtoken0:
      on usbtoken0:
    ! Specifies that keys generated on initial auto enroll will be generated on and stored on
      ! usbtoken0:

Configuring Manual Certificate Enrollment

Manual certificate enrollment can be set up via TFTP or the manual cut-and-paste method. Both options can be used if your CA does not support SCEP or if a network connection between the router and CA is not possible. Perform one of the following tasks to set up manual certificate enrollment:

- Configuring Cut-and-Paste Certificate Enrollment, page 11
- Configuring TFTP Certificate Enrollment, page 13

PEM-Formatted Files for Certificate Enrollment Request

Using PEM-formatted files for certificate requests can be helpful for customers who are using terminal or profile-based enrollment to request certificates from their CA server. Customers using PEM-formatted files can directly use existing certificates on their Cisco IOS routers.

Restrictions for Manual Certificate Enrollment

Switching Enrollment URLs When Using SCEP

We do not recommend switching URLs if SCEP is used; that is, if the enrollment URL is “http://myca,” do not change the enrollment URL after getting the CA certificate and before enrolling the certificate. A user can switch between TFTP and manual cut-and-paste.

Key Regeneration Restriction

Do not regenerate the keys manually using the `crypto key generate` command; key regeneration will occur when the `crypto pki enroll` command is issued if the `regenerate` keyword is specified.

Configuring Cut-and-Paste Certificate Enrollment

Perform this task to configure manual certificate enrollment via the cut-and-paste method for peers participating in your PKI.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. enrollment terminal [pem]
5. fingerprint ca-fingerprint
How to Configure Certificate Enrollment for a PKI

6. `exit`
7. `crypto pki authenticate name`
8. `crypto pki enroll name`
9. `crypto pki import name certificate`
10. `exit`
11. `show crypto pki certificates`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>

<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto pki trustpoint name</td>
<td>Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto pki trustpoint mytp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> enrollment terminal [pem]</td>
<td>Specifies manual cut-and-paste certificate enrollment method. The certificate request will be displayed on the console terminal so that you may manually copied (or cut).</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(ca-trustpoint)# enrollment terminal</td>
<td>• pem—Configures the trustpoint to generate PEM-formatted certificate requests to the console terminal.</td>
</tr>
<tr>
<td><strong>Step 5</strong> fingerprint ca-fingerprint</td>
<td>(Optional) Specifies a fingerprint that can be matched against the fingerprint of a CA certificate during authentication.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E</td>
<td><strong>Note</strong> If the fingerprint is not provided, it will be displayed for verification.</td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits ca-trustpoint configuration mode and returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> crypto pki authenticate name</td>
<td>Retrieves the CA certificate and authenticates it.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto pki authenticate mytp</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring TFTP Certificate Enrollment

Perform this task to configure manual certificate enrollment using a TFTP server.

#### Prerequisites for TFTP Certificate Enrollment

- You must know the correct URL to use if you are configuring certificate enrollment via TFTP.
- The router must be able to write a file to the TFTP server for the `crypto pki enroll` command.
- If using a file specification with the `enrollment` command, the file must contain the CA certificate either in binary format or be base-64 encoded.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto pki enroll <code>name</code></td>
<td>Generates certificate request and displays the request for copying and pasting into the certificate server. You are prompted for enrollment information, such as whether to include the router FQDN and IP address in the certificate request. You are also given the choice about displaying the certificate request to the console terminal. The base-64 encoded certificate with or without PEM headers as requested is displayed.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# crypto pki enroll mytp</td>
<td></td>
</tr>
<tr>
<td>crypto pki import <code>name</code> <code>certificate</code></td>
<td>Imports a certificate manually at the console terminal (pasting). The base-64 encoded certificate is accepted from the console terminal and inserted into the internal certificate database. <strong>Note</strong> You must enter this command twice if usage keys, a signature key and an encryption key, are used. The first time the command is entered, one of the certificates is pasted into the router. The second time the command is entered, the other certificate is pasted into the router. It does not matter which certificate is pasted first. <strong>Note</strong> Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If this applies to the certificate authority you are using, import the general purpose certificate. The router will not use one of the two key pairs generated.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# crypto pki import mytp certificate</td>
<td></td>
</tr>
<tr>
<td>exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# exit</td>
<td></td>
</tr>
<tr>
<td>show crypto pki certificates</td>
<td>(Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# show crypto pki certificates</td>
<td></td>
</tr>
</tbody>
</table>
You must know if your CA ignores key usage information in a certificate request and issues only a general purpose usage certificate.

**Caution**

Some TFTP servers require that the file must exist on the server before it can be written.

Most TFTP servers require that the file be “write-able” by the world. This requirement may pose a risk because any router or other device may write or overwrite the certificate request; thus, the replacement certificate request will not be used by the CA administrator, who must first check the enrollment request fingerprint before granting the certificate request.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. enrollment [mode] [retry period minutes] [retry count number] url url [pem]
5. fingerprint ca-fingerprint
6. exit
7. crypto pki authenticate name
8. crypto pki enroll name
9. crypto pki import name certificate
10. exit
11. show crypto pki certificates

Configuring Certificate Enrollment for a PKI

How to Configure Certificate Enrollment for a PKI

This section contains the following tasks:

- Configuring a Trustpoint and Specifying Self-Signed Certificate Parameters, page 17
- Enabling the HTTPS Server, page 19

Note: These tasks are optional because if you enable the HTTPS server, it generates a self-signed certificate automatically using default values.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 8**

    crypto pki enroll name

    Example:
    Router(config)# crypto pki enroll mytp

    Generates certificate request and writes the request out to the TFTP server.
    You are prompted for enrollment information, such as whether to include the router FQDN and IP address in the certificate request. You are queried about whether or not to display the certificate request to the console terminal.
    The filename to be written is appended with the extension ".req". For usage keys, a signature key and an encryption key, two requests are generated and sent. The usage key request filenames are appended with the extensions ".sign.req" and ".encr.req" respectively.

| **Step 9**

    crypto pki import name certificate

    Example:
    Router(config)# crypto pki import mytp certificate

    Imports a certificate via TFTP at the console terminal, which retrieves the granted certificate.
    The router will attempt to retrieve the granted certificate via TFTP using the same filename used to send the request, except the extension is changed from ".req" to ".crt". For usage key certificates, the extensions ".sign.crt" and ".encr.crt" are used.
    The router will parse the received files, verify the certificates, and insert the certificates into the internal certificate database on the router.
    Note: Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If your CA ignores the usage key information in the certificate request, only import the general purpose certificate. The router will not use one of the two keypairs generated.

| **Step 10**

    exit

    Example:
    Router(config)# exit

    Exits global configuration mode.

| **Step 11**

    show crypto pki certificates

    Example:
    Router# show crypto pki certificates

    (Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.

**Configuring a Persistent Self-Signed Certificate for Enrollment via SSL**

This section contains the following tasks:
Persistent Self-Signed Certificates Overview

The SSL protocol can be used to establish a secure connection between an HTTPS server and a client (web browser). During the SSL handshake, the client expects the SSL server’s certificate to be verifiable using a certificate the client already possesses.

If Cisco IOS software does not have a certificate that the HTTPS server can use, the server generates a self-signed certificate by calling a PKI application programming interface (API). When the client receives this self-signed certificate and is unable to verify it, intervention is needed. The client asks you if the certificate should be accepted and saved for future use. If you accept the certificate, the SSL handshake continues.

Future SSL handshakes between the same client and the server use the same certificate. However, if the router is reloaded, the self-signed certificate is lost. The HTTPS server must then create a new self-signed certificate. This new self-signed certificate does not match the previous certificate so you are once again asked to accept it.

Requesting acceptance of the router’s certificate each time that the router reloads may present an opportunity for an attacker to substitute an unauthorized certificate when you are being asked to accept the certificate. Persistent self-signed certificates overcome all these limitations by saving a certificate in the router’s startup configuration.

Restrictions

You can configure only one trustpoint for a persistent self-signed certificate.

Do not change the IP domain name or the hostname of the router after creating the self-signed certificate. Changing either name triggers the regeneration of the self-signed certificate and overrides the configured trustpoint. WebVPN ties the SSL trustpoint name to the WebVPN gateway configuration. If a new self-signed certificate is triggered, then the new trustpoint name does not match the WebVPN configuration, causing the WebVPN connections to fail.

Configuring a Trustpoint and Specifying Self-Signed Certificate Parameters

Perform the following task to configure a trustpoint and specify self-signed certificate parameters.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. enrollment selfsigned
5. subject-name [x.500-name]
6. rsakeypair key-label [key-size [encryption-key-size]]
7. crypto pki enroll name
8. end
9. show crypto pki certificates [trustpoint-name [verbose]]
10. show crypto pki trustpoints [status | label [status]]
## How to Configure Certificate Enrollment for a PKI

</tbody>
</table>
Enabling the HTTPS Server

Perform the following task to enable the HTTPS server.

Prerequisites

To specify parameters, you must create a trustpoint and configure it. To use default values, delete any existing self-signed trustpoints. Deleting all self-signed trustpoints causes the HTTPS server to generate a persistent self-signed certificate using default values as soon as the server is enabled.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip http secure-server
4. end
5. copy system:running-config nvram: startup-config

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
</tbody>
</table>

**Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment**

Perform this task to configure an enrollment profile for certificate enrollment or reenrollment of a router with a Cisco IOS CA that is already enrolled with a third-party vendor CA.

Enable a router that is enrolled with a third-party vendor CA to use its existing certificate to enroll with the Cisco IOS certificate server so the enrollment request is automatically granted. To enable this functionality, you must issue the `enrollment credential` command. Also, you cannot configure manual certificate enrollment.

**Prerequisites**

Before configuring a certificate enrollment profile for the client router that is already enrolled with a third party vendor CA so that the router can reenroll with a Cisco IOS certificate server, you should have already performed the following tasks at the client router:

- Defined a trustpoint that points to the third-party vendor CA.
- Authenticated and enrolled the client router with the third-party vendor CA.

**Restrictions**

- To use certificate profiles, your network must have an HTTP interface to the CA.
If an enrollment profile is specified, an enrollment URL may not be specified in the trustpoint configuration. Although both commands are supported, only one command can be used at a time in a trustpoint.

Because there is no standard for the HTTP commands used by various CAs, the user is required to enter the command that is appropriate to the CA that is being used.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. enrollment profile label
5. exit
6. crypto pki profile enrollment label
7. authentication url url
   or
   authentication terminal
8. authentication command
9. enrollment url url
   or
   enrollment terminal
10. enrollment credential label
11. enrollment command
12. parameter number {value value | prompt string}
13. exit
14. show crypto pki certificates
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto pki trustpoint name</td>
<td>Declares the trustpoint and a given name and enter ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> enrollment profile label</td>
<td>Specifies that an enrollment profile is to be used for certificate authentication and enrollment.</td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exits ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> crypto pki profile enrollment label</td>
<td>Defines an enrollment profile and enters ca-profile-enroll configuration mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong> authentication url url</td>
<td>Specifies the URL of the CA server to which to send certificate authentication requests.</td>
</tr>
</tbody>
</table>

**Example:**
- Router> enable
  - Enter your password if prompted.
- Router# configure terminal
- Router(config)# crypto pki trustpoint Entrust
- Router(ca-trustpoint)# enrollment profile E
- Router(ca-profile-enroll)# authentication url http://entrust:81
  - or
- authentication terminal
  - Router(ca-profile-enroll)# authentication terminal

**url**—URL of the CA server to which your router should send authentication requests.

If using HTTP, the URL should read “http://CA_name,” where CA_name is the host DNS name or IP address of the CA.

If using TFTP, the URL should read “tftp://certserver/file_specification.” (If the URL does not include a file specification, the FQDN of the router will be used.)

Specifies manual cut-and-paste certificate authentication.
Configuring Certificate Enrollment for a PKI

How to Configure Certificate Enrollment for a PKI

What to Do Next

If you configured the router to reenroll with a Cisco IOS CA, you should configure the Cisco IOS certificate server to accept enrollment requests only from clients already enrolled with the specified third-party vendor CA trustpoint to take advantage of this functionality. For more information, see the module “Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment.”
Configuring Certificate Enrollment for PKI Certificate Enrollment Requests

This section contains the following configuration examples:

- Configuring Autoenrollment: Example, page 24
- Configuring Certificate Autoenrollment with Key Regeneration: Example, page 25
- Configuring Cut-and-Paste Certificate Enrollment: Example, page 26
- Configuring Manual Certificate Enrollment with Key Regeneration: Example, page 29
- Creating and Verifying a Persistent Self-Signed Certificate: Example, page 29
- Configuring Direct HTTP Enrollment: Example, page 31

Configuring Autoenrollment: Example

The following example shows how to configure the router to automatically enroll with a CA on startup, enabling automatic rollover, and how to specify all necessary enrollment information in the configuration:

```
crypto pki trustpoint trustpt1

```

Note

In this example, keys are neither regenerated nor rolled over.
Configuring Certificate Autoenrollment with Key Regeneration: Example

The following example shows how to configure the router to automatically enroll with the CA named “trustme1” on startup and enable automatic rollover. The **regenerate** keyword is issued, so a new key will be generated for the certificate and reissued when the automatic rollover process is initiated. The renewal percentage is configured as 90 so if the certificate has a lifetime of one year, a new certificate is requested 36.5 days before the old certificate expires. The changes made to the running configuration are saved to the NVRAM startup configuration because autoenrollment will not update NVRAM if the running configuration has been modified but not written to NVRAM.

```plaintext
crypto pki trustpoint trustme1
   enrollment url http://trustme1.company.com/
   subject-name OU=Spiral Dept., O=tiedye.com
   ip-address ethernet0
   serial-number none
   auto-enroll 90 regenerate
   password revokeme
   rsakeypair trustme1 2048
   exit

crypto pki authenticate trustme1

copy system:running-config nvram:startup-config
```
The following example shows how to configure certificate enrollment using the manual cut-and-paste enrollment method:

Router(config)# crypto pki trustpoint TP
Router(config)# enrollment terminal
Router(config)# crypto pki authenticate TP

Enter the base 64 encoded CA certificate. End with a blank line or the word "quit" on a line by itself

```

```
Configuring Certificate Enrollment for a PKI

**Configuring Manual Certificate Enrollment with Key Regeneration: Example**

The following example shows how to regenerate new keys with a manual certificate enrollment from the CA named “trustme2”:

```
crypto pki trustpoint trustme2
  enrollment url http://trustme2.company.com/
  subject-name OU=Spiral Dept., O=tiedye.com
  ip-address ethernet0
  serial-number none
  regenerate
  password revokeme
  rsakeypair trustme2 2048s
  exit
```
```
crypto pki authenticate trustme2
```
```
crypto pki enroll trustme2
```

**Creating and Verifying a Persistent Self-Signed Certificate: Example**

The following example shows how to declare and enroll a trustpoint named “local” and generate a self-signed certificate with an IP address:

```
crypto pki trustpoint local
  enrollment selfsigned
  end
```
```
configure terminal
  Enter configuration commands, one per line.  End with CNTL/Z.
```
```
crypto pki enroll local
```
```
Nov 29 20:51:13.067: %SSH-5-ENABLED: SSH 1.99 has been enabled
Nov 29 20:51:13.267: %CRYPTO-6-AUTOGEN: Generated new 512 bit key pair
% Include the router serial number in the subject name? [yes/no]: yes
% Include an IP address in the subject name? [no]: yes
Enter Interface name or IP Address[]: ethernet 0
Generate Self Signed Router Certificate? [yes/no]: yes
Router Self Signed Certificate successfully created
```

**Note**

A router can have only one self-signed certificate. If you attempt to enroll a trustpoint configured for a self-signed certificate and one already exists, you receive a notification and are asked if you want to replace it. If so, a new self-signed certificate is generated to replace the existing one.

**Enabling the HTTPS Server: Example**

The following example shows how to enable the HTTPS server and generate a default trustpoint because one was not previously configured:

```
configure terminal
  Enter configuration commands, one per line.  End with CNTL/Z.
```
```
ip http secure-server
```
```
% Generating 1024 bit RSA keys ...[OK]
```
```
*Dec 21 19:14:19.421:%PKI-4-NOAUTOSAVE:Configuration was modified. Issue "write memory" to save new certificate
```
```
Router(config)#
```

**Note**

You need to save the configuration to NVRAM if you want to keep the self-signed certificate and have the HTTPS server enabled following router reloads.
The following message also appears:

*Dec 21 19:14:10.441:%SSH-5-ENABLED:SSH 1.99 has been enabled

**Note**

Creation of the key pair used with the self-signed certificate causes the Secure Shell (SSH) server to start. This behavior cannot be suppressed. You may want to modify your access control lists (ACLs) to permit or deny SSH access to the router.

**Verifying the Self-Signed Certificate Configuration: Example**

The following example displays information about the self-signed certificate that you just created:

```
Router# show crypto pki certificates

Router Self-Signed Certificate
Status: Available
Certificate Serial Number: 01
Certificate Usage: General Purpose
Issuer:
    cn=IOS-Self-Signed-Certificate-3326000105
Subject:
    Name: IOS-Self-Signed-Certificate-3326000105
    cn=IOS-Self-Signed-Certificate-3326000105
Validity Date:
    start date: 19:14:14 GMT Dec 21 2004
    end   date: 00:00:00 GMT Jan 1 2020
Associated Trustpoints: TP-self-signed-3326000105
```

**Note**

The number 3326000105 above is the router’s serial number and varies depending on the router’s actual serial number.

The following example displays information about the key pair corresponding to the self-signed certificate:

```
Router# show crypto key mypubkey rsa

% Key pair was generated at: 19:14:10 GMT Dec 21 2004
Key name: TP-self-signed-3326000105
Usage: General Purpose Key
Key is not exportable.
Key Data:
    30819F30 0D06092A 864886F7 0D010101 05000381 8D003081 89028181 0DB88F70
    6BC78B6D 67D6CFF3 135C1D91 8F360292 CA44A032 5AC1A8FD 095E4B65 F8C95A2B
    BFD1C2B7 E64A3804 9BBDD326 207BD456 19BAB78B D075E78E 0DD2560C B09289AE
    6DCEB880 6672FB8A 5CDAE8B2 9D4C4F71 F3BCB269 214F6293 4B8A9FBB 9486BCFC
    2B941BCA 550999A7 2EFE12A5 6B7B669A 2D88AB77 39B38E0E AA23B8C8 B7020301 0001
% Key pair was generated at: 19:14:13 GMT Dec 21 2004
Key name: TP-self-signed-3326000105.server
Usage: Encryption Key
Key is not exportable.
Key Data:
    307C300D 06092A86 4886F70D 01010101 00036B00 30680261 00C5680E 89777B42
    463E5783 FE9E9A9E F446DC7B 70499AF3 EA266651 56EE29F4 5B003D93 2FC9F81D
    8A4612F3 3F9AC2F3 046ED9DD C5F27C20 1BBA6B9B 0B206E45 C3D6D337 F863D605
    34E30F0E B4921BC5 DAC9EBBA 50C54AA0 BF551BDD 88453F50 61020301 0001
```

**Note**

The second key pair with the name TP-self-signed-3326000105.server is the SSH key pair and is generated when any key pair is created on the router and SSH starts up.
The following example displays information about the trustpoint named “local”:

```
Router# show crypto pki trustpoints
```

```
Trustpoint local:
Subject Name:
  serialNumber=C63EBB9+ipaddress=10.3.0.18+hostname=test.company.com
  Serial Number: 01
  Persistent self-signed certificate trust point
```

## Configuring Direct HTTP Enrollment: Example

The following example show how to configure an enrollment profile for direct HTTP enrollment with a CA server:

```
crypto pki trustpoint Entrust
  enrollment profile E
  serial

crypto pki profile enrollment E
  authentication url http://entrust:81
  authentication command GET /certs/cacert.der
  enrollment url http://entrust:81/cda-cgi/clientcgi.exe
  enrollment command POST reference_number=$P2&authcode=$P1
    &retrievedAs=rawDER&action=getServerCert&pkcs10Request=$REQ
  parameter 1 value aaaa-bbbb-cccc
  parameter 2 value 5001
```

Feature Information for PKI Certificate Enrollment

Table 1 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “Implementing and Managing PKI Features Roadmap.”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS, Catalyst OS, and Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

| Cisco IOS USB Token PKI Enhancements—Phase 2 | 12.4(11)T | This feature enhances USB token functionality by using the USB token as a cryptographic device. USB tokens may be used for RSA operations such as key generation, signing, and authentication. The following sections in this document provide information about this feature:  
  - Configuring Certificate Enrollment or Autoenrollment  
  - Certificate Authority (CA) Key Rollover  
  This document covers the use of utilizing USB tokens for RSA operations during initial autoenrollment for a trustpoint. For other documents on this topic, see the “Related Documents” section. |
| Certificate Authority (CA) Key Rollover | 12.4(2)T | This feature introduces the ability for root CAs to roll over expiring CA certificates and keys and to have these changes propagate through the PKI network without manual intervention. The following sections provide information about this feature:  
  - Automatic Certificate Enrollment  
  - Configuring Certificate Enrollment or Autoenrollment  
  The following commands were introduced or modified by this feature: auto-rollover, crypto pki certificate chain, crypto pki export pem, crypto pki server, crypto pki server info request, show crypto pki certificates, show crypto pki server, and show crypto pki trustpoint |
| Certificate Autoenrollment | 12.2(8)T Cisco IOS XE Release 2.1 | This feature introduces certificate autoenrollment, which allows the router to automatically request a certificate from the CA that is using the parameters in the configuration. In Cisco IOS XE Release 2.1, this feature was implemented on the Cisco ASR series routers. The following sections provide information about this feature:  
  - Automatic Certificate Enrollment  
  - Configuring Certificate Enrollment or Autoenrollment  
  The following commands were introduced by this feature: auto-enroll, rsakeypair, show crypto ca timers |
### Table 1: Feature Information for PKI Certificate Enrollment (continued)

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Certificate Enrollment Enhancements               | 12.2(8)T Cisco IOS XE Release 2.1 | This feature introduces five new `crypto ca trustpoint` subcommands that provide new options for certificate requests and allow users to specify fields in the configuration instead of having to go through prompts. In Cisco IOS XE Release 2.1, this feature was implemented on the Cisco ASR series routers. The following section provides information about this feature:  
  - Configuring Certificate Enrollment or Autoenrollment The following commands were introduced by this feature: `ip-address (ca-trustpoint)`, `password (ca-trustpoint)`, `serial-number`, `subject-name`, `usage` |
| Direct HTTP Enrollment with CA Servers            | 12.3(4)T Cisco IOS XE Release 2.1 | This feature allows users to configure an enrollment profile if their CA server does not support SCEP and they do not want to use an RA-mode CS. The enrollment profile allows users to send HTTP requests directly to the CA server instead of to an RA-mode CS. In Cisco IOS XE Release 2.1, this feature was implemented on the Cisco ASR series routers. The following sections provide information about this feature:  
  - Certificate Enrollment Profiles  
  - Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment The following commands were introduced by this feature: `authentication command`, `authentication terminal`, `authentication url`, `crypto ca profile enrollment`, `enrollment command`, `enrollment profile`, `enrollment terminal`, `enrollment url`, `parameter` |
| Import of RSA Key Pair and Certificates in PEM Format | 12.3(4)T               | This feature allows customers to issue certificate requests and receive issued certificates in PEM-formatted files. The following section provides information about this feature:  
  - Configuring Manual Certificate Enrollment The following commands were modified by this feature: `enrollment`, `enrollment terminal` |
### Key Rollover for Certificate Renewal

- **Release**: 12.3(7)T
- **Platform**: Cisco IOS XE Release 2.1

This feature allows the certificate renewal request to be made before the certificate expires and retains the old key and certificate until the new certificate is available.

In Cisco IOS XE Release 2.1, this feature was implemented on the Cisco ASR series routers.

The following sections provide information about this feature:

- Automatic Certificate Enrollment
- Configuring Certificate Enrollment or Autoenrollment
- Configuring Manual Certificate Enrollment

The following commands were introduced or modified by this feature: `auto-enroll`, `regenerate`

### Manual Certificate Enrollment (TFTP Cut-and-Paste)

- **Release**: 12.2(13)T
- **Platform**: Cisco IOS XE Release 2.1

This feature allows users to generate a certificate request and accept CA certificates as well as the router’s certificates via a TFTP server or manual cut-and-paste operations.

In Cisco IOS XE Release 2.1, this feature was implemented on the Cisco ASR series routers.

The following sections provide information about this feature:

- Supported Certificate Enrollment Methods
- Configuring Manual Certificate Enrollment

The following commands were introduced or modified by this feature: `crypto ca import`, `enrollment`, `enrollment terminal`

### Multiple-Tier CA Hierarchy

- **Release**: 12.2(15)T

This enhancement enables users to set up a PKI in a hierarchical framework to support multiple CAs. Within a hierarchical PKI, all enrolled peers can validate the certificate of one another as long as the peers share a trusted root CA certificate or a common subordinate CA.

The following section provides information about this enhancement:

- Hierarchical PKI: Multiple CAs

| Persistent Self-Signed Certificates | 12.2(33)SXH, 12.2(33)SRA, 12.3(14)T, Cisco IOS XE Release 2.1 | This feature allows the HTTPS server to generate and save a self-signed certificate in the router startup configuration. Thus, future SSL handshakes between the client and the HTTPS server can use the same self-signed certificate without user intervention. In Cisco IOS XE Release 2.1, this feature was implemented on the Cisco ASR series routers. The following sections provide information about this feature:  
  - Supported Certificate Enrollment Methods  
  - Configuring a Persistent Self-Signed Certificate for Enrollment via SSL  
  The following commands were introduced or modified by this feature: `enrollment selfsigned`, `show crypto pki certificates`, `show crypto pki trustpoints`  
  
PKI Status | 12.3(11)T | This enhancement added the `status` keyword to the `show crypto pki trustpoints` command, which allows you to view the current status of the trustpoint. Prior to this enhancement, you had to issue the `show crypto pki certificates` and the `show crypto pki timers` commands for the current status. The following section provides information about this enhancement:  
  - How to Configure Certificate Enrollment for a PKI  
  
Reenroll Using Existing Certificates | 12.3(11)T, Cisco IOS XE Release 2.1 | This feature allows users to reenroll a router with a Cisco IOS CA via existing certificates from a third-party vendor CA. In Cisco IOS XE Release 2.1, this feature was implemented on the Cisco ASR series routers. The following section provides information about this enhancement:  
  - Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment  
  The following commands were introduced by this feature: `enrollment credential`, `grant auto trustpoint`  
  
Trustpoint CLI | 12.2(8)T | This feature introduces the `crypto pki trustpoint` command, which adds support for trustpoint CAs.

Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

This module describes how to use Secure Device Provisioning (SDP) in a public key infrastructure (PKI). SDP is a web-based certificate enrollment interface that can be used to easily deploy PKI between two end devices, such as a Cisco IOS client and a Cisco IOS certificate server. The end devices may or may not be directly connected to the network at the time of deployment or provisioning. SDP provides a solution for users deploying a large number of peer devices (including certificates and configurations).

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for SDP in a PKI” section on page 46.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Setting Up SDP

Setting Up SDP for Enrollment in a PKI
Before you set up SDP, your environment should meet the following requirements:

- The petitioner device and the server must have IP connectivity between each other.
- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- A Cisco IOS Release 12.3(8)T PKI-enabled image or a later image.

Setting Up SDP for Enrollment in a PKI Using USB Tokens
To leverage USB tokens to provision devices with SDP, your environment should meet the following requirements:

- Both the petitioner device and the server must have IP connectivity between each other.
- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- The introducer must have access to a petitioner device.
- The introducer must have access to the USB token and PIN, if configured.
- A Cisco IOS Release 12.4(15)T PKI-enabled image or a later image.

Note
Cisco IOS Release 12.4(15)T or a later release provides the flexibility to move credentials stored on the USB token. However, the device used to configure the USB token may run any Cisco IOS Release 12.3(14)T PKI-enabled image or a later image.

Using SDP to Configure a Device for an Internet Connection Through a Service Provider
To leverage SDP to configure a device that is not connected to the Internet, your environment should meet the following requirements:

- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- A Cisco router that supports a DHCP client and a PPPoE client and has a configured LAN or WAN interface.
- A Cisco IOS Release 12.4(20)T PKI-enabled image or a later image. If a previous Cisco IOS release is used on one of the devices, the SDP functionality will default to the earlier Cisco IOS version.

Information About Setting Up SDP for Enrollment in a PKI
Before using SDP for certificate enrollment, you should understand the following concepts:

- SDP Overview, page 3
- How SDP Works, page 4
- SDP Leveraging USB Tokens, page 10
SDP Overview

SDP (also referred to as Trusted Transitive Introduction [TTI]) is a communication protocol that provides a bidirectional introduction between two end entities, such as a new network device and a Virtual Private Network (VPN). SDP involves the following three entities (see Figure 1):

- **Introducer**—A mutually trusted device that introduces the petitioner to the registrar. The introducer can be a device user, such as a system administrator.
  - An introducer can be configured as an administrative introducer, which allows an administrator performing the introduction to supply the name for the device being introduced. The supplied device name is used as if it were the name of an introducer in the normal SDP mechanisms, preserving the existing functionality of the SDP configuration. For more information on the function of the administrative introducer, see the section “Authentication and Authorization Lists for an Administrative Introducer.”
- **Petitioner**—A client, or new device, to be introduced to the secure network.
- **Registrar**—A server that authorizes the petitioner. The registrar can be a certificate server.

As of Cisco IOS Release 12.4(20)T or a later release, the introducer can start the SDP process without establishing prior Internet connectivity on the petitioner. The use of the prep-connect phase and the connect phase provides the ability to configure a petitioner for Internet connectivity through a service provider. For more information on the prep-connect phase and the connect phase, see the section “How SDP Works.”

The registrar communicates directly with an external authentication, authorization, and accounting (AAA) server to verify petitioner credentials, permit or deny enrollment, and retrieve specific petitioner configuration information. The petitioner and registrar serve web pages to the introducer, the end user. The petitioner receives the bootstrap configuration from a remote management system via the introducer’s web browser.

SDP is implemented over a web browser with six possible phases—prep-connect (optional), connect, start (optional), welcome, introduction, and completion. Each phase is shown to the user via a web page. For more information on each phase, see the section “How SDP Works.”

- How SDP Uses an External AAA Database, page 13
- How Custom Templates Work with SDP, page 15
How SDP Works

The following sections describe how SDP deploys PKI between two devices:

- SDP Prep-Connect Phase
- SDP Connect Phase
- SDP Start Phase
- SDP Welcome Phase
- SDP Introduction Phase
- SDP Completion Phase

The SDP process starts with one of three entry pages being loaded into the web browser by the introducer: the SDP prep-connect phase received from the administrator; the start phase loaded from the registrar; or the welcome phase loaded from the petitioner.

The sample figures show how to introduce the local device (the petitioner) to the secure domain of the registrar. The “introducer” is referred to as the end user.

SDP Prep-Connect Phase

The prep-connect page is optional. Without the prep-connect page, the petitioner must have IP connectivity established.

The administrator must configure the prep-connect template and send the prep-connect page to the introducer. For more information on configuring the prep-connect template, see the section “Default Prep-Connect Template.”

The administrator must also obtain and communicate the username and password for the secure network to the introducer by a telephone call, an e-mail, a secure e-mail, a CD, or a USB token. The registrar may be configured to authenticate the introducer using an existing AAA infrastructure (for example, an existing username and password database that is part of the existing corporate domain). The SDP prep-connect phase supports a one time password mechanism as is used by common AAA infrastructures. For more information on SDP and AAA, see the section “How SDP Uses an External AAA Database.”

After receiving the prep-connect page, the introducer must load the page onto the computer where the HTTP browser will run. The introducer then loads the prep-connect page into the HTTP browser as a local file and then the prep-connect page is displayed (see Figure 2).

Figure 2 Sample SDP Prep-Connect Page
After the introducer clicks the Log onto Cisco Device button, the login dialog box is displayed (see Figure 3). The introducer enters the factory default username (cisco) and password (cisco) of the Cisco device.

*Figure 3  Sample Petitioner Login Dialog Box*

The introducer authenticates with the petitioner and then Internet connectivity is tested by attempting to access a known URL. Access to www.cisco.com (198.133.219.25) is tested by default. The administrator can modify the URL to be used for testing connectivity by modifying the default prep-connect template. For more information about modifying the default test URL and other fields that the administrator may configure for the prep-connect page, see the section “Default Prep-Connect Template.”

To mitigate the possibility that the prep-connect page could be modified to contain an IP address of an untrusted registrar or that a prep-connect page might be e-mailed from an untrusted source, use a secure method, such as secure e-mail, to send the prep-connect page.

If Internet connectivity is established either the start page or welcome page is displayed, depending on the prep-connect template setting as defined by the administrator. If Internet connectivity is not established, the connect page is displayed.

**SDP Connect Phase**

The connect page is displayed only if the prep-connect page is used and there is no IP connectivity for the petitioner at the completion of the prep-connect phase. The connect page has three IP address assignment methods to allow flexibility for your Cisco IOS platform: Dynamic Host Configuration Protocol (DHCP), Point to Point Protocol over Ethernet (PPPoE), or static IP address assignment.

Note

SDP functionality is not used with the Cisco IOS configuration to establish Internet connectivity. SDP functionality includes a signature on the Cisco IOS configuration, guaranteeing that the values have not changed in transit.

**DHCP IP Address Assignment Method**

If the introducer chooses DHCP, the default method, for the IP address assignment method option (see Figure 4), clicking the Connect button causes the petitioner to be configured for Internet connectivity.
Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

Information About Setting Up SDP for Enrollment in a PKI

**Figure 4** Sample Connect Page for DHCP IP Address Assignment Method

PPPoe IP Address Assignment Method
If the introducer chooses PPPoE, input fields for PPPoE username and password are displayed (see Figure 5). The introducer must enter the username and password as supplied by the Internet service provider (ISP) and then click the Connect button, which causes petitioner to be configured for Internet connectivity.

**Figure 5** Sample Connect Page for PPPoE IP Address Assignment Method

**Static IP Address Assignment Method**
If the introducer chooses static, input fields for the IP address, netmask, and the default gateway are displayed (see Figure 6). The introducer must enter the configuration values as supplied by the ISP and then click the Connect button, which causes petitioner to be configured for Internet connectivity.
Connect Page IP Address Configuration

After IP address configuration, Internet connectivity is tested again by attempting to access a known URL configured by the administrator in the prep-connect template (www.cisco.com by default). If Internet connectivity is now established either the start page or welcome page is displayed, depending on the prep-connect template setting as defined by the administrator. If Internet connectivity is not established, the introducer should verify the settings entered or contact their administrator.

SDP Start Phase

The start page is optional. Without the start page, during the SDP exchange, the user clicks the Next button on the welcome page and is sent to the registrar’s introduction page. Because the user has not previously connected to the registrar, the user is required to log in to the registrar using available credentials (per the registrar configuration). Some browsers fail to reconnect to the registrar after the user credentials are requested (after the user has entered the login data). As of Cisco IOS Release 12.4(4)T, users may configure their browsers to begin the SDP exchange by contacting the registrar’s introduction URL via a start page. Thereafter, the registrar can direct the user to the welcome page, which is on the petitioner device. The SDP transaction will then continue through the welcome, introduction, and completion phases as described in this document.

To begin the SDP transaction from the registrar, the user must configure the browser via the template `http start` command; otherwise, the SDP transaction must begin from the welcome page on the petitioner. For more information on how to configure a custom template, see the section “How Custom Templates Work with SDP.”

Before the welcome page is displayed, the user must direct his or her browser to the start page via the URL `http://registrar/ezsdd/intro`. A login dialog box is then displayed, and the end user can log into the registrar via a username and password supplied by the administrator to access the secure network (see Figure 7).
After entering a valid username and password, the start page is displayed (see Figure 8).

After entering the URL of the petitioner's welcome page (for example, http://10.10.10.1/ezsdd/welcome) and clicking the Next button on the start web page, the end user enters the SDP welcome phase and logs into his or her petitioner as shown in Figure 9.

**SDP Welcome Phase**

The welcome phase begins when the user clicks the Next button on the start page. Before the welcome page is displayed, the user must log into the petitioner via the URL “http://10.10.10.1/ezsdd/welcome.” The local login dialog box is then displayed (see Figure 9). The end user can then log into the local device via the factory default username (cisco) and password (cisco).
After the password is successfully entered, the welcome web page is displayed (see Figure 10), which is served by the petitioner.

**Figure 10 Sample SDP Welcome Page**

After entering the URL of the registrar (for example, http://192.0.2.155/ezsdd/intro) and clicking the Next button on the welcome web page, the SDP introduction phase begins and the introduction page, which is served by the registrar, is displayed.

**SDP Introduction Phase**

Before the introduction page is displayed, the end user must log into the registrar if the user has not already done so from the start page (see “SDP Start Phase”), which utilizes the external AAA database.

With an external AAA database, the introducer can use an account on the database to perform the introduction without requiring knowledge of the enable password of the registrar. Without an external AAA database, the introducer may use the enable password of the registrar for authentication.

---

**Note**

Using the enable password of the registrar exposes the password to end users; therefore, it is recommended that the enable password be used for administrative testing only.

The administrative introducer is identified by the HTTP authentication for the introduction page (or the start page), with the AAA database query returning administrative privilege for the user. If the introducer has administrator privilege, the device name is that which was entered in the administrative introduction page. If the introducer does not have administrative privileges, the device name is the introducer name. The existing device certificate is the current certificate on the petitioner, which may be the

manufacturing identification certificate (MIC). This certificate may or may not exist. For more information on the function of the external AAA database, see the section “How SDP Uses an External AAA Database.”

After the end user successfully enters his or her password, the introduction web page is displayed (see Figure 11).

At this point, the registrar passes device information to the external management system to obtain a bootstrap configuration file. For more information on options available to identify a customized bootstrap configuration file, see the section “Custom HTML Template Expansion Rules.”

After the end user clicks the Next button on the introduction page, the end user enters the completion phase and automatically returns to his or her local device.

**SDP Completion Phase**

Now that the end user has enrolled the petitioner with the registrar, the petitioner will serve the completion page (see Figure 12).

The SDP exchange is now complete. The petitioner has received configuration information from the registrar and should receive a certificate from the registrar shortly.

**SDP Leveraging USB Tokens**

SDP provides for highly scalable deployments and streamlines the deployment of an individual device or multiple devices. USB tokens provide for secure storage and configuration distribution.
As of Cisco IOS Release 12.4(15)T or a later release, USB tokens may be utilized to transfer PKI credentials using SDP to a remote device, and SDP may be used to configure the USB token. The USB token may then be used to provision a device at the same location, or the USB token may be transported to another location where it may be used to provision a remote device. For more information about configuring and using USB tokens, see the “Related Documents” section.

An example SDP deployment using a USB token to transfer PKI credentials is shown in Figure 13. The required devices include the USB token and the SDP entities required to provision a device. These SDP entities are the introducer, the registrar, a petitioner at the local location, Petitioner A, and a petitioner at the remote location, Petitioner B. Optionally, a management server may be used.

An optional configuration would be to configure one device as both the registrar and a petitioner, which may be beneficial when the USB token is transported to a remote location. The remote location would not require a separate petitioner device.

**Figure 13 Example SDP Environment Using USB Tokens to Transfer Credentials**

Use of SDP to Configure the USB Token

Prior to initiating an SDP introduction a USB token is inserted into the petitioner device. In the example configuration shown in Figure 13, the USB token would be inserted into Petitioner A. The petitioner may be configured to ignore any existing information on the USB token. As in regular SDP operations, for a scalable configuration of USB tokens, an initial template configuration has to be prepared and placed onto each SDP device with appropriate target configuration information.
Files used to provision a device are moved in the following sequence, shown by the numbered arrows in Figure 13.

1. One petitioner, Petitioner A, is at the local location. petitioner A engages directly with the SDP exchange to perform the initial configuration of the USB token. Files used to configure the USB token, binary files and template files, are retrieved from the registrar and moved to Petitioner A.

   The URL for the binary file location is expanded on the registrar. Binary files are not processed through the template expansion functions. The template expansion occurs on the registrar for both the source URL and destination URL.

   By default, binary files and template files will be retrieved from and stored to NVRAM on the registrar and petitioner respectively. The binary file location on the registrar and the destination binary file location on Petitioner A may be specified with the `binary file` command. The template file location on the registrar and the destination template file location on Petitioner A may be specified with the `template file` command.

2. The RSA keys and certificate chain information are moved from Petitioner A to the USB token.

3. The USB token is transported to the remote location where it is inserted into Petitioner B.

4. The configuration files on the USB token are used to provision the local device. Files from the USB token may be moved to a storage location on Petitioner B with the `crypto key move rsa` command.

SDP Phases with a USB Token

The same SDP phase concepts introduced in the “SDP Overview” section are used, with the following distinctions in the SDP welcome phase, the SDP introduction phase, and the SDP completion phase.

**SDP Welcome Phase with a USB Token**

The SDP welcome phase begins as usual, when an introduction is initiated by connecting to the welcome user interface. If there is an existing certificate on the USB token, it will be used for signing the SDP exchange. Instead of a local RSA key pair, a new RSA key pair on the token is used.

---

**Note**

The RSA key pair generation may take a substantial length of time, anywhere from 5 to 10 minutes if the key is generated on the token. The length of time is dependent on hardware key generation routines available on the USB token. An informative web page will be presented to the introducer, indicating that RSA key pair generation is occurring.

The new key pair generated by Petitioner A is added to the USB token without removing any existing RSA key pairs. SDP AV pairs indicate both that a token is being used and if there is any token secondary configuration information. If an optional management server is in use, the AV pair information is used to determine if any special configuration commands are needed.

**SDP Introduction Phase with a USB Token**

The SDP Introduction phase begins with AV pairs being transferred to the registrar. When the registrar detects USB token related AV pairs, the registrar, if previously configured, may prepare configuration information destined for the USB token. Currently configuration commands are sent as a specific configuration files that are subsequently merged with the running configuration.

The administrator can leverage normal SDP configuration commands to configure the USB token. USB token information that should be configured includes the certificate, the bootstrap configuration, and the PIN number configuration.
SDP Completion Phase with a USB Token

At the beginning of the completion phase, the introduction proceeds with AV pairs being transferred to the petitioner (in Figure 13, this would be Petitioner A). The various files are stored in the specified file system locations and then the existing configuration file processing proceeds. This ordering allows the configuration to take advantage of the new files that have been transferred.

Use of the Configured USB Token

After the USB token is configured by Petitioner A, it is transported from its current location to the remote location, where the second petitioner, Petitioner B is located. The USB token is inserted into the target device, Petitioner B, which then inherits the USB token configuration and cryptographic material from the USB token. The end user at the remote location must have the PIN number on the USB token. The PIN number is either the default factory PIN or the PIN number the administrator configured during the introduction phase.

How SDP Uses an External AAA Database

The external AAA database is accessed twice during the SDP exchange. The first time the AAA database is accessed the introducer is authenticated; that is, when the registrar receives an introduction request via the secure HTTP (HTTPS) server, the registrar does an AAA lookup based on the introducer’s username and password to authorize the request. The second time the AAA database is accessed authorization information is obtained and applied to the configuration and certificates that are issued to the petitioner device; that is, the registrar checks the integrity of the request by verifying the request signature using the petitioner-signing certificate. The certificate subject name may be specified in the AAA database, and up to nine configuration template variables may be specified and expanded into the template configuration.

Use of a Self-Signed Certificate Versus a Certificate Issued by Another CA Server

By default, the SDP exchange results in only one certificate being issued to the petitioner device. Although just one certificate is issued, the introducer is not restricted from introducing multiple devices and thus obtaining multiple certificates. By specifying the subject name in the certificate that is issued, you can be assured that all certificates that are issued in this way are associated with the introducer. You can use PKI AAA integration to further restrict the use of these certificates. Additionally, the AAA database can be configured to accept only one authentication and authorization request per user.

Because the petitioner certificate is self-signed, it is just used to convey the public key of the petitioner. No verification or authorization check is performed on the certificate; thus, authorization is per-user based and no per-device information is used.

There are some scenarios when per-device authorization is preferred. Therefore, if the petitioner is able to use certificates issued by other certification authority (CA) servers for SDP transactions, the existing PKI can be used and authorization can be achieved over the certificate attributes.

Configuring the petitioner and the registrar for certificate-based authorization provides authorization of the specific device being deployed. Previously, introducer-to-petitioner device communication was secured only using physical security between the introducer and the petitioner device. SDP certificate-based authorization gives the registrar an opportunity to validate the current device identity before accepting the introduction.
Authentication and Authorization Lists for SDP

When you are configuring your SDP registrar, if you specify an authentication list and an authorization list, the registrar uses the specified lists for all introducer requests. The authentication list is used when authenticating the introducer (the AAA server checks for a valid account by looking at the username and password). The authorization list is used to receive the appropriate authorized fields for the certificate subject name and a list of template variables to be expanded into the Cisco IOS command-line interface (CLI) snippet that is sent back to the petitioner. The authentication and authorization lists will usually point to the same AAA server list, but it is possible to use a different database for authentication and authorization. (Storing files on different databases is not recommended.)

When a petitioner makes an introduction request, multiple queries are sent to the AAA list database on the RADIUS or TACACS+ server. The queries search for entries of the following form:

```
user Password <userpassword>
cisco-avpair="tti:subjectname=<DN subjectname>>
cisco-avpair="tti:iosconfig#<<value>>"
cisco-avpair="tti:iosconfig#=<<value>>"
```

Note

The existence of a valid AAA username record is enough to pass the authentication check. The “cisco-avpair=tti” information is necessary only for the authorization check.

If a subject name was received in the authorization response, the SDP registrar stores it in the enrollment database, and that “subjectname” overrides the subject name that is supplied in the subsequent certificate request (PKCS10) from the petitioner device.

The numbered “tti:iosconfig” values are expanded into the SDP Cisco IOS snippet that is sent to the petitioner. The configurations replace any numbered ($1 through $9) template variable. Because the default Cisco IOS snippet template does not include the variables $1 through $9, these variables are ignored unless you configure an external Cisco IOS snippet template. To specify an external configuration, use the `template config` command. For more information on external configurations, see the section “Custom Configuration and File Template Variable Expansion Rules at the Petitioner.”

Note

The template configuration location may include a variable “$n,” which is expanded to the name with which the user is logged in.

Authentication and Authorization Lists for an Administrative Introducer

The SDP mechanisms assume a permanent relationship between the introducer and the device. As a result, the introducer username is used to define the device name.

In some SDP deployment scenarios, the introducer is an administrator doing the introduction for many devices. However, using the introducer (the administrator) name to define the device name results in multiple devices being incorrectly deployed with the same device name. Instead, an administrative introducer allows the administrator to specify the correct device name during the introduction.

More generally stated, the introducer username is used as the database record locator to determine all other information about the device including the Cisco IOS configuration template, various template variables (pulled from an AAA database and expanded into the template), and the appropriate subject name for PKI certificates issued to the device. For simplicity, this database record locator is called the user/device name.
The administrative introducer provides a device name. In that way, an administrator can provide the appropriate record locator when doing an introduction. For example, if an administrator is trying to introduce a device for username “user1,” the administrator introduces the device into the PKI network and provides user1 as the record locator after logging into the registrar using the administrator’s own credentials. The record locator, user1, becomes the device name. All other template and PKI certificate subject name information specific to the introduction is then provided by the user1 username records instead of by the administrator’s record.

The registrar device uses the supplied username information with a user introducer name. The username allows the existing mechanisms for determining a user’s authorization, template, and PKI certificate information to be supported without modification.

### How Custom Templates Work with SDP

You may use custom templates to streamline the SDP process.

- Custom templates allow you to complete the web pages with the required start information, so the introducer is no longer required to contact the registrar and can immediately begin the SDP transaction.
- Custom templates allow customized deployment information to be displayed on the web pages, thereby tailoring the user experience.

An easy way to define a custom template is to modify the default template. Without custom templates, the introducer must contact the registrar for information to begin the SDP transaction. For a list of the default templates, see the section “Default Templates for SDP Transaction Web Pages.”

**Note**

It is recommended that only advanced SDP users configure custom templates because problems can result from modifying templates incorrectly before the templates are displayed in the introducer’s browser.

### Custom Template Variable Expansion

There are expansion variables in the templates that are replaced by the Cisco IOS SDP registrar or petitioner. These variables are expanded as follows:

- $s—“$”
- $a—attribute-value (AV) pairs
- $c—Trusted certificate
- $d—Dump AV pairs in browser
- $h—Hostname
- $k—Keylabel or “tti”
- $l—Trustpoint label = “tti”
- $n—HTTP client’s username
- $s—Default TTI key size
- $t—Trustpoint configuration
- $u—Completion URL
- $1 to $9—Variables retrieved from AAA server during user authentication
Custom Template Variable Expansion Rules

Configuration and templates are used during an SDP exchange. Prior to use and after distribution, these templates are expanded using the following rules based in the SDP communication stage.

Custom HTML Template Expansion Rules

HTML templates are expanded immediately before being served to the HTTP client. The HTTP templates are expanded as follows:

- $u$—Completion url, which is be populated with the SDP completion URL (for example: http://10.10.10.1/ezsd/completion). This variable is used internally by SDP as the internal “wizard” state. It is expected that the SDP introduction page include something similar to the following text: “<FORM action="$u" method="post">” for normal wizard processing.
- $n$—introducer name or the device name entered by the administrative introducer.
- $$
- $h$—Hostname
- $a$—All AV pairs with or without a specified template character will be written out in the following HTML form format. (Because these AV pairs are not “INPUT type=hidden,” they are directly displayed on the web page for debugging templates or the SDP process.)

  ```html
  <INPUT type=hidden NAME="attribute string here" value="variable string here"><BR>
  all HTML templates should have this!
  $d = dump all av pairs in: attribute = value
  ```

URL Template Expansion Rules

There are URLs for the configuration template source, the file template source, and the file destination. These variables are expanded when the registrar prepares the URL, just before retrieving the configuration or file. For the file destination, these variables are expanded just before the petitioner copies the file to the file destination.

- $$
- $h$—Hostname

Custom Configuration and File Template Variable Expansion Rules

Custom configuration and file template variables are expanded both when the registrar prepares the configuration or file template and when the petitioner receives the configuration or file template.

Custom Configuration and File Template Variable Expansion Rules at the Registrar

When the registrar expands the configuration or file template, the following variables are used by the Cisco IOS CA. These variables are expanded before being sent through the SDP wizard.

- $$
- $h$—Hostname
- $t$—A simple default trustpoint configuration that includes $l$, $k$, and $s$ to be expanded at the client
- $1$ to $9$—Variables retrieved from AAA server during user authentication (not applicable to the file template)
Custom Configuration and File Template Variable Expansion Rules at the Petitioner

When the petitioner expands the configuration or file template, the following variables are expanded:

- $$s$$—$s$
- $$h$$—Hostname
- $$k$$—Keylabel
- $$l$$—Trustpoint label
- $$s$$—Key size
- $$c$$—Expanded to certificate chain
- $$n$$—Expanded to username (not applicable to the file template)

Custom Configuration HTTP Template Variable Expansion Rules

Custom configuration HTTP templates provide flexibility for backend Common Gateway Interface (CGI) scripts and integration with external management systems. Template URLs run through the HTTP template expansions before registrar retrieves the bootstrap configuration from the external management system. The device name ($n$) is expanded into the URL and passed to the external management system so that a specific bootstrap configuration file can be located based on the device information.

Note

You should only modify the HTML text that is displayed. The existing expansion variables, Javascript, and forms in the default templates should not be removed when customizing the templates. They are required for SDP to function properly.

The HTTP template expansion and template config command allow you to specify either of the following file types to obtain a customized bootstrap configuration file:

- A configuration file based on the device name (for example, template config http://myserver/$n-config-file.conf)
- A CGI script based on the device name (for example, template config http://myserver/cgi-bin/mysdpcgi post)

As of Cisco IOS Release 12.4(6)T, the CGI support has been expanded so that the bootstrap configuration can be identified by not only the device name, but also the type, current Cisco IOS version information, and current configuration. This functionality expands the template config command with the post keyword, which tells the registrar to send this additional device information to the external management system via a CGI script with the HTTP or HTTPS protocol only.

The registrar passes the device information via AV pairs ($a$) to the external management system. Using the AV pair information, the management system identifies the appropriate bootstrap configuration files and sends it back to the registrar. The additional AV pairs that are sent with the expanded CGI support for identification of customized bootstrap configuration file are shown in Table 1.

Table 1 | AV Pairs Sent During HTTP Post to External Management System

<table>
<thead>
<tr>
<th>AV Pair</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTIFixSubjectName</td>
<td>AAA_AT_TTI_SUBJECTNAME (sent only if the realm authentication user is not the root user on the registrar)</td>
</tr>

<tr>
<td>TTIKeyHash</td>
<td>Digest calculated over the device public key</td>
</tr>
</tbody>
</table>
Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

Information About Setting Up SDP for Enrollment in a PKI

Note

The registrar must be running Cisco IOS Release 12.4(6)T; the template config command must be issued with the post keyword, and the url argument must include either HTTP or HTTPS. No other protocol is supported for the expanded CGI template functionality (for example, FTP).

Default Templates for SDP Transaction Web Pages

The following default templates exist for each SDP transaction web page:

- Default Prep-Connect Template
- Default Start Page Template
- Default Welcome Page Template
- Default Introduction Page Template
- Default Admin-Introduction Page Template
- Default Completion Page Template

Default Prep-Connect Template

The prep-connect template may be modified by the administrator to contain values that are appropriate for their environment. The format of the prep-connect page may also be modified by the settings contained in the template.

Except for the registrar IP address, which the administrator must customize, the prep-connect template may be used as shown below.

```html
<html><head><title>SDP: Test Internet Connection</title></head>
<noscript><b>
If you see this message, your browser is not running JavaScript,<br>which is required by Cisco Secure Device Provisioning.<br>If you cannot enable JavaScript, please contact your system administrator.<br></b></noscript>
<body style="background-color: rgb(204, 255, 255);">
```

<table>
<thead>
<tr>
<th>AV Pair</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTIPrivilege</td>
<td>AAA_AT_TTI_PRIVILEGE—&quot;admin&quot; is sent if the user is an administrator, &quot;user&quot; is sent if the user is not an administrator (sent only if the realm authentication user is an administrator and the information is available from the AAA server)</td>
</tr>
<tr>
<td>TTISignature</td>
<td>Digest calculated over all AV pairs except UserDeviceName and TTISignCert</td>
</tr>
<tr>
<td>TTISignCert</td>
<td>Device current certificate (sent only if the device currently has a certificate)</td>
</tr>
<tr>
<td>TTITemplateVar</td>
<td>AAA_AT_TTI_IOSCONFIG(1-9) (sent only if the realm authentication user is not the root user on the registrar)</td>
</tr>
<tr>
<td>TTIUserName</td>
<td>Device name</td>
</tr>
<tr>
<td>TTIVersion</td>
<td>TTI version of the registrar</td>
</tr>
<tr>
<td>UserDeviceName</td>
<td>Device name as entered by the administrative introducer (sent only if the realm authentication user is an administrator)</td>
</tr>
</tbody>
</table>
Hidden HTML Form Fields

The hidden HTML form fields communicate initial configuration information to the browser as set by the administrator and are not signed.

Table 2  Administrator Defined AV Pairs Sent During Prep-Connect Phase

<table>
<thead>
<tr>
<th>AV Pair</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTIAfterConnectURL</td>
<td>The administrator may set the TTIAfterConnectURL field to either the welcome page URL or the start page URL. The welcome page URL is specified with the factory default petitioner IP address. The connect after URL may be any valid URL if SDP is not going to be used after establishing Internet connectivity.</td>
</tr>
<tr>
<td>TTIConnectTestURL</td>
<td>The administrator may set the TTIConnectTestURL field to a valid URL that should be accessible when Internet connectivity is established. The default prep-connect template value is <a href="http://www.cisco.com">www.cisco.com</a> (198.133.219.25).</td>
</tr>
<tr>
<td>TTIInsideAddr</td>
<td>The administrator may set the TTIInsideAddr field to the factory default IP address of the petitioner. For the Cisco 871 ISR, the IP address is 10.10.10.1.</td>
</tr>
<tr>
<td>TTIanportx</td>
<td>The administrator may set the TTIanportx field to the LAN interface name of the petitioner platform. This field is used to apply the Cisco IOS connect configuration. For the Cisco 871, the field value is “Vlan1.”</td>
</tr>
<tr>
<td>TTIwanport</td>
<td>The administrator may set the TTIwanport field to the WAN interface name of the petitioner. This field is used to apply the Cisco IOS connect configuration. For the Cisco 871, the field value is “FastEthernet4.”</td>
</tr>
</tbody>
</table>

Note: The connect template cannot be customized.

Welcome to the VPN network gateway on $h$. Your administrator 'username' and 'password' entered have been accepted. Please provide the name to be associated with this device. Your name to be associated with this device:

Now enrolling $h$ with the VPN network... Full network VPN access should be available in a moment.

The default configuration template is shown below. This default configuration file is used if a configuration template is not specified or if the template config command is issued without the post keyword. For more information on using the default configuration template, see the section “Using a Configuration Template File: Example.”

$\!$

How to Set Up SDP for a PKI

This section contains the following procedures that should be followed when setting up SDP for your PKI. You can configure the registrar according to only one of the registrar configuration tasks.

- Enabling the SDP Petitioner, page 21
- Enabling the SDP Registrar and Adding AAA Lists to the Server, page 23
- Enabling the SDP Registrar for Certificate-Based Authorization, page 27
- Configuring an Administrative Introducer, page 29
- Configuring Custom Templates, page 32

Enabling the SDP Petitioner

Perform this task to enable or disable the petitioner and associate a trustpoint with the SDP exchange. You can also use this task to configure the petitioner to use a certificate and the Rivest, Shamir, and Adelman (RSA) keys associated with a specific trustpoint.

Note: The petitioner is enabled by default on a Cisco device that contains a crypto image; thus, you have only to issue the crypto provisioning petitioner command if you have previously disabled the petitioner or if you want to use an existing trustpoint instead of the automatically generated trustpoint.
By default, the SDP petitioner device uses an existing certificate. If multiple certificates and one specific certificate exist, use this task to make a choice. However, this task is not necessary to enable the default behavior.

**Prerequisites**

- The HTTP server must be enabled via the `ip http server` command. (The HTTP server is typically enabled by default on many default Cisco IOS configurations.)
- If you are configuring the petitioner to use a certificate and RSA keys, your SDP petitioner device must have an existing manufacturer’s or a third-party certificate.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto provisioning petitioner`
4. `trustpoint trustpoint-label`
   or
   `trustpoint signing trustpoint-label`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<tr>
<td><strong>Step 3</strong> crypto provisioning petitioner</td>
<td>Allows SDP petitioner device behavior to be modified and enters tti-petitioner configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Note Effective with Cisco IOS Release 12.3(14)T, the <code>crypto provisioning petitioner</code> command replaced the <code>crypto wui tti petitioner</code> command.</td>
</tr>
<tr>
<td><code>crypto provisioning petitioner</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# crypto provisioning petitioner</code></td>
<td></td>
</tr>
</tbody>
</table>
Troubleshooting Tips

After the SDP exchange is complete, a new trustpoint-label named “tti” will exist. The trustpoint will be automatically enrolled with the certificate server (the registrar). To verify that the trustpoint is really there, use the `show running-config` command.

What to Do Next

If you set up the petitioner to use a certificate and the RSA keys associated with the specified trustpoint, you should configure the registrar as shown in the task “Enabling the SDP Registrar for Certificate-Based Authorization.”

Enabling the SDP Registrar and Adding AAA Lists to the Server

Perform this task to enable the registrar and associate a certificate server with the SDP exchange. You can also use this task if you want to add an authentication list and an authorization list to the RADIUS or TACACS+ server.

Prerequisites

Before configuring an registrar, ensure the following tasks are complete:

- Enable the HTTP server or the HTTPS server.

  **Note**
  
  It is recommended that you issue the `ip http secure-server` command to enable the HTTPS web server. If you enable a secure server, you should issue the `ip http secure-trustpoint` command. You must disable the standard HTTP server via the `no ip http server` command (if the standard server is enabled). The specified trustpoint is a registrar local trustpoint appropriate for HTTPS communication between the registrar and the user’s browser.
- Configure the Cisco IOS certificate server (via the `crypto pki server` command).

If you are configuring AAA lists, you should complete the prerequisites required for the registrar in addition to completing the following tasks:

- Add user information to the AAA server database. To configure a RADIUS or TACACS+ AAA server, see the “Configuring RADIUS” and “Configuring TACACS+” chapters of the *Cisco IOS Security Configuration Guide*.

- Configure new AAA lists. To configure AAA lists, see the following chapters in the *Cisco IOS Security Configuration Guide*: “Configuring RADIUS,” “Configuring TACACS+,” “Configuring Authentication,” and “Configuring Authorization.”

**Restrictions**

*Cisco IOS CA Device Requirement*

During the SDP process, a Cisco IOS CA certificate is automatically issued to the peer device. If an SDP registrar is configured on a third-party vendor’s CA device, the SDP process will not work.

**The template config Command**

There are nine Cisco IOS configuration variables. If you require more configuration flexibility, the `template config` command can be used to reference a configuration template that is specific to the introducer. For more information on configuration flexibility, see the “Custom Configuration and File Template Variable Expansion Rules” section.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto provisioning registrar`
4. `pki-server label`
5. `authentication list list-name`
6. `authorization list list-name`
7. `template username name [password password]`
8. `template config url [post]`
9. `end`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example: | Router> enable |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example: | Router# configure terminal |
| Step 3 | crypto provisioning registrar | Configures a device to become a registrar for the SDP exchange and enters tti-registrar configuration mode.  
**Note** Effective with Cisco IOS Release 12.3(14)T, the `crypto provisioning registrar` command replaced the `crypto wui tti registrar` command. |
| Example: | Router(config)# crypto provisioning registrar |
| Step 4 | pki-server label | Specifies the certificate server that is to be associated with the SDP exchange between the petitioner and the registrar. |
| Example: | Router(tti-registrar)# pki-server mycs |
| Step 5 | authentication list list-name | (Optional) Authenticates the introducer in an SDP exchange. |
| Example: | Router (tti-registrar)# authentication list authen-tac |
| Step 6 | authorization list list-name | (Optional) Receives the appropriate authorized fields for the certificate subject name and list of template variables to be expanded into the Cisco IOS CLI snippet that is sent back to the petitioner. |
| Example: | Router (tti-registrar)# authorization list author-rad |
| Step 7 | template username name [password password] | (Optional) Establishes a username and password in which to access the configuration template on the file system. |
| Example: | Router(tti-registrar)# template username ftpuser password ftppwd |
To help troubleshoot the SDP transaction, you can issue the `debug crypto provisioning` command, which displays output from the petitioner and registrar devices.

The following is output for the `debug crypto provisioning` command. The output from the petitioner and registrar devices are shown below.

**Petitioner device**

*The user starts the Welcome phase.*

Nov 7 03:15:48.171: CRYPTO_PROVISIONING: received welcome get request.

*The router generates a Rivest, Shamir, and Adelman (RSA) keypair for future enrollment.*

Nov 7 03:15:48.279: CRYPTO_PROVISIONING: keyhash 'A506BE3B83C6F4B4A6EFCEB3D584AACA'

*The TTI transaction is completed.*

Nov 7 03:16:10.607: CRYPTO_PROVISIONING: received completion post request.

**Registrar device**

*During the introduction phase, the browser prompts for login information.*

06:39:18: CRYPTO_PROVISIONING: received introduction post request.

06:39:18: CRYPTO_PROVISIONING: checking AAA authentication (ipseccca_script_ldaplist, ttiuser)

*This happens if the user types in the wrong username or password.*

06:39:19: CRYPTO_PROVISIONING: authentication declined by AAA, or AAA server not found - 0x3

06:39:19: CRYPTO_PROVISIONING: aaa query fails!

*The user re-enters login information.*

06:39:19: CRYPTO_PROVISIONING: received introduction post request.

06:39:19: CRYPTO_PROVISIONING: checking AAA authentication (ipseccca_script_ldaplist, ttiuser)

06:39:20: CRYPTO_PROVISIONING: checking AAA authorization (ipseccca_script_ldaplist, ttiuser)

*The login attempt succeeds and authorization information is retrieved from the AAA database.*

06:39:21: CRYPTO_PROVISIONING: aaa query ok!
Enabling the SDP Registrar for Certificate-Based Authorization

Perform this task to enable the SDP registrar to perform the following functions:

- Verify the petitioner-signing certificate using a specified trustpoint or any configured trustpoint.
- Initiate authorization lookups using the introducer username and the certificate name field.

Prerequisites

You must also configure the SDP petitioner to use a certificate and RSA keys associated with a specific trustpoint. To complete this task, use the trustpoint signing command as shown in the task “Enabling the SDP Petitioner.”

Restrictions

Because RADIUS does not differentiate between authentication and authorization, you need to use the default password, cisco, for certificate authorization.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto provisioning registrar
4. template file sourceURL destinationURL
5. binary file sourceURL destinationURL
6. authentication trustpoint {trustpoint-label | use-any}
7. authorization {login | certificate | login certificate}
8. authorization username {subjectname subjectname}
9. end
### Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

#### How to Set Up SDP for a PKI

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
* • Enter your password if prompted.  
**Example:**  
Router> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
**Example:**  
Router# configure terminal |
| **Step 3** crypto provisioning registrar | Configures a device to become an SDP registrar and enters tti-registrar configuration mode.  
**Example:**  
Router(config)# crypto provisioning registrar |
| **Step 4** template file sourceURL destinationURL | (Optional) Specifies the source template file location on the registrar and the destination template file location on the petitioner.  
**Note** This command is useful when using a USB token to provision a device.  
The template expansion occurs on the registrar for both the source URL and file content. The destination URL is expanded on the petitioner.  
**Example:**  
Router(tti-registrar)# template file  
http://myserver/registrar_file_r1  
http://myserver/petitioner_file_p1 |
| **Step 5** binary file sourceURL destinationURL | (Optional) Specifies the binary file location on the registrar and the destination binary file location on the petitioner.  
**Note** This command is useful when using a USB token to provision a device.  
Both the source and destination URL are expanded on the registrar. Also, the destination URL and file content are expanded on the petitioner. Binary files are not processed through the template expansion functions.  
**Example:**  
Router(tti-registrar)# binary file  
http://myserver/registrar_file_a1  
http://myserver/petitioner_file_b1 |
| **Step 6** authentication trustpoint {trustpoint-label} | (Optional) Specifies the trustpoint used to authenticate the SDP petitioner device’s existing certificate.  
* • trustpoint-label—Specifies a specific trustpoint.  
* • use-any—Specifies any configured trustpoint.  
**Note** If you do not use this command to specify a trustpoint, the existing petitioner certificate is not validated. (This functionality provides compatibility with self-signed petitioner certificates.)  
**Example:**  
Router(tti-registrar)# authentication trustpoint mytrust |
Configuring an Administrative Introducer

Perform the following task to configure an administrative introducer using administrator authentication and authorization lists.

Prerequisites

The administrative introducer must have enable privileges on the client device and administrator privileges on the server.

Restrictions

When using RADIUS, a user/device that needs to be introduced by the administrative introducer must always use cisco as its own password. TACACS+ does not have this limitation; a user/device can have any password and be introduced by the administrative introducer.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto provisioning registrar
4. administrator authentication list list-name
5. administrator authorization list list-name
6. end
DETAILED STEPS

<table>

### Configuration Examples for Setting Up a PKI via SDP

This section contains the following configuration examples:

- Verifying the SDP Registrar: Example, page 34
- Verifying the SDP Petitioner: Example, page 37
- Adding AAA Lists to a RADIUS or TACACS+ Server: Examples, page 39

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 5**

`template http welcome URL`

Example:

Router(tti-registrar)# template http welcome
tftp://registrar.company.com/welcome.html

(Optional) Uses a custom welcome template rather than the default template.

| **Step 6**

`template http introduction URL`

Example:

Router(tti-registrar)# template http introduction
tftp://registrar.company.com/intro.html

(Optional) Uses a custom introduction template rather than the default template.

| **Step 7**

`template http admin-introduction URL`

Example:

Router(tti-registrar)# template http admin-introduction
tftp://registrar.company.com/admin-intro.html

(Optional) Uses a custom admin-introduction template rather than the default template.

| **Step 8**

`template http completion URL`

Example:

Router(tti-registrar)# template http completion
tftp://registrar.company.com/completion.html

(Optional) Uses a custom completion template rather than the default template.

| **Step 9**

`template http error URL`

Example:

Router(tti-registrar)# template http error
tftp://registrar.company.com/error.html

(Optional) Uses a custom error template rather than the default template.

| **Step 10**

`end`

Example:

Router(tti-registrar)# end

(Optional) Exits tti-registrar configuration mode.

---

**Examples**

The following example shows the use of custom start, introduction, and completion templates:

`template http start tftp://registrar.company.com/start.html`
`template http introduction tftp://registrar.company.com/intro.html`
`template http completion tftp://registrar.company.com/completion.html`
Verifying the SDP Registrar: Example

The following sample output from the `show running-config` command verifies that the certificate server "cs1" was configured and associated with the SDP exchange between the registrar and petitioner:

```
Router# show running-config

Building configuration...

Verifying the SDP Petitioner: Example

After the SDP exchange is complete, the petitioner will automatically enroll with the registrar and obtain a certificate. The following sample output via the `show running-config` command shows the automatically generated configuration, which verifies that the trustpoint is really there:

```
Router# show running-config
Building configuration...

Current configuration : 4650 bytes

Adding AAA Lists to a RADIUS or TACACS+ Server: Examples

This section contains the following configuration examples:

- TACACS+ AAA Server Database: Example, page 40
- RADIUS AAA Server Database: Example, page 40
- AAA List on a TACACS+ and a RADIUS AAA Server: Example, page 40
TACACS+ AAA Server Database: Example

In the following example, user information has been added to a TACACS+ AAA database. The username is “user1.” The password is “cisco.” Two Cisco IOS configuration template variables are configured for “user1”: iosconfig1 and iosconfig2. The variables will replace $1 and $2 in the configuration template file. The subject name “CN=user1, O=company, C=US” is also configured. This subject name will replace the subject name field in the subsequent enrollment request (PKCS10) that is received from the petitioner device.

```
user = user1
    password = clear "pswd"
    service=tti
        ! The certificate server inserts the following subject name to the certificate.
        set subjectname="CN=user1, O=company, C=US"
        ! Up to nine template variables may be added.
        set iosconfig1="ntp server 10.3.0.1"
        set iosconfig2="hostname user1-vpn"
```

RADIUS AAA Server Database: Example

User information has been added to the RADIUS AAA server database in the following example. The username is “user1.” The password is “cisco.” Two Cisco IOS configuration template variables are configured for “user1”: iosconfig1 and iosconfig2. The variables will replace $1 and $2 in the configuration template file. The subject name “CN=user1, O=company, C=US” is also configured. This subject name will replace the subject name field in the subsequent enrollment request (PKCS10) that is received from the petitioner device.

```
user = user1
    password = clear "pswd"
    radius=company
        reply_attributes=9,1="tti:subjectname=CN=user1, O=company, C=US"
        ! Up to nine template variables may be added.
        9,1="tti:iosconfig1=ntp server 10.3.0.5"
        9,1="tti:iosconfig2=hostname user1-vpn"
```

AAA List on a TACACS+ and a RADIUS AAA Server: Example

The following is a configuration example showing that AAA authentication has been configured on a TACACS+ server and that AAA authorization has been configured on a RADIUS server.

```
Authentication and authorization usually point to the same server.

Router(config)# tacacs-server host 10.0.0.48 key cisco
Router(config)# aaa authentication login authen-tac group tacacs+
Router(config)# radius-server host 10.0.1.49 key cisco
Router(config)# aaa authorization network author-rad group radius
```
Using a Configuration Template File: Example

You can use a different configuration template file on the basis of the introducer name. For example, if you have multiple template files for different users, each with the username in the filename, configure the following under the registrar:

Router(config)# crypto provisioning registrar
Router (tti-registrar)# pki-server cs1
Router (tti-registrar)# template config tftp://server/config-$n.txt

In this example, the default configuration file shown in the section “Default Template for the Configuration File” will be used because the template config command does not reference a CGI script.

CGI Script: Example

The following example would execute a CGI script named “mysdpcgi”:

Router(config)# crypto provisioning registrar
Router (tti-registrar)# pki-server cs1
Router (tti-registrar)# template config tftp://server/cgi-bin/mysdpcgi post

The following is an example CGI script, named “mysdpcgi”, that would be executed with the example template config command above:

#!/usr/bin/perl -w
# for debugging use the -debug form
# use CGI (-debug);
use CGI;

# base64 decoding is being used.
use MIME::Base64;

# The following has been commented out, but left for your information.
#
# Reading everything that has been received from stdin and writing it to the debug log to see what has been sent from the registrar.
#
# Remember to reset the STDIN pointer so that the normal CGI processing can get the input.
#
# print STDERR "mysdpcgi.cgi dump of stdin:\n";
# if($ENV{'REQUEST_METHOD'} eq "GET"){
#    $input_data = $ENV{'QUERY_STRING'};
# }
# else {
#    $data_length = $ENV{'CONTENT_LENGTH'};
#    $bytes_read = read(STDIN, $input_data, $data_length);
# } 
# print STDERR $input_data,\\n";
# exit;

$query = new CGI;
my %av_table;

# A basic configuration file is being sent back, therefore it is being indicated as plain text in the command below.
print $query->header ("text/plain");
print "\n";

# For testing, parameters can be passed in so that the test applications can
# see what has been received.
#
# print STDERR "The following are the raw AV pairs mysdpcgi.cgi received:\n";
# for each $key ($query->param) {
# print STDERR "! $key is: \n";
# $value = $query->param($key);
# print STDERR "! \n";$value;
# print STDERR "! \n";
#}

# The post process AV pairs are identical to those in Cisco IOS and may be used to produce
# AV pair specific configurations as needed.

%av_table = &postprocessavpairs($query->param);

# Decoded values may be written out.
# WARNING: Some error_logs cannot handle the amount of data and will freeze.
# print STDERR "The following are the decoded AV pairs mysdpcgi.cgi received:\n";
# now write the values out
# while ( ($a, $v) = each(%av_table) ) {
# print STDERR "$a = "$v\n";
#}

# Identifying the AV pairs and specifying them in the config.
while ( ($a, $v) = each(%av_table) ) {
    if ($a eq "TTIIosRunningConfig") {
        $search = "hostname ";
        $begin = index($v, $search) + length($search);
        $end = index($v, "\n", $begin);
        $hostname = substr($v, $begin, $end - $begin);
    }
    if ($a eq "TTIIosVersion") {
        $search = "Version ";
        $begin = index($v, $search) + length($search);
        $end = index($v, "\n", $begin);
        $version = substr($v, $begin, $end - $begin);
    }
}

print <<END_CONFIG;

        $av_table{$a} = decode_base64($av_table{$a});
    }
}
return %av_table;

Note
A CGI script cannot be executed without using the post keyword with the template config command in Cisco IOS Release 12.4(6)T or a later release.

Configuring the Petitioner and Registrar for Certificate-Based Authentication: Example

The following examples shows how to configure a petitioner to use the certificate issued by the trustpoint named mytrust:

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# crypto provisioning petitioner
Router(tti-petitioner)# trustpoint signing mytrust
Router(tti-petitioner)# end
The following example shows how to configure a registrar to verify the petitioner-signing certificate and to perform authorization lookups:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# crypto provisioning registrar
Router(tti-registrar)# authentication trustpoint mytrust
Router(tti-registrar)# authorization login certificate
Router(tti-registrar)# authorization username subjectname all
Router(tti-registrar)# end
```

**Configuring an Administrative introducer Using Authentication and Authorization Lists: Example**

The following example shows how to configure an administrative introducer with the authentication list “authen-tac” and the authorization list “author-tac”:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Router(config)# crypto provisioning registrar
Router(tti-registrar)# administrator authentication list authen-tac
Router(tti-registrar)# administrator authorization list author-tac
Router(tti-registrar)# end
```

Feature Information for SDP in a PKI

Table 3 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “Implementing and Managing PKI Features Roadmap.”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note Table 3 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

| SDP Expanded Template CGI Support  | 12.4(6)T | This feature allows users to configure the SDP registrar to send a bootstrap configuration to the SDP petitioner based on not only the device name, but also its current Cisco IOS version and current configuration. The following sections provide information about this feature:  
  - SDP Introduction Phase  
  - Custom Configuration and File Template Variable Expansion Rules  
  - Default Template for the Configuration File  
  - Enabling the SDP Registrar and Adding AAA Lists to the Server  
  - CGI Script: Example  
    The following command was modified by this feature: `template config` |
| Secure Device Provisioning (SDP) Start Page | 12.4(4)T | This feature allows users to configure their browsers to begin the TTI transaction by contacting the registrar’s introduction URL via a start page. Thus, users no longer have to begin the TTI transaction from the welcome page on the petitioner. The following sections provide information about this feature:  
  - How Custom Templates Work with SDP  
  - Configuring Custom Templates  
    The following commands were introduced by this feature: `template http admin-introduction`, `template http completion`, `template http error`, `template http introduction`, `template http start`, `template http welcome` |
| Administrative Secure Device Provisioning Introducer | 12.3(14)T | This feature allows you to act as an administrative introducer to introduce a device into a PKI network and then provide a username as the device name for the record locator in the AAA database. The following sections provide information about this feature:  
  - Authentication and Authorization Lists for an Administrative Introducer  
  - Configuring an Administrative Introducer  
    The following commands were introduced by this feature: `administrator authentication list`, `administrator authorization list` |
Easy Secure Device Deployment

This feature introduces support for SDP, which offers a web-based enrollment interface that enables network administrators to deploy new devices in large networks. The following sections provide information about this feature:

- **Information About Setting Up SDP for Enrollment in a PKI**
- **Enabling the SDP Registrar and Adding AAA Lists to the Server**

The following commands were introduced or modified by this feature: `crypto wui tti petitioner`, `crypto wui tti registrar`, `pki-server`, `template config`, `template username`, `trustpoint (tti-petitioner)`

Easy Secure Device Deployment AAA Integration

This feature integrates an external AAA database, allowing the SDP introducer to be authenticated against a AAA database instead of having to use the enable password of the local Cisco certificate server. The following sections provide information about this feature:

- **How SDP Uses an External AAA Database**
- **Enabling the SDP Registrar and Adding AAA Lists to the Server**

The following commands were introduced or modified by this feature: `authentication list (tti-registrar)`, `authorization list (tti-registrar)`, `debug crypto wui template config`, `template username`.

Secure Device Provisioning (SDP) Certificate-Based Authorization

This feature allows certificates issued by other authority (CA) servers to be used for SDP introductions. The following sections provide information about this feature:

- **Use of a Self-Signed Certificate Versus a Certificate Issued by Another CA Server**
- **Enabling the SDP Registrar for Certificate-Based Authorization**

The following commands were introduced by this feature: `administrator authentication list`, `administrator authorization list`.

Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment

First Published: May 2, 2005
Last Updated: November 17, 2006

This module describes how to set up and manage a Cisco IOS certificate server for public key infrastructure (PKI) deployment. A certificate server embeds a simple certificate server, with limited certification authority (CA) functionality, into the Cisco IOS software. Thus, the following benefits are provided to the user:

• Easier PKI deployment by defining default behavior. The user interface is simpler because default behaviors are predefined. That is, you can leverage the scaling advantages of PKI without all of the certificate extensions that a CA provides, thereby allowing you to easily enable a basic PKI-secured network.

• Direct integration with Cisco IOS software.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for the Cisco IOS Certificate Server” section on page 50.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Contents

• Prerequisites for Configuring a Cisco IOS Certificate Server, page 2
• Restrictions for Configuring a Cisco IOS Certificate Server, page 3
• Information About Cisco IOS Certificate Servers, page 3
• How to Set Up and Deploy a Cisco IOS Certificate Server, page 10
Prerequisites for Configuring a Cisco IOS Certificate Server

Planning Your PKI Before Configuring the Certificate Server

Before configuring a Cisco IOS certificate server, it is important that you have planned for and chosen appropriate values for the settings you intend to use within your PKI (such as certificate lifetimes and certificate revocation list (CRL) lifetimes). After the settings have been configured in the certificate server and certificates have been granted, settings cannot be changed without having to reconfigure the certificate server and reenrolling the peers. For information on certificate server default settings and recommended settings, see the section “Certificate Server Default Values and Recommended Values.”

Enabling an HTTP Server

The certificate server supports Simple Certificate Enrollment Protocol (SCEP) over HTTP. The HTTP server must be enabled on the router for the certificate server to use SCEP. (To enable the HTTP server, use the `ip http server` command.) The certificate server will automatically enable or disable SCEP services after the HTTP server is enabled or disabled. If the HTTP server is not enabled, only manual PKCS10 enrollment is supported.

**Note**

To take advantage of automatic CA certificate and key pair rollover functionality for all types of certificate servers, Cisco IOS Release 12.4(4)T or a later release must be used and SCEP must be used as the enrollment method.

Configuring Reliable Time Services

Time services must be running on the router because the certificate server must have reliable time knowledge. If a hardware clock is unavailable, the certificate server will depend on manually configured clock settings, such as Network Time Protocol (NTP). If there is not a hardware clock or the clock is invalid, the following message will be displayed at bootup:

```
% Time has not been set. Cannot start the Certificate server.
```

After the clock has been set, the certificate server will automatically switch to running status.

For information on manually configuring clock settings, see the section “Setting Time and Calendar Services” in the chapter “Performing Basic System Management” of the *Cisco IOS Network Management Configuration Guide*.

“crypto ca” to “crypto pki” CLI Change

As of Cisco IOS Release 12.3(7)T, all commands that begin as “crypto ca” have been changed to begin as “crypto pki.” Although the router will still accept crypto ca commands, all output will be read back as crypto pki.
Restrictions for Configuring a Cisco IOS Certificate Server

The certificate server does not provide a mechanism for modifying the certificate request that is received from the client; that is, the certificate that is issued from the certificate server matches the requested certificate without modifications. If a specific certificate policy, such as name constraints, must be issued, the policy must be reflected in the certificate request.

Information About Cisco IOS Certificate Servers

Before setting up and deploying a certificate server in your PKI, you should understand the following concepts:

- RSA Key Pair and Certificate of the Certificate Server, page 3
- Certificate Server Database, page 4
- Trustpoint of the Certificate Server, page 6
- Certificate Revocation Lists (CRLs), page 6
- Certificate Server Error Conditions, page 7
- Certificate Enrollment Using a Certificate Server, page 8
- Types of CA Servers: Subordinate and Registration Authorities (RAs), page 8
- Automatic CA Certificate and Key Rollover, page 9

RSA Key Pair and Certificate of the Certificate Server

The certificate server automatically generates a 1024-bit Rivest, Shamir, and Adelman (RSA) key pair. You must manually generate an RSA key pair if you prefer a different key pair modulus. For information on completing this task, see the section “Generating a Certificate Server RSA Key Pair.”

Note

The recommended modulus for a certificate server key pair is 2048 bits.

The certificate server will use a regular Cisco IOS RSA key pair as its CA key. This key pair must have the same name as the certificate server. If you do not generate the key pair before the certificate server is created on the router, a general-purpose key pair will be automatically generated during the configuration of the certificate server.

As of Cisco IOS Release 12.3(11)T and later releases, the CA certificate and CA key can be backed up automatically one time after they are generated by the certificate server. As a result, it is not necessary to generate an exportable CA key for backup purposes.

What to Do with Automatically Generated Key Pairs in Cisco IOS Software Prior to Release 12.3(11)T

If the key pair is automatically generated, it will not be marked as exportable. Thus, you must manually generate the key pair as exportable if you want to back up the CA key. For information on how to complete this task, see the section “Generating a Certificate Server RSA Key Pair.”
How the CA Certificate and CA Key Are Automatically Archived

At initial certificate server setup, you can enable the CA certificate and the CA key to be automatically archived so that they may be restored later if either the original copy or the original configuration is lost.

When the certificate server is turned on the first time, the CA certificate and CA key will be generated. If automatic archive is also enabled, the CA certificate and the CA key will be exported (archived) to the server database. The archive can be in PKCS12 or privacy-enhanced mail (PEM) format.

- This CA key backup file is extremely important and should be moved immediately to another secured place.
- This archiving action occurs only one time. Only the CA key that is (1) manually generated and marked exportable or (2) automatically generated by the certificate server will be archived (this key will be marked nonexportable).
- Autoarchiving will not occur if you generate the CA key manually and mark it “nonexportable.”
- In addition to the CA certificate and CA key archive file, you should also regularly back up the serial number file (.ser) and the CRL file (.crl). The serial file and the CRL file are both critical for CA operation if you need to restore your certificate server.
- It is not possible to manually back up a server that uses nonexportable RSA keys or manually generated, nonexportable RSA keys. Although automatically generated RSA keys are marked as nonexportable, they are automatically archived once.

Certificate Server Database

The Cisco IOS certificate server stores files for its own use and may publish files for other processes to use. Critical files generated by the certificate server that are needed for its ongoing operation are stored to only one location per file type for its exclusive use. The certificate server reads from and writes to these files. The critical certificate server files are the serial number file (.ser) and the CRL storage location file (.crl). Files that the certificate server writes to, but does not read from again, may be published and available for use by other processes. An example of a file that may be published is the issued certificates file (.crt).

Performance of your certificate server may be affected by the following factors, which should be considered when you choose storage options and publication options for your certificate server files.

- The storage or publish locations you choose may affect your certificate server performance. Reading from a network location takes more time than reading directly from a router’s local storage device.
- The number of files you choose to store or publish to a specific location may affect your certificate server performance. The local Cisco IOS file system may not always be suitable for a large number of files.
- The file types you choose to store or publish may affect your certificate server performance. Certain files, such as the .crl files, can become very large.

- It is recommended that you store .ser and .crl files to your local Cisco IOS file system and publish your .crt files to a remote file system.
Certificate Server Database File Storage

The certificate server allows the flexibility to store different critical file types to different storage locations depending on the database level set (see the `database level` command for more information). When choosing storage locations, consider the file security needed and server performance. For instance, serial number files and archive files (.p12 or .pem) might have greater security restrictions than the issued certificates file storage location (.crt) or the name file storage location (.cnm).

Table 1 shows the critical certificate server file types by file extension that may be stored to a specific location.

<table>
<thead>
<tr>
<th>File Extension</th>
<th>File Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>.ser</td>
<td>The main certificate server database file.</td>
</tr>
<tr>
<td>.crl</td>
<td>The CRL storage location.</td>
</tr>
<tr>
<td>.crt</td>
<td>The issued certificates storage location.</td>
</tr>
<tr>
<td>.cnm</td>
<td>The certificate name and expiration file storage location.</td>
</tr>
<tr>
<td>.p12</td>
<td>The certificate server certificate archive file location in PKCS12 format.</td>
</tr>
<tr>
<td>.pem</td>
<td>The certificate server certificate archive file location in PEM format.</td>
</tr>
</tbody>
</table>

Cisco IOS certificate server files may be stored to three levels of specificity:

- Default location, NVRAM
- Specified primary storage location for all critical files
- Specified storage location for specific critical file(s)

A more specific storage location setting overrides a more general storage location setting. For instance, if you have not specified any certificate server file storage locations, all certificate server files will be stored to NVRAM. If you specify a storage location for the name file, only the name file will be stored there; all other files will still be stored to NVRAM. If you then specify a primary location, all files except the name file will now be stored to this location, instead of NVRAM.

**Note**

You may specify either .p12 or .pem; you cannot specify both types of archive files.

Certificate Server Database File Publication

A publish file is a copy of the original file and is available for other processes to use or for your use. If the certificate server fails to publish a file, it does cause the server to shut down. You may specify one publish location for the issued certificates file and name file and multiple publish locations for the CRL file. See Table 2 for files types available for publication. You may publish files regardless of the database level that is set.
Trustpoint of the Certificate Server

The certificate server will also have an automatically generated trustpoint of the same name; the trustpoint will store the certificate of the certificate server. After the router detects that a trustpoint is being used to store the certificate of the certificate server, the trustpoint will be locked so that it cannot be modified.

Before configuring the certificate server you can perform the following:

- Manually create and set up this trustpoint (using the `crypto pki trustpoint` command), which allows you to specify an alternative RSA key pair (using the `rsakeypair` command).
- Specify that the initial autoenrollment key pair will be generated on a specific device, such as a configured and available USB token, using the `on` command.

### Table 2: Certificate Server Publish File Types

<table>
<thead>
<tr>
<th>File Extension</th>
<th>File Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>.crl</td>
<td>The CRL publish location.</td>
</tr>
<tr>
<td>.crt</td>
<td>The issued certificates publish location.</td>
</tr>
<tr>
<td>.cnm</td>
<td>The certificate name and expiration file publish location.</td>
</tr>
</tbody>
</table>

A certificate server trustpoint must not be automatically enrolled using the `auto-enroll` command. Initial enrollment of the certificate server must be initiated manually and ongoing automatic rollover functionality may be configured with the `auto-rollover` command. For more information on automatic rollover functionality, see the section “Automatic CA Certificate and Key Rollover.”

Certificate Revocation Lists (CRLs)

By default, CRLs are issued once every 168 hours (1 calendar week). To specify a value other than the default value for issuing the CRL, execute the `lifetime crl` command. After the CRL is issued, it is written to the specified database location as `ca-label.crl`, where `ca-label` is the name of the certificate server.

CRLs can be distributed via SCEP, which is the default method, or a CRL distribution point (CDP), if configured and available. If you set up a CDP, use the `cdp-url` command to specify the CDP location. If the `cdp-url` command is not specified, the CDP certificate extension will not be included in the
certificates that are issued by the certificate server. If the CDP location is not specified, Cisco IOS PKI clients will automatically request a CRL from the certificate server with a SCEP GetCRL message. The CA then returns the CRL in a SCEP CertRep message to the client. Because all SCEP messages are enveloped and signed PKCS#7 data, the SCEP retrieval of the CRL from the certificate server is costly and not highly scalable. In very large networks, an HTTP CDP provides better scalability and is recommended if you have many peer devices that will be checking CRLs. You may specify the CDP location by a simple HTTP URL string for example,

    cdp-url http://my-cdp.company.com/filename.crl

The certificate server supports only one CDP; thus, all certificates that are issued include the same CDP. If you have PKI clients that are not running Cisco IOS software and that do not support a SCEP GetCRL request and wish to use a CDP you may set up an external server to distribute CRLs and configure the CDP to point to that server. Or, you can specify a non-SCEP request for the retrieval of the CRL from the certificate server by specifying the cdp-url command with the URL in the following format where cs-addr is the location of the certificate server:

    cdp-url http://cs-addr/cgi-bin/pkiclient.exe?operation=GetCRL

Note

If your Cisco IOS CA is also configured as your HTTP CDP server, specify your CDP with the cdp-url http://cs-addr/cgi-bin/pkiclient.exe?operation=GetCRL command syntax.

It is the responsibility of the network administrator to ensure that the CRL is available from the location that is specified via the cdp-url command.

The CDP location may be changed after the certificate server is running via the cdp-url command. New certificates will contain the updated CDP location, but existing certificates will not be reissued with the newly specified CDP location. When a new CRL is issued, the certificate server uses its current cached CRL to generate a new CRL. (When the certificate server is rebooted, it reloads the current CRL from the database.) A new CRL cannot be issued unless the current CRL has expired. After the current CRL expires, a new CRL is issued only after a certificate is revoked from the CLI.

**Certificate Server Error Conditions**

At startup, the certificate server checks the current configuration before issuing any certificates. It reports the last known error conditions via the show crypto pki server command output. Example errors can include any of the following conditions:

- Storage inaccessible
- Waiting for HTTP server
- Waiting for time setting

If the certificate server experiences a critical failure at any time, such as failing to publish a CRL, the certificate server will automatically enter a disabled state. This state allows the network administrator to fix the condition; thereafter, the certificate server will return to the previous normal state.
Certificate Enrollment Using a Certificate Server

A certificate enrollment request functions as follows:

- The certificate server receives the enrollment request from an end user, and the following actions occur:
  - A request entry is created in the enrollment request database with the initial state. (See Table 3 for a complete list of certificate enrollment request states.)
  - The certificate server refers to the CLI configuration (or the default behavior any time a parameter is not specified) to determine the authorization of the request. Thereafter, the state of the enrollment request is updated in the enrollment request database.
- At each SCEP query for a response, the certificate server examines the current request and performs one of the following actions:
  - Responds to the end user with a “pending” or “denied” state.
  - Generates and signs the appropriate certificate and stores the certificate in the enrollment request database.

If the connection of the client has closed, the certificate server will wait for the client to request another certificate.

All enrollment requests transition through the certificate enrollment states that are defined in Table 3. To see current enrollment requests, use the `crypto pki server request pkcs10` command.

<table>
<thead>
<tr>
<th>Certificate Enrollment State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authorized</td>
<td>The certificate server has authorized the request.</td>
</tr>
<tr>
<td>denied</td>
<td>The certificate server has denied the request for policy reasons.</td>
</tr>
<tr>
<td>granted</td>
<td>The CA core has generated the appropriate certificate for the certificate request.</td>
</tr>
<tr>
<td>initial</td>
<td>The request has been created by the SCEP server.</td>
</tr>
<tr>
<td>malformed</td>
<td>The certificate server has determined that the request is invalid for cryptographic reasons.</td>
</tr>
<tr>
<td>pending</td>
<td>The enrollment request must be manually accepted by the network administrator.</td>
</tr>
</tbody>
</table>

SCEP Enrollment

All SCEP requests are treated as new certificate enrollment requests, even if the request specifies a duplicate subject name or public key pair as a previous certificate request.

Types of CA Servers: Subordinate and Registration Authorities (RAs)

CA servers have the flexibility to be configured as a subordinate certificate server or an RA-mode certificate server.
Why Configure a Subordinate CA?
A subordinate certificate server provides all the same features as a root certificate server. The root RSA key pairs are extremely important in a PKI hierarchy, and it is often advantageous to keep them offline or archived. To support this requirement, PKI hierarchies allow for subordinate CAs that have been signed by the root authority. In this way, the root authority can be kept offline (except to issue occasional CRL updates), and the subordinate CA can be used during normal operation.

Why Configure an RA-Mode Certificate Server?
A Cisco IOS certificate server can be configured to run in RA mode. An RA offloads authentication and authorization responsibilities from a CA. When the RA receives a SCEP or manual enrollment request, the administrator can either reject or grant it on the basis of local policy. If the request is granted, it will be forwarded to the issuing CA, and the CA will automatically generate the certificate and return it to the RA. The client can later retrieve the granted certificate from the RA.

An RA is the authority charged with recording or verifying some or all of the data required for the CA to issue certificates. In many cases the CA will undertake all of the RA functions itself, but where a CA operates over a wide geographical area or when there is security concern over exposing the CA to direct network access, it may be administratively advisable to delegate some of the tasks to an RA and leave the CA to concentrate on its primary tasks of signing certificates and CRLs.

Automatic CA Certificate and Key Rollover
CAs—root CAs, subordinate CAs, and RA-mode CAs—like their clients, have certificates and key pairs with expiration dates that need to be reissued when the current certificate and key pair are about to expire. When a root CA’s certificate and key pair are expiring it must generate a self-signed rollover certificate and key pair. If a subordinate CA or an RA-mode CA’s certificate and key pair are expiring, it will request a rollover certificate and key pair from its superior CA, obtaining the superior CA’s new self-signed rollover certificates at the same time. The CA must distribute the new CA rollover certificate and keys too all its peers. This process, called rollover, allows for continuous operation of the network while the CAs and their clients are switching from an expiring CA certificate and key pair to a new CA certificate and key pair.

Rollover relies on the PKI infrastructure requirements of trust relationships and synchronized clocks. The PKI trust relationships allow (1) the new CA certificate to be authenticated, and (2) the rollover to be accomplished automatically without the loss of security. Synchronized clocks allow the rollover to be coordinated throughout your network.

Automatic CA Certificate Rollover: How It Works
The CA server must have rollover configured. All levels of CAs must be automatically enrolled and have auto-rollover enabled. CA clients support rollover automatically when automatically enrolled. For more information about clients and automatic rollover, see the section “Automatic Certificate Enrollment” in the chapter “Configuring Certificate Enrollment for a PKI”.

After CAs have rollover enabled and their clients are automatically enrolled, there are three stages to the automatic CA certificate rollover process.

Stage One: Active CA Certificate and Key Pair Only
In stage one, there is an active CA certificate and key pair only.
Stage Two: Rollover CA Certificate and Key Pair Generation and Distribution

In stage two, the rollover CA certificate and key pair are generated and distributed. The superior CA generates a rollover certificate and key pair. After the CA successfully saves its active configuration, the CA is ready to respond to client requests for the rollover certificate and key pair. When the superior CA receives a request for the new CA certificate and key pair from a client, the CA responds by sending the new rollover CA certificate and key pair to the requesting client. The clients store the rollover CA certificate and key pair.

Note

When a CA generates its rollover certificate and key pair, it must be able to save its active configuration. If the current configuration has been altered, saving of the rollover certificate and key pair will not happen automatically. In this case, the administrator must save the configuration manually or rollover information will be lost.

Stage Three: Rollover CA Certificate and Key Pair Become the Active CA Certificate and Key Pair

In stage three, the rollover CA certificate and key pair become the active CA certificate and key pair. All devices that have stored a valid rollover CA certificate rename the rollover certificate to the active certificate and the once-active certificate and key pair are deleted.

How to Set Up and Deploy a Cisco IOS Certificate Server

This section contains the following procedures:

- Generating a Certificate Server RSA Key Pair, page 10
- Configuring Certificate Servers, page 13
- Configuring Certificate Server Functionality, page 24
- Working with Automatic CA Certificate Rollover, page 28
- Maintaining, Verifying, and Troubleshooting the Certificate Server, Certificates, and the CA, page 30

Generating a Certificate Server RSA Key Pair

Perform this task to manually generate an RSA key pair for the certificate server. Manually generating a certificate server RSA key pair allows you to specify the type of key pair you want to generate, to create an exportable key pair for backup purposes, to specify the key pair storage location, or to specify the key generation location.

If you are running Cisco IOS Release 12.3(8)T or earlier releases, you may want to create an exportable certificate server key pair for backup, or archive purposes. If this task is not performed, the certificate server will automatically generate a key pair, which will not be marked as exportable. Automatic CA certificate archiving was introduced in Cisco IOS Release 12.3(11)T.

As of Cisco IOS Release 12.4(11)T and later releases, if your router has a USB token configured and available, the USB token can be used as cryptographic device in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication of credentials to be performed on a USB token. The private key never leaves the USB token and is not exportable. The public key is exportable. For titles of specific documents about configuring a USB token and making it available to use as a cryptographic device, see the “The following sections provide references related to Cisco IOS certificate server Related Documents” section.
It is recommended that the private key be kept in a secure location and that you regularly archive the certificate server database.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. ```
   crypto key generate rsa [general-keys | usage-keys | signature | encryption] [label key-label] [exportable] [modulus modulus-size] [storage devicename:] [on devicename:]
   ```
4. `crypto key export rsa key-label pem {terminal | url [url] {3des | des}} passphrase`
5. `crypto key import rsa key-label pem [usage-keys | signature | encryption] {terminal | url [url]} [exportable] [on devicename:] passphrase`
6. `exit`
7. `show crypto key mypubkey rsa`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Generates the RSA key pair for the certificate server. When specifying a label name, you must use the same name for the label that you plan to use for the certificate server (via the <code>crypto pki server cs-label</code> command). By default, the fully qualified domain name (FQDN) of the router is used for the key label.</td>
</tr>
<tr>
<td>`crypto key generate rsa [general-keys</td>
<td>usage-keys</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config)# crypto key generate rsa label mycs exportable modulus 2048</td>
</tr>
</tbody>
</table>
### Examples

The following example generates a general usage 1024-bit RSA key pair on a USB token with the label “ms2” with crypto engine debugging messages shown:

```
Router(config)# crypto key generate rsa on usbtokon0 label ms2 modulus 1024
The name for the keys will be: ms2
% The key modulus size is 1024 bits
% Generating 1024 bit RSA keys, keys will be on-token, non-exportable...
Jan 7 02:41:40.895: crypto_engine: Generate public/private keypair [OK]
Jan 7 02:44:09.623: crypto_engine: Create signature
Jan 7 02:44:10.467: crypto_engine: Verify signature
Jan 7 02:44:10.467: CryptoEngine0: CRYPTO_RSA_CREATE_PUBLKEY(hw)(ipsec)
Jan 7 02:44:10.467: CryptoEngine0: CRYPTO_RSA_PUB_DECRYPT(hw)(ipsec)
```

Now, the on-token keys labeled “ms2” may be used for enrollment.

The following example shows the successful import of an encryption key to a configured and available USB tokens:

```
Router(config)# crypto key import rsa mycs pem url nvramp:mycs
% Importing public Encryption key or certificate PEM file...
filename [e-encr.pub]?
Reading file from nvramp:e-encr.pub
% Importing private Encryption key PEM file...
Source filename [e-encr.prv]?
Reading file from nvramp:e-encr.prv
% Key pair import succeeded.
```
Configuring Certificate Servers

The following tasks explain how to configure a certificate server, a subordinate certificate server, or an RA-mode certificate server, and how to enable automatic rollover.

- Configuring a Certificate Server, page 13
- Configuring a Subordinate Certificate Server, page 15
- Configuring a Certificate Server to Run in RA Mode, page 21
- Configuring the Root Certificate Server to Delegate Enrollment Tasks to the RA Mode Certificate Server, page 23

Prerequisites for Automatic CA Certificate Rollover

When configuring a certificate server, for automatic CA certificate rollover to run successfully, the following prerequisites are applicable for your CA servers:

- You must be running Cisco IOS Release 12.4(2)T or a later release on your CA servers.
- Your CA server must be enabled and fully configured with a reliable time of day, an available key pair, a self-signed, valid CA certificate associated with the key pair, a CRL, an accessible storage device, and an active HTTP/SCEP server.
- CA clients must have successfully completed automatic enrollment and have autoenrollment enabled with the same certificate server.

Note

If you are running Cisco IOS 12.4(2)T or earlier releases, only your root CA will support automatic CA certificate rollover functionality. Cisco IOS 12.4(4)T or later releases support all CAs—root CAs, subordinate CAs, and RA-mode CAs.

Restrictions for Automatic CA Certificate Rollover

When configuring a certificate server, in order for automatic CA certificate rollover to run successfully, the following restrictions are applicable:

- SCEP must be used to support rollover. Any device that enrolls with the PKI using an alternative to SCEP as the certificate management protocol or mechanism (such as enrollment profiles, manual enrollment, or TFTP enrollment) will not be able to take advantage of the rollover functionality provided by SCEP.
- If you have automatic archive configured on your network and the archive fails, rollover will not occur because the certificate server will not enter the rollover state, and the rollover certificate and key pair will not be automatically saved.

Configuring a Certificate Server

Perform this task to configure a Cisco IOS certificate server and enable automatic rollover.

SUMMARY STEPS

1. enable
2. configure terminal
3. `ip http server`
4. `crypto pki server cs-label`
5. `no shutdown`
6. `auto-rollover [time-period]`

### DETAILED STEPS

<table>

</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip http server</code></td>
<td>Enables the HTTP server on your system.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router(config)# ip http server</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>crypto pki server cs-label</code></td>
<td>Defines a label for the certificate server and enters certificate server configuration mode. &lt;ul&gt;&lt;li&gt;Note If you manually generated an RSA key pair, the <code>cs-label</code> argument must match the name of the key pair.&lt;/li&gt;&lt;/ul&gt;</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router(config)# crypto pki server server-pki</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>no shutdown</code></td>
<td>(Optional) Enables the certificate server. &lt;ul&gt;&lt;li&gt;Note Only use this command at this point if you want to use the preconfigured default functionality. That is, do not issue this command just yet if you plan to change any of the default settings as shown in the task “Configuring Certificate Server Functionality.”&lt;/li&gt;&lt;/ul&gt;</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router(cs-server)# no shutdown</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>auto-rollover [time-period]</code></td>
<td>(Optional) Enables the automated CA certificate rollover functionality. &lt;ul&gt;&lt;li&gt;time-period—default is 30 days.&lt;/li&gt;&lt;/ul&gt;</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router(cs-server)# auto-rollover 90</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure the certificate server “ca”:

```plaintext
Router(config)# crypto pki server ca
Router(cs-server)# no shutdown

% Once you start the server, you can no longer change some of the configuration.
Are you sure you want to do this? [yes/no]: yes
% Generating 1024 bit RSA keys ...[OK]
```
% Certificate Server enabled.
Router(cs-server)# end
!
Router# show crypto pki server

Certificate Server ca:
Status: enabled, configured
CA cert fingerprint: 5A856122 4051347F 55E8C246 866D0AC3
Granting mode is: manual
Last certificate issued serial number: 0x1
Current storage dir: nvram:
Database Level: Complete - all issued certs written as <serialnum>.cer

The following example shows how to enable automated CA certificate rollover on the server mycs with the auto-rollover command. The show crypto pki server command shows that the automatic rollover has been configured on the server mycs with an overlap period of 25 days.

Router(config)# crypto pki server mycs
Router(cs-server)# auto-rollover 25
Router(cs-server)# no shut

%Some server settings cannot be changed after CA certificate generation.
% Generating 1024 bit RSA keys, keys will be non-exportable...[OK]
% Exporting Certificate Server signing certificate and keys...

% Certificate Server enabled.
Router(cs-server)#

Router# show crypto pki server

Certificate Server mycs:
Status:enabled
Server's configuration is locked (enter "shut" to unlock it)
Issuer name:CN=mycs
CA cert fingerprint:70AFECA9 211CDDCC 6AA9D7FF 3ADB03AE
Granting mode is:manual
Last certificate issued serial number:0x1
CA certificate expiration timer:00:49:26 PDT Jun 20 2008
CRL NextUpdate timer:00:49:29 PDT Jun 28 2005
Current storage dir:nvram:
Database Level:Minimum - no cert data written to storage
Auto-Rollover configured, overlap period 25 days
Autorollover timer:00:49:26 PDT May 26 2008

Configuring a Subordinate Certificate Server

Perform this task to configure a subordinate certificate server to grant all or certain SCEP or manual certificate requests and to enable automatic rollover.

Restrictions

- You must be running Cisco IOS Release 12.3(14)T or a later release. (Versions prior to Cisco IOS software Release 12.3(14)T support only one certificate server and no hierarchy; that is, subordinate certificate servers are not supported.)
- The root certificate server should be a Cisco IOS certificate server.
SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. enrollment url url
5. exit
6. crypto pki server cs-label
7. issuer name DN-string
8. mode sub-cs
9. auto-rollover [time-period]
10. grant auto rollover {ca-cert | ra-cert}
11. no shutdown

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<td>Router (ca-trustpoint)# exit</td>
</tr>
<tr>
<td>Step 6 crypto pki server cs-label</td>
<td>Enables a Cisco IOS certificate server and enters cs-server configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# crypto pki server sub</td>
</tr>
<tr>
<td>Note</td>
<td>The subordinate server must have the same name as the trustpoint that was created in Step 3 above.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 7**
issuer name DN-string

**Example:**
Router(cs-server)# issuer-name CN=sub CA, O=Cisco, C=us

(Optional) Specifies the DN as the CA issuer name for the certificate server.

| **Step 8**
mode sub-cs

**Example:**
Router(cs-server)# mode sub-cs

Places the PKI server into sub-certificate server mode.

| **Step 9**
auto-rollover [time-period]

**Example:**
Router(cs-server)# auto-rollover 90

(Optional) Enables the automated CA certificate rollover functionality.

- time-period — default is 30 days.

| **Step 10**
grant auto rollover {ca-cert | ra-cert}

**Example:**
Router(cs-server)# grant auto rollover ca-cert

(Optional) Automatically grants reenrollment requests for subordinate CAs and RA-mode CAs without operator intervention.

- ca-cert — Specifies that the subordinate CA rollover certificate will be automatically granted.
- ra-cert — Specifies that the RA-mode CA rollover certificate will be automatically granted.

**Note** If this is the first time that a subordinate certificate server is enabled and enrolled, the certificate request must be manually granted.

| **Step 11**
no shutdown

**Example:**
Router(cs-server)# no shutdown

Enables or reenables the certificate server.

If this is the first time that a subordinate certificate server is enabled, the certificate server will generate the key and obtain its signing certificate from the root certificate server.

**Examples**

If the certificate server fails to enable or if the certificate server has trouble handling the request that has been configured, you can use the **debug crypto pki server** command to troubleshoot your configuration as shown in the following examples (Clock Not Set and Trustpoint Not Configured):

Router# debug crypto pki server

**Clock Not Set**

Router (config)# crypto pki server sub
Router (cs-server)# mode sub-cs
Router (cs-server)# no shutdown
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key % or type Return to exit
Password:
*Jan  6 20:57:37.667: CRYPTO_CS: enter FSM: input state initial, input signal no shut

Re-enter password:
% Generating 1024 bit RSA keys ...
*Jan  6 20:57:45.303: CRYPTO_CS: starting enabling checks
*Jan  6 20:57:45.303: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]
% Time has not been set. Cannot start the Certificate server

Trustpoint Not Configured
Router (config)# crypto pki server sub
Router (cs-server)# mode sub-cs
Router (cs-server)# no shutdown

% Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key or type Return to exit
Password:
Jan  6 21:00:15.961: CRYPTO_CS: enter FSM: input state initial, input signal no shut.
Jan  6 21:03:34.309: CRYPTO_CS: enter FSM: input state initial, input signal time set.
Jan  6 21:03:34.313: CRYPTO_CS: exit FSM: new state initial.
Jan  6 21:03:34.313: CRYPTO_CS: cs config has been unlocked
Re-enter password:
% Generating 1024 bit RSA keys ...
Jan  6 21:03:44.413: CRYPTO_CS: starting enabling checks
Jan  6 21:03:44.413: CRYPTO_CS: associated trust point 'sub' does not exist; generated automatically
Jan  6 21:03:44.417: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]

Jan  6 21:04:03.993: CRYPTO_CS: nvram filesystem
Jan  6 21:04:04.077: CRYPTO_CS: serial number 0x1 written.
You must specify an enrollment URL for this CA before you can authenticate it.
% Failed to authenticate the Certificate Authority

If the certificate server fails to obtain its signing certificate from the root certificate server, you can use the `debug crypto pki transactions` command to troubleshoot your configuration as shown in the following example:

Router# debug crypto pki transactions

Jan  6 21:07:00.311: CRYPTO_CS: enter FSM: input state initial, input signal time set
Jan  6 21:07:00.311: CRYPTO_CS: exit FSM: new state initial
% Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key or type Return to exit
Password:
Jan  6 21:07:03.535: CRYPTO_CS: enter FSM: input state initial, input signal no shut
Re-enter password:
% Generating 1024 bit RSA keys ...
Jan  6 21:07:10.619: CRYPTO_CS: starting enabling checks
Jan  6 21:07:10.619: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]

Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment

How to Set Up and Deploy a Cisco IOS Certificate Server

Jan  6 21:09:18.432: CRYPTO_CS: DB version 1
Jan  6 21:09:18.432: CRYPTO_CS: last issued serial number is 0x1
Jan  6 21:09:18.532: CRYPTO_CS: SCEP server started
Jan  6 21:09:18.532: CRYPTO_CS: exit FSM: new state enabled
Jan  6 21:09:18.536: CRYPTO_CS: cs config has been locked
Jan  6 21:09:18.536: CRYPTO_PKI: All enrollment requests completed for trustpoint sub.

If the certificate server fails to enable or if the certificate server has trouble handling the request that has been configured, you can use the `debug crypto pki server` command to troubleshoot the progress of an enrollment. This command can also be used to debug the root CA (turn it on at the root CA).

### Configuring a Certificate Server to Run in RA Mode

#### Restrictions for Configuring a Certificate Server for RA Mode

When the Cisco IOS certificate server is acting as an RA, the issuing CA should be a Cisco IOS certificate server.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki trustpoint *name*
4. enrollment url *url*
5. subject-name x.500-name
6. exit
7. crypto pki server *cs-label*
8. mode ra
9. auto-rollover [*time-period*]
10. grant auto rollover {ca-cert | ra-cert}
11. no shutdown
12. no shutdown

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>

Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment

How to Set Up and Deploy a Cisco IOS Certificate Server

Configuring the Root Certificate Server to Delegate Enrollment Tasks to the RA Mode Certificate Server

Perform the following steps on the router that is running the issuing certificate server; that is, configure the root certificate server that is delegating enrollment tasks to the RA mode certificate server.

**Note**
Granting enrollment requests for an RA is essentially the same process as granting enrollment requests for client devices—except that enrollment requests for an RA are displayed in the section “RA certificate requests” of the command output for the `crypto pki server info-requests` command.

### SUMMARY STEPS

1. `enable`
2. `crypto pki server cs-label info requests`
3. `crypto pki server cs-label grant req-id`
4. `configure terminal`
5. `crypto pki server cs-label`
6. `grant ra-auto`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>crypto pki server cs-label info requests</code></td>
<td>Displays the outstanding RA certificate request.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>Router# crypto pki server root-server info requests</code></td>
<td>This command is issued on the router that is running the issuing certificate server.</td>
</tr>
</tbody>
</table>
After you have configured a certificate server, you can use the preconfigured default values or specify values via the CLI for the functionality of the certificate server. If you choose to specify values other than the defaults, see the following section, “Configuring Certificate Server Functionality.”

### Configuring Certificate Server Functionality

After you have enabled a certificate server and are in certificate server configuration mode, use any of the steps in this task to configure basic certificate server functionality values other than the default values.

### Certificate Server Default Values and Recommended Values

The default values for a certificate server are intended to address a relatively small network (of about ten devices). For example, the database settings are minimal (via the `database level minimal` command) and the certificate server handles all CRL requests via SCEP. For larger networks, it is recommended that you use either the database setting “names” or “complete” (as described in the `database level` command) for possible audit and revocation purposes. Depending on the CRL checking policy, you should also use an external CDP in a larger network.
Certificate Server File Storage and Publication Locations

You have the flexibility to store file types to different storage and publication locations.

**SUMMARY STEPS**

1. `database url root-url`
2. `database url {cnm | crl | crt | p12 | pem | ser} root-url`
3. `database url {cnm | crl | crt} publish root-url`
4. `database level {minimal | names | complete}`
5. `database username username [password [encr-type] password]`
6. `database archive {pkcs12 | pem} [password [encr-type] password]`
7. `issuer-name DN-string`
8. `lifetime {ca-certificate | certificate} time`
9. `lifetime crl time`
10. `lifetime enrollment-request time`
11. `cdp-url url`
12. `no shutdown`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
`database url root-url`

*Example:*`Router (cs-server)# database url tftp://cert-svr-db.company.com`

Specifies the primary location where database entries for the certificate server will be written out.

If this command is not specified, all database entries will be written to NVRAM.

| **Step 2**
`database url {cnm | crl | crt | p12 | pem | ser} root-url`

*Example:*`Router (cs-server)# database url ser nvram:`

Specifies certificate server critical file storage location by file type.

*Note* If this command is not specified, all critical files will be stored to the primary location if specified. If the primary location is not specified, all critical files will be stored to NVRAM.

| **Step 3**
`database url {cnm | crl | crt} publish root-url`

*Example:*`Router (cs-server)# database url crl publish tftp://csdb_specific_crl_files.company.com`

Specifies certificate server publish location by file type.

*Note* If this command is not specified, all publish files will be stored to the primary location if specified. If the primary location is not specified, all publish files will be stored to NVRAM.
### Command or Action

| Step 4 | database level (minimal | names | complete) |
|--------|-------------------------|
| **Example:** | Router (cs-server)# database level complete |

- **Purpose:** Controls what type of data is stored in the certificate enrollment database.
  - **minimal**—Enough information is stored only to continue issuing new certificates without conflict; the default value.
  - **names**—In addition to the information given in the minimal level, the serial number and subject name of each certificate.
  - **complete**—In addition to the information given in the minimal and names levels, each issued certificate is written to the database.

Note: The `complete` keyword produces a large amount of information; if it is issued, you should also specify an external TFTP server in which to store the data via the `database url` command.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>database username username [password [encr-type] password]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router (cs-server)# database username user password PASSWORD</td>
</tr>
</tbody>
</table>

- **Purpose:** (Optional) Sets a username and password when a user is required to access a primary certificate enrollment database storage location.

| Step 6 | database archive (pkcs12 | pem) [password [encr-type] password] |
|--------|--------------------------------------|
| **Example:** | Router (cs-server)# database archive pem |

- **Purpose:** (Optional) Sets the CA key and CA certificate archive format and password to encrypt the file.
  - The default value is `pkcs12`, so if this subcommand is not configured, autoarchiving will still be done, and the PKCS12 format will be used.
  - The password is optional. If it is not configured, you will be prompted for the password when the server is turned on for the first time.

Note: It is recommended that you remove the password from the configuration after the archive is finished.

<table>
<thead>
<tr>
<th>Step 7</th>
<th>issuer-name DN-string</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router (cs-server)# issuer-name my-server</td>
</tr>
</tbody>
</table>

- **Purpose:** (Optional) Sets the CA issuer name to the specified distinguished name (`DN-string`). The default value is as follows: `issuer-name cn={cs-label}`.

| Step 8 | lifetime (ca-certificate | certificate) time |
|--------|----------------------|
| **Example:** | Router (cs-server)# lifetime certificate 888 |

- **Purpose:** (Optional) Specifies the lifetime, in days, of a CA certificate or a certificate.
  - Valid values range from 1 day to 1825 days. The default CA certificate lifetime is 3 years; the default certificate lifetime is 1 year. The maximum certificate lifetime is 1 month less than the lifetime of the CA certificate.

<table>
<thead>
<tr>
<th>Step 9</th>
<th>lifetime crl time</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router (cs-server)# lifetime crl 333</td>
</tr>
</tbody>
</table>

- **Purpose:** (Optional) Defines the lifetime, in hours, of the CRL that is used by the certificate server.
  - Maximum lifetime value is 336 hours (2 weeks). The default value is 168 hours (1 week).
Examples

The following example shows how to configure a CDP location where the PKI clients do not support SCEP GetCRL requests:

Router (config)# crypto pki server aaa
Router (cs-server)# database level minimum
Router (cs-server)# database url tftp://10.1.1.1/username1/
Router (cs-server)# issuer-name CN=aaa
Router (cs-server)# cdp-url http://server.company.com/certEnroll/aaa.crl

After a certificate server has been enabled on a router, the `show crypto pki server` command displays the following output:

Router# show crypto pki server
Certificate Server status: enabled, configured
Granting mode is: manual
Last certificate issued serial number: 0x1
CA certificate expiration timer: 19:31:15 PST Nov 17 2006
Current storage dir: nvram:
Database Level: Minimum - no cert data written to storage
Working with Automatic CA Certificate Rollover

This section describes different methods of initiating automatic CA certificate rollover on the server and obtaining rollover certificates. Use the following tasks as appropriate:

- Starting Automated CA Certificate Rollover Immediately, page 28
- Requesting a Certificate Server Client’s Rollover Certificate, page 28
- Exporting a CA Rollover Certificate, page 29

Starting Automated CA Certificate Rollover Immediately

Use this task to initiate the automated CA certificate rollover process immediately on your root CA server.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto pki server cs-label [rollover [cancel]]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example: | Router> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: | Router# configure terminal |
| **Step 3** crypto pki server cs-label [rollover [cancel]] | Immediately starts the CA certificate rollover process by generating a shadow CA certificate.  
To delete the CA certificate rollover certificate and keys, use the cancel keyword. |
| Example: | Router(config)# crypto pki server mycs rollover |

Requesting a Certificate Server Client’s Rollover Certificate

Use this task to request a certificate server client’s rollover certificate.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto pki server cs-label [rollover request pkcs10 terminal]`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | enable  | Enables privileged EXEC mode.  
| Example:          |         | • Enter your password if prompted. |
| configure terminal|         | Enters global configuration mode. |
| crypto pki server cs-label [rollover request pkcs10 terminal] | Requests a client rollover certificate from the server. |

Examples

The following example shows a rollover certificate request being inputted into the server:

```
Router# crypto pki server mycs rollover request pkcs10 terminal
% Enter Base64 encoded or PEM formatted PKCS10 enrollment request.
% End with a blank line or "quit" on a line by itself.
-----BEGIN CERTIFICATE REQUEST-----
MIIBUTCBuwIBADASMRAwDgYDVQQDEwdOZXdSb290MIGfMA0GCSqGSIb3DQEBAQUA
A4GNADCBiQKBgQDMHeev1ERSs320zblQqk+31hV/R2HpYQ/iM6uT1jkJf5iyU0UPR

sBxeEc40xe0d5Fm0h0YKOSASsh2YKOf1nyQR2Dmm2x/33QGol5QyRvjkheQidaQAB
oAwDQYJKoZIhvcNAQEEBQADgYEALM90r4d79X6vxdDgjuYJxfBCoV4UyF4junr
ahBS/y6CnVYYyFSF8UBoohX2G7Fw4I14+s618gYfoFUn1/L82djs18TLr0r6wPCoRqAfps7IWWle4ciz0fjAUU+C7IWowbCAhwF16qz2nIEj9pQ/y2fK907sb3CCJZiBe
-----END CERTIFICATE REQUEST-----
```

Exporting a CA Rollover Certificate

Use this task to export a CA rollover certificate.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki export trustpoint pem {terminal | url url} [rollover]
Managing the Enrollment Request Database

SCEP supports two client authentication mechanisms—manual and preshared key. Manual enrollment requires the administrator at the CA server to specifically authorize the enrollment requests; enrollment using preshared keys allows the administrator to preauthorize enrollment requests by generating a one-time password (OTP).

Use any of the optional steps within this task to help manage the enrollment request database by performing functions such as specifying enrollment processing parameters that are to be used by SCEP and by controlling the run-time behavior or the certificate server.

SUMMARY STEPS

1. enable
2. crypto pki server cs-label grant \{all | req-id\}
3. crypto pki server cs-label reject \{all | req-id\}
4. crypto pki server cs-label password generate \{minutes\}
5. `crypto pki server cs-label revoke certificate-serial-number`
6. `crypto pki server cs-label request pkcs10 {url | terminal} [base64 | pem]`
7. `crypto pki server cs-label info crl`
8. `crypto pki server cs-label info requests`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:** Router> enable | |
| **Step 2** `crypto pki server cs-label grant {all | req-id}` | Grants all or specific SCEP requests. |
| **Example:** Router# crypto pki server mycs grant all | |
| **Step 3** `crypto pki server cs-label reject {all | req-id}` | Rejects all or specific SCEP requests. |
| **Example:** Router# crypto pki server mycs reject all | |
| **Step 4** `crypto pki server cs-label password generate [minutes]` | Generates a OTP for SCEP requests.  
- `minutes`—Length of time, in minutes, that the password is valid. Valid values range from 1 to 1440 minutes. The default is 60 minutes.  
**Note** Only one OTP is valid at a time; if a second OTP is generated, the previous OTP is no longer valid. |
| **Example:** Router# crypto pki server mycs password generate 75 | |
| **Step 5** `crypto pki server cs-label revoke certificate-serial-number` | Revokes a certificate on the basis of its serial number.  
- `certificate-serial-number`—One of the following options:  
  - A string with a leading 0x, which is treated as a hexadecimal value  
  - A string with a leading 0 and no x, which is treated as octal  
  - All other strings, which are treated as decimal |
| **Example:** Router# crypto pki server mycs revoke 3 | |
Removing Requests from the Enrollment Request Database

After the certificate server receives an enrollment request, the server can leave the request in a pending state, reject it, or grant it. The request stays in the enrollment request database for 1 week until the client polls the certificate server for the result of the request. If the client exits and never polls the certificate server, you can remove either individual requests or all requests from the database.

Use this task to remove requests from the database and allow the server to be returned to a clean slate with respect to the keys and transaction IDs. Also, you can use this task to help troubleshoot a SCEP client that may not be behaving properly.

### SUMMARY STEPS

1. enable
2. **crypto pki server cs-label remove {all | req-id}**

### Command or Action | Purpose
--- | ---
**Step 6** crypto pki server cs-label request pkcs10 (url | terminal) [base64 | pem] | Manually adds either a base64-encoded or PEM-formatted PKCS10 certificate enrollment request to the request database. After the certificate is granted, it will be displayed on the console terminal using base64 encoding.

- **pem**— Specifies the certificate will be returned with PEM headers automatically added to the certificate after the certificate is granted, regardless of whether PEM headers were used in the request.

- **base64**— Specifies the certificate will be returned without privacy-enhanced mail (PEM) headers, regardless of whether PEM headers were used in the request.

**Example:**
```
Router# crypto pki server mycs request pkcs10 terminal pem
```

**Step 7** crypto pki server cs-label info crl | Displays information regarding the status of the current CRL.

**Example:**
```
Router# crypto pki server mycs info crl
```

**Step 8** crypto pki server cs-label info requests | Displays all outstanding certificate enrollment requests.

**Example:**
```
Router# crypto pki server mycs info requests
```
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Example:** Router> enable | |
| **Step 2** crypto pki server cs-label remove {all | req-id} | Removes enrollment requests from the enrollment request database. |
| **Example:** Router# crypto pki server mycs remove 15 | |

Deleting a Certificate Server

Users can delete a certificate server from the PKI configuration if they no longer want it on the configuration. Typically, a subordinate certificate server or an RA is being deleted. However, users may delete a root certificate server if they are moving it to another device via the archived RSA keys.

Perform this task to delete a certificate server from your PKI configuration.

**Note** When a certificate server is deleted, the associated trustpoint and key are also deleted.

SUMMARY STEPS

1. enable
2. configure terminal
3. no crypto pki server cs-label

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Example:** Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Router# configure terminal | |
| **Step 3** no crypto pki server cs-label | Deletes a certificate server and associated trustpoint and key. |
| **Example:** Router (config)# no crypto pki server mycs | |
Verifying and Troubleshooting Certificate Server and CA Status

Use any of the following optional steps to verify the status of the certificate server or the CA.

**SUMMARY STEPS**

1. `enable`
2. `debug crypto pki server`
3. `dir filesystem:`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

**Verifying CA Certificate Information**

To obtain information relating to the CA certificates including the certificate server rollover process, rollover certificates, and timers, you may use any of the following commands.

**Note**

These commands are not exclusive to shadow certificate information. If no shadow certificate exists, the following commands will simply display the active certificate information.

**SUMMARY STEPS**

1. `crypto pki certificate chain name`
2. `crypto pki server cs-label info requests`
3. `show crypto pki certificates`
4. `show crypto pki server`
5. `show crypto pki trustpoints`
DETAILED STEPS

Step 1 The **crypto pki certificate chain** command can be used to view the certificate chain details and to distinguish the current active certificate from the rollover certificate in the certificate chain. The following example shows a certificate chain with an active CA certificate and a shadow, or rollover, certificate:

Router(config)# crypto pki certificate chain mica

certificate 06  
certificate ca 01  
  ! This is the peer’s shadow PKI certificate.  
certificate rollover 0B  
  ! This is the CA shadow PKI certificate  
certificate rollover ca 0A

Step 2 The **crypto pki server info requests** command displays all outstanding certificate enrollment requests. The following example shows the output for shadow PKI certificate information requests:

Router# crypto pki server myca info requests

Enrollment Request Database:
RA certificate requests:

<table>
<thead>
<tr>
<th>ReqID</th>
<th>State</th>
<th>Fingerprint</th>
<th>SubjectName</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

RA rollover certificate requests:

<table>
<thead>
<tr>
<th>ReqID</th>
<th>State</th>
<th>Fingerprint</th>
<th>SubjectName</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Router certificates requests:

<table>
<thead>
<tr>
<th>ReqID</th>
<th>State</th>
<th>Fingerprint</th>
<th>SubjectName</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>pending</td>
<td>A426AF07FE3A4BB69062E0E47198E5BF</td>
<td>hostname=client</td>
</tr>
</tbody>
</table>

Router rollover certificates requests:

<table>
<thead>
<tr>
<th>ReqID</th>
<th>State</th>
<th>Fingerprint</th>
<th>SubjectName</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>pending</td>
<td>B69062E0E47198E5BFA426AF07FE3A4B</td>
<td>hostname=client</td>
</tr>
</tbody>
</table>

Step 3 The **show crypto pki certificates** command displays information about your certificate, the certification authority certificate, shadow certificates, and any registration authority certificates. The following example displays the certificate of the router and the certificate of the CA. There is no shadow certificate available. A single, general-purpose RSA key pair was previously generated, and a certificate was requested but not received for that key pair. Note that the certificate status of the router shows “Pending.” After the router receives its certificate from the CA, the Status field changes to “Available” in the **show** output:

Router# show crypto pki certificates

Certificate

<table>
<thead>
<tr>
<th>Subject Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name: myrouter.example.com</td>
</tr>
<tr>
<td>IP Address: 192.0.2.1</td>
</tr>
<tr>
<td>Serial Number: 04806682</td>
</tr>
<tr>
<td>Status: Pending</td>
</tr>
<tr>
<td>Key Usage: General Purpose</td>
</tr>
</tbody>
</table>

Fingerprint: 428125BD A3419600 3F6C7831 6CD8FA95 00000000
CA Certificate
Status: Available
Certificate Serial Number: 3051DF7123BEE31B8341DFE4B3A338E5F
Key Usage: Not Set

Step 4 The `show crypto pki server` command displays the current state and configuration of the certificate server. The following example shows that the certificate server “routercs” has rollover configured. The CA auto-rollover time has occurred and the rollover, or shadow, PKI certificate is available. The status shows the rollover certificate fingerprint and rollover CA certificate expiration timer information.

```
Router# show crypto pki server
Certificate Server routercs:
  Status: enabled, configured
  Issuer name: CN=walnutcs
  CA cert fingerprint: 800F5944 74337E5B C2DF6C52 9A7B1BDB
  Granting mode is: auto
  Last certificate issued serial number: 0x7
  CRL NextUpdate timer: 21:50:56 GMT Mar 5 2004
  Current storage dir: nvram:
  Database Level: Minimum - no cert data written to storage
  Rollover status: available for rollover
  Rollover CA cert fingerprint: 6AAF5944 74227A5B 23DF3E52 9A7F1FEF
  Rollover CA certificate expiration timer: 22:10:29 GMT Jan 29 2017
```

Step 5 The `show crypto pki trustpoints` command displays the trustpoints that are configured in the router. The following output shows that a shadow CA certificate is available and shows the SCEP capabilities reported during the last enrollment operation:

```
Router# show crypto pki trustpoints
Trustpoint vpn:
  Subject Name:
    cn=Cisco SSL CA
    o=Cisco Systems
  Serial Number: 0FFEBBD1B6F6D9D0EA7875875E4C695
  Certificate configured.
  Rollover certificate configured.
  Enrollment Protocol:
    SCEPV1, PKI Rollover
```

Configuration Examples for Using a Certificate Server

This section contains the following configuration examples:

- Configuring Specific Storage and Publication Locations: Examples, page 37
- Removing Enrollment Requests from the Enrollment Request Database: Examples, page 38
- Autoarchiving the Certificate Server Root Keys: Examples, page 39
- Restoring a Certificate Server from Certificate Server Backup Files: Examples, page 41
- Subordinate Certificate Server: Example, page 43
- RA Mode Certificate Server: Example, page 45
- Enabling CA Certificate Rollover to Start Immediately: Example, page 47
Configuring Specific Storage and Publication Locations: Examples

The following example shows the configuration of a minimal local file system, so that the certificate server can respond quickly to certificate requests. The .ser and .crl files are stored on the local Cisco IOS file system for fast access, and a copy of all of the .crt files are published to a remote location for long-term logging.

```
crypto pki server myserver
  !Pick your database level.
  database level minimum
  !Specify a location for the .crt files that is different than the default local
  !Cisco IOS file system.
  database url crt publish http://url username user1 password secret
  Note
  Free space on the local file system should be monitored, in case the .crl file becomes too large.
```

The following example shows the configuration of a primary storage location for critical files, a specific storage location for the critical file serial number file, the main certificate server database file, and a password protected file publication location for the CRL file:

```
Router(config)# crypto pki server mycs
Router(cs-server)# database url ftp://cs-db.company.com
!
  % Server database url was changed. You need to move the
  % existing database to the new location.
!
Router(cs-server)# database url ser nvram:
Router(cs-server)# database url crl publish ftp://crl.company.com username myname password mypassword
Router(cs-server)# end
```

The following output displays the specified primary storage location and critical file storage locations specified:

```
Router# show

Sep  3 20:19:34.216: %SYS-5-CONFIG_I: Configured from console by user on console

Router# show crypto pki server

Certificate Server mycs:
  Status: disabled
  Server's configuration is unlocked (enter "no shut" to lock it)
  Issuer name: CN=mycs
  CA cert fingerprint: -Not found-
  Granting mode is: manual
  Last certificate issued serial number: 0x0
  CA certificate expiration timer: 00:00:00 GMT Jan 1 1970
  CRL not present.
  Current primary storage dir: ftp://cs-db.company.com
  Current storage dir for .ser files: nvram:
  Database Level: Minimum - no cert data written to storage The following output displays all storage and publication locations. The serial number file (.ser) is stored in NVRAM. The CRL file will be published to ftp://crl.company.com with a username and password. All other critical files will be stored to the primary location, ftp://cs-db.company.com.

Router# show running-config

section crypto pki server
  crypto pki server mycs shutdown database url ftp://cs-db.company.com
```
Removing Enrollment Requests from the Enrollment Request Database: Examples

The following examples show both the enrollment requests that are currently in the enrollment request database and the result after one of the enrollment requests has been removed from the database.

Enrollment Request Currently in the Enrollment Request Database

The following example shows that the `crypto pki server info requests` command has been used to display the enrollment requests that are currently in the Enrollment Request Database:

```
Router# crypto pki server myserver info requests
Enrollment Request Database:

RA certificate requests:
ReqID | State  | Fingerprint   | SubjectName
---   | ------ | --------------| --------------
      |        |                |               

Router certificates requests:
ReqID | State | Fingerprint   | SubjectName
---   |------ |-------------- | --------------
2     | pending | 1B07F3021DAAB0F19F35DA25D01D8567 | hostname=host1.company.com
1     | denied | 5322459D2DC70B3F8EF3D03A795CP6356 | hostname=host2.company.com
```

crypto pki server remove Command Used to Remove One Enrollment Request

The following example shows that the `crypto pki server remove` command has been used to remove Enrollment Request 1:

```
Router# crypto pki server myserver remove 1
```

Enrollment Request Database After the Removal of One Enrollment Request

The following example shows the result of the removal of Enrollment Request 1 from the Enrollment Request Database:

```
Router# crypto pki server mycs info requests
Enrollment Request Database:

RA certificate requests:
ReqID | State  | Fingerprint   | SubjectName
---   | ------ | --------------| --------------
      |        |                |               

Router certificates requests:
ReqID | State | Fingerprint   | SubjectName
---   |------ |-------------- | --------------
2     | pending | 1B07F3021DAAB0F19F35DA25D01D8567 | hostname=host1.company.com
```
Autoarchiving the Certificate Server Root Keys: Examples

The following output configurations and examples show what you might see if the `database archive` command has not been configured (that is, configured using the default value); if the `database archive` command has been configured to set the CA certificate and CA key archive format as PEM, without configuring a password; and if the `database archive` command has been configured to set the CA certificate and CA key archive format as PKCS12, with a password configured. The last example is sample content of a PEM-formatted archive file.

**database archive Command Not Configured**

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
</table>

The default is PKCS12, and the prompt for the password appears after the `no shutdown` command has been issued.

```plaintext
Router (config)# crypto pki server myserver
Router (cs-server)# no shutdown
% Generating 1024 bit RSA keys ...[OK]
% Ready to generate the CA certificate.
%Some server settings cannot be changed after CA certificate generation.
Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
! Note the next two lines, which are asking for a password.
% Please enter a passphrase to protect the private key.
Password:
% Certificate Server enabled.
Router (cs-server)# end
```

Router# dir nvram:

Directory of nvram:/

```
  125  -rw-  1693  <no date>  startup-config
  126  ----  5    <no date>  private-config
     1  -rw-  32    <no date>  myserver.ser
     2  -rw-  214   <no date>  myserver.crl
! Note the next line, which indicates PKCS12 format.
     3  -rw-  1499  <no date>  myserver.p12
```

**database archive Command and pem Keyword Configured**

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
</table>

The prompt for the password appears after the `no shutdown` command has been issued.

```plaintext
Router (config)# crypto pki server myserver
Router (cs-server)# database archive pem
Router (cs-server)# no shutdown
% Generating 1024 bit RSA keys ...[OK]
% Ready to generate the CA certificate.
%Some server settings cannot be changed after CA certificate generation.
Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
! Note the next two lines, which are asking for a password.
% Please enter a passphrase to protect the private key.
Password:
```
% Certificate Server enabled.
Router (cs-server)# end

Router# dir nvram
Directory of nvram:/
  125 -rw- 1693 <no date> startup-config
  126 ---- 5 <no date> private-config
  1 -rw- 32 <no date> myserver.ser
  2 -rw- 214 <no date> myserver.crl

! Note the next line showing that the format is PEM.
  3 -rw- 1705 <no date> myserver.pem

database archive Command and pkcs12 Keyword (and Password) Configured

Note
When the password is entered, it will be encrypted. However, it is recommended that you remove the password from the configuration after the archive has finished.

Router (config)# crypto pki server myserver
Router (cs-server)# database archive pkcs12 password cisco123
Router (cs-server)# no shutdown
% Generating 1024 bit RSA keys ...[OK]
% Ready to generate the CA certificate.
% Some server settings cannot be changed after CA certificate generation.

Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
! Note that you are not being prompted for a password.
% Certificate Server enabled.
Router (cs-server)# end
Router# dir nvram:
Directory of nvram:/
  125 -rw- 1693 <no date> startup-config
  126 ---- 5 <no date> private-config
  1 -rw- 32 <no date> myserver.ser
  2 -rw- 214 <no date> myserver.crl

! Note that the next line indicates that the format is PKCS12.
  3 -rw- 1499 <no date> myserver.p12

PEM-Formatted Archive
The following sample output shows that autoarchiving has been configured in PEM file format. The archive consists of the CA certificate and the CA private key. To restore the certificate server using the backup, you would have to import the PEM-formatted CA certificate and CA key individually.

Note
In addition to the CA certificate and CA key archive files, you should also back up the serial file (.ser) and the CRL file (.crl) regularly. The serial file and the CRL file are both critical for CA operation if you need to restore your certificate server.

Router# more nvram:mycs.pem

-----BEGIN CERTIFICATE-----

Restoring a Certificate Server from Certificate Server Backup Files: Examples

The following example shows that restoration is from a PKCS12 archive and that the database URL is NVRAM (the default).

```
Router# copy tftp://192.0.2.71/backup.ser nvram:mycs.ser
Destination filename [mycs.ser]?
32 bytes copied in 1.320 secs (24 bytes/sec)
Router# copy tftp://192.0.2.71/backup.crl nvram:mycs.crl
Destination filename [mycs.crl]?
214 bytes copied in 1.324 secs (162 bytes/sec)
Router# configure terminal
Router (config)# crypto pki import mycs pkcs12 tftp://192.0.2.71/backup.p12 cisco123
Source filename [backup.p12]?
CRYPTO_PKI: Imported PKCS12 file successfully.
Router (config)# crypto pki server mycs
! fill in any certificate server configuration here
Router (cs-server)# no shutdown
% Certificate Server enabled.
Router (cs-server)# end
Router# show crypto pki server
Certificate Server mycs:
  Status: enabled
  Server's current state: enabled
  Issuer name: CN=mycs
  CA cert fingerprint: 34885330 B13EAD45 196DA461 B43E813F
  Granting mode is: manual
  Last certificate issued serial number: 0x1

```

The private key is protected by the password that is configured in "database archive pem password pwd" or that is entered when you are prompted for the password.

Configuration Examples for Using a Certificate Server

Subordinate Certificate Server: Example

The following configuration and output is typical of what you might see after configuring a subordinate certificate server:

```
Router (config)# crypto pki trustpoint sub
Router (ca-trustpoint)# enrollment url http://192.0.2.6
Router (ca-trustpoint)# exit

Router (config)# crypto pki server sub
Router (ca-server)# mode sub-cs
Router (ca-server)# no shutdown

%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key
% or type Return to exit
Password:
Jan  6 22:32:22.698: CRYPTO_CS: enter FSM: initial, initial signal no shut

Re-enter password:
% Generating 1024 bit RSA keys ...
Jan  6 22:32:23.302: CRYPTO_CS: starting enabling checks
Jan  6 22:32:23.304: CRYPTO_CS: key 'sub' does not exist; generated automatically [OK]

Jan  6 22:32:23.810: %SSH-5-ENABLED: SSH 1.99 has been enabled
Certificate has the following attributes:
```
Fingerprint MD5: 328ACC02 52B25DB8 22F8F104 B6055B5B
Fingerprint SHA1: 02FD799D DD40C7A8 61DC53AB 1E89A3EA 2A729EE2

% Do you accept this certificate? [yes/no]:
Jan 6 22:32:44.830: CRYPTO_CS: nvram filesystem
Jan 6 22:32:44.922: CRYPTO_CS: serial number 0x1 written.
Jan 6 22:32:46.798: CRYPTO_CS: authenticating the CA 'sub'y
Trustpoint CA certificate accepted. %

% Certificate request sent to Certificate Authority

% Enrollment in progress...

Jan 6 22:35:02.359: CRYPTO_CS: exit FSM: new state enabled
Jan 6 22:35:02.359: CRYPTO_CS: cs config has been locked

Root Certificate Server Differentiation: Example

When issuing certificates, the root certificate server (or parent subordinate certificate server) will differentiate the certificate request from “Sub CA,” “RA,” and peer requests, as shown in the following sample output:

Router# crypto pki server server1 info req

Enrollment Request Database:
RA certificate requests:
ReqID State Fingerprint SubjectName
--------------------------------------------------------------------
Subordinate CS certificate requests:
ReqID State Fingerprint SubjectName
--------------------------------------------------------------------
1 pending CB9977AD8A73B146D322174999980F66 hostname=host-subcs.company.com
RA certificate requests:
<table>
<thead>
<tr>
<th>ReqID</th>
<th>State</th>
<th>Fingerprint</th>
<th>SubjectName</th>
</tr>
</thead>
</table>

Router certificate requests:
<table>
<thead>
<tr>
<th>ReqID</th>
<th>State</th>
<th>Fingerprint</th>
<th>SubjectName</th>
</tr>
</thead>
</table>

Show Output for a Subordinate Certificate Server: Example

The following `show crypto pki server` command output indicates that a subordinate certificate server has been configured:

```
Router# show crypto pki server
Certificate Server sub:
  Status: enabled
  Server's configuration is locked (enter "shut" to unlock it)
  Issuer name: CN=sub
  CA cert fingerprint: 11B586EE 3B354F33 14A25DDD 7BD39187
  Server configured in subordinate server mode
  Upper CA cert fingerprint: 328ACC02 52B25DBB 22F8F104 B6055B5B
  Granting mode is: manual
  Last certificate issued serial number: 0x1
  CRL NextUpdate timer: 22:33:29 GMT Jan 13 2005
  Current storage dir: nvram:
  Database Level: Minimum - no cert data written to storage
```

RA Mode Certificate Server: Example

The following output is typical of what you might see after having configured an RA mode certificate server:

```
Router-ra (config)# crypto pki trustpoint myra
Router-ra (ca-trustpoint)# enrollment url http://192.0.2.17
! Include "cn=ioscs RA" or "ou=ioscs RA" in the subject-name.
Router-ra (ca-trustpoint)# subject-name cn=myra, ou=ioscs RA, o=company, c=us
Router-ra (ca-trustpoint)# exit
Router-ra (config)# crypto pki server myra
Router-ra (cs-server)# mode ra
Router-ra (cs-server)# no shutdown
% Generating 1024 bit RSA keys ...[OK]
Certificate has the following attributes:
  Fingerprint MD5: 32661452 0DDA3CE5 8723B469 09AB9E85
  Fingerprint SHA1: 9785BBCD 6C67D27C C950E8D0 718C7A14 C0FE9C38
% Do you accept this certificate? [yes/no]: yes
% Trustpoint CA certificate accepted.
% Ready to request the CA certificate.
% Some server settings cannot be changed after the CA certificate has been requested.

Are you sure you want to do this? [yes/no]: yes
% % Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this password to the CA administrator in order to revoke your certificate.
% For security reasons your password will not be saved in the configuration. Please make a note of it.
```
Password:
Re-enter password:

% The subject name in the certificate will include: cn=myra, ou=ioscs RA, o=company, c=us
% The subject name in the certificate will include: Router-ra.company.com
% Include the router serial number in the subject name? [yes/no]: no
% Include an IP address in the subject name? [no]: no
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
% The certificate request fingerprint will be displayed.
% The 'show crypto pki certificate' command will also show the fingerprint.

% Enrollment in progress...
Router-ra (cs-server)#

Sep 15 22:32:40.201: CRYPTO_PKI: Certificate Request Fingerprint SHA1: 897CDF40 C6563EAA
0FED05F7 0115FD3A 4FFC5231
Sep 15 22:34:00.366: %PKI-6-CERTRET: Certificate received from Certificate Authority
Router-ra (cs-server)#
Router-ra(cs-server)# end

Router-ra# show crypto pki server
Certificate Server myra:
Status: enabled
Issuer name: CN=myra
CA cert fingerprint: 32661452 0DDA3CE5 8723B469 09AB9E85
! Note that the certificate server is running in RA mode
Server configured in RA mode
RA cert fingerprint: C65F5724 0E63B3CC BE7AE016 BE0D34FE
Granting mode is: manual
Current storage dir: nvram:
Database Level: Minimum - no cert data written to storage

The following output shows the enrollment request database of the issuing certificate server after the RA has been enabled:

The RA certificate request is recognized by the issuing certificate server because "ou=ioscs RA" is listed in the subject name.

Router-ca# crypto pki server mycs info request
Enrollment Request Database:

Subordinate CA certificate requests:
ReqID State Fingerprint SubjectName
--------------------------------------------------------------
! The request is identified as RA certificate request.
RA certificate requests:
ReqID State Fingerprint SubjectName
--------------------------------------------------------------
12 pending 88F547A407FA0C90F97CDE8900A30CB0
hostname=Router-ra.company.com,cn=myra,ou=ioscs RA,o=company,c=us
Router certificates requests:
ReqID  State  Fingerprint  SubjectName
--------------------------------------------------------------
  ! Issue the RA certificate.
Router-ca# crypto pki server mycs grant 12

The following output shows that the issuing certificate server is configured to issue a certificate automatically if the request comes from an RA:

Router-ca(config)# crypto pki server mycs
Router-ca (cs-server)# grant ra-auto
% This will cause all certificate requests already authorized by known RAs to be automatically granted.

Are you sure you want to do this? [yes/no]: yes
Router-ca (cs-server)# end
Router-ca# show crypto pki server

Certificate Server mycs:
  Status: enabled
  Server's current state: enabled
  Issuer name: CN=mycs
  CA cert fingerprint: 32661452 0DDA3CE5 8723B469 09AB9E85
  ! Note that the certificate server will issue certificate for requests from the RA.
  Granting mode is: auto for RA-authorized requests, manual otherwise
  Last certificate issued serial number: 0x2
  Current storage dir: nvram:
  Database Level: Minimum - no cert data written to storage

The following example shows the configuration of “myra”, an RA server, configured to support automatic rollover from “myca”, the CA. After the RA server is configured, automatic granting of certificate reenrollment requests is enabled:

crypto pki trustpoint myra
  enrollment url http://myca
  subject-name ou=iosca RA
rsakeypair myra
crypto pki server myra
  mode ra
  auto-rollover

crypto pki server mycs
  grant auto rollover ra-cert
  auto-rollover 25

**Enabling CA Certificate Rollover to Start Immediately: Example**

The following example shows how to enable automated CA certificate rollover on the server mycs with the `crypto pki server` command. The `show crypto pki server` command then shows the current state of the mycs server and that the rollover certificate is currently available for rollover.

Router(config)# crypto pki server mycs rollover

Jun 20 23:51:21.211:%PKI-4-NOSHADOWAUTOSAVE:Configuration was modified. Issue "write memory" to save new IOS CA certificate

! The config has not been automatically saved because the config has been changed.
Router# show crypto pki server

Certificate Server mycs:
  Status:enabled
  Server’s configuration is locked (enter "shut" to unlock it)
  Issuer name:CN=mycs
  CA cert fingerprint:E7A5FABA 5D7AA26C F2A9F7B3 03CE229A
  Granting mode is:manual
  Last certificate issued serial number:0x2
  CA certificate expiration timer:00:49:26 PDT Jun 20 2008
  CRL NextUpdate timer:00:49:29 PDT Jun 28 2005
  Current storage dir:nvram:
  Database Level:Minimum - no cert data written to storage
  Rollover status:available for rollover
  ! Rollover certificate is available for rollover.
  Rollover CA certificate fingerprint:9BD7A443 00A6DD74 E4D9ED5F B7931BE0
  Rollover CA certificate expiration time:00:49:26 PDT Jun 20 2011
  Auto-Rollover configured, overlap period 25 days

Where to Go Next

After the certificate server is successfully running, you can either begin enrolling clients via manual mechanisms (as explained in the module “Configuring Certificate Enrollment for a PKI”) or begin configuring SDP, which is a web-based enrollment interface, (as explained in the module “Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI.”)

Feature Information for the Cisco IOS Certificate Server

Table 4 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

For information on a feature in this technology that is not documented here, see the “Implementing and Managing PKI Features Roadmap.”

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note Table 4 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

### Subordinate/RA Mode IOS Certificate Server (CS) Rollover

12.4(4)T

This feature expands on Certificate Authority (CA) Key Rollover introduced in 12.4(2)T to allow CA certificate rollover for subordinate CAs and RA-mode CAs. This functionality allows the rollover expiring CA certificates and keys and to have these changes propagate through the PKI network without manual intervention.

The following sections provide information about this feature:

- **Automatic CA Certificate and Key Rollover**
- **Configuring Certificate Servers**
- **RA Mode Certificate Server: Example**

The following command was modified by this feature: `grant auto rollover`

### Certificate Authority (CA) Key Rollover

12.4(2)T

This feature introduces the ability for root or subordinate CAs to roll over expiring CA certificates and keys and to have these changes propagate through the PKI network without manual intervention.

The following sections provide information about this feature:

- **Automatic CA Certificate and Key Rollover**
- **Configuring Certificate Servers**
- **Working with Automatic CA Certificate Rollover**
- **Enabling CA Certificate Rollover to Start Immediately: Example**

The following commands were introduced or modified by this feature: `auto-rollover, crypto pki certificate chain, crypto pki export pem, crypto pki server info request, crypto pki server`, `show crypto pki certificates`, `show crypto pki server`, and `show crypto pki trustpoint`

### Cisco IOS Certificate Server

12.3(8)T

This feature introduces support for the Cisco IOS certificate server, which offers users a CA that is directly integrated with Cisco IOS software to more easily deploy basic PKI networks.

The following sections provide information about this feature:

- **Information About Cisco IOS Certificate Servers**
- **How to Set Up and Deploy a Cisco IOS Certificate Server**
The Certificate Server Auto Archive Enhancement

Enhancement 12.3(11)T This enhancement enables the CA certificate and CA key to be backed up automatically just once after they are generated by the certificate server. As a result, it is not necessary to generate an exportable CA key if CA backup is desirable.

The following sections provide information about this feature:
- Certificate Enrollment Using a Certificate Server
- Configuring Certificate Server Functionality

The following commands were introduced by this feature:
- `crypto pki server remote`
- `database archive`

The Certificate Server Registration Authority (RA) Mode enhancement

Enhancement 12.3(7)T A certificate server can be configured to run in RA mode.

The following section provides information about this feature:
- Configuring a Certificate Server to Run in RA Mode

The following commands were introduced by this feature:
- `grant ra-auto`
- `lifetime enrollment-requests`

PKI Status 1 12.3(11)T This enhancement provides a quick snapshot of current trustpoint status.

The following section provides information about this enhancement:
- Maintaining, Verifying, and Troubleshooting the Certificate Server, Certificates, and the CA

The following command was modified by this enhancement: `show crypto pki trustpoints`

Subordinate Certificate Server 1 12.3(14)T This enhancement allows you to configure a subordinate certificate server to grant all or certain SCEP or manual certificate requests.

The following section provides information about this enhancement:
- Configuring a Subordinate Certificate Server

The following command was introduced by this enhancement: `mode sub-cs`

Cisco IOS Certificate Server

This feature was introduced on Cisco ASR 1000 Series Routers.

Trustpoint CLI

This feature was introduced on Cisco ASR 1000 Series Routers.

---

1. This is a minor enhancement. Minor enhancements are not typically listed in Feature Navigator.
Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

Storing PKI Credentials

First Published: May 2, 2005
Last Updated: August 21, 2007

This module explains how to store public key infrastructure (PKI) credentials, such as Rivest, Shamir, and Adelman (RSA) keys and certificates in a specific location.

An example of a certificate storage location includes NVRAM, which is the default location, and other local storage locations, such as flash, as supported by your platform.

An example of an RSA key and certificate storage location includes a USB token. Selected Cisco platforms support smart card technology in a USB key form factor (such as an Aladdin USB eToken key). USB tokens provide secure configuration distribution, provide RSA operations such as on-token key generation, signing, and authentication, and allow users to store Virtual Private Network (VPN) credentials for deployment.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Storing PKI Credentials” section on page 25.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Contents

- Prerequisites for Storing PKI Credentials, page 2
- Restrictions for Storing PKI Credentials, page 2
- Information About Storing PKI Credentials, page 3
- How to Configure PKI Storage, page 5
- Configuration Examples for PKI Storage, page 21
Prerequisites for Storing PKI Credentials

Prerequisites for Specifying a Local Certificate Storage Location
Before you can specify the local certificate storage location, your system should meet the following requirements:
- A Cisco IOS Release 12.4(2)T PKI-enabled image or a later image
- A platform that supports storing PKI credentials as separate files
- A configuration that contains at least one certificate
- An accessible local file system

Prerequisites for Specifying USB Token Storage for PKI Credentials
Before you can use a USB token, your system should meet the following requirements:
- A Cisco 871 router, Cisco 1800 series, Cisco 2800 series, a Cisco 3800 series router, or a Cisco 7200VXR NPE-G2 platform
- At least a Cisco IOS Release 12.3(14)T image running on any of the supported platforms
- A Cisco supported USB token
- A k9 image

Restrictions for Storing PKI Credentials

Restrictions for Specifying a Local Certificate Storage Location
When storing certificates to a local storage location, the following restrictions are applicable:
- Only local file systems may be used. An error message will be displayed if a remote file system is selected, and the command will not take effect.
- A subdirectory may be specified if supported by the local file system. NVRAM does not support subdirectories.

Restrictions for Specifying USB Token Storage
When using a USB token to store PKI data, the following restrictions are applicable:
- USB token support requires a 3DES (k9) Cisco IOS software image, which provides secure file storage.
- You cannot boot an image from a USB token. (However, you can boot a configuration from a USB token.)
- USB hubs are currently not supported. Thus, the number of supported devices is limited to the number of available USB ports.
Information About Storing PKI Credentials

To determine where to store PKI credentials, you should understand the following concepts:

- Storing Certificates to a Local Storage Location, page 3
- PKI Credentials and USB Tokens, page 3

Storing Certificates to a Local Storage Location

Certificates are stored to NVRAM by default, however some routers do not have the required amount of NVRAM to successfully store certificates. Introduced in Cisco IOS Release 12.4(2)T is the ability to specify where certificates are stored on a local file system.

All Cisco platforms support NVRAM and flash local storage. Depending on your platform, you may have other supported local storage options including bootflash, slot, disk, USB flash, or USB token.

During run time, you can specify what active local storage device you would like to use to store certificates.

PKI Credentials and USB Tokens

To use a secure USB token on your router, you should understand the following concepts:

- How a USB Token Works, page 3
- Benefits of USB Tokens, page 4

How a USB Token Works

A smart card is a small plastic card, containing a microprocessor and memory that allows you to store and process data. A USB token is a smart card with a USB interface. The token can securely store any type of file within its available storage space (32 KB). Configuration files that are stored on the USB token can be encrypted and accessed only via a user PIN. The router will not load the configuration file unless the proper PIN has been configured for secure deployment of router configuration files.

After you plug the USB token into the router, you must log into the USB token; thereafter, you can change default settings, such as the user PIN (default: 1234567890) and the allowed number of failed login attempts (default: 15 attempts) before future logins are refused. For more information on accessing and configuring the USB token, see the section “Logging Into and Setting Up the USB Token.”

After you have successfully logged into the USB token, you can copy files from the router on to the USB token via the `copy` command. USB token RSA keys and associated IPsec tunnels remain available until the router is reloaded. To specify the length of time before the keys are removed and the IPsec tunnels are torn down, issue the `crypto pki token removal timeout` command.

Table 1 highlights the capabilities of the USB token.

<table>
<thead>
<tr>
<th>Function</th>
<th>USB Token</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessibility</td>
<td>Used to securely store and transfer digital certificates, preshared keys, and router configurations from the USB token to the router.</td>
</tr>
<tr>
<td>Storage Size</td>
<td>32 KB</td>
</tr>
</tbody>
</table>
Benefits of USB Tokens

USB token support on a Cisco router provides the following application benefits:

**Removable Credentials: Provide or Store VPN Credentials on an External Device for Deployment**
A USB token can use smart card technology to store a digital certificate and configuration for IPsec VPN deployment. This ability enhances the capability of the router to generate RSA public keys to authenticate at least one IPsec tunnel. (Because a router can initiate multiple IPsec tunnels, the USB token can contain several certificates, as appropriate.)

Storing VPN credentials on an external device reduces the threat of compromising secure data.

**PIN Configuration for Secure File Deployment**
A USB token can store a configuration file that can be used for enabling encryption on the router via a user-configured PIN. (That is, no digital certificates, preshared keys, or VPNs are used.)

**Touchless or Low Touch Configuration**
The USB token can provide remote software configuration and provisioning with little or no human interaction. Configuration is set up as an automated process. That is, the USB token can store a bootstrap configuration that the router can use to boot from after the USB token has been inserted into the router. The bootstrap configuration connects the router to a TFTP server, which contains a configuration that completely configures the router.

**RSA Operations**
As of Cisco IOS Release 12.4(11)T and later releases, a USB token may be used as a cryptographic device in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication to be performed on the token.

General-purpose, special-usage, encryption, or signature RSA key pairs with a modulus of 2048 bits or less may be generated from credentials located on your token storage device. Private keys are not distributed and remain on the token by default, however you may configure the private key storage location.

Keys that reside on a USB token are saved to persistent token storage when they are generated. Key deletion will remove the keys stored on the token from persistent storage immediately. (Keys that do not reside on a token are saved to or deleted from nontoken storage locations when the write memory or a similar command is issued.)
Remote Device Configuration and Provisioning in a Secure Device Provisioning (SDP) Environment

As of Cisco IOS Release 12.4(15)T and later releases, SDP may be used to configure a USB token. The configured USB token may be transported to provision a device at a remote location. That is, a USB token may be used to transfer cryptographic information from one network device to another remote network device providing a solution for a staged USB token deployment.

For information about using USB tokens with SDP, see document titles in the “Related Documents” section.

How to Configure PKI Storage

This section contains the following configuration tasks:

- Specifying a Local Storage Location for Certificates, page 5
- Setting Up and Using USB Tokens on Cisco Routers, page 6
- Troubleshooting USB Tokens, page 16

Specifying a Local Storage Location for Certificates

The following procedure allows you to specify the local storage location for certificates.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto pki certificate storage location-name`
4. `exit`
5. `copy source-url destination-url`
6. `show crypto pki certificates storage`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto pki certificate storage location-name</td>
<td>Specifies the local storage location for certificates.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto pki certificate storage flash:/certs</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> copy source-url destination-url</td>
<td>(Optional) Saves the running configuration to the startup configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# copy system:running-config nvram:startup-config</td>
<td><strong>Note</strong> Settings will only take effect when the running configuration is saved to the startup configuration.</td>
</tr>
<tr>
<td><strong>Step 6</strong> show crypto pki certificates storage</td>
<td>(Optional) Displays the current setting for the PKI certificate storage location.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show crypto pki certificates storage</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output for the `show crypto pki certificates storage` command where the certificates are stored in the `certs` subdirectory of disk0:

```
Router# show crypto pki certificates storage
Certificates will be stored in disk0:/certs/
```

**Setting Up and Using USB Tokens on Cisco Routers**

This section contains the following procedures that allow you to configure a router to support USB tokens:

- Storing the Configuration on a USB Token, page 7
- Logging Into and Setting Up the USB Token, page 7
- Configuring the USB Token, page 10
- Setting Administrative Functions on the USB Token, page 13
Storing the Configuration on a USB Token

Perform this task to store the configuration file in a USB token.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. boot config usbtoken[0-9]:filename

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> boot config usbtoken[0-9]:filename</td>
<td>Specifies that the startup configuration file is stored in a secure USB token.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# boot config usbtoken0:file</td>
<td></td>
</tr>
</tbody>
</table>

Logging Into and Setting Up the USB Token

Perform this task to log into and to perform the initial set up of a USB token.

**Use of RSA Keys with a USB Token**

- RSA keys are loaded after the USB token is successfully logged into the router.
- By default, newly generated RSA keys are stored on the most recently inserted USB token. Regenerated keys should be stored in the same location where the original RSA key was generated.

**Automatic Login**

Automatic login allows the router to completely come back up without any user or operator intervention. The PIN is stored in the private NVRAM, so it is not visible in the startup or running configuration.

**Note**

A hand-generated startup configuration can contain the automatic login command for deployment purposes, but the `copy system:running-config nvram: startup-config` command must be issued to put the hand-generated configuration in the private configuration.

**Manual Login**

Unlike automatic login, manual login requires that the user know the actual USB token PIN.
Manual login can be used when storing a PIN on the router is not desirable. Manual login may also be suitable for some initial deployment or hardware replacement scenarios for which the router is obtained from the local supplier or drop-shipped to the remote site. Manual login can be executed with or without privileges, and it will make files and RSA keys on the USB token available to the Cisco IOS software. If a secondary configuration file is configured, it will be executed only with the privileges of the user who is performing the login. Thus, if you want to use manual login and set up the secondary configuration on the USB token to perform anything useful, you need to enable privileges.

Manual login can also be used in recovery scenarios for which the router configuration has been lost. If the scenario contains a remote site that normally connects to the core network with a VPN, the loss of the configuration and RSA keys requires out-of-band services that the USB token can provide. The USB token can contain a boot configuration, a secondary configuration, or both, and RSA keys to authenticate the connection.

**SUMMARY STEPS**

1. `enable`
2. `crypto pki token token-name [admin] login [pin]`
   
   or
   
   `configure terminal`
3. `crypto pki token token-name user-pin [pin]`
4. `exit`
5. `show usbtoken[0-9]:filename`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2** crypto pki token token-name [admin] login [pin] | Manually logs into the USB token.  
You must specify the `admin` keyword if later you want to change the user PIN.  
**Example:**  
Router# crypto pki token usbtoken0 admin login 5678  
or  
configure terminal  
**Example:**  
Router# configure terminal |
| **Step 3** crypto pki token token-name user-pin [pin] | (Optional) Configures the router to log into the token automatically, using the specified PIN at router startup or when the USB token is inserted into a USB slot.  
The PIN is encrypted and stored in NVRAM.  
**Note** You will be asked to enter your passphrase.  
**Example:**  
Router(config)# crypto pki token usbtoken0 user-pin 1234 |
| **Step 4** exit | Exits global configuration mode.  
**Example:**  
Router(config)# exit |
| **Step 5** show usbtokentoken-name:[0-9]:filename | (Optional) Verifies whether the USB token has been logged onto the router.  
**Example:**  
Router# show usbtokentoken-name:0:filename |

### What to Do Next

After you have logged into the USB token, it is available for use.
- To further configure the USB token, see the “Configuring the USB Token” section.
- To perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the “Setting Administrative Functions on the USB Token” section.
- To utilize the USB token as a cryptographic device to perform RSA operations, see the document titles in the “Related Documents” section.
- To specify that the USB token be used for RSA operations during initial autoenrollment, see the document titles in the “Related Documents” section.
Configuring the USB Token

After you have set up automatic login, you may perform this task to further configure the USB token.

**PINs and Passphrases**

For additional PIN security with automatic login, you may encrypt your PIN stored in NVRAM and set up a passphrase for your USB token. Establishing a passphrase allows you to keep your PIN secure; another user needs only to know the passphrase, not the PIN.

When the USB token is inserted into the router, the passphrase is needed to decrypt the PIN. Once the PIN is decrypted, the router can then use the PIN to login the USB token.

*Note*

The user has only the access they would normally have and needs only privilege level 1 to log in.

Unlocking and Locking the USB Token

The USB token itself can be locked (encrypted) or unlocked (decrypted).

Unlocking the USB token allows it to be used. Once unlocked, Cisco IOS treats the token as if it were automatically logged in. Any keys on the USB token are loaded, and if a secondary configuration file is on the token, it is executed with full user privileges (privilege level 15) independent of the privilege level of the logged-in user.

Locking the token, unlike logging out of the token, deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if configured.

Secondary Configuration and Unconfiguration Files

Configuration files that exist on a USB token are called secondary configuration files. If you create and configure a secondary configuration file, it is executed after the token is logged in. The existence of a secondary configuration file is determined by the presence of a secondary configuration file option in the Cisco IOS configuration stored in NVRAM. When the token is removed or logged out and the removal timer expires, a separate secondary unconfiguration file is processed to remove all secondary configuration elements from the running configuration. Secondary configuration and secondary unconfiguration files are executed at privilege level 15 and are not dependent on the level of the user logged in.

**SUMMARY STEPS**

1. `enable`
2. `crypto pki token token-name unlock [pin]`
3. `configure terminal`
4. `crypto pki token token-name encrypted-user-pin [write]`
5. `crypto pki token token-name secondary unconfig file`
6. `exit`
7. `crypto pki token token-name lock [pin]`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>crypto pki token token-name unlock [pin]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# crypto pki token mytoken unlock mypin</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>crypto pki token token-name encrypted-user-pin [write]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# crypto pki token mytoken encrypted-user-pin write</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>crypto pki token token-name secondary unconfig file</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# crypto pki token mytoken secondary unconfig configs/myunconfigfile.cfg</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>exit</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# exit</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>crypto pki token token-name lock [pin]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# crypto pki token mytoken lock mypin</td>
</tr>
</tbody>
</table>

### Examples

The following example shows both the configuration and encryption of a user PIN and then the router reloading and the user PIN being unlocked:

```
! Configuring the user PIN

Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# crypto pki token usbtoken0: user-pin
Enter password:

! Encrypt the user PIN
```

(Original content continued...)

(Optional) Allows the token to be used if the USB token has been locked.

Once unlocked, Cisco IOS treats the token as if it has been automatically logged in. Any keys on the token are loaded and if a secondary configuration file exists, it is executed.

(Optional) Encrypts the stored PIN in NVRAM.

(Optional) Specifies the secondary configuration file and its location.

(Optional) Deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if it exists.
How to Configure PKI Storage

Router (config)# crypto pki token usbtoken0: encrypted-user-pin
Enter passphrase:
Router(config)# exit
Router#
Sep 20 21:51:38.076: %SYS-5-CONFIG_I: Configured from console by console
!
Router# show running config
.
.
crypto pki token usbtoken0 user-pin *encrypted*
.
.
! Reloading the router.
!
Router> enable
Password:
!
! Decrypting the user pin.
!
Router# crypto pki token usbtoken0: unlock
Token eToken is usbtoken0
!
Enter passphrase:
Token login to usbtoken0(eToken) successful
Router#
Sep 20 22:31:13.128: %CRYPTO-6-TOKENLOGIN: Cryptographic Token eToken Login Successful

The following example shows a how a secondary unconfiguration file might be used to remove secondary configuration elements from the running configuration. For example, a secondary configuration file might be used to set up a PKI trustpoint. A corresponding unconfiguration file, named mysecondaryunconfigfile.cfg, might contain this command line:

   no crypto pki trustpoint token-tp

If the token were removed and the following commands executed, the trustpoint and associated certificates would be removed from the router’s running configuration:

Router# configure terminal
Router(config)# no crypto pki token mytoken secondary unconfig mysecondaryunconfigfile.cfg

What to Do Next

After you have logged into and configured the USB token, it is available for use.

- To perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the “Setting Administrative Functions on the USB Token” section.
- To utilize the USB token as a cryptographic device to perform RSA operations, see the document titles in the “Related Documents” section.
To specify that the USB token be used for RSA operations during initial autoenrollment, see the document titles in the “Related Documents” section.

## Setting Administrative Functions on the USB Token

Perform this task to change default settings, such as the user PIN, the maximum number of failed attempts on the USB token, or the credential storage location.

### SUMMARY STEPS

1. `enable`
2. `crypto pki token token-name [admin] change-pin [pin]`
3. `crypto pki token token-name device: label token-label`
4. `configure terminal`
5. `crypto key storage device:`
6. `crypto key generate rsa [general-keys | usage-keys | signature | encryption] [label key-label] [exportable] [modulus modulus-size] [storage devicename:] [on devicename:]`
7. `crypto key move rsa keylabel [non-exportable] [on | storage] location`
8. `crypto pki token {token-name | default} removal timeout [seconds]`
9. `crypto pki token {token-name | default} max-retries [number]`
10. `exit`
11. `copy usbfash[0-9]:filename destination-url`
12. `show usbtoken[0-9]:filename`
13. `crypto pki token token-name logout`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> crypto pki token token-name [admin] change-pin [pin]</td>
<td>(Optional) Changes the user PIN number on the USB token.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# crypto pki token usbtoken0 admin change-pin</td>
<td>- If the PIN is not changed, the default PIN—1234567890—will be used.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>After the PIN has been changed, you must reset the login failure count to zero (via the crypto pki token max-retries command). The maximum number of allowable login failures is set (by default) to 15.</td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto pki token token-name device: label token-label</td>
<td>(Optional) Sets or changes the name of the USB token.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# crypto pki token my token usb0: label newlabel</td>
<td>- The value of the token-label argument may be up to 31 alphanumeric characters in length including dashes and underscores.</td>
</tr>
<tr>
<td><strong>Tip</strong></td>
<td>This command is useful when configuring multiple USB tokens for automatic login, secondary configuration files, or other token specific settings.</td>
</tr>
<tr>
<td><strong>Step 4</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> crypto key storage device:</td>
<td>(Optional) Sets the default RSA key storage location for newly created keys.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto key storage usbtoken0:</td>
<td><strong>Note</strong> Regardless of configuration settings, existing keys are stored on the device from where they were originally loaded.</td>
</tr>
<tr>
<td><strong>Step 6</strong> crypto key generate rsa [general-keys</td>
<td>usage-keys</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto key generate rsa label tokenkey1 storage usbtoken0:</td>
<td>- The storage keyword specifies the key storage location.</td>
</tr>
<tr>
<td></td>
<td>- The on keyword specifies that the keys will be generated on the designated device.</td>
</tr>
</tbody>
</table>
### Command or Action

#### Step 7
```
crypto key move rsa keylabel (non-exportable) on | storage] location
```

**Example:**
```
Router(config)# crypto key move rsa keypairname non-exportable on token
```

(Optional) Moves existing Cisco IOS credentials from the current storage location to the specified storage location. By default, the RSA key pair remains stored on the current device. Generating the key on the router and moving it to the token takes less than a minute. Generating a key on the token, using the on keyword could take five to ten minutes, and is dependent on hardware key generation routines available on the USB token. When an existing RSA key pair is generated in Cisco IOS, stored on a USB token, and used for an enrollment, it may be necessary to move those existing RSA key pairs to an alternate location for permanent storage. This command is useful when using SDP with USB tokens to deploy credentials.

#### Step 8
```
crypto pki token (token-name | default) removal timeout [seconds]
```

**Example:**
```
Router(config)# crypto pki token usbtoken0 removal timeout 60
```

(Optional) Sets the time interval, in seconds, that the router will wait before removing the RSA keys that are stored in the USB token after the USB token has been removed from the router. **Note** If this command is not issued, all RSA keys and IPsec tunnels associated with the USB token are torn down immediately after the USB token is removed from the router.

#### Step 9
```
crypto pki token (token-name | default) max-retries [number]
```

**Example:**
```
Router(config)# crypto pki token usbtoken0 max-retries 20
```

(Optional) Sets the maximum number of consecutive failed login attempts allowed before access to the USB token is denied.

- By default, the value is set at 15.

#### Step 10
```
exit
```

Exits global configuration mode.

#### Step 11
```
copy usbflash[0-9]:filename destination-url
```

**Example:**
```
Router# copy usbflash0:file1 nvram:
```

Copies files from USB token to the router. **destination-url**—See the copy command page documentation for a list of supported options.

#### Step 12
```
show usbtoken[0-9]:filename
```

**Example:**
```
Router# show usbtoken:usbfile
```

(Optional) Displays information about the USB token. You can use this command to verify whether the USB token has been logged onto the router.

#### Step 13
```
crypto pki token token-name logout
```

**Example:**
```
Router# crypto pki token usbtoken0 logout
```

Logs the router out of the USB token. **Note** If you want to save any data to the USB token, you must log back into the token.
Troubleshooting USB Tokens

This section contains descriptions of the following Cisco IOS commands that can be used to help troubleshoot possible problems that may arise while using a USB token:

- The show file systems Command, page 16
- The show usb device Command, page 17
- The show usb controllers Command, page 17
- The dir Command, page 19

The show file systems Command

Use the `show file systems` command to determine whether the router recognizes that there is a USB module plugged into a USB port. The USB module should appear on the list of file systems. If the module does not appear on the list, it can indicate any of the following problems:

- A connection problem with the USB module.
- The Cisco IOS image running on the router does not support a USB module.
- A hardware problem with the USB module itself.

SUMMARY STEPS

1. `show file systems`

DETAILED STEPS

Step 1 Sample output from the `show file systems` command showing a USB token appears below. The USB module listing appears in the last line of the examples.

```
Router# show file systems

File Systems:
  Size(b) Free(b)  Type Flags  Prefixes
  -        -  opaque  rw   archive:
  -        -  opaque  rw   system:
  -        -  opaque  rw   null:
  -        -  network rw   tftp:
  * 129880064 69414912  disk  rw   flash:#
  491512   486395  nvram  rw   nvram:
  -        -  opaque  wo   syslog:
  -        -  opaque  rw   xmodem:
  -        -  opaque  rw   ymodem:
  -        -  network rw   rcp:
  -        -  network rw   rcp:
  -        -  network rw   rcp:
  -        -  network rw   rcp:
  -        -  network rw   rcp:
  -        -  network rw   rcp:
  -        -  network rw   rcp:
  63158272 33037312  usbflash rw   usbflash0:
  32768     858  usbtoken rw   usbtoken1:
```
The show usb device Command

Use the `show usb device` command to determine if a USB token is supported by Cisco.

**SUMMARY STEPS**

1. `show usb device`

**DETAILED STEPS**

**Step 1** The following sample output for the `show usb device` command indicates whether or not the module is supported is bold in the sample output below:

```
Router# show usb device
Host Controller:1
Address:0x11
Device Configured:YES
Device Supported:YES
Description:eToken Pro 4254
Manufacturer:AKS
Version:1.0
Serial Number:
Device Handle:0x1010000
USB Version Compliance:1.0
Class Code:0xFF
Subclass Code:0x0
Protocol:0x0
Vendor ID:0x529
Product ID:0x514
Max. Packet Size of Endpoint Zero:8
Number of Configurations:1
Speed:Low
Selected Configuration:1
Selected Interface:0

Configuration:
    Number:1
    Number of Interfaces:1
    Description:
        Attributes:None
        Max Power:60 mA

Interface:
    Number:0
    Description:
        Class Code:255
        Subclass:0
        Protocol:0
        Number of Endpoints:0
```

The show usb controllers Command

Use the `show usb controllers` command to determine if there is a hardware problem with a USB flash module. If the `show usb controllers` command displays an error, the error indicates a hardware problem in the USB module.
You can also use the `show usb controllers` command to verify that copy operations onto a USB flash module are occurring successfully. Issuing the `show usb controllers` command after performing a file copy should display successful data transfers.

**SUMMARY STEPS**

1. `show usb controllers`

**DETAILED STEPS**

**Step 1**

The following sample output for the `show usb controllers` command displays a working USB flash module:

```
Router# show usb controllers

Name:1362HCD
Controller ID:1
Controller Specific Information:
  Revision:0x11

  Transfer Failures:
    Interrupt Transfer :0       Bulk Transfer :0
```
The dir Command

Use the `dir` command with the `filesystem` keyword option `usbtoken[0-9]` to display all files, directories, and their permission strings on the USB token.

**SUMMARY STEPS**

1. `dir [filesystem: ]`
DETAILED STEPS

Step 1
The following sample output displays directory information for the USB token:

Router# dir usbtoken1:

Directory of usbtoken1: /

2 d--- 64 Dec 22 2032 05:23:40 +00:00 1000
5 d--- 4096 Dec 22 2032 05:23:40 +00:00 1001
8 d--- 0 Dec 22 2032 05:23:40 +00:00 1002
10 d--- 512 Dec 22 2032 05:23:42 +00:00 1003

Cisco IOS USB Token PKI Enhancements — Phase 2

12.4(11)T This feature enhances USB token functionality by using the USB token as a cryptographic device. USB tokens may be used for RSA operations such as key generation, signing, and authentication.

The following sections in this document provide information about this feature:

- Benefits of USB Tokens
- Logging Into and Setting Up the USB Token
- Setting Administrative Functions on the USB Token

Note This document introduces the benefits of using USB tokens and the keys on the token for RSA operations. For other documentation on this topic, see the “Related Documents” section.

USB Storage PKI Enhancements

12.4(4)T 12.4(11)T This feature enhances the USB token PIN security for automatic login and increases the flexibility of USB token configuration and the RSA key storage.

The following sections provide information about this feature:

- Configuring the USB Token
- Setting Administrative Functions on the USB Token

The following commands were introduced or modified by this feature: `crypto key storage`, `crypto pki generate rsa`, `crypto pki token encrypted-user-pin`, `crypto pki token label`, `crypto pki token lock`, `crypto pki token secondary unconfig`, `crypto pki token unlock`

Certificate — Storage Location Specification

12.2(33)SXH 12.4(2)T 12.2(33)SRA This feature allows you to specify the storage location of local certificates for platforms that support storing certificates as separate files. All Cisco platforms support NVRAM, which is the default location, and flash local storage. Depending on your platform, you may have other supported local storage options including bootflash, slot, disk, USB flash, or USB token.

The following sections provide information about this feature:

- Storing Certificates to a Local Storage Location
- Specifying a Local Storage Location for Certificates
- Storing Certificates to a Specific Local Storage Location: Example

The following commands were introduced by this feature: `crypto pki certificate storage`, `show crypto pki certificates storage`
This feature enables certain models of Cisco routers to support USB tokens. USB tokens provide secure configuration distribution and allow users to VPN credentials for deployment.

The following sections provide information about this feature:

- PKI Credentials and USB Tokens
- Setting Up and Using USB Tokens on Cisco Routers
- Troubleshooting USB Tokens
- Logging Into a USB Token and Saving RSA Keys to the USB Token: Example

The following commands were introduced or modified by this feature: `copy`, `crypto pki token change-pin`, `crypto pki token login`, `crypto pki token logout`, `crypto pki token max-retries`, `crypto pki token removal timeout`, `crypto pki token secondary config`, `crypto pki token user-pin`, `debug usb driver`, `dir`, `show usb controllers`, `show usb device`, `show usb driver`, `show usbtoken`

Certificate - Storage Location Specification

Cisco IOS XE Release 2.1

This feature was introduced on Cisco ASR 1000 Series Routers.

Neighbor Router Authentication: Overview and Guidelines

You can prevent your router from receiving fraudulent route updates by configuring neighbor router authentication. This chapter describes neighbor router authentication as part of a total security plan. It describes what neighbor router authentication is, how it works, and why you should use it to increase your overall network security.

This chapter refers to neighbor router authentication as “neighbor authentication.” Neighbor router authentication is also sometimes called “route authentication.”

In This Chapter

This chapter describes the following topics:
- About Neighbor Authentication
- How Neighbor Authentication Works
- Key Management (Key Chains)
- Finding Neighbor Authentication Configuration Information

About Neighbor Authentication

This section contains the following sections:
- Benefits of Neighbor Authentication
- Protocols That Use Neighbor Authentication
- When to Configure Neighbor Authentication
Benefits of Neighbor Authentication

When configured, neighbor authentication occurs whenever routing updates are exchanged between neighbor routers. This authentication ensures that a router receives reliable routing information from a trusted source.

Without neighbor authentication, unauthorized or deliberately malicious routing updates could compromise the security of your network traffic. A security compromise could occur if an unfriendly party diverts or analyzes your network traffic. For example, an unauthorized router could send a fictitious routing update to convince your router to send traffic to an incorrect destination. This diverted traffic could be analyzed to learn confidential information of your organization, or merely used to disrupt your organization’s ability to effectively communicate using the network.

 Neighbor authentication prevents any such fraudulent route updates from being received by your router.

Protocols That Use Neighbor Authentication

Neighbor authentication can be configured for the following routing protocols:

- Border Gateway Protocol (BGP)
- DRP Server Agent
- Intermediate System-to-Intermediate System (IS-IS)
- IP Enhanced Interior Gateway Routing Protocol (EIGRP)
- Open Shortest Path First (OSPF)
- Routing Information Protocol (RIP) version 2

When to Configure Neighbor Authentication

You should configure any router for neighbor authentication if that router meets all of these conditions:

- The router uses any of the routing protocols previously mentioned.
- It is conceivable that the router might receive a false route update.
- If the router were to receive a false route update, your network might be compromised.
- If you configure a router for neighbor authentication, you also need to configure the neighbor router for neighbor authentication.

How Neighbor Authentication Works

When neighbor authentication has been configured on a router, the router authenticates the source of each routing update packet that it receives. This is accomplished by the exchange of an authenticating key (sometimes referred to as a password) that is known to both the sending and the receiving router.

There are two types of neighbor authentication used: plain text authentication and Message Digest Algorithm Version 5 (MD5) authentication. Both forms work in the same way, with the exception that MD5 sends a “message digest” instead of the authenticating key itself. The message digest is created using the key and a message, but the key itself is not sent, preventing it from being read while it is being transmitted. Plain text authentication sends the authenticating key itself over the wire.
Note that plain text authentication is not recommended for use as part of your security strategy. Its primary use is to avoid accidental changes to the routing infrastructure. Using MD5 authentication, however, is a recommended security practice.

As with all keys, passwords, and other security secrets, it is imperative that you closely guard authenticating keys used in neighbor authentication. The security benefits of this feature are reliant upon your keeping all authenticating keys confidential. Also, when performing router management tasks via Simple Network Management Protocol (SNMP), do not ignore the risk associated with sending keys using non-encrypted SNMP.

This section includes the following sections:

- Plain Text Authentication
- MD5 Authentication

### Plain Text Authentication

Each participating neighbor router must share an authenticating key. This key is specified at each router during configuration. Multiple keys can be specified with some protocols; each key must then be identified by a key number.

In general, when a routing update is sent, the following authentication sequence occurs:

**Step 1** A router sends a routing update with a key and the corresponding key number to the neighbor router. In protocols that can have only one key, the key number is always zero.

**Step 2** The receiving (neighbor) router checks the received key against the same key stored in its own memory.

**Step 3** If the two keys match, the receiving router accepts the routing update packet. If the two keys do not match, the routing update packet is rejected.

These protocols use plain text authentication:

- DRP Server Agent
- IS-IS
- OSPF
- RIP version 2

### MD5 Authentication

MD5 authentication works similarly to plain text authentication, except that the key is never sent over the wire. Instead, the router uses the MD5 algorithm to produce a “message digest” of the key (also called a “hash”). The message digest is then sent instead of the key itself. This ensures that nobody can eavesdrop on the line and learn keys during transmission.

These protocols use MD5 authentication:

- OSPF
Key Management (Key Chains)

You can configure key chains for these IP routing protocols:

- RIP version 2
- BGP
- IP Enhanced IGRP

These routing protocols offer the additional function of managing keys by using key chains. When you configure a key chain, you specify a series of keys with lifetimes, and the Cisco IOS software rotates through each of these keys. This decreases the likelihood that keys will be compromised.

Each key definition within the key chain must specify a time interval for which that key will be activated (its “lifetime”). Then, during a given key’s lifetime, routing update packets are sent with this activated key. Keys cannot be used during time periods for which they are not activated. Therefore, it is recommended that for a given key chain, key activation times overlap to avoid any period of time for which no key is activated. If a time period occurs during which no key is activated, neighbor authentication cannot occur, and therefore routing updates will fail.

Multiple key chains can be specified.

Note that the router needs to know the time to be able to rotate through keys in synchronization with the other participating routers, so that all routers are using the same key at the same moment. Refer to the Network Time Protocol (NTP) and calendar commands in the “Performing Basic System Management” chapter of the Cisco IOS Configuration Fundamentals Configuration Guide for information about configuring time at your router.

Finding Neighbor Authentication Configuration Information

To find complete configuration information for neighbor authentication, refer to the appropriate section and chapter in the Cisco IOS IP Configuration Guide as listed in Table 66.

Configuring IP Security Options

Cisco provides IP Security Option (IPSO) support as described in RFC 1108. Cisco’s implementation is only minimally compliant with RFC 1108 because the Cisco IOS software only accepts and generates a 4-byte IPSO.

IPSO is generally used to comply with the U.S. government’s Department of Defense security policy. For a complete description of IPSO commands, refer to the chapter “IP Security Options Commands” of the Cisco IOS Security Command Reference. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

In This Chapter

This chapter describes how to configure IPSO for both the basic and extended security options described in RFC 1108. This chapter also describes how to configure auditing for IPSO. This chapter includes the following sections:

- IPSO Configuration Task List
- IPSO Configuration Examples

IPSO Configuration Task List

This section describes the following configuration tasks:

- Configuring Basic IP Security Options
- Configuring Extended IP Security Options
- Configuring the DNSIX Audit Trail Facility
Configuring Basic IP Security Options

Cisco’s basic IPSO support provides the following features:

- Defines security level on a per-interface basis
- Defines single-level or multilevel interfaces
- Provides a label for incoming packets
- Strips labels on a per-interface basis
- Reorders options to put any basic security options first

To configure basic IPSO, complete the tasks in the following sections:

- Enabling IPSO and Setting the Security Classifications
- Specifying How IP Security Options Are Processed

Enabling IPSO and Setting the Security Classifications

To enable IPSO and set security classifications on an interface, use either of the following commands in interface configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-if)# ip security dedicated level authority [authority...]</td>
<td>Sets an interface to the requested IPSO classification and authorities.</td>
</tr>
<tr>
<td>Router(config-if)# ip security multilevel level1 [authority1...] to level2 authority2 [authority2...]</td>
<td>Sets an interface to the requested IPSO range of classifications and authorities.</td>
</tr>
</tbody>
</table>

Use the `no ip security` command to reset an interface to its default state.

Specifying How IP Security Options Are Processed

To specify how IP security options are processed, use any of the following optional commands in interface configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-if)# ip security ignore-authorities</td>
<td>Enables an interface to ignore the authorities field of all incoming packets.</td>
</tr>
<tr>
<td>Router(config-if)# ip security implicit-labelling [level authority [authority...]]</td>
<td>Classifies packets that have no IPSO with an implicit security label.</td>
</tr>
<tr>
<td>Router(config-if)# ip security extended-allowed</td>
<td>Accepts packets on an interface that has an extended security option present.</td>
</tr>
<tr>
<td>Router(config-if)# ip security ad</td>
<td>Ensures that all packets leaving the router on an interface contain a basic security option.</td>
</tr>
<tr>
<td>Router(config-if)# ip security strip</td>
<td>Removes any basic security option that might be present on a packet leaving the router through an interface.</td>
</tr>
</tbody>
</table>
Configuring IP Security Options

Default Values for Command Keywords

To fully comply with IPSO, the default values for the minor keywords have become complex. Default value usages include the following:

- The default for all of the minor keywords is off, with the exception of implicit-labelling and add.
- The default value of implicit-labelling is on if the interface is “unclassified Genser;” otherwise, it is off.
- The default value for add is on if the interface is not “unclassified Genser;” otherwise, it is off.

Table 67 provides a list of all default values.

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Level</th>
<th>Authority</th>
<th>Implicit Labeling</th>
<th>Add IPSO</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
<td>On</td>
<td>Off</td>
</tr>
<tr>
<td>Dedicated</td>
<td>Unclassified</td>
<td>Genser</td>
<td>On</td>
<td>Off</td>
</tr>
<tr>
<td>Dedicated</td>
<td>Any</td>
<td>Any</td>
<td>Off</td>
<td>On</td>
</tr>
<tr>
<td>Multilevel</td>
<td>Any</td>
<td>Any</td>
<td>Off</td>
<td>On</td>
</tr>
</tbody>
</table>

The default value for any interface is “dedicated, unclassified Genser.” Note that this implies implicit labeling. This might seem unusual, but it makes the system entirely transparent to packets without options. This is the setting generated when you specify the no ip security interface configuration command.

Configuring Extended IP Security Options

Cisco’s extended IPSO support is compliant with the Department of Defense Intelligence Information System Network Security for Information Exchange (DNSIX) specification documents. Extended IPSO functionality can unconditionally accept or reject Internet traffic that contains extended security options by comparing those options to configured allowable values. This support allows DNSIX networks to use additional security information to achieve a higher level of security than that achievable with basic IPSO.

Cisco also supports a subset of the security features defined in the DNSIX version 2.1 specification. Specifically, Cisco supports DNSIX definitions of the following:

- How extended IPSO is processed
- Audit trail facility

There are two kinds of extended IPSO fields defined by the DNSIX 2.1 specification and supported by Cisco’s implementation of extended IPSO—Network-level Extended Security Option (NLESO) and Auxiliary Extended Security Option (AESO) fields.

NLESO processing requires that security options be checked against configured allowable information, source, and compartment bit values, and requires that the router be capable of inserting extended security options in the IP header.
AESO is similar to NLESO, except that its contents are not checked and are assumed to be valid if its source is listed in the AESO table.

To configure extended IPSO, complete the tasks in the following sections:

- Configuring Global Default Settings
- Attaching ESOs to an Interface
- Attaching AESOs to an Interface

## Configuring Global Default Settings

To configure global default setting for extended IPSO, including AESOs, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# ip security eso-info source compartment-size default-bit</td>
<td>Configures system-wide default settings.</td>
</tr>
</tbody>
</table>

## Attaching ESOs to an Interface

To specify the minimum and maximum sensitivity levels for an interface, use the following commands in interface configuration mode:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-if)# ip security eso-min source compartment-bits</td>
<td>Sets the minimum sensitivity level for an interface.</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip security eso-max source compartment-bits</td>
<td>Sets the maximum sensitivity level for an interface.</td>
<td></td>
</tr>
</tbody>
</table>

## Attaching AESOs to an Interface

To specify the extended IPSO sources that are to be treated as AESO sources, use the following command in interface configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-if)# ip security aeso source compartment-bits</td>
<td>Specifies AESO sources.</td>
</tr>
</tbody>
</table>

DNSIX version 2.1 causes slow-switching code.

See the “IPSO Configuration Examples” section at the end of this chapter.

## Configuring the DNSIX Audit Trail Facility

The audit trail facility is a UDP-based protocol that generates an audit trail of IPSO security violations. This facility allows the system to report security failures on incoming and outgoing packets. The Audit Trail Facility sends DNSIX audit trail messages when a datagram is rejected because of IPSO security violations. This feature allows you to configure organization-specific security information.
The DNSIX audit trail facility consists of two protocols:

- DNSIX Message Deliver Protocol (DMDP) provides a basic message-delivery mechanism for all DNSIX elements.
- Network Audit Trail Protocol provides a buffered logging facility for applications to use to generate auditing information. This information is then passed on to DMDP.

To configure the DNSIX auditing facility, complete the tasks in the following sections:

- Enabling the DNSIX Audit Trail Facility
- Specifying Hosts to Receive Audit Trail Messages
- Specifying Transmission Parameters

### Enabling the DNSIX Audit Trail Facility

To enable the DNSIX audit trail facility, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# dnsix-nat source ip-address</td>
<td>Starts the audit writing module.</td>
</tr>
</tbody>
</table>

### Specifying Hosts to Receive Audit Trail Messages

To define and change primary and secondary addresses of the host to receive audit messages, use the following commands in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Router(config)# dnsix-nat primary ip-address</td>
<td>Specifies the primary address for the audit trail.</td>
</tr>
<tr>
<td>2</td>
<td>Router(config)# dnsix-nat secondary ip-address</td>
<td>Specifies the secondary address for the audit trail.</td>
</tr>
<tr>
<td>3</td>
<td>Router(config)# dnsix-nat authorized-redirection ip-address</td>
<td>Specifies the address of a collection center that is authorized to change primary and secondary addresses. Specified hosts are authorized to change the destination of audit messages.</td>
</tr>
</tbody>
</table>

### Specifying Transmission Parameters

To specify transmission parameters, use the following commands in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Router(config)# dnsix-nat transmit-count count</td>
<td>Specifies the number of records in a packet before it is sent to a collection center.</td>
</tr>
<tr>
<td>2</td>
<td>Router(config)# dnsix-dmdp retries count</td>
<td>Specifies the number of transmit retries for DMDP.</td>
</tr>
</tbody>
</table>

### IPSO Configuration Examples

The following sections provide IPSO configuration examples:
Example 1

In this example, three Ethernet interfaces are presented. These interfaces are running at security levels of Confidential Genser, Secret Genser, and Confidential to Secret Genser, as shown in Figure 106.

The following commands set up interfaces for the configuration in Figure 106:

```plaintext
interface ethernet 0
  ip security dedicated confidential genser
interface ethernet 1
  ip security dedicated secret genser
interface ethernet 2
  ip security multilevel confidential genser to secret genser
```

It is possible for the setup to be much more complex.

Example 2

In the following example, there are devices on Ethernet 0 that cannot generate a security option, and so must accept packets without a security option. These hosts do not understand security options; therefore, never place one on such interfaces. Furthermore, there are hosts on the other two networks that are using the extended security option to communicate information, so you must allow these to pass through the system. Finally, there also is a host (a Blacker Front End; see the “Configuring X.25 and LABP” chapter of the Cisco IOS Wide-Area Networking Configuration Guide for more information about Blacker emergency mode) on Ethernet 2 that requires the security option to be the first option present, and this condition also must be specified. The new configuration follows.

```plaintext
interface ethernet 0
  ip security dedicated confidential genser
```
ip security implicit-labelling
ip security strip
interface ethernet 1
  ip security dedicated secret genser
  ip security extended-allowed
!
interface ethernet 2
  ip security multilevel confidential genser to secret genser
  ip security extended-allowed
  ip security first

Example 3

This example shows how to configure a Cisco router with HP-UX CMW DNSIX hosts. The following commands should be configured on each LAN interface of the router for two DNSIX hosts to communicate:

ip security multilevel unclassified nsa to top secret nsa
ip security extended allowed

DNSIX hosts do not need to know the router’s IP addresses, and DNSIX hosts do not need to set up M6RHDB entries for the routers.

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

</table>

This chapter describes the Unicast Reverse Path Forwarding (Unicast RPF) feature. The Unicast RPF feature helps to mitigate problems that are caused by malformed or forged IP source addresses that are passing through a router.

For a complete description of the Unicast RPF commands in this chapter, refer to the chapter “Unicast Reverse Path Forwarding Commands” of the Cisco IOS Security Command Reference. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

In This Chapter

This chapter has the following sections:

- About Unicast Reverse Path Forwarding
- Unicast RPF Configuration Task List
- Troubleshooting Tips
- Monitoring and Maintaining Unicast RPF
- Unicast RPF Configuration Examples
About Unicast Reverse Path Forwarding

The Unicast RPF feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

This section covers the following information:

- How Unicast RPF Works
- Implementing Unicast RPF
- Restrictions
- Related Features and Technologies
- Prerequisites to Configuring Unicast RPF

How Unicast RPF Works

When Unicast RPF is enabled on an interface, the router examines all packets received as input on that interface to make sure that the source address and source interface appear in the routing table and match the interface on which the packet was received. This “look backwards” ability is available only when Cisco express forwarding (CEF) is enabled on the router, because the lookup relies on the presence of the Forwarding Information Base (FIB). CEF generates the FIB as part of its operation.

Note

Unicast RPF is an input function and is applied only on the input interface of a router at the upstream end of a connection.

Unicast RPF checks to see if any packet received at a router interface arrives on the best return path (return route) to the source of the packet. Unicast RPF does this by doing a reverse lookup in the CEF table. If the packet was received from one of the best reverse path routes, the packet is forwarded as normal. If there is no reverse path route on the same interface from which the packet was received, it might mean that the source address was modified. If Unicast RPF does not find a reverse path for the packet, the packet is dropped or forwarded, depending on whether an access control list (ACL) is specified in the `ip verify unicast reverse-path` interface configuration command.

Note

With Unicast RPF, all equal-cost “best” return paths are considered valid. This means that Unicast RPF works in cases where multiple return paths exist, provided that each path is equal to the others in terms of the routing cost (number of hops, weights, and so on) and as long as the route is in the FIB. Unicast RPF also functions where EIGRP variants are being used and unequal candidate paths back to the source IP address exist.

When a packet is received at the interface where Unicast RPF and ACLs have been configured, the following actions occur:

Step 1

Input ACLs configured on the inbound interface are checked.
Configuring Unicast Reverse Path Forwarding

About Unicast Reverse Path Forwarding

Step 2
Unicast RPF checks to see if the packet has arrived on the best return path to the source, which it does by doing a reverse lookup in the FIB table.

Step 3
CEF table (FIB) lookup is carried out for packet forwarding.

Step 4
Output ACLs are checked on the outbound interface.

Step 5
The packet is forwarded.

This section provides information about Unicast RPF enhancements:

- Access Control Lists and Logging
- Per-Interface Statistics

Access Control Lists and Logging

If an ACL is specified in the command, then when (and only when) a packet fails the Unicast RPF check, the ACL is checked to see if the packet should be dropped (using a deny statement in the ACL) or forwarded (using a permit statement in the ACL). Whether a packet is dropped or forwarded, the packet is counted in the global IP traffic statistics for Unicast RPF drops and in the interface statistics for Unicast RPF.

If no ACL is specified in the Unicast RPF command, the router drops the forged or malformed packet immediately and no ACL logging occurs. The router and interface Unicast RPF counters are updated.

Unicast RPF events can be logged by specifying the logging option for the ACL entries used by the Unicast RPF command. Using the log information, administrators can see what source addresses are being used in the attack, the time the packets arrived at the interface, and so on.

Caution
Logging requires CPU and memory resources. Logging Unicast RPF events for attacks having a high rate of forged packets can degrade the performance of the router.

Per-Interface Statistics

Each time a packet is dropped or forwarded at an interface, that information is counted two ways: globally on the router and at each interface where you have applied Unicast RPF. Global statistics on dropped packets provide information about potential attacks on the network; however, these global statistics do not help to specify which interface is the source of the attack.

Per-interface statistics allow network administrators to track two types of information about malformed packets: Unicast RPF drops and Unicast RPF suppressed drops. Statistics on the number of packets that Unicast RPF drops help to identify the interface that is the entry point of the attack. The Unicast RPF drop count tracks the number of drops at the interface. The Unicast RPF suppressed drop count tracks the number of packets that failed the Unicast RPF check but were forwarded because of the permit permission set up in the ACL. Using the drop count and suppressed drop count statistics, a network administrator can take steps to isolate the attack at a specific interface.

Note
Judicious use of ACL logging can further identify the address or addresses that are being dropped by Unicast RPF.
Figure 38 illustrates how Unicast RPF and CEF work together to validate IP source addresses by verifying packet return paths. In this example, a customer has sent a packet having a source address of 192.168.1.1 from interface FDDI 2/0/0. Unicast RPF checks the FIB to see if 192.168.1.1 has a path to FDDI 2/0/0. If there is a matching path, the packet is forwarded. If there is no matching path, the packet is dropped.

Figure 38  Unicast RPF Validating IP Source Addresses

Figure 39 illustrates how Unicast RPF drops packets that fail validation. In this example, a customer has sent a packet having a source address of 209.165.200.225, which is received at interface FDDI 2/0/0. Unicast RPF checks the FIB to see if 209.165.200.225 has a return path to FDDI 2/0/0. If there is a matching path, the packet is forwarded. In this case, there is no reverse entry in the routing table that routes the customer packet back to source address 209.165.200.225 on interface FDDI 2/0/0, and so the packet is dropped.
Implementing Unicast RPF

Unicast RPF has several key implementation principles:

- The packet must be received at an interface that has the best return path (route) to the packet source (a process called symmetric routing). There must be a route in the FIB matching the route to the receiving interface. Adding a route in the FIB can be done via static route, network statement, or dynamic routing. (ACLs permit Unicast RPF to be used when packets are known to be arriving by specific, less optimal asymmetric input paths.)

- IP source addresses at the receiving interface must match the routing entry for the interface.

- Unicast RPF is an input function and is applied only on the input interface of a router at the upstream end of a connection.

Given these implementation principles, Unicast RPF becomes a tool that network administrators can use not only for their customers but also for their downstream network or ISP, even if the downstream network or ISP has other connections to the Internet.

Caution

Using optional BGP attributes such as weight and local preference, the best path back to the source address can be modified. Modification would affect the operation of Unicast RPF.
This section provides information about the implementation of Unicast RPF:

- **Security Policy and Unicast RPF**
- **Where to Use Unicast RPF**
- **Routing Table Requirements**
- **Where Not to Use Unicast RPF**
- **Unicast RPF with BOOTP and DHCP**

### Security Policy and Unicast RPF

Consider the following points in determining your policy for deploying Unicast RPF:

- Unicast RPF must be applied at the interface downstream from the larger portion of the network, preferably at the edges of your network.
- The further downstream you apply Unicast RPF, the finer the granularity you have in mitigating address spoofing and in identifying the sources of spoofed addresses. For example, applying Unicast RPF on an aggregation router helps mitigate attacks from many downstream networks or clients and is simple to administer, but it does not help identify the source of the attack. Applying Unicast RPF at the network access server helps limit the scope of the attack and trace the source of the attack; however, deploying Unicast RPF across many sites does add to the administration cost of operating the network.
- The more entities that deploy Unicast RPF across Internet, intranet, and extranet resources, the better the chances of mitigating large-scale network disruptions throughout the Internet community, and the better the chances of tracing the source of an attack.
- Unicast RPF will not inspect IP packets encapsulated in tunnels, such as GRE, LT2P, or PPTP. Unicast RPF must be configured at a home gateway so that Unicast RPF processes network traffic only after the tunneling and encryption layers have been stripped off the packets.

### Where to Use Unicast RPF

Unicast RPF can be used in any “single-homed” environment where there is essentially only one access point out of the network; that is, one upstream connection. Networks having one access point offer the best example of symmetric routing, which means that the interface where a packet enters the network is also the best return path to the source of the IP packet. Unicast RPF is best used at the network perimeter for Internet, intranet, or extranet environments, or in ISP environments for customer network terminations.

The following sections provide a look at implementing Unicast RPF in two network environments:

- **Enterprise Networks with a Single Connection to an ISP**
- **Network Access Server Application (Applying Unicast RPF in PSTN/ISDN PoP Aggregation Routers)**

### Enterprise Networks with a Single Connection to an ISP

In enterprise networks, one objective of using Unicast RPF for filtering traffic at the input interface (a process called *ingress filtering*) is for protection from malformed packets arriving from the Internet. Traditionally, local networks that have one connection to the Internet would use ACLs at the receiving interface to prevent spoofed packets from the Internet from entering their local network.
ACLs work well for many single-homed customers; however, there are trade-offs when ACLs are used as ingress filters, including two commonly referenced limitations:

- Packet per second (PPS) performance at very high packet rates
- Maintenance of the ACL (whenever there are new addresses added to the network)

Unicast RPF is one tool that addresses both of these limitations. With Unicast RPF, ingress filtering is done at CEF PPS rates. This processing speed makes a difference when the link is more than 1 Mbps. Additionally, since Unicast RPF uses the FIB, no ACL maintenance is necessary, and thus the administration overhead of traditional ACLs is reduced. The following figure and example demonstrate how Unicast RPF is configured for ingress filtering.

Figure 40 illustrates an enterprise network that has a single link to an upstream ISP. In this example, Unicast RPF is applied at interface S0 on the enterprise router for protection from malformed packets arriving from the Internet. Unicast RPF is also applied at interface S5/0 on the ISP router for protection from malformed packets arriving from the enterprise network.

Using the topography in Figure 40, a typical configuration (assuming that CEF is turned on) on the ISP router would be as follows:

```
ip cef
interface loopback 0
description Loopback interface on Gateway Router 2
 ip address 192.168.3.1 255.255.255.255
 no ip redirects
 no ip directed-broadcast
 no ip proxy-arp
interface Serial 5/0
description 128K HDLC link to ExampleCorp WT50314E R5-0
 bandwidth 128
 ip unnumbered loopback 0
 ip verify unicast reverse-path
 no ip redirects
 no ip directed-broadcast
 no ip proxy-arp
 ip route 192.168.10.0 255.255.252.0 Serial 5/0
```

The gateway router configuration of the enterprise network (assuming that CEF is turned on) would look similar to the following:

```
ip cef
interface Ethernet 0
description ExampleCorp LAN
 ip address 192.168.10.1 255.255.252.0
 no ip redirects
 no ip directed-broadcast
 no ip proxy-arp
interface Serial 0
```
Configuring Unicast Reverse Path Forwarding

About Unicast Reverse Path Forwarding

Notice that Unicast RPF works with a single default route. There are no additional routes or routing protocols. Network 192.168.10.0/22 is a connected network. Hence, packets coming from the Internet with a source address in the range 192.168.10.0/22 will be dropped by Unicast RPF.

Network Access Server Application (Applying Unicast RPF in PSTN/ISDN PoP Aggregation Routers)

Aggregation routers are ideal places to use Unicast RPF with single-homed clients. Unicast RPF works equally well on leased-line or PSTN/ISDN/xDSL customer connections into the Internet. In fact, dialup connections are reputed to be the greatest source of DoS attacks using forged IP addresses. As long as the network access server supports CEF, Unicast RPF will work. In this topology, the customer aggregation routers need not have the full Internet routing table. Aggregation routers need the routing prefixes information (IP address block); hence, information configured or redistributed in the Interior Gateway Protocol (IGP) or Internal Border Gateway Protocol (IBGP) (depending on the way that you add customer routes into your network) would be enough for Unicast RPF to do its job.

Figure 41 illustrates the application of Unicast RPF to the aggregation and access routers for an Internet service provider (ISP) point of presence (POP), with the ISP routers providing dialup customer connections. In this example, Unicast RPF is applied upstream from the customer dialup connection router on the receiving (input) interfaces of the ISP aggregation routers.

Figure 41 Unicast RPF Applied to PSTN/ISDN Customer Connections
Routing Table Requirements

To work correctly, Unicast RPF needs proper information in the CEF tables. This requirement does not mean that the router must have the entire Internet routing table. The amount of routing information needed in the CEF tables depends on where Unicast RPF is configured and what functions the router performs in the network. For example, in an ISP environment, a router that is a leased-line aggregation router for customers needs only the information based on the static routes redistributed into the IGP or IBGP (depending on which technique is used in the network). Unicast RPF would be configured on the customer interfaces—hence the requirement for minimal routing information. In another scenario, a single-homed ISP could place Unicast RPF on the gateway link to the Internet. The full Internet routing table would be required. Requiring the full routing table would help protect the ISP from external DoS attacks that use addresses that are not in the Internet routing table.

Where Not to Use Unicast RPF

Unicast RPF should not be used on interfaces that are internal to the network. Internal interfaces are likely to have routing asymmetry (see Figure 42), meaning multiple routes to the source of a packet. Unicast RPF should be applied only where there is natural or configured symmetry. As long as administrators carefully plan which interfaces they activate Unicast RPF on, routing asymmetry is not a serious problem.

For example, routers at the edge of the network of an ISP are more likely to have symmetrical reverse paths than routers that are in the core of the ISP network. Routers that are in the core of the ISP network have no guarantee that the best forwarding path out of the router will be the path selected for packets returning to the router. Hence, it is not recommended that you apply Unicast RPF where there is a chance of asymmetric routing, unless you use ACLs to allow the router to accept incoming packets. ACLs permit Unicast RPF to be used when packets are known to be arriving by specific, less optimal asymmetric input paths. However, it is simplest to place Unicast RPF only at the edge of a network or, for an ISP, at the customer edge of the network.

Figure 42 illustrates how Unicast RPF can block legitimate traffic in an asymmetrical routing environment.
Unicast RPF with BOOTP and DHCP

Unicast RPF will allow packets with 0.0.0.0 source and 255.255.255.255 destination to pass so that Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) functions work properly. This enhancement was added in Cisco IOS Release 12.0 and later, but it is not in Cisco IOS Release 11.1CC.

Restrictions

There are some basic restrictions to applying Unicast RPF to multihomed clients:

- Clients should not be multihomed to the same router because multihoming defeats the purpose of building a redundant service for the client.
- Customers must ensure that the packets flowing up the link (out to the Internet) match the route advertised out the link. Otherwise, Unicast RPF filters those packets as malformed packets.
- Unicast RPF is available only for platform images that support CEF. Unicast RPF is supported in Cisco IOS Releases 11.1(17)CC and 12.0 and later. It is not available in Cisco IOS Release 11.2 or 11.3.

Related Features and Technologies

For more information about Unicast RPF-related features and technologies, review the following:

- Unicast RPF requires Cisco express forwarding (CEF) to function properly on the router. For more information about CEF, refer to the Cisco IOS Switching Services Configuration Guide.
- Unicast RPF can be more effective at mitigating spoofing attacks when combined with a policy of ingress and egress filtering using Cisco IOS access control lists (ACLs).
  - Ingress filtering applies filters to traffic received at a network interface from either internal or external networks. With ingress filtering, packets that arrive from other networks or the Internet and that have a source address that matches a local network, private, or broadcast address are dropped. In ISP environments, for example, ingress filtering can apply to traffic received at the router from either the client (customer) or the Internet.
  - Egress filtering applies filters to traffic exiting a network interface (the sending interface). By filtering packets on routers that connect your network to the Internet or to other networks, you can permit only packets with valid source IP addresses to leave your network.

For more information on network filtering, refer to RFC 2267 and to the Cisco IOS IP Configuration Guide.

- Cisco IOS software provides additional features that can help mitigate DoS attacks:
  - Committed Access Rate (CAR). CAR allows you to enforce a bandwidth policy against network traffic that matches an access list. For example, CAR allows you to rate-limit what should be low-volume traffic, such as ICMP traffic. To find out more about CAR, refer to the Cisco IOS Quality of Service Solutions Configuration Guide.
  - Context-based Access Control (CBAC). CBAC selectively blocks any network traffic not originated by a protected network. CBAC uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. Setting timeout values for network sessions helps mitigate DoS attacks by freeing up system resources, dropping sessions after a specified amount of time. For more information on CBAC, refer to the Cisco IOS Security Configuration Guide.
- TCP Intercept. The TCP Intercept feature implements software to protect TCP servers from TCP SYN-flooding attacks, which are a type of DoS attack. A SYN-flooding attack occurs when a hacker floods a server with a barrage of requests for connection. Like CBAC, the TCP Intercept feature also uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. For more information on TCP Intercept, refer to the *Cisco IOS Security Configuration Guide*.

**Prerequisites to Configuring Unicast RPF**

Prior to configuring Unicast RPF, configure ACLs:

- Configure standard or extended ACLs to mitigate transmission of invalid IP addresses (perform egress filtering). Permit only valid source addresses to leave your network and get onto the Internet. Prevent all other source addresses from leaving your network for the Internet.
- Configure standard or extended ACLs entries to drop (deny) packets that have invalid source IP addresses (perform ingress filtering). Invalid source IP addresses include the following types:
  - Reserved addresses
  - Loopback addresses
  - Private addresses (RFC 1918, *Address Allocation for Private Internets*)
  - Broadcast addresses (including multicast addresses)
  - Source addresses that fall outside the range of valid addresses associated with the protected network
- Configure standard or extended ACL entries to forward (permit) packets that fail the Unicast RPF checks to allow specific traffic from known asymmetric routed sources.
- Configure ACLs to track Unicast RPF events by adding the logging option into the ACL command. During network attacks, judicious logging of dropped or forwarded packets (suppressed drops) can provide additional information about network attacks.

**Unicast RPF Configuration Task List**

The following sections describe the configuration tasks for Unicast RPF. Each task in the list is identified as either optional or required.

- **Configuring Unicast RPF** (Required)
- **Verifying Unicast RPF** (Optional)

See the section “Unicast RPF Configuration Examples” at the end of this chapter.

**Configuring Unicast RPF**

To use Unicast RPF, you must configure the router for CEF switching or CEF distributed switching. There is no need to configure the input interface for CEF switching because Unicast RPF has been implemented as a search through the FIB using the source IP address. As long as CEF is running on the router, individual interfaces can be configured with other switching modes. Unicast RPF is an input-side function that is enabled on an interface or subinterface that supports any type of encapsulation and operates on IP packets received by the router. It is very important that CEF be turned on globally in the router—Unicast RPF will not work without CEF.
To configure Unicast RPF, use the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> &lt;br&gt;Router(config)# ip cef &lt;br&gt;or &lt;br&gt;Router(config)# ip cef distributed</td>
<td>Enables CEF or distributed CEF on the router. Distributed CEF is required for routers that use a Route Switch Processor (RSP) and Versatile Interface Processor (VIP), which includes Unicast RPF. You might want to disable CEF or distributed CEF (dCEF) on a particular interface if that interface is configured with a feature that CEF or dCEF does not support. In this case, you would enable CEF globally, but disable CEF on a specific interface using the no ip route-cache cef interface command, which enables all but that specific interface to use express forwarding. If you have disabled CEF or dCEF operation on an interface and want to reenable it, you can do so by using the ip route-cache cef command in interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> &lt;br&gt;Router(config-if)# interface type</td>
<td>Selects the input interface on which you want to apply Unicast RPF. This is the receiving interface, which allows Unicast RPF to verify the best return path before forwarding the packet on to the next destination. The interface type is specific to your router and the types of interface cards installed on the router. To display a list of available interface types, enter the interface ? command.</td>
</tr>
<tr>
<td><strong>Step 3</strong> &lt;br&gt;Router(config-if)# ip verify unicast reverse-path list</td>
<td>Enables Unicast RPF on the interface. Use the list option to identify an access list. If the access list denies network access, spoofed packets are dropped at the interface. If the access list permits network access, spoofed packets are forwarded to the destination address. Forwarded packets are counted in the interface statistics. If the access list includes the logging option, information about the spoofed packets is logged to the log server. Repeat this step for each access list that you want specify.</td>
</tr>
<tr>
<td><strong>Step 4</strong> &lt;br&gt;Router(config-if)# exit</td>
<td>Exits interface configuration mode. Repeat Steps 2 and 3 for each interface on which you want to apply Unicast RPF.</td>
</tr>
</tbody>
</table>

**Verifying Unicast RPF**

To verify that Unicast RPF is operational, use the show cef interface command. The following example shows that Unicast RPF is enabled at interface serial2/0/0.

Router-3# show cef interface serial 2/0/0
Serial2/0/0 is up (if_number 8)
Internet address is 192.168.10.2/30
ICMP redirects are never sent
Per packet loadbalancing is disabled
!The next line displays Unicast RPF packet dropping information.
IP unicast RPF check is enabled
Inbound access list is not set
Outbound access list is not set
Interface is marked as point to point interface
Packets switched to this interface on linecard are dropped to next slow path
Hardware idb is Serial2/0/0
Fast switching type 4, interface type 6
!The next line displays Unicast RPF packet dropping information.
IP LES Feature Fast switching turbo vector
IP Feature CEF switching turbo vector
Input fast flags 0x40, Output fast flags 0x0, ifindex 7(7)
Slot 2 Slot unit 0 VC -1
Transmit limit accumulator 0x48001A02 (0x48001A02)
IP MTU 1500

**Troubleshooting Tips**

If you experience problems while using Unicast RPF, check the following items.

**HSRP Failure**

Failure to disable Unicast RPF before disabling CEF can cause Hot Standby Router Protocol (HSRP) failure. If you want to disable CEF on the router, you must first disable Unicast RPF. To disable Unicast RPF, see the section “Monitoring and Maintaining Unicast RPF.”

**Dropped Boot Requests**

In Cisco IOS Release 11.1(17)CC, Unicast RPF can drop BOOTP request packets that have a source address of 0.0.0.0 due to source address verification at the interface. To enable boot requests to work on the interface, you must use ACLs instead of Unicast RPF.
Monitoring and Maintaining Unicast RPF

This section describes commands used to monitor and maintain Unicast RPF.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router# show ip traffic</code></td>
<td>Displays global router statistics about Unicast RPF drops and suppressed drops.</td>
</tr>
<tr>
<td><code>Router# show ip interface type</code></td>
<td>Displays per-interface statistics about Unicast RPF drops and suppressed drops.</td>
</tr>
<tr>
<td><code>Router# show access-lists</code></td>
<td>Displays the number of matches to a specific ACL.</td>
</tr>
<tr>
<td><code>Router(config-if)# no ip verify unicast reverse-path list</code></td>
<td>Disables Unicast RPF at the interface. Use the <code>list</code> option to disable Unicast RPF for a specific ACL at the interface.</td>
</tr>
</tbody>
</table>

To disable CEF, you must first disable Unicast RPF. Failure to disable Unicast RPF before disabling CEF can cause HSRP failure. If you want to disable CEF on the router, you must first disable Unicast RPF.

Unicast RPF counts the number of packets dropped or suppressed because of malformed or forged source addresses. Unicast RPF counts dropped or forwarded packets that include the following global and per-interface information:

- Global Unicast RPF drops
- Per-interface Unicast RPF drops
- Per-interface Unicast RPF suppressed drops

The `show ip traffic` command shows the total number (global count) of dropped or suppressed packets for all interfaces on the router. The Unicast RPF drop count is included in the IP statistics section.

```
Router# show ip traffic
```

```
IP statistics:
  Rcvd:    1471590 total, 887368 local destination
    0 format errors, 0 checksum errors, 301274 bad hop count
    0 unknown protocol, 0 not a gateway
    0 security failures, 0 bad options, 0 with options
  Opts:    0 end, 0 nop, 0 basic security, 0 loose source route
    0 timestamp, 0 extended security, 0 record route
    0 stream ID, 0 strict source route, 0 alert, 0 other
  Frags:   0 reassembled, 0 timeouts, 0 couldn't reassemble
    0 fragmented, 0 couldn't fragment
  Bcast:   205233 received, 0 sent
  Mcast:   463292 received, 462118 sent
  Sent:    990158 generated, 282938 forwarded

  ! The second line below (~0 unicast RPF) displays Unicast RPF packet dropping
  information.

  Drop:    3 encapsulation failed, 0 unresolved, 0 no adjacency
    0 no route, 0 unicast RPF, 0 forced drop
```

A nonzero value for the count of dropped or suppressed packets can mean one of two things:

- Unicast RPF is dropping or suppressing packets that have a bad source address (normal operation).
Unicast RPF is dropping or suppressing legitimate packets because the route is misconfigured to use Unicast RPF in environments where asymmetric routing exists; that is, where multiple paths can exist as the best return path for a source address.

The `show ip interface` command shows the total of dropped or suppressed packets at a specific interface. If Unicast RPF is configured to use a specific ACL, that ACL information is displayed along with the drop statistics.

```
Router> show ip interface ethernet0/1/1

    Unicast RPF ACL 197
        1 unicast RPF drop
        1 unicast RPF suppressed drop
```

The `show access-lists` command displays the number of matches found for a specific entry in a specific access list.

```
Router> show access-lists

Extended IP access list 197
    deny ip 192.168.201.0 0.0.0.63 any log-input (1 match)
    permit ip 192.168.201.64 0.0.0.63 any log-input (1 match)
    deny ip 192.168.201.128 0.0.0.63 any log-input
    permit ip 192.168.201.192 0.0.0.63 any log-input
```

## Unicast RPF Configuration Examples

This section provides the following configuration examples:

- **Unicast RPF on a Leased-Line Aggregation Router Example**
- **Unicast RPF on the Cisco AS5800 Using Dialup Ports Example**
- **Unicast RPF with Inbound and Outbound Filters Example**
- **Unicast RPF with ACLs and Logging Example**

### Unicast RPF on a Leased-Line Aggregation Router Example

The following commands enable Unicast RPF on a serial interface:

```
ip cef
! or "ip cef distributed" for RSP+VIP based routers
!
interface serial 5/0/0
    ip verify unicast reverse-path
```

### Unicast RPF on the Cisco AS5800 Using Dialup Ports Example

The following example enables Unicast RPF on a Cisco AS5800. The `interface Group-Async` command makes it easy to apply Unicast RPF on all the dialup ports.

```
ip cef
!
interface Group-Async1
    ip verify unicast reverse-path
```
Unicast RPF with Inbound and Outbound Filters Example

The following example uses a very simple single-homed ISP to demonstrate the concepts of ingress and egress filters used in conjunction with Unicast RPF. The example illustrates an ISP-allocated classless interdomain routing (CIDR) block 209.165.202.128/28 that has both inbound and outbound filters on the upstream interface. Be aware that ISPs are usually not single-homed. Hence, provisions for asymmetrical flows (when outbound traffic goes out one link and returns via a different link) need to be designed into the filters on the border routers of the ISP.

```
ip cef distributed
!
interface Serial 5/0/0
  description Connection to Upstream ISP
  ip address 209.165.200.225 255.255.255.252
  no ip redirects
  no ip directed-broadcast
  no ip proxy-arp
  ip verify unicast reverse-path
  ip access-group 111 in
  ip access-group 110 out

access-list 110 permit ip 209.165.202.128 0.0.0.31 any
access-list 110 deny ip any any log
access-list 111 deny ip host 0.0.0.0 any log
access-list 111 deny ip 127.0.0.0 0.255.255.255 any log
access-list 111 deny ip 10.0.0.0 0.255.255.255 any log
access-list 111 deny ip 172.16.0.0 0.15.255.255 any log
access-list 111 deny ip 192.168.0.0 0.0.255.255 any log
access-list 111 deny ip 209.165.202.128 0.0.0.31 any log
access-list 111 permit ip any any
```

Unicast RPF with ACLs and Logging Example

The following example demonstrates the use of ACLs and logging with Unicast RPF. In this example, extended ACL 197 provides entries that deny or permit network traffic for specific address ranges. Unicast RPF is configured on interface Ethernet0 to check packets arriving at that interface.

For example, packets with a source address of 192.168.201.10 arriving at interface Ethernet0 are dropped because of the deny statement in ACL 197. In this case, the ACL information is logged (the logging option is turned on for the ACL entry) and dropped packets are counted per interface and globally. Packets with a source address of 192.168.201.100 arriving at interface Ethernet0 are forwarded because of the permit statement in ACL 197. ACL information about dropped or suppressed packets is logged (logging option turned on for the ACL entry) to the log server.

```
ip cef distributed
!
int eth0/1/1
  ip address 192.168.200.1 255.255.255.0
  ip verify unicast reverse-path 197
!
int eth0/1/2
  ip address 192.168.201.1 255.255.255.0
!
access-list 197 deny ip 192.168.201.0 0.0.0.63 any log-input
access-list 197 permit ip 192.168.201.64 0.0.0.63 any log-input
access-list 197 deny ip 192.168.201.128 0.0.0.63 any log-input
access-list 197 permit ip 192.168.201.192 0.0.0.63 any log-input
access-list 197 deny ip host 0.0.0.0 any log
```

</tbody>
</table>

This chapter describes the Secure Shell (SSH) feature. The SSH feature consists of an application and a protocol.

For a complete description of the SSH commands in this chapter, refer to the chapter “Secure Shell Commands” of the Cisco IOS Security Command Reference. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

In This Chapter

This chapter has the following sections:

- About Secure Shell
- SSH Configuration Task List
- Troubleshooting Tips
- Monitoring and Maintaining SSH
- SSH Configuration Examples
About Secure Shell

Secure Shell (SSH) is an application and a protocol that provide a secure replacement to the Berkeley r-tools. The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. There are currently two versions of SSH available: SSH Version 1 and SSH Version 2. This document describes SSH Version 1. For information about SSH Version 2, see the document Secure Shell Version 2 Support.

Note

Hereafter, unless otherwise noted, the term “SSH” will denote “SSH Version 1” only.

This rest of this section covers the following information:

- How SSH Works
- Restrictions
- Related Features and Technologies
- Prerequisites to Configuring SSH

How SSH Works

This section provides the following information about how SSH works:

- SSH Server
- SSH Integrated Client

SSH Server

The SSH Server feature enables a SSH client to make a secure, encrypted connection to a Cisco router. This connection provides functionality that is similar to that of an inbound Telnet connection. Before SSH, security was limited to Telnet security. SSH allows a strong encryption to be used with the Cisco IOS software authentication. The SSH server in Cisco IOS software will work with publicly and commercially available SSH clients.

SSH Integrated Client

The SSH Integrated Client feature is an application running over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco router to make a secure, encrypted connection to another Cisco router or to any other device running the SSH server. This connection provides functionality that is similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for a secure communication over an insecure network.

The SSH client in the Cisco IOS software works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), Triple DES (3DES), and password authentication. User authentication is performed like that in the Telnet session to the router. The user authentication mechanisms supported for SSH are RADIUS, TACACS+ and the use of locally stored user names and passwords.

Note

The SSH client functionality is available only when the SSH server is enabled.
Restrictions

There following are some basic SSH restrictions:

- RSA authentication available in SSH clients is not supported in the SSH server for Cisco IOS software.
- SSH server and SSH client are supported on DES (56-bit) and 3DES (168-bit) data encryption software images only. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
- Execution shell is the only application supported.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.

Related Features and Technologies

For more information about SSH-related features and technologies, review the following:

- Authentication, Authorization, and Accounting (AAA) feature. AAA is a suite of network security services that provide the primary framework through which access control can be set up on your Cisco router or access server. For more information on AAA, refer to the Authentication, Authorization, and Accounting chapters earlier in this book and the Cisco IOS Security Command Reference.
- IP Security (IPSec) feature. IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses Internet Key Exchange (IKE) to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host. For more information on IPSec, refer to the chapter “Configuring IPSec Network Security” and the Cisco IOS Security Command Reference.

Prerequisites to Configuring SSH

Prior to configuring SSH, perform the following tasks:

- Download the required image on your router. (The SSH server requires you to have an IPSec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(1)T downloaded on your router; the SSH client requires you to have an IPSec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(3)T downloaded on your router.) For more information on downloading a software image, refer to the Cisco IOS Configuration Fundamentals Configuration Guide.
- Configure a host name and host domain for your router.

To configure a host name and host domain, enter the following commands beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# hostname hostname</td>
<td>Configures a host name for your router.</td>
</tr>
<tr>
<td>Router(config)# ip domain-name domainname</td>
<td>Configures a host domain for your router.</td>
</tr>
</tbody>
</table>
- Generate an RSA key pair for your router, which automatically enables SSH. To generate an RSA key pair, enter the following global configuration command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto key generate rsa</code></td>
<td>Enables the SSH server for local and remote authentication on the router. The recommended minimum modulus size is 1024 bits.</td>
</tr>
</tbody>
</table>

**Note** To delete the RSA key-pair, use the `crypto key zeroize rsa` global configuration command. Once you delete the RSA key-pair, you automatically disable the SSH server.

- Configure user authentication for local or remote access. You can configure authentication with or without AAA. For more information, refer to the Configuring Authentication, Configuring Authorization, and Configuring Accounting chapters earlier in the book. See also Enabling AAA.

**SSH Configuration Task List**

The following sections describe the configuration tasks for SSH. Each task in the list is identified as either optional or required.

- Configuring SSH Server (Required)
- Verifying SSH (Optional)

See the section “SSH Configuration Examples” at the end of this chapter.

**Configuring SSH Server**

**Note** The SSH client feature runs in user EXEC mode and has no specific configuration on the router.

**Note** The SSH commands are optional and are disabled when the SSH server is disabled.

To enable and configure a Cisco Router for SSH, you can configure SSH parameters. If you do not configure SSH parameters, the default values will be used.

To configure SSH server, use the following command in global configuration mode:
Verifying SSH

To verify that the SSH server is enabled and view the version and configuration data for your SSH connection, use the `show ip ssh` command. The following example shows that SSH is enabled:

```
Router# show ip ssh
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
```

The following example shows that SSH is disabled:

```
Router# show ip ssh
%SSH has not been enabled
```

To verify the status of your SSH server connections, use the `show ssh` command. The following example shows the SSH server connections on the router when SSH is enabled:

```
Router# show ssh
Connection      Version     EncryptionStateUsername
0 1.5 3DES Session Started guest
```

The following example shows that SSH is disabled:

```
Router# show ssh
%No SSH server connections running.
```

Troubleshooting Tips

- If your SSH configuration commands are rejected as illegal commands, you have not successfully generated a RSA key pair for your router. Make sure you have specified a host name and domain. Then use the `crypto key generate rsa` command to generate a RSA key pair and enable the SSH server.
- When configuring the RSA key pair, you might encounter the following error messages:
Monitoring and Maintaining SSH

To monitor and maintain your SSH connections, use the following commands in user EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# show ip ssh</td>
<td>Displays the version and configuration data for SSH.</td>
</tr>
<tr>
<td>Router# show ssh</td>
<td>Displays the status of SSH server connections.</td>
</tr>
</tbody>
</table>

SSH Configuration Examples

This section provides the following configuration examples, which are output from the show running configuration EXEC command on a Cisco 7200, Cisco 7500, and Cisco 12000.

- SSH on a Cisco 7200 Series Router Example
- SSH on a Cisco 7500 Series Router Example
- SSH on a Cisco 1200 Gigabit Switch Router Example

Note: The crypto key generate rsa command is not displayed in the show running configuration output.

SSH on a Cisco 7200 Series Router Example

In the following example, SSH is configured on a Cisco 7200 with a timeout that is not to exceed 60 seconds, and no more than 2 authentication retries. Also, before configuring the SSH server feature on the router, TACACS+ is specified as the method of authentication.

```
hostname Router72K
aaa new-model
aaa authentication login default tacacs+
aaa authentication login aaa7200kw none
enable password enable7200pw

username mcisco password 0 maryspw
username jcisco password 0 johnspw
```
ip subnet-zero
no ip domain-lookup
ip domain-name cisco.com

! Enter the ssh commands.
ip ssh time-out 60
ip ssh authentication-retries 2

Reverse SSH Enhancements

The Reverse SSH Enhancements feature provides an alternative method of configuring reverse Secure Shell (SSH). Using this feature, you can configure reverse SSH without having to list separate lines for every terminal or auxiliary line on which SSH has to be enabled. This feature also eliminates the rotary-group limitation. This feature is supported for SSH Version 1 and SSH Version 2.

- Information About Reverse SSH Enhancements, page 2
- How to Configure Reverse SSH Enhancements, page 2
- Configuration Examples for Reverse SSH Enhancements, page 7
- Additional References, page 8
- Command Reference, page 9
Prerequisites for Reverse SSH Enhancements

- SSH must be enabled.
- The SSH client and server must be running the same version of SSH.

Restrictions for Reverse SSH Enhancements

- The -I keyword and userid:{number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

Information About Reverse SSH Enhancements

To configure Reverse SSH Enhancements, you should understand the following concepts:

- Reverse Telnet, page 2
- Reverse SSH, page 2

Reverse Telnet

Cisco IOS software has for quite some time included a feature called Reverse Telnet, whereby you can telnet to a certain port range and connect to terminal or auxiliary lines. Reverse telnetting has often been used to connect a Cisco IOS router that has many terminal lines to the consoles of other Cisco IOS routers or to other devices. Telnetting makes it easy to reach the router console from anywhere simply by telnetting to the terminal server on a specific line. This telnetting approach can be used to configure a router even if all network connectivity to that router is disconnected. Reverse telnetting also allows modems that are attached to Cisco IOS routers to be used for dial-out (usually with a rotary device).

Reverse SSH

Reverse telnetting can be accomplished using SSH. Unlike reverse telnetting, SSH provides for secure connections. The Reverse SSH Enhancements feature provides you with a simplified method of configuring SSH. Using this feature, you no longer have to configure a separate line for every terminal or auxiliary line on which you want to enable SSH. The previous method of configuring reverse SSH limited the number of ports that can be accessed to 100. The Reverse SSH Enhancements feature removes the port number limitation. For information on the alternative method of configuring reverse SSH, see the section “How to Configure Reverse SSH Enhancements.”

How to Configure Reverse SSH Enhancements

This section contains the following procedures:

- Configuring Reverse SSH for Console Access, page 3
- Configuring Reverse SSH for Modem Access, page 4
• Troubleshooting Reverse SSH on the Client, page 6
• Troubleshooting Reverse SSH on the Server, page 6

Configuring Reverse SSH for Console Access

To configure reverse SSH console access on the SSH server, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. line line-number [ending-line-number]
4. no exec
5. login authentication listname
6. transport input ssh
7. exit
8. exit
9. ssh -l userid:{number} {ip-address}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> line line-number [ending-line-number]</td>
<td>Identifies a line for configuration and enters line configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# line 1 3</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> no exec</td>
<td>Disables EXEC processing on a line.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-line)# no exec</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> login authentication listname</td>
<td>Defines a login authentication mechanism for the lines.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-line)# login authentication default</td>
<td><strong>Note</strong> The authentication method must use a username and password.</td>
</tr>
</tbody>
</table>
Configuring Reverse SSH for Modem Access

To configure Reverse SSH for modem access, perform the steps shown in the “SUMMARY STEPS” section below.

In this configuration, reverse SSH is being configured on a modem used for dial-out lines. To get any of the dial-out modems, you can use any SSH client and start a SSH session as shown (in Step 10) to get to the next available modem from the rotary device.

SUMMARY STEPS

1. enable
2. configure terminal
3. line line-number [ending-line-number]
4. no exec
5. login authentication listname
6. rotary group
7. transport input ssh

Steps:

Command or Action | Purpose
--- | ---
Step 6 transport input ssh | Defines which protocols to use to connect to a specific line of the router.  
- The ssh keyword must be used for the Reverse SSH Enhancements feature.

Example:

Router (config-line)# transport input ssh

Step 7 exit | Exits line configuration mode.

Example:

Router (config-line)# exit

Step 8 exit | Exits global configuration mode.

Example:

Router (config)# exit

Step 9 ssh -l userid:(number) {ip-address} | Specifies the user ID to use when logging in on the remote networking device that is running the SSH server.  
- userid—User ID.  
- :—Signifies that a port number and terminal IP address will follow the userid argument.  
- number—Terminal or auxiliary line number.  
- ip-address—Terminal server IP address.

Note: The userid argument and :rotary{number}{ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.

Example:

Router# ssh -l lab:1 router.example.com

Defines which protocols to use to connect to a specific line of the router.
### DETAILED STEPS

<td>Step 2 debug ip ssh client</td>
<td>Displays debugging messages for the SSH client.</td>
</tr>
<tr>
<td>Example: Router# debug ip ssh client</td>
<td></td>
</tr>
</tbody>
</table>

Troubleshooting Reverse SSH on the Server

To troubleshoot the reverse SSH configuration on the terminal server, perform the following steps. The steps may be configured in any order or independent of one another.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 10 ssh -l userid:rotary{number} {ip-address}</td>
<td>Specifies the user ID to use when logging in on the remote networking device that is running the SSH server.</td>
</tr>
<tr>
<td>Example: Router# ssh -l lab:rotary1 router.example.com</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>The userid argument and :rotary{number}{ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.</td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. enable
2. debug ip ssh
3. show ssh
4. show line

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

</tbody>
</table>

Configuration Examples for Reverse SSH Enhancements

This section includes the following configuration examples:

- Reverse SSH Console Access: Example, page 7
- Reverse SSH Modem Access: Example, page 8

Reverse SSH Console Access: Example

The following configuration example shows that reverse SSH has been configured for console access for terminal lines 1 through 3:

Terminal Server Configuration

```plaintext
line 1 3
  no exec
  login authentication default
  transport input ssh
```
**Client Configuration**

The following commands configured on the SSH client will form the reverse SSH session with lines 1, 2, and 3, respectively:

```bash
ssh -l lab:1 router.example.com
ssh -l lab:2 router.example.com
ssh -l lab:3 router.example.com
```

**Reverse SSH Modem Access: Example**

The following configuration example shows that dial-out lines 1 through 200 have been grouped under rotary group 1 for modem access:

```plaintext
line 1 200
   no exec
   login authentication default
   rotary 1
   transport input ssh
   exit
```

The following command shows that reverse SSH will connect to the first free line in the rotary group:

```bash
ssh -l lab:rotary1 router.example.com
```

Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html. For information about all Cisco IOS commands, go to the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or to the Cisco IOS Master Commands List.

- ssh
Secure Copy

The Secure Copy (SCP) feature provides a secure and authenticated method for copying router configuration or router image files. SCP relies on Secure Shell (SSH), an application and a protocol that provide a secure replacement for the Berkeley r-tools.

Contents

- Prerequisites for Secure Copy, page 2
- Information About Secure Copy, page 2
- How to Configure SCP, page 2
- Configuration Examples for Secure Copy, page 4
- Additional References, page 5
- Command Reference, page 6
- Glossary, page 8
Prerequisites for Secure Copy

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the router.
- Because SCP relies on SSH for its secure transport, the router must have a Rivest, Shamir, and Adelman (RSA) key pair.

Information About Secure Copy

To configure Secure Copy feature, you should understand the following concepts.

- How SCP Works, page 2

How SCP Works

The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. In addition, SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.

SCP allows a user who has appropriate authorization to copy any file that exists in the Cisco IOS File System (IFS) to and from a router by using the copy command. An authorized administrator may also perform this action from a workstation.

How to Configure SCP

This section contains the following procedures:

- Configuring SCP, page 2
- Verifying SCP, page 3
- Troubleshooting SCP, page 4

Configuring SCP

To enable and configure a Cisco router for SCP server-side functionality, perform the following steps.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login` {default | list-name} method1 [method2...]
5. `aaa authorization` {network | exec | commands level | reverse-access | configuration} {default | list-name} [method1 [method2...]]
6. `username name` [privilege level] {password encryption-type encrypted-password}
How to Configure SCP

7. ip scp server enable

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3 aaa new-model</td>
<td>Sets AAA authentication at login.</td>
</tr>
<tr>
<td>Step 4 aaa authentication login (default</td>
<td>Enables the AAA access control system.</td>
</tr>
<tr>
<td>list-name) method1</td>
<td></td>
</tr>
<tr>
<td>[method2...]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 5 aaa authorization</td>
<td>Sets parameters that restrict user access to</td>
</tr>
<tr>
<td>(network</td>
<td>exec</td>
</tr>
<tr>
<td>reverse-access</td>
<td>configuration) (default</td>
</tr>
<tr>
<td>[method1 [method2...]]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 6 username name [privilege</td>
<td>Establishes a username-based authentication</td>
</tr>
<tr>
<td>level] [password encryption-type encrypted-password]</td>
<td>system.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Step 7 ip scp server enable</td>
<td>Enables SCP server-side functionality.</td>
</tr>
</tbody>
</table>

Verifying SCP

To verify SCP server-side functionality, perform the following steps.
SUMMARY STEPS

1. enable
2. show running-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 show running-config</td>
<td>Verifies the SCP server-side functionality.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show running-config</td>
</tr>
</tbody>
</table>

Troubleshooting SCP

To troubleshoot SCP authentication problems, perform the following steps.

SUMMARY STEPS

1. enable
2. debug ip scp

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 debug ip scp</td>
<td>Troubleshoots SCP authentication problems.</td>

<td>Router# debug ip scp</td>
</tr>
</tbody>
</table>

Configuration Examples for Secure Copy

This section provides the following configuration examples:

- SCP Server-Side Configuration Using Local Authentication: Example, page 5
- SCP Server-Side Configuration Using Network-Based Authentication: Example, page 5
**SCP Server-Side Configuration Using Local Authentication: Example**

The following example shows how to configure the server-side functionality of SCP. This example uses a locally defined username and password.

```plaintext
! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
aaa authentication login default local
aaa authorization exec default local
username tiger privilege 15 password 0 lab
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable
```

**SCP Server-Side Configuration Using Network-Based Authentication: Example**

The following example shows how to configure the server-side functionality of SCP using a network-based authentication mechanism:

```plaintext
! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable
```

Command Reference
The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html. For information about all Cisco IOS commands, go to the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or to the Cisco IOS Master Commands List.

- debug ip scp
- ip scp server enable
**Glossary**

**AAA**—authentication, authorization, and accounting. Framework of security services that provide the method for identifying users (authentication), for remote access control (authorization), and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

**rcp**—remote copy. Relying on Remote Shell (Berkeley r-toools suite) for security, rcp copies files, such as router images and startup configurations, to and from routers.

**SCP**—secure copy. Relying on SSH for security, SCP support allows the secure and authenticated copying of anything that exists in the Cisco IOS File Systems. SCP is derived from rcp.

**SSH**—Secure Shell. Application and a protocol that provide a secure replacement for the Berkeley r-tools. The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. SSH Version 1 is implemented in the Cisco IOS software.

Secure Shell Version 2 Support

First Published: November 3, 2003
Last Updated: July 11, 2008

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2 (SSH Version 1 support was implemented in an earlier Cisco IOS software release). SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. Currently, the only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH also allows for the secure transfer of files.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Secure Shell Version 2 Support” section on page 20.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

- Where to Go Next, page 17
- Additional References, page 17
- Command Reference, page 19
- Feature Information for Secure Shell Version 2 Support, page 20
Prerequisites for Secure Shell Version 2 Support

Prior to configuring SSH, perform the following task:

- Download the required image on your router. The SSH server requires you to have a k9 (Triple Data Encryption Standard [3DES]) software image from Cisco IOS Release 12.3(4)T, 12.2(25)S, or 12.3(7)JA downloaded on your router.

\[\text{Note}\]
The SSH Version 2 server is supported in Cisco IOS Release 12.3(4)T, 12.3(2)XE, 12.2(25)S, and 12.3(7)JA; the SSH Version 2 client is supported beginning with Cisco IOS Release 12.3(7)T and is supported in Cisco IOS Release 12.3(7)JA. (The SSH client runs both the SSH Version 1 and Version 2 protocol and is supported in both k8 and k9 images in Cisco IOS Release 12.3(4)T.)

For more information on downloading a software image, refer to *Cisco IOS Configuration Fundamentals and Network Management Configuration Guide*.

Restrictions for Secure Shell Version 2 Support

- Rivest, Shamir, and Adelman (RSA) user authentication is not supported in the SSH server or SSH client for Cisco IOS software.
- SSH servers and SSH clients are supported in 3DES software images.
- Execution Shell, remote command execution, and Secure Copy Protocol (SCP) are the only applications supported.
- Compression is not supported.
- The RSA key-pair size must be greater than or equal to 768.

Information About Secure Shell Version 2 Support

To configure SSH Version 2, you should understand the following concept:

- **Secure Shell Version 2**, page 2
- **SNMP Trap Generation**, page 3
- **SSH Keyboard Interactive Authentication**, page 4

Secure Shell Version 2

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The command `ip ssh version` has been introduced so that you may define which version of SSH that you want to configure. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.
Secure Shell Version 2 Support

Secure Shell Version 2 Enhancements

The Secure Shell Version 2 Enhancements include a number of additional capabilities such as supporting VRF aware SSH, SSH debug enhancements, and Diffie-Hellman group exchange support.

The Cisco IOS SSH implementation has traditionally used 768 bit modulus but with an increasing need for higher key sizes to accommodate Diffie-Hellman (DH) Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications a message exchange between the client and server to establish the favored DH group becomes necessary. The `ip ssh dh min size` command was introduced in Cisco IOS Release 12.4(20)T so you can configure modulus size on the SSH server. In addition to this the `ssh` command was extended to add VRF awareness to SSH client side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging has been enhanced by modifying SSH debug commands. The `debug ip ssh` command has been extended to allow you to simplify the debugging process. Previously this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the `debug ip ssh` command with a keyword messages are limited to information specified by the keyword.

SNMP Trap Generation

Effective with Cisco IOS Release 12.4(17), Simple Network Management Protocol (SNMP) traps will be generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been turned on. For information about enabling SNMP traps, see the chapter “Configuring SNMP Support” in the Cisco IOS Network Management Configuration Guide.

Note: When configuring the `snmp-server host` command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server. For an example of an SNMP trap generation configuration, see the section “Setting an SNMP Trap: Example.”
You must also turn on SNMP debugging using the `debug snmp packet` command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session. For an example of SNMP debugging, see the section “SNMP Debugging: Example.”

### SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically deployed.

The following methods are currently supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)

For examples of various scenarios in which the SSH Keyboard Interactive Authentication feature has been automatically deployed, see the chapter “SSH Keyboard Interactive Authentication: Examples.”

### How to Configure Secure Shell Version 2 Support

This section contains the following procedures:

- Configuring a Router for SSH Version 2 Using a Host Name and Domain Name, page 4 (required)
- Configuring a Router for SSH Version 2 Using RSA Key Pairs, page 5 (optional)
- Starting an Encrypted Session with a Remote Device, page 7 (optional)
- Verifying the Status of the Secure Shell Connection Using the show ssh Command, page 7 (optional)
- Verifying the Secure Shell Status Using the show ip ssh Command, page 9 (optional)
- Monitoring and Maintaining Secure Shell Version 2, page 10 (optional)

### Configuring a Router for SSH Version 2 Using a Host Name and Domain Name

To configure your router for SSH Version 2 using a host name and domain name, perform the following steps. You may also configure SSH Version 2 by using the RSA key pair configuration (See the section “Configuring a Router for SSH Version 2 Using RSA Key Pairs”).

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `hostname hostname`
4. `ip domain-name name`
Secure Shell Version 2 Support

How to Configure Secure Shell Version 2 Support

5. `crypto key generate rsa`
6. `ip ssh [timeout seconds | authentication-retries integer]`
7. `ip ssh version [1 | 2]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** `enable` | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:**  
  Router> enable | |
| **Step 2** `configure terminal` | Enters global configuration mode. |
| **Example:**  
  Router# configure terminal | |
| **Step 3** `hostname hostname` | Configures a host name for your router. |
| **Example:**  
  Router (config)# hostname cisco 7200 | |
| **Step 4** `ip domain-name name` | Configures a domain name for your router. |
| **Example:**  
  Router (config)# ip domain-name cisco.com | |
| **Step 5** `crypto key generate rsa` | Enables the SSH server for local and remote authentication. |
| **Example:**  
  Router (config)# crypto key generate rsa | |
| **Step 6** `ip ssh [timeout seconds | authentication-retries integer]` | (Optional) Configures SSH control variables on your router. |
| **Example:**  
  Router (config)# ip ssh timeout 120 | |
| **Step 7** `ip ssh version [1 | 2]` | (Optional) Specifies the version of SSH to be run on your router. |
| **Example:**  
  Router (config)# ip ssh version 1 | |

Configuring a Router for SSH Version 2 Using RSA Key Pairs

To enable SSH Version 2 without configuring a host name or domain name, perform the following steps. SSH Version 2 will be enabled if the key pair that you configure already exists or if it is generated later. You may also configure SSH Version 2 by using the host name and domain name configuration (See the section “Configuring a Router for SSH Version 2 Using a Host Name and Domain Name”).
### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. `ip ssh rsa keypair-name keypair-name`
4. `crypto key generate rsa usage-keys label key-label modulus modulus-size`
5. `ip ssh [timeout seconds | authentication-retries integer]`
6. `ip ssh version 2`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2** | `configure terminal` | Enters global configuration mode. |
| **Step 3** | `ip ssh rsa keypair-name keypair-name` | Specifies which RSA keypair to use for SSH usage.  
**Note** A Cisco IOS router can have many RSA key pairs. |
| **Step 4** | `crypto key generate rsa usage-keys label key-label modulus modulus-size` | Enables the SSH server for local and remote authentication on the router.  
For SSH Version 2, the modulus size must be at least 768 bits.  
**Note** To delete the RSA key-pair, use the `crypto key zeroize rsa` command. After you have deleted the RSA key-pair, you automatically disable the SSH server. |
| **Step 5** | `ip ssh [timeout seconds | authentication-retries integer]` | Configures SSH control variables on your router. |
| **Step 6** | `ip ssh version 2` | Specifies the version of SSH to be run on a router. |
Starting an Encrypted Session with a Remote Device

To start an encrypted session with a remote networking device, perform the following step. (You do not have to enable your router. SSH can be run in disabled mode.)

Note

The device you wish to connect with must support a SSH server that has an encryption algorithm that is supported in Cisco IOS software.

SUMMARY STEPS

1. `ssh [-v {1 | 2}] [-c {3des | aes128-cbc | aes192-cbc | aes256-cbc}] [-m {hmac-md5 | hmac-md5-96 | hmac-sha1 | hmac-sha1-96}] [-l userid] [-o numberofpasswordprompts n] [-p port-num] {ip-addr | hostname} [command]`

DETAILED STEPS

Step 1

```
Example:
Router# ssh -v 2 -c aes256-cbc -m hmac-sha1-96 -l user2 10.76.82.24
```

Or

The above example adheres to the SSH Version 2 conventions. A more natural and common way to start a session is by linking the username with the hostname. For example, the following configuration example provides an end result that is identical to that of the above example:

```
Router# ssh -v 2 -c aes256-cbc -m hmac-sha1-96 user2@10.76.82.24
```

Troubleshooting Tips

The `ip ssh version` command can be used for troubleshooting your SSH configuration. By changing versions, you can determine which SSH version has a problem.

Verifying the Status of the Secure Shell Connection Using the `show ssh` Command

To display the status of the SSH connection on your router, use the `show ssh` command.
SUMMARY STEPS

1. enable
2. show ssh

DETAILED STEPS

Step 1 enable

Example:
Router> enable

Enables privileged EXEC mode.
- Enter your password if prompted.

Step 2 show ssh

Example:
Router# show ssh

Displays the status of SSH server connections.

Examples

The following output examples from the show ssh command display status about various SSH Version 1 and Version 2 connections.

Version 1 and Version 2 Connections

```
Router# show ssh
Connection      Version Encryption      State                   Username
0              1.5     3DES            Session started         lab
```

```
Connection Version Mode Encryption  Hmac                State                   Username
Username
1          2.0     IN   aes128-cbc  hmac-md5     Session started       lab
1          2.0     OUT  aes128-cbc  hmac-md5     Session started       lab
```

Version 2 Connection with No Version 1

```
Router# show ssh
Connection Version Mode Encryption  Hmac                State                   Username
Username
1          2.0     IN   aes128-cbc  hmac-md5     Session started       lab
1          2.0     OUT  aes128-cbc  hmac-md5     Session started       lab
%No SSHv1 server connections running.
```

Version 1 Connection with No Version 2

```
Router# show ssh
Connection      Version Encryption State                   Username
0              1.5     3DES            Session started         lab
%No SSHv2 server connections running.
```
Verifying the Secure Shell Status Using the show ip ssh Command

To verify your SSH configuration, perform the following steps.

**SUMMARY STEPS**

1. *enable*
2. *show ip ssh*

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>enable</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td>Enables privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>show ip ssh</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router# show ip ssh</td>
</tr>
<tr>
<td>Displays the version and configuration data for SSH.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following examples from the *show ip ssh* command display the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries.

**Version 1 and Version 2 Connections**

```
router# show ip ssh
3d06h: %SYS-5-CONFIG_I: Configured from console by consoleh
SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3
```

**Version 2 Connection with No Version 1**

```
Router# show ip ssh
SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3
```

**Version 1 Connection with No Version 2**

```
Router# show ip ssh
3d06h: %SYS-5-CONFIG_I: Configured from console by console
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
```
Monitoring and Maintaining Secure Shell Version 2

To display debug messages about the SSH connections, use the `debug ip ssh` command.

**SUMMARY STEPS**

1. `enable`
2. `debug ip ssh`
3. `debug snmp packet`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | `enable` | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| 2    | `debug ip ssh` | Displays debugging messages for SSH. |
| 3    | `debug snmp packet` | Displays information about every SNMP packet sent or received by the router. |

**Example**

The following output from the `debug ip ssh` command shows that the digit 2 keyword has been assigned, signifying that it is an SSH Version 2 connection.

```
Router# debug ip ssh
```

```
00:33:55: SSH1: starting SSH control process
00:33:55: SSH1: sent protocol version id SSH-1.99-Cisco-1.25
00:33:55: SSH1: protocol version id is - SSH-2.0-OpenSSH_2.5.2p2
00:33:55: SSH2 1: send: len 280 (includes padlen 4)

00:34:08: SSH2 1: done calc MAC out #14
00:34:08: SSH2 1: send: len 16 (includes padlen 6)
00:34:08: SSH2 1: done calc MAC out #15
00:34:08: SSH1: Session terminated normally
Configuration Examples for Secure Shell Version 2 Support

This section provides the following configuration examples:

- Configuring Secure Shell Version 1: Example, page 13
- Configuring Secure Shell Version 2: Example, page 13
- Configuring Secure Shell Versions 1 and 2: Example, page 13
- Starting an Encrypted Session with a Remote Device: Example, page 13
- Setting an SNMP Trap: Example, page 13
- SSH Keyboard Interactive Authentication: Examples, page 14
- SNMP Debugging: Example, page 16
- SSH Debugging Enhancements: Examples, page 16

Configuring Secure Shell Version 1: Example

Router# configure terminal
Router (config)# ip ssh version 1
c7200-25-2013(config)# end

Configuring Secure Shell Version 2: Example

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip ssh version 2
Router(config)# end

Configuring Secure Shell Versions 1 and 2: Example

Router# configure terminal
Router (config)# no ip ssh version
Router (config)# end

Starting an Encrypted Session with a Remote Device: Example

Router# ssh -v 2 -c aes256-cbc -m hmac-shal-160 -l sship 10.76.82.24

Setting an SNMP Trap: Example

The following shows that an SNMP trap has been set. The trap notification is generated automatically when the SSH session terminates. For an example of SNMP trap debug output, see the section “SNMP Debugging: Example.”

snmp-server
snmp-server host a.b.c.d public tty

Where a.b.c.d is the IP address of the SSH client.
SSH Keyboard Interactive Authentication: Examples

The following are examples of various scenarios in which the SSH Keyboard Interactive Authentication feature has been automatically deployed:

### Client-Side Debugs

In the following example, client-side debugs are turned on and the maximum number of prompts = six, (three each for the SSH Keyboard Interactive Authentication method and for the password method of authentication).

```
Password:
Password:
Password:
Password:
Password: cisco123
Last login: Tue Dec 6 13:15:21 2005 from 10.76.248.213
user1@courier--> exit
logout
[Connection to 10.76.248.200 closed by foreign host]
```

```
Router1# debug ip ssh client
SSH Client debugging is on
```

```
Router1# ssh -l lab 10.1.1.3
Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123
```

```
Router2>
```

### TACACS+ ACS Is the Backend AAA Server, ChPass Is Enabled, and a Blank Password Change Is Made

In the following example, a TACACS+ access control server (ACS) is the backend Accounting, Authentication, and Authorization (AAA) server; the ChPass feature is enabled; and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method:

```
Router1# ssh -l cisco 10.1.1.3
Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123
```

```
Router2> exit
[Connection to 10.1.1.3 closed by foreign host]
```
TACACS+ ACS Is the Backend AAA Server, ChPass Is Enabled, and the Password Is Changed on First Login

In the following example, a TACACS+ ACS is the backend server, and the ChPass feature is enabled. The password is changed on the first login using the SSH Keyboard Interactive Authentication method:

Router1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Router2> exit
[Connection to 10.1.1.3 closed by foreign host]

Router1# ssh -l cisco 10.1.1.3
Password: cisco1
Your password has expired.
Enter a new one now.
New Password: cisco
Re-enter New password: cisco12
The New and Re-entered passwords have to be the same.
Try again.
New Password: cisco
Re-enter New password: cisco

Router2>

TACACS+ ACS Is the Backend AAA Server, ChPass Is Enabled, and the Password Expires After Three Logins

In the following example, a TACACS+ ACS is the backend AAA server, and the ChPass feature is enabled. The password expires after three logins using the SSH Keyboard Interactive Authentication method:

Router# ssh -l cisco 10.1.1.3
Password: cisco

Router2> exit
[Connection to 10.1.1.3 closed by foreign host]

Router1# ssh -l cisco 10.1.1.3
Password: cisco

Router2> exit

Router1# ssh -l cisco 10.1.1.3
Password: cisco

Router2> exit
[Connection to 10.1.1.3 closed by foreign host]

Router1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Router2>
SNMP Debugging: Example

The following is sample output using the `debug snmp packet` command. The output provides SNMP trap information for an SSH session.

```
Router1# debug snmp packet
SNMP packet debugging is on

Router1# ssh -l lab 10.0.0.2
Password:

`exit`

[Connection to 10.0.0.2 closed by foreign host]

Router1# *Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2
*Jul 18 10:18:42.619: SNMP: V1 Trap, ent cisco, addr 10.0.0.1, gentrap 6, spectrap 1
  local.9.3.1.1.2.1 = 6
  tcpConnEntry.1.10.0.0.1.22.10.0.0.2.55246 = 4
  ltcpConnEntry.1.10.0.0.1.22.10.0.0.2.55246 = 1015
  ltcpConnEntry.1.10.0.0.1.22.10.0.0.2.55246 = 1056
  ltcpConnEntry.2.10.0.0.1.22.10.0.0.2.55246 = 1392
  local.9.2.1.18.2 = lab
*Jul 18 10:18:42.879: SNMP: Packet sent via UDP to 10.0.0.2
```

SSH Debugging Enhancements: Examples

The following is sample output from the `debug ip ssh detail` command. The output provides debugging information regarding the SSH protocol and channel requests.

```
Router# debug ip ssh detail

00:04:22: SSH0: starting SSH control process
00:04:22: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
00:04:22: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
00:04:22: SSH2 0: SSH2_MSG_KEXINIT sent
00:04:22: SSH2 0: SSH2_MSG_KEXINIT received
00:04:22: SSH2 0: expecting SSH2_MSG_KEXDH_INIT
00:04:22: SSH2 0: SSH2_MSG_KEXDH_INIT received
00:04:22: SSH2: kex_derive_keys complete
00:04:22: SSH2 0: SSH2_MSG_KEXDH_INIT received
00:04:22: SSH2: kex_derive_keys complete
00:04:22: SSH2: kex_derive_keys complete
00:04:22: SSH2 0: waiting for SSH2_MSG_NEWKEYS
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS received
00:04:24: SSH2 0: authentication successful for lab
00:04:24: SSH2 0: channel open request
00:04:24: SSH2 0: pty-req request
00:04:24: SSH2 0: setting TTY - requested: height 24, width 80; set: height 24, width 80
00:04:24: SSH2 0: shell request
00:04:24: SSH2 0: shell message received
00:04:24: SSH2 0: starting shell for vty
00:04:38: SSH0: Session terminated normally
```

The following is sample output from the `debug ip ssh packet` command. The output provides debugging information regarding the ssh packet.
Where to Go Next

You have to use a SSH remote device that supports SSH Version 2, and you have to connect to a Cisco IOS router.

# Feature Information for Secure Shell Version 2 Support

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

| Secure Shell Version 2 Enhancements | 12.4(20)T   | The Secure Shell Version 2 Enhancements include a number of additional capabilities such as support for VRF aware SSH, SSH debug enhancements and Diffie-Hellman group 14 and group 16 exchange support. For information about this feature see the following sections:  
  * “Secure Shell Version 2 Enhancements” section on page 3  |
SSH Terminal-Line Access

This feature module describes the SSH Terminal-Line Access feature and includes the following sections:

- Feature Overview, page 1
- Supported Platforms, page 2
- Supported Standards, MIBs, and RFCs, page 4
- Prerequisites, page 4
- Configuration Tasks, page 4
- Configuration Examples, page 5
- Command Reference, page 7

Feature Overview

Cisco IOS supports reverse Telnet, which allows users to Telnet through the router—via a certain port range—to connect them to tty (asynchronous) lines. Reverse Telnet has allowed users to connect to the console ports of remote devices that do not natively support Telnet. However, this method has provided very little security because all Telnet traffic goes over the network in the clear. The SSH Terminal-Line Access feature replaces reverse Telnet with secure shell (SSH). This feature may be configured to use encryption to access devices on the tty lines, which provide users with connections that support strong privacy and session integrity.

SSH is an application and a protocol that provide secure replacement for the suite of Berkeley r-tools such as rsh, rlogin and rcp. (Cisco IOS supports rlogin.) The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. There are currently two versions of SSH available: SSH Version 1 and SSH Version 2. Only SSH Version 1 is implemented in the Cisco IOS software.

The SSH Terminal-Line Access feature enables users to configure their router with secure access and perform the following tasks:

- Connect to a router that has multiple terminal lines connected to consoles or serial ports of other routers, switches, or devices.
- Simplify connectivity to a router from anywhere by securely connecting to the terminal server on a specific line.
- Allow modems attached to routers to be used for dial-out securely.
- Require authentication to each of the lines through a locally defined username and password, TACACS+, or RADIUS.

Benefits

The SSH Terminal-Line Access feature provides users secure access to tty lines.

Restrictions

**Console Server Requirement**
To configure secure console server access, you must define each line in its own rotary and configure SSH to use SSH over the network when users wish to access each of those devices.

**Memory and Performance Impact**
Replacing reverse Telnet with SSH may reduce the performance of available tty lines due to the addition of encryption and decryption processing above the vty processing. (Any cryptographic mechanism uses more memory than a regular access.)

Related Documents

The following documents provide information related to the SSH Terminal-Line Access feature:

- Cisco IOS Dial Technologies Configuration Guide, Release 12.2
- *Cisco IOS Dial Technologies Command Reference*, Release 12.2
- *Cisco IOS Security Command Reference*, Release 12.2

For more information on SSH, such as the details of the protocol, go to the SSH website at http://www.ssh.com/.

Supported Platforms

This feature is supported on the following platforms:

- Cisco 1700 Series
- Cisco 2600 Series
- Cisco 3620
- Cisco 3640
- Cisco 3660
- Cisco 4500
- Cisco 12000 Series
This feature is supported on all platforms that support SSH.
SSH Terminal-Line Access

Supported Standards, MIBs, and RFCs

Standards
No new or modified standards are supported by this feature.

MIBs
No new or modified MIBs are supported by this feature.
To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.

RFCs
No new or modified RFCs are supported by this feature.

Prerequisites
Download the required image on your router. The SSH server requires you to have an IPSec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(1)T downloaded on your router; the SSH client requires you to have an IPSec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(3)T downloaded on your router. For more information on downloading a software image, refer to the Cisco IOS Configuration Fundamentals Configuration Guide, Release 12.2.
The SSH server requires the use of a username and password, which must be defined through the use of a local username and password, TACACS+, or RADIUS.

Note
The SSH Terminal-Line Access feature is available on any image that contains SSH.

Configuration Tasks
See the following section for configuration tasks for the SSH Terminal-Line Access feature:

• Configuring SSH Terminal-Line Access

Configuring SSH Terminal-Line Access

Note
SSH must already be configured on the router.

To configure a Cisco router to support reverse secure Telnet, use the following commands beginning in global configuration mode:
Verifying SSH Terminal-Line Access

To verify that this functionality is working, you can connect to a router using an SSH client.

Configuration Examples

This section provides the following configuration examples:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Router(config)# line line-number [ending-line-number]</td>
<td>Identifies a line for configuration and enters line configuration mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> For router console configurations, each line must be defined in its own rotary, and SSH must be configured to listen in on each rotary.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> An authentication method requiring a username and password must be configured for each line. This may be done through the use of a local username and password stored on the router, through the use of TACACS+, or through the use of RADIUS. Neither Line passwords nor the enable password are sufficient to be used with SSH.</td>
</tr>
<tr>
<td>2</td>
<td>Router(config-line)# no exec</td>
<td>Disables exec processing on each of the lines.</td>
</tr>
<tr>
<td>3</td>
<td>Router(config-line)# login (local</td>
<td>authentication listname)</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> The authentication method must utilize a username and password.</td>
</tr>
<tr>
<td>4</td>
<td>Router(config-line)# rotary group</td>
<td>Defines a group of lines consisting or one or more lines.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> All rotaries used must be defined, and each defined rotary must be used when SSH is enabled.</td>
</tr>
<tr>
<td>5</td>
<td>Router(config-line)# transport input {all</td>
<td>ssh}</td>
</tr>
<tr>
<td>6</td>
<td>Router(config-line)# exit</td>
<td>Exits line configuration mode.</td>
</tr>
<tr>
<td>7</td>
<td>Router(config)# ip ssh port portnum rotary group</td>
<td>Enables secure network access to the tty lines. Use this command to connect the portnum argument with the rotary group argument, which is associated with a line or group of lines.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> The group argument must correspond with the rotary group number chosen in Step 4.</td>
</tr>
</tbody>
</table>
SSH Terminal-Line Access Configuration Example

The following example shows how to configure the SSH Terminal-Line Access feature on a modem used for dial-out on lines 1 through 200. To get any of the dial-out modems, use any SSH client and start a SSH session to port 2000 of the router to get to the next available modem from the rotary.

```
line 1 200
  no exec
  login authentication default
  rotary 1
  transport input ssh
  exit
ip ssh port 2000 rotary 1
```

SSH Terminal-Line Access for a Console (Serial Line) Ports Configuration Example

The following example shows how to configure the SSH Terminal-Line Access feature to access the console or serial line interface of various devices. For this type of access, each line is put into its own rotary, and each rotary is used for a single port. In this example, lines 1 through 3 are used; the port (line) mappings of the configuration are shown in Table 68.

<table>
<thead>
<tr>
<th>Line Number</th>
<th>SSH Port Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2001</td>
</tr>
<tr>
<td>2</td>
<td>2002</td>
</tr>
<tr>
<td>3</td>
<td>2003</td>
</tr>
</tbody>
</table>

```
line 1
  no exec
  login authentication default
  rotary 1
  transport input ssh
line 2
  no exec
  login authentication default
  rotary 2
  transport input ssh
line 3
  no exec
  login authentication default
  rotary 3
  transport input ssh
ip ssh port 2001 rotary 1 3
```
Command Reference

- `ip ssh port`

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

Remote Site IEEE 802.1X Local Authentication Service

The Remote Site IEEE 802.1X Local Authentication Service feature provides the ability to configure an access point or wireless-aware router to act as a local RADIUS server. Configuring local authentication service provides a backup authentication service in the event of a WAN link or server failure.

Feature History for the Remote Site IEEE 802.1X Local Authentication Service Feature

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(11)JA</td>
<td>This feature was introduced on the Cisco IOS Release 12.2(11)JA on Cisco Aironet access points.</td>
</tr>
<tr>
<td>12.3(11)T</td>
<td>This feature was integrated into the Cisco IOS Release 12.3(11)T on the Cisco 2600XM, Cisco 2691, Cisco 2811, Cisco 2821, Cisco 2851, Cisco 3700 series, and Cisco 3800 series routers.</td>
</tr>
</tbody>
</table>

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.
Prerequisites for Configuring Remote Site IEEE 802.1X Local Authentication Service

Follow these guidelines when you configure an access point or wireless-aware router as a local authentication server:

- To prevent performance degradation, configure local authentication service on an access point or a wireless-aware router that does not have a high CPU load.
- Physically secure the access point or router to protect its configuration.

Restrictions for Configuring Remote Site IEEE 802.1X Local Authentication Service

The following are restrictions of the local authentication service feature:

- The local authentication server does not synchronize its database with the main RADIUS servers. It is necessary to manually configure the local authentication server with client usernames and passwords.
- LEAP is the only supported authentication protocol.
- Although multiple local authentication servers can exist on one network, only one authentication server can be configured on any single device.

Information About Configuring Remote Site IEEE 802.1x Local Authentication Service

On typical wireless LANs that use 802.1X authentication, access points and wireless-aware routers rely on remote site RADIUS servers to authenticate client devices. This authentication traffic must cross a WAN link. If the WAN link fails, or if the access points and routers cannot reach the RADIUS servers, then the client devices cannot access the wireless network even if their requirements for access are strictly local.

To provide for local authentication service or backup authentication service in the event of a WAN link or server failure, you can configure an access point or wireless-aware router to act as a local RADIUS server. The access point or wireless-aware router can authenticate Light Extensible Authentication Protocol (LEAP)–enabled wireless client devices and allow them to join your network.

Because the local authentication device does not synchronize its database with the main RADIUS servers. You must configure the local authentication server with client usernames and passwords. The local authentication server also permits you to specify a VLAN and a list of service set identifiers (SSIDs) that a client is allowed to use.

Table 69 shows the maximum number of clients that can be configured on a local authentication server.
Users that are associated to the local authentication server might notice a drop in performance during authentication of client devices. However, if your wireless LAN contains only one access point, you can configure that device as both the 802.1X authenticator and the local authentication server.

You configure access points and routers to use the local authentication server when they cannot reach the main servers or when a RADIUS server is not available.

The access points and wireless-aware routers stop using the local authentication server automatically when the link to the main servers is restored.

If your local authentication server also serves client devices, you must enter the local authentication server access point or router as a network access server (NAS). When a LEAP client associates to the local authentication server access point, the access point uses itself to authenticate the client.

The access point or wireless-aware router that you use as an authentication server contains detailed authentication information about your wireless LAN, so you should secure it physically to protect its configuration.

### How to Configure Remote Site IEEE 802.1X Local Authentication Service

This section contains the following procedures:

- Configuring the Local Authentication Server, page 4 (required)

<table>
<thead>
<tr>
<th>Local Authentication Server</th>
<th>Maximum Number of Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Aironet Access Point 1100 and Cisco Aironet Access Point 1200</td>
<td>50</td>
</tr>
<tr>
<td>Cisco 2610XM, Cisco 2611XM routers</td>
<td>50</td>
</tr>
<tr>
<td>Cisco 2620XM, Cisco 2621XM routers</td>
<td>50</td>
</tr>
<tr>
<td>Cisco 2650XM, Cisco 2651XM routers</td>
<td>50</td>
</tr>
<tr>
<td>Cisco 2691 routers</td>

</tbody>
</table>
Configuring the Local Authentication Server

Perform this task to configure the access point as a local authentication server.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `radius-server local`
5. `nas ip-address key shared-key`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;Router&gt; <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;Router# <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;Router(config)# <code>aaa new-model</code></td>
<td>Enables AAA.</td>
</tr>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;Router(config)# <code>radius-server local</code></td>
<td>Enables the access point or router as a local authentication server and enters configuration mode for the authentication server.</td>
</tr>
</tbody>
</table>
| **Step 5**<br>Router(config-radsrv)# `nas ip-address key shared-key` | Adds an access point or wireless domain services (WDS) device to the list of units that use the local authentication server. Enter the IP address of the access point or WDS device, and the shared key used to authenticate communication between the local authentication server and other access points. You must enter this shared key on the WDS devices that use the local authentication server. Each access point and candidate WDS that uses the local authentication server is a network access server (NAS). If an access point is the local authentication server that also serves client devices, you must enter the local authentication server access point as a NAS. 
**Note** Leading spaces in the key string are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key. |

Repeat this step to add each access point and candidate WDS device that uses the local authentication server.
Configuring User Groups on the Local Authentication Server

Perform this optional task (beginning in local RADIUS server configuration mode) to configure user groups on the local authentication server.

Note
If you do not wish to configure user groups on the local authentication server, skip this task and go to the “Creating the User List on the Local Authentication Server” section on page 6.

SUMMARY STEPS

1. `group group-name`
2. `vlan vlan`
3. `ssid ssid`
4. `reauthentication time seconds`
5. `block count count time {seconds | infinite}`
6. `exit`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config-radsrv)# <code>group group-name</code></td>
<td>Enters user group configuration mode and configures a user group to which you can assign shared settings.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-radsrv-group)# <code>vlan vlan</code></td>
<td>(Optional) Specifies a VLAN to be used by members of the user group. The access point moves group members into that VLAN, overriding other VLAN assignments. You can assign only one VLAN to the group.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router(config-radsrv-group)# <code>ssid ssid</code></td>
<td>(Optional) Enters up to 20 service set identifiers (SSIDs) to limit members of the user group to those SSIDs. The access point checks whether the client’s SSID matches an SSID in the list. If the SSID does not match, the client is disassociated.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Router(config-radsrv-group)# <code>reauthentication time seconds</code></td>
<td>(Optional) Configures the number of seconds after which access points should reauthenticate members of the group. The reauthentication provides users with a new encryption key. The default setting is 0, which means that group members are never required to reauthenticate.</td>
</tr>
</tbody>
</table>
| Step 5 | Router(config-radsrv-group)# `block count count time {seconds | infinite}` | (Optional) To help protect against password-guessing attacks, you can lock out group members for a length of time after a set number of incorrect passwords.  
  - Count—The number of failed passwords that triggers a lockout of the username.  
  - Time—The number of seconds that the lockout should last. If you enter `infinite`, an administrator must manually unblock the locked username. For more information, see the “Unblocking Usernames” section on page 6. |
| Step 6 | Router(config-radsrv-group)# `exit` | Returns to authenticator configuration mode. |
Unblocking Usernames

You can unblock usernames before the lockout time expires or when the lockout time is set to infinite. To unblock a locked username, enter the following command in privileged EXEC mode on the local authentication server.

```
Router# clear radius local-server user username
```

Creating the User List on the Local Authentication Server

Perform the required task described in the following paragraphs to create a user list on the local authentication server and to configure the users that are allowed to authenticate using the local authentication server.

**Note**

If you do not wish to configure users on the local authentication server, skip this task and go to the “Saving the Configuration on the Local Authentication Server” section on page 6.

You must enter a username and password for each user. If you know only the NT hash value of the password, which you can often find in the authentication server database, you can enter the NT hash as a string of hexadecimal digits.

To add the user to a user group, enter the group name. If you do not specify a group, the user is not assigned to a specific VLAN and is never forced to reauthenticate.

Beginning in local RADIUS server configuration mode, enter the `user` command for each username:

```
Router(config-radsrv)# user username {password | nthash} password [group group-name]
```

Saving the Configuration on the Local Authentication Server

Perform this optional task to save the current configuration.

**SUMMARY STEPS**

1. `end`
2. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config-radsrv)# end</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router# <code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>
Configuring Access Points or Routers to Use the Local Authentication Server

Perform this required task to add the local authentication server to the list of servers on the client access point or wireless-aware router.

**Note**
If your local authentication server access point also serves client devices, you must configure the local authentication server to use itself to authenticate client devices.

On the wireless devices that use the local authentication server, use the `radius-server host` command in privileged EXEC mode to enter the local authentication server as a RADIUS server. The order in which the devices attempt to use the servers matches the order in which you enter the servers in the device configuration. If you are configuring the device to use a RADIUS server for the first time, enter the main RADIUS servers first, and enter the local authentication server last.

**Note**
You must enter 1812 as the authentication port and 1813 as the accounting port. The local authentication server listens on User Datagram Protocol (UDP) port 1813 for RADIUS accounting packets. It discards the accounting packets but sends acknowledge packets back to the RADIUS clients to prevent the clients from reacting as though the server is down.

Use the `radius-server deadtime` command in global configuration mode to set an interval during which the access point or router does not attempt to use servers that do not respond, thus avoiding the wait for a request to time out before trying the next configured server. A server marked as dead is skipped by additional requests for the duration of minutes that you specify, up to 1440 (24 hours).

To remove the local authentication server from the access point or router configuration, use the `no radius-server host` command in global configuration mode.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]`
5. `aaa group server {radius | tacacs+} group-name`
6. `server ip-address auth-port 1812 acct-port 1813`
7. `aaa authentication login named-authentication-list`
8. `end`
9. `show running-config`
10. `copy running-config startup-config`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router&gt; <code>enable</code>&lt;br&gt;Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router# <code>configure terminal</code>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Router(config)# <code>aaa new-model</code>&lt;br&gt;Enables authentication, authorization, and accounting (AAA). This step must be configured before the rest of the AAA configuration steps.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Router(config)# `radius-server host {hostname</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>`aaa group server {radius</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Router(config-sg-radius)# <code>server ip-address auth-port 1812 acct-port 1813</code>&lt;br&gt;Defines the AAA server IP address, authentication port, and accounting port.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Router(config)# <code>aaa authentication login named-authentication-list</code>&lt;br&gt;Creates an authentication method list for the server group.</td>
</tr>
</tbody>
</table>
Remote Site IEEE 802.1X Local Authentication Service

Monitoring and Maintaining 802.1X Local Authentication Service

Verifying the Configuration for Local Authentication Service

Use the `show running-config` command in global configuration mode to verify the current configuration for local authentication service.

SUMMARY STEPS

1. `enable`
2. `show running-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 8</td>
<td><code>Router(config)# end</code></td>
</tr>
<tr>
<td>Step 9</td>
<td><code>Router# show running-config</code></td>
</tr>
<tr>
<td>Step 10</td>
<td><code>Router# copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

Monitoring and Maintaining 802.1X Local Authentication Service

To view statistics collected by the local authentication server, enter the following command in privileged EXEC mode:

`Router# show radius local-server statistics`

To reset local authentication server statistics to zero, enter the following command in privileged EXEC mode:

`Router# clear radius local-server statistics`

Configuration Examples for Remote Site IEEE 802.1X Local Authentication Service

This section provides the following configuration examples:

- Setting Up a Local Authentication Server: Example
- Setting Up Two Main Servers and a Local Authentication Server: Example
- Displaying Local Authentication Server Configuration: Example
- Displaying Local Authentication Server Statistics: Example
Setting Up a Local Authentication Server: Example

This example shows how to set up a local authentication server used by three access points with three user groups and several users:

```
AP# configure terminal
AP(config)# aaa new-model
AP(config)# aaa group server radius RADIUS_SERVER_GROUP
AP(config-ag-radius)# server 10.0.0.1 auth-port 1812 acct-port 1813
AP(config)# aaa authentication login RADIUS_METHOD_LIST
AP(config)# radius-server host 10.0.0.1 auth-port 1812 acct-port 1813 key 110337
AP(config)# radius-server local
AP(config-radsrv)# nas 10.91.6.159 key 110337
AP(config-radsrv)# nas 10.91.6.162 key 110337
AP(config-radsrv)# nas 10.91.6.181 key 110337
AP(config-radsrv)# group clerks
AP(config-radsrv-group)# vlan 87
AP(config-radsrv-group)# ssid batman
AP(config-radsrv-group)# ssid robin
AP(config-radsrv-group)# reauthentication time 1800
AP(config-radsrv-group)# block count 2 time 600
AP(config-radsrv-group)# group cashiers
AP(config-radsrv-group)# vlan 97
AP(config-radsrv-group)# ssid deer
AP(config-radsrv-group)# ssid antelope
AP(config-radsrv-group)# ssid elk
AP(config-radsrv-group)# reauthentication time 1800
AP(config-radsrv-group)# block count 2 time 600
AP(config-radsrv-group)# group managers
AP(config-radsrv-group)# vlan 77
AP(config-radsrv-group)# ssid mouse
AP(config-radsrv-group)# ssid chipmunk
AP(config-radsrv-group)# reauthentication time 1800
AP(config-radsrv-group)# block count 2 time 600
AP(config-radsrv-group)# exit
AP(config-radsrv)# user jsmith password twain74 group clerks
AP(config-radsrv)# user stpatrick password snake100 group clerks
AP(config-radsrv)# user nick password uptown group clerks
AP(config-radsrv)# user sam password rover32 group cashiers
AP(config-radsrv)# user patsy password crowder group cashiers
AP(config-radsrv)# user carl password 272165 group managers
AP(config-radsrv)# user vic password lid178 group managers
AP(config-radsrv)# end
```

Setting Up Two Main Servers and a Local Authentication Server: Example

This example shows how to set up two main servers and a local authentication server with a server deadtime of 10 minutes:

```
Router(config)# aaa new-model
Router(config)# aaa group server radius RADIUS_SERVER_GROUP
Router(config-ag-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Router(config-ag-radius)# server 172.10.0.1 auth-port 1645 acct-port 1646
Router(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001 key 77654
Router(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646 key 77654
Router(config)# radius-server host 10.91.6.151 auth-port 1812 acct-port 1813 key 110337
Router(config)# radius-server deadtime 10
```
In this example, if the WAN link to the main servers fails, the access point or wireless-aware router completes these steps when a LEAP-enabled client device associates:

1. It tries the first server, times out multiple times, and marks the first server as dead.
2. It tries the second server, times out multiple times, and marks the second server as dead.
3. It tries and succeeds using the local authentication server.

If another client device needs to authenticate during the 10-minute deadtime interval, the access point skips the first two servers and tries the local authentication server first. After the deadtime interval, the access point tries to use the main servers for authentication. When setting a deadtime, you must balance the need to skip dead servers with the need to check the WAN link and begin using the main servers again as soon as possible.

Each time an access point or wireless-aware router tries to use the main servers while they are down, the client device that is trying to authenticate might report an authentication timeout. The client device retries and succeeds when the main servers time out and the access point or wireless-aware router tries the local authentication server. You can extend the timeout value on Cisco client devices to accommodate expected server timeouts.

### Displaying Local Authentication Server Configuration: Example

The following is sample output for configuration of a local authentication server on the Cisco 2621 router.

```

Shared key mismatch : 0     Invalid state attribute: 0
Unknown EAP message : 0    Unknown EAP auth type : 0

Maximum number of configurable users: 50, current user count: 11
Username          Successes  Failures  Blocks
vayu-ap-1         2235         0       0
vayu-ap-2         2235         0       0
vayu-ap-3         2246         0       0
vayu-ap-4         2247         0       0
vayu-ap-5         2247         0       0
vayu-11           3           0       0
vayu-12           5           0       0
vayu-13           5           0       0
vayu-14           30          0       0
vayu-15           3           0       0
scm-test          1           8       0

router-2621-1#
```

The first section shows cumulative statistics from the local authentication server. The second section shows statistics for each access point (NAS) that is authorized to use the local authentication server. The third section shows statistics for individual users. If a user is blocked and the lockout time is set to infinite, `Blocked` appears at the end of the line of statistics for that user. If the lockout time is not set to infinite, `Unblocked in x seconds` appears at the end of the statistics line for that user.

MIBs

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

http://tools.cisco.com/ITDIT/MIBS/servlet/index

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

VPN Access Control Using 802.1X Authentication

The home access router provides connectivity to the corporate network via a Virtual Private Network (VPN) tunnel through the Internet. In the home LAN, apart from the employee, other members of the household may also be using the same access router. The VPN Access Control Using 802.1X Authentication feature allows enterprise employees to access their enterprise networks from home while allowing other household members to access only the Internet. The feature uses the IEEE 802.1X protocol framework to achieve the VPN access control. The authenticated employee has access to the VPN tunnel and others (unauthenticated users on the same LAN) have access only to the Internet.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for VPN Access Control Using 802.1X Authentication” section on page 33.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Prerequisites for VPN Access Control Using 802.1X Authentication

- The PCs connecting behind the router should have 802.1X clients running on them.
- You should know how to configure authentication, authorization, and accounting (AAA) and RADIUS.
- You should be familiar with IP Security (IPSec).
- You should be familiar with Dynamic Host Configuration Protocol (DHCP).
- You should know how to configure user lists on a Cisco access control server (ACS).

Restrictions for VPN Access Control Using 802.1X Authentication

- Easy VPN is not supported.
- VLAN interfaces are currently not supported.
- If there is a switch located between the router and the supplicant (client PC), the Extensible Authentication Protocol over LAN (EAPOL) frames will not reach the router because the switch discards them.

Information About VPN Access Control Using 802.1X Authentication

To configure the VPN Access Control Using 802.1X Authentication feature, you should understand the following concepts:

- How VPN Control Using 802.1X Authentication Works, page 2
- 802.1X Supplicant Support, page 4
- Authentication Using Passwords and MD5, page 5

How VPN Control Using 802.1X Authentication Works

The home access router provides connectivity to the corporate network via a VPN tunnel through the Internet. In the home LAN, both authenticated (employee) and unauthenticated (other household members) users exist, and both have access to the corporate VPN tunnel. Currently there is no existing mechanism to prevent the unauthenticated user from accessing the VPN tunnel.
To distinguish between the users, the VPN Access Control Using 802.1X Authentication feature uses the IEEE 802.1X protocol that allows end hosts to send user credentials on Layer 2 of the network operating system. Unauthenticated traffic users will be allowed to pass through the Internet but will be blocked from accessing the corporate VPN tunnel. The VPN Access Control Using 802.1X feature expands the scope of the 802.1X standard to authenticate devices rather than ports, meaning that multiple devices can be independently authenticated for any given port. This feature separates traffic from authenticated and unauthenticated users so that separate access policies can be applied.

When an 802.1X-capable host starts up, it will initiate the authentication phase by sending the EAPOL-Start 802.1X protocol data unit (PDU) to the reserved IEEE multicast MAC address (01-80-C2-00-00-03) with the Ethernet type or length set to 0x888E.

All 802.1X PDUs will be identified as such by the Ethernet driver and will be enqueued to be handled by an 802.1X process. On some platforms, Ethernet drivers have to program the interface address filter so that EAPOL packets can be accepted.

On the router, the receipt of the EAPOL-Start message will result in the source MAC address being “remembered,” and an EAPOL-request or identity PDU being sent to the host. The router will send all host-addressed PDUs to the individual MAC address of the host rather than to the multicast address.

### 802.1X Authentication Sample Topology and Configuration

Figure 1 illustrates a typical scenario in which VPN access control using 802.1X authentication is in place.

**Figure 1** Typical 802.1X Authentication Setup

- **Note**
  - You can have any kind of connectivity or network beyond the Cisco router WAN.
  - If there is a switch located between the router and the supplicant (client PC), the EAPOL frames will not reach the router because the switch discards them.
  - A supplicant is an entity at one end of a point-to-point LAN segment that is being authenticated by an authenticator that is attached to the other end of that link.
Converged 802.1X Authenticator Support

The Cisco IOS commands in Cisco IOS Release 12.4(6)T for 802.1X authenticators have been standardized to work the same way on various Cisco IOS platforms.

802.1X Supplicant Support

There are deployment scenarios in which a network device (a router acting as an 802.1X authenticator) is placed in an unsecured location and cannot be trusted as an authenticator. This scenario requires that a network device be able to authenticate itself against another network device. The 802.1X supplicant support functionality provides the following solutions for this requirement:

- An Extensible Authentication Protocol (EAP) framework has been included so that the supplicant has the ability to “understand” and “respond” to EAP requests. EAP-Message Digest 5 (EAP-MD5) is currently supported.
- Two network devices that are connected through an Ethernet link can act as a supplicant and as an authenticator simultaneously, thus providing mutual authentication capability.
- A network device that is acting as a supplicant can authenticate itself with more than one authenticator (that is, a single port on a supplicant can be connected to multiple authenticators).

The following illustration is an example of 802.1X supplicant support. The illustration shows that a single supplicant port has been connected to multiple authenticators. Router A is acting as an authenticator to devices that are sitting behind it on the LAN while those devices are acting as supplicants. At the same time, Router B is an authenticator to Router A (which is acting as a supplicant). The RADIUS server is located in the enterprise network.

When Router A tries to authenticate devices on the LAN, it needs to “talk” to the RADIUS server, but before it can allow access to any of the devices that are sitting behind it, it has to prove its identity to Router B. Router B checks the credential of Router A and gives access.

Figure 2  Multiple Instances of Supplicant Support

Converged 802.1X Supplicant Support

The Cisco IOS commands in Cisco IOS Release 12.4(6)T for 802.1X supplicants have been standardized to work the same way on various Cisco IOS platforms.
Authentication Using Passwords and MD5

For information about using passwords and Message Digest 5 (MD5), see the following document on Cisco.com:
- *Improving Security on Cisco Routers*

How to Configure VPN Access Control Using 802.1X Authentication

This section includes the following procedures:
- Configuring an AAA RADIUS Server, page 5
- Configuring a Router, page 5
- Configuring a PC, page 19
- Monitoring VPN Access Control Using 802.1X Authentication, page 21
- Verifying VPN Access Control Using 802.1X Authentication, page 23

Configuring an AAA RADIUS Server

To configure an AAA RADIUS server, perform the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Step 1** | Configure entries for the network access server and associated shared secrets.  
**Note** | The AAA server can be FreeRADIUS or Cisco Secure ACS or any other similar product with 802.1X support. |
| **Step 2** | Add the username and configure the password of the user. |
| **Step 3** | Configure a global or per-user authentication scheme. |

Configuring a Router

This section contains the following procedures:
- Enabling 802.1X Authentication, page 6 (required)
- Configuring Router and RADIUS Communication, page 7 (required)

Enabling 802.1X Authentication

To enable 802.1X port-based authentication, you should configure the router so that it can communicate with the AAA server, enable 802.1X globally, and enable 802.1X on the interface. To enable 802.1X port-based authentication, perform the following steps.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication dot1x default group radius
5. dot1x system-auth-control
6. identity profile default
7. interface type slot/port
8. dot1x port-control auto

**DETAILED STEPS**

How to Configure VPN Access Control Using 802.1X Authentication

Example

This section provides the following examples:

- 802.1X Configuration
- Verifying 802.1X Authentication

802.1X Configuration

The following example shows that 802.1X authentication has been configured on a router:

```plaintext
Router# configure terminal
Router(config)# aaa new-model
Router(config)# aaa authentication dot1x default group radius
Router(config)# dot1x system-auth-control
Router(config)# interface fastethernet 5/1
Router(config-if)# dot1x port-control auto
```

Verifying 802.1X Authentication

The following `show dot1x` command sample output shows that 802.1X authentication has been configured on a router:

```plaintext
Router# show dot1x all
PortControl       = AUTO
ReAuthentication  = Disabled
ReAuthPeriod      = 3600 Seconds
ServerTimeout     = 30 Seconds
SuppTimeout       = 30 Seconds
QuietWhile        = 120 Seconds
MaxReq            = 2
```

Configuring Router and RADIUS Communication

To configure RADIUS server parameters, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip radius source-interface interface-name`
4. `radius-server host {hostname \ ip-address}`
5. `radius-server key string`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:**  
  Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**  
  Router# configure terminal | |
| **Step 3** ip radius source-interface interface-name | Forces RADIUS to use the IP address of a specified interface for all outgoing RADIUS packets. |
| **Example:**  
  Router (config)# ip radius source-interface ethernet1 | |
| **Step 4** radius-server host (hostname | Configures the RADIUS server host name or IP address of the router.  
  - To use multiple RADIUS servers, reenter this command for each server. |
|  ip-address) | |
| **Example:**  
  Router (config)# radius-server host 172.16.39.46 | |
| **Step 5** radius-server key string | Configures the authorization and encryption key used between the router and the RADIUS daemon running on the RADIUS server.  
  - The key is a text string that must match the encryption key used on the RADIUS server. |
| **Example:**  
  Router (config)# radius-server key radiuskey | |

**Example**

The following example shows that RADIUS server parameters have been configured on the router:

```
Router# configure terminal
Router(config)# ip radius source-interface ethernet1
Router(config)# radius-server host 172.16.39.46
Router(config)# radius-server key radiuskey
```

**Configuring 802.1X Parameters (Retransmissions and Timeouts)**

Various 802.1X retransmission and timeout parameters can be configured. Because all of these parameters have default values, configuring them is optional. To configuring the retransmission and timeout parameters, perform the following steps.

**SUMMARY STEPS**

1. enable  
2. configure terminal  
3. interface type slot/port  
4. dot1x max-req number-of-retries
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Example: Router> enable |

**Step 2** configure terminal  
Enters global configuration mode.  
Example: Router# configure terminal

**Step 3** interface type slot/port
Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.  
Example: Router (config)# interface ethernet 0/1

**Step 4** dot1x max-req number-of-retries  
Sets the maximum number of times that the router sends an EAP request/identity frame (assuming that no response is received) to the supplicant before concluding that the supplicant does not support 802.1X.  
Example: Router (config-if)# dot1x max-req 3

**Step 5** dot1x port-control [auto | force-authorized | force-unauthorized]  
Sets the port control value.  
- **auto (optional)**—Authentication status of the supplicant will be determined by the authentication process.  
- **force-authorized (optional)**—All the supplicants on the interface will be authorized. The force-authorized keyword is the default.  
- **force-unauthorized (optional)**—All the supplicants on the interface will be unauthorized.  
Example: Router (config-if)# dot1x port-control auto

**Step 6** dot1x control-direction {both | in}  
Changes the port control to unidirectional or bidirectional.  
Example: Router (config-if)# dot1x control-direction both
How to Configure VPN Access Control Using 802.1X Authentication

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>

</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router (config-if)# dot1x reauthentication</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>dot1x timeout tx-period</strong> seconds&lt;br&gt;Sets the timeout for supplicant retries.&lt;br&gt;• If an 802.1X packet is sent to the supplicant and the supplicant does not send a response, the packet will be sent again after the time that was set using the <strong>seconds</strong> argument.&lt;br&gt;• The value is 1 through 65535 seconds. The default is 30 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router (config-if)# dot1x timeout tx-period 60</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>dot1x timeout server-timeout</strong> seconds&lt;br&gt;Sets the timeout for RADIUS retries.&lt;br&gt;• If an 802.1X packet is sent to the server, and the server does not send a response, the packet will be sent again after the time that was set using the <strong>seconds</strong> argument.&lt;br&gt;• The value is from 1 to 65535 seconds. The default is 30 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router (config-if)# dot1x timeout server-timeout 60</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>dot1x timeout reauth-period</strong> seconds&lt;br&gt;Sets the time after which an automatic reauthentication should be initiated.&lt;br&gt;• The value is from 1 to 65535 seconds. The default is 3600 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router (config-if)# dot1x timeout reauth-period 1800</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td><strong>dot1x timeout quiet-period</strong> seconds&lt;br&gt;The time after which authentication is restarted after the authentication has failed.&lt;br&gt;• The value is from 1 to 65535 seconds. The default is 120 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router (config-if)# dot1x timeout quiet-period 600</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td><strong>dot1x timeout ratelimit-period</strong> seconds&lt;br&gt;The rate limit period throttles the EAP-START packets from misbehaving supplicants.&lt;br&gt;• The value is from 1 to 65535 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Router (config-if)# dot1x timeout ratelimit-period 60</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

The following configuration example shows that various retransmission and timeout parameters have been configured:

Router# configure terminal
Router(config)# interface ethernet 0
Router(config-if)# dot1x port-control auto
Router(config-if)# dot1x reauthentication
Router(config-if)# dot1x timeout reauth-period 1800
Router(config-if)# dot1x timeout quiet-period 600
Router(config-if)# dot1x timeout supp-timeout 60
Router(config-if)# dot1x timeout server-timeout 60
Configuring the Identity Profile

The `identity profile default` command allows you to configure the static MAC addresses of the client that do not support 802.1X and to authorize or unauthorize them statically. The VPN Access Control Using 802.1X Authentication feature allows authenticated and unauthenticated users to be mapped to different interfaces. Under the `dot1x profile` configuration mode, you can specify the virtual template interface that should be used to create the virtual-access interface to which unauthenticated supplicants will be mapped. To specify which virtual template interface should be used to create the virtual access interface, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `identity profile default`
4. `description text line-of-description`
5. `template virtual-template`
6. `device [authorize | not-authorize] mac-address mac-address`
7. `device authorize type device-type`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3 <code>identity profile default</code></td>
<td>Creates an identity profile and enters identity profile configuration mode.</td>
</tr>
<tr>
<td>Step 4 <code>description line-of-description</code></td>
<td>Associates descriptive text with the profile.</td>
</tr>
<tr>
<td>Step 5 <code>template virtual-template</code></td>
<td>Specifies the virtual template interface that will serve as the configuration clone source for the virtual interface that is dynamically created for authenticated users.</td>
</tr>
</tbody>
</table>

Example:

```
Router> enable

Router# configure terminal

Router (config)# identity profile default

Router (config-identity-prof)# description description 1

Router (config-identity-prof)# template virtual-template

Router (config-identity-prof)# template virtual-template 1
```
How to Configure VPN Access Control Using 802.1X Authentication

The following example shows that Cisco IP phones and a specific MAC address have been statically authorized:

```
Router# configure terminal
Router(config)# identity profile default
Router(config-1x-prof)# description put the description here
Router(config-1x-prof)# template virtual-template1
Router(config-1x-prof)# device authorize type cisco ip phone
Router(config-1x-prof)# device authorize mac-address 0001.024B.B4E7
```

**Example**

Step 6

```
device [authorize | not-authorize] mac-address
```

**Example:**

```
Router (config-identity-prof)# device authorize
mac-address H.H.H
```

Step 7

```
device authorize type device-type
```

**Example:**

```
Router (config-identity-prof)# device authorize type
Cisco ip phone
```

**Command Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| Step 6  | device [authorize | not-authorize] mac-address 
          mac-address |
| Example: | Statically authorizes or unauthorizes a supplicant (by giving its MAC address) if the supplicant does not “understand” 802.1X. |
| Step 7  | device authorize type device-type |
| Example: | Statically authorizes or unauthorizes a device type. |

**Configuring the Virtual Template and DHCP**

The VPN Access Control Using 802.1X Authentication feature can be configured with one DHCP pool or two. If there are two pools, the unauthenticated and authenticated devices will get their addresses from separate DHCP pools. For example, the public pool can have an address block that has only local significance, and the private pool can have an address that is routable over the VPN tunnel. To configure your router for a private pool and for a public pool, perform the following steps.

**SUMMARY STEPS**

**Configuring the Identity Profile**

1. enable
2. configure terminal
3. identity profile default
4. description description-string
5. template virtual-template
6. exit

**Configuring the DHCP Private Pool**

1. ip dhcp pool name
2. network network-number [mask]
3. default-router address
Configuring the DHCP Public Pool
1. `ip dhcp pool name`
2. `network network-number [mask]`
3. `default-router address`
4. `exit`

Configuring the Interface
1. `configure terminal`
2. `interface type slot/port`
3. `ip address ip-address mask [secondary]`
4. `interface virtual-template number`
5. `ip address ip-address mask [secondary]`
6. `exit`

Configuring an Interface Without Assigning an Explicit IP Address to the Interface
1. `enable`
2. `configure terminal`
3. `interface type slot/port`
4. `ip unnumbered type number`

**DETAILED STEPS**

**Configuring the Identity Profile**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
 * Enter your password if prompted. |
| **Example:**  
Router> enable | |

</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>ip dhcp pool name</code></td>
<td>Configures the DHCP public address pool on a Cisco IOS DHCP server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-dhcp)# ip dhcp pool public</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>network network-number [mask]</code></td>
<td>Configures the subnet number and mask for a DHCP public address pool on a Cisco IOS DHCP server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-dhcp)# network 10.4.4.4.255.0.0.0</td>
</tr>
</tbody>
</table>
### Configuring the Interface

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface type slot/port</td>
<td>Enters interface configuration mode and specifies the interface to be enabled.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config)# interface loopback 0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip address ip-address mask [secondary]</td>
<td>Sets the private IP address for the interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-if)# ip address 10.5.5.5 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>interface virtual-template number</td>
<td>Creates a virtual template interface that can be configured and applied dynamically in creating virtual access interfaces.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-if)# interface virtual-template 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>ip address ip-address mask [secondary]</td>
<td>Sets the public IP address for the interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-if)# ip address 10.6.6.6 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>exit</td>
<td>Exits interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-if)# exit</td>
<td></td>
</tr>
</tbody>
</table>
Configuring an Interface Without Assigning an Explicit IP Address to the Interface

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Step 1**
| enable | Enables privileged EXEC mode. |
| **Example:**
| Router# enable | |
| **Step 2**
| configure terminal | Enters global configuration mode. |
| **Example:**
| Router# configure terminal | |
| **Step 3**
| interface type slot/port | Enters interface configuration mode and specifies the interface to be enabled. |
| **Example:**
| Router (config)# interface virtual-template 1/2 | |
| **Step 4**
| ip unnumbered type number | Enables IP processing on an interface without assigning an explicit IP address to the interface. |
| **Example:**
| Router (config-if)# ip unnumbered loopback 0 | |

**Example**

The following example shows that the identity profile associates virtual-template1 with unauthenticated supplicants. Virtual-template1 gets its IP address from interface loopback 0, and unauthenticated supplicants are associated with a public pool. Authenticated users are associated with a private pool.

```
Router(config)# identity profile default
Router(config-1x-prof)# description put the description here
Router(config-1x-prof)# template virtual-template1
Router(config-1x-prof)# exit

Router(config)# ip dhcp pool private
Router(config-dhcp)# network 10.0.0.1 255.0.0.0
Router(config-dhcp)# default-router 10.2.2.2
Router(config-dhcp)# exit

Router(config)# ip dhcp pool public
Router(config-dhcp)# network 10.4.4.4 255.0.0.0
Router(config-dhcp)# default-router 10.12.12.12
Router(config-dhcp)# exit

Router(config)# interface loopback0
Router(config-if)# ip address 10.5.5.5 255.255.255.0
Router(config-if)# interface ethernet0
Router(config-if)# ip address 10.6.6.6 255.255.255.0
Router(config-if)# exit

Router(config)# interface virtual-template1
Router(config-if)# ip unnumbered loopback 0
```
Configuring the Necessary Access Control Policies

802.1X authentication separates traffic from authenticated and unauthenticated devices. Traffic from authenticated devices transit via the physical interface, and unauthenticated traffic transits via the Virtual-Template1. Therefore, different policies can be applied on each interface. The configuration will also depend on whether two DHCP pools or a single DHCP pool is being used. If a single DHCP pool is being used, access control can be configured on Virtual-Template1, which will block any traffic from going to the networks to which unauthenticated devices should not have access. These networks (to which unauthenticated devices should not have access) could be the corporate subnetworks protected by the VPN or encapsulated by generic routing encapsulation (GRE). There can also be access control that restricts the access between authenticated and unauthenticated devices.

If two pools are configured, the traffic from a non-trusted pool is routed to the Internet using Network Address Translation (NAT), whereas trusted pool traffic is forwarded via a VPN tunnel. The routing can be achieved by configuring ACLs used by NAT and VPN accordingly.

For an example of an access control policy configuration, see the “Access Control Policies: Example” section.

Configuring a Router As a Supplicant

To configure a router to act as a supplicant, you have to first configure the identity profile that the supplicant will use to obtain its EAP credentials. Then you have to configure the interface as a supplicant Port Access Entity (PAE) type. To configure a router as a supplicant, perform the following steps.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dot1x credentials name
4. username name
5. password [0 | 7] password
6. description text
7. exit
8. interface type number
9. dot1x pae supplicant
10. exit
11. exit

</table>

Enabling 802.1X Authentication on a Windows 2000/XP PC

802.1X implementation on a Windows 2000/XP PC is unstable. A more stable 802.1X client, AEGIS (beta) for Microsoft Windows, is available at the Meetinghouse Data Communications website at www.mtghouse.com.

Enabling 802.1X Authentication on a Windows 2000 PC

To enable 802.1X authentication on your Windows 2000 PC, perform the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Make sure that the PC has at least Service Pack 3.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>At the above site, download and install 802.1X client for Windows 2000.</td>
<td></td>
</tr>
</tbody>
</table>
Enabling 802.1X Authentication on a Windows XP PC

To enable 802.1X authentication on a Windows XP PC, perform the following steps.

Step 1  Go to the Microsoft Windows registry and install the following entry there:
“HKLM\Software\Microsoft\EAPOL\Parameters\General\Global\SupplicantMode REG_DWORD 3”

Step 2  Reboot your PC.

Enabling 802.1X Authentication on Windows 2000 and Windows XP PCs

To enable 802.1X authentication on Windows 2000 and Windows XP PCs, that is, if you are operating both at the same time, perform the following steps.

Step 1  Open the Network and Dial-up Connections window on your computer.

Step 2  Right-click the Ethernet interface (Local Area Connection) to open the properties window. It should have a tab called “Authentication.”

Click the Authentication tab. Select the check box titled “Enable network access control using IEEE 802.1X.”

In a short period of time you should see a dialog box (for Windows 2000) or a floating window asking you to select it. Select it, and when the next window appears, enter the username and password in this dialog box. See Figure 3.
Monitoring VPN Access Control Using 802.1X Authentication

To monitor VPN Access Control Using 802.1X Authentication, perform the following steps. The commands shown in the steps may be used one at a time and in no particular order.

**SUMMARY STEPS**

1. `enable`
2. `clear dot1x`
3. `clear eap [sessions [credentials credentials-name | interface interface-name | method method-name | transport transport-name]]`
4. `debug dot1x [aaa | all | process | rxdata | state-machine | txdata | vlan]`
5. `debug eap [all | method] [authenticator | peer] [all | errors | events | packets | sm]`
6. `dot1x initialize [interface interface-name]`
7. `dot1x re-authenticate interface-type interface-number`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
`enable`  
**Example:**  
`Router> enable` | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2**  
`clear dot1x`  
**Example:**  
`Router# clear dot1x` | Clears 802.1X interface information. |
| **Step 3**  
`clear eap [sessions | credentials credentials-name | interface interface-name | method method-name | transport transport-name]`  
**Example:**  
`Router# clear eap sessions credentials type1` | Clears EAP information on a switch or for a specified port. |
| **Step 4**  
`debug dot1x [aaa | all | process | rxdata | state-machine | txdata | vlan]`  
**Example:**  
`Router# debug dot1x all` | Displays 802.1X debugging information.  
- **aaa**—Information is provided for AAA communications.  
- **all**—All 802.1X debugging messages are turned on.  
- **process**—Information is provided regarding the 802.1X process.  
- **rxdata**—Information is provided for packets that have been received from clients.  
- **state-machine**—Information is provided regarding the 802.1X state-machine.  
- **txdata**—Information is provided regarding packets that have been transmitted to clients.  
- **vlan**—Information is provided regarding the MAC address-based VLAN operation.  
- **Note** VLAN interfaces are currently not supported. |
| **Step 5**  
`debug eap [all | method] [authenticator | peer]  
(all | errors | events | packets | sm)`  
**Example:**  
`Router# debug eap all` | Displays information about EAP. |
### Verifying VPN Access Control Using 802.1X Authentication

To verify VPN Access Control Using 802.1X Authentication, perform the following steps.

#### SUMMARY STEPS

1. enable
2. `show dot1x [interface interface-name [details]]`
3. `show eap registrations [method | transport]`
4. `show eap sessions [credentials credentials-name | interface interface-name | method method-name | transport transport-name]`

Configuration Examples for VPN Access Control Using 802.1X Authentication

This section includes the following example:

- Typical VPN Access Control Using 802.1X Configuration: Example, page 24
- Access Control Policies: Example, page 28
- Router Acting As a Supplicant: Example, page 29

Typical VPN Access Control Using 802.1X Configuration: Example

The following sample output shows that VPN access control using 802.1X authentication has been configured. Output is shown for the router and for the gateway.

VPN Access Control Using 802.1X Authentication

Feature Information for VPN Access Control Using 802.1X Authentication

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

SSL VPN

First Published: February 27, 2006
Last Updated: October 10, 2008

The SSL VPN feature (also known as WebVPN) provides support, in Cisco IOS software, for remote user access to enterprise networks from anywhere on the Internet. Remote access is provided through a Secure Socket Layer- (SSL-) enabled SSL VPN gateway. The SSL VPN gateway allows remote users to establish a secure Virtual Private Network (VPN) tunnel using a web browser. This feature provides a comprehensive solution that allows easy access to a broad range of web resources and web-enabled applications using native HTTP over SSL (HTTPS) browser support. SSL VPN delivers three modes of SSL VPN access: clientless, thin-client, and full-tunnel client support.

This document is primarily for system administrators. If you are a remote user, see the document SSL VPN Remote User Guide.

Note

The Cisco AnyConnect VPN Client is introduced in Cisco IOS Release 12.4(15)T. This feature is the next-generation SSL VPN Client. If you are using Cisco software earlier than Cisco IOS Release 12.4(15)T, you should be using SSL VPN Client and see GUI for the SSL VPN Client when you are web browsing. However, if you are using Cisco software Release 12.4(15)T or later, you should be using Cisco AnyConnect VPN Client and see GUI for Cisco AnyConnect VPN Client when you are web browsing.

For “What’s New” information about SSL VPN features by release, see the section “Finding Feature Information in This Module,” which follows.

Finding Feature Information in This Module

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for SSL VPN” section on page 118.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for SSL VPN

To securely access resources on a private network behind an SSL VPN gateway, the remote user of an SSL VPN service must have the following:

- An account (login name and password)
- An SSL-enabled browser (for example, Internet Explorer, Netscape, Mozilla, or FireFox)
- Operating system support

Note
Later versions of the following software are also supported.

- Microsoft Windows 2000, Windows XP, or Windows Vista
- Macintosh OS X 10.4.6
- Linux (Redhat RHEL 3.0 +, FEDORA 5, or FEDORA 6)

- SSL VPN-supported browser—The following browsers have been verified for SSL VPN. Other browsers might not fully support SSL VPN features.

Note
Later versions of the following software are also supported.

- Internet Explorer 6.0 or 7.0
- Firefox 2.0 (Windows and Linux)
- Safari 2.0.3

- “Thin Client” support used for TCP port-forwarding applications requires administrative privileges on the computer of the remote user.
- “Tunnel mode” for Cisco SSL VPN requires administrative privileges for initial installation of the full tunnel client.
- The remote user must have local administrative privileges to use thin client or full tunnel client features.
The SSL VPN gateway and context configuration must be completed before a remote user can access resources on a private network behind an SSL VPN. This configuration is shown in the section “How to Configure SSL VPN Services on a Router.”

**ACL Support**
- Before configuring this feature, the time range should have already been configured.

**Single SignOn (SSO) Netegrity Cookie Support**
- A Cisco plug-in must be installed on a Netegrity SiteMinder server.

---

**Restrictions for SSL VPN**

- URLs referred by the Macromedia Flash player cannot be modified for secure retrieval by the SSL VPN gateway.

**Cisco AnyConnect VPN Client**
Cisco AnyConnect VPN Client does not support the following:
- Datagram Transport Layer Security (DTLS) with SSL connections
- Standalone Mode (supported in Cisco IOS Release 12.4(20)T and later versions)
- IPsec
- IPv6 VPN access
- Compression support
- Language translation (localization)
- Client-side authentication
- Adaptive Security Appliance (ASA) and Adaptive Security Device Manager (ASDM) and any command-line interface (CLI) associated with them
- Adjusting Maximum Transmission Unit (MTU) size
- Sequencing

**Thin Client Control List Support**
- Although there is no limitation on the maximum number of filtering rules that can be applied for each access control list (ACL) entry, keeping the number below 50 should have no impact on router performance.

**HTTP Proxy**
- This feature works only with Microsoft Internet Explorer.
- This feature will not work if the browser proxy setup cannot be modified because of any security policies that have been placed on the client workstation.
Information About SSL VPN

To configure SSL VPN, you should understand the following concepts:
- SSL VPN Overview, page 4
- Modes of Remote Access, page 5
- SSL VPN Features, page 10
- Other SSL VPN Features, page 25
- Platform Support, page 28

SSL VPN Overview

Cisco IOS SSL VPN provides SSL VPN remote-access connectivity from almost any Internet-enabled location using only a web browser that natively supports SSL encryption. This feature allows your company to extend access to its secure enterprise network to any authorized user by providing remote-access connectivity to corporate resources from any Internet-enabled location.

Cisco IOS SSL VPN can also support access from noncorporate-owned machines, including home computers, Internet kiosks, and wireless hot spots. These locations are difficult places to deploy and manage VPN client software and remote configuration required to support IPsec VPN connections.

Figure 1 shows how a mobile worker (the lawyer at the courthouse) can access protected resources from the main office and branch offices. Site-to-site IPsec connectivity between the main and remote sites is unaltered. The mobile worker needs only Internet access and supported software (web browser and operating system) to securely access the corporate network.
SSL VPN delivers the following three modes of SSL VPN access:

- **Clientless**—Clientless mode provides secure access to private web resources and will provide access to web content. This mode is useful for accessing most content that you would expect to access in a web browser, such as Internet access, databases, and online tools that employ a web interface.

- **Thin Client** (port-forwarding Java applet)—Thin client mode extends the capability of the cryptographic functions of the web browser to enable remote access to TCP-based applications such as Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP), Internet Message Access protocol (IMAP), Telnet, and Secure Shell (SSH).

- **Tunnel Mode**—Full tunnel client mode offers extensive application support through its dynamically downloaded Cisco AnyConnect VPN Client (next-generation SSL VPN Client) for SSL VPN. Full tunnel client mode delivers a lightweight, centrally configured and easy-to-support SSL VPN tunneling client that provides network layer access to virtually any application.

SSL VPN application accessibility is somewhat constrained relative to IPsec VPNs; however, SSL-based VPNs provide access to a growing set of common software applications, including web page access, web-enabled services such as file access, e-mail, and TCP-based applications (by way of a downloadable thin-client applet). SSL-based VPN requires slight changes to user workflow because some applications are presented through a web browser interface, not through their native GUI. The advantage for SSL VPN comes from accessibility from almost any Internet-connected system without needing to install additional desktop software.

**Modes of Remote Access**

This section includes the following:

- Remote Access Overview, page 5
- Clientless Mode, page 6
- Thin-Client Mode, page 7
- Tunnel Mode, page 9

**Remote Access Overview**

End-user login and authentication is performed by the web browser to the secure gateway using an HTTP request. This process creates a session that is referenced by a cookie. After authentication, the remote user is shown a portal page that allows access to the SSL VPN networks. All requests sent by the browser include the authentication cookie. The portal page provides all the resources available on the internal networks. For example, the portal page could provide a link to allow the remote user to download and install a thin-client Java applet (for TCP port forwarding) or a tunneling client.

*Figure 2* shows an overview of the remote access modes.
Table 1 summarizes the level of SSL VPN support that is provided by each access mode.

Table 1  Access Mode Summary

<table>
<thead>
<tr>
<th></th>
<th>Clientless Mode</th>
<th>Thin-Client Mode</th>
<th>Tunnel Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Browser-based (clientless)</td>
<td>TCP port forwarding</td>
<td>Works like “clientless” IPsec VPN</td>
</tr>
<tr>
<td></td>
<td>Microsoft Windows or Linux</td>
<td>Uses Java Applet</td>
<td>Tunnel client loaded through Java or ActiveX (approximately 500 kB)</td>
</tr>
<tr>
<td></td>
<td>Web-enabled applications, file sharing, Outlook Web Access</td>
<td>Extends application support</td>
<td>Application agnostic—supports all IP-based applications</td>
</tr>
<tr>
<td></td>
<td>Gateway performs address or protocol conversion and content parsing and rewriting</td>
<td>Telnet, e-mail, SSH, Meeting Maker, Sametime Connect</td>
<td>Scalable</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Static port-based applications</td>
<td>Local administrative permissions required for installation</td>
</tr>
</tbody>
</table>

Clientless Mode

In clientless mode, the remote user accesses the internal or corporate network using the web browser on the client machine. The PC of the remote user must run the Windows 2000, Windows XP, or Linux operating systems.

The following applications are supported in clientless mode:

- Web browsing (using HTTP and secure HTTP [HTTPS])—provides a URL box and a list of web server links in the portal page that allows the remote user to browse the web.
- File sharing (using common Internet file system [CIFS])—provides a list of file server links in the portal page that allows the remote user to do the following operations:
  - Browse a network (listing of domains)
  - Browse a domain (listing of servers)
  - Browse a server (listing of shares)
  - List the files in a share
  - Create a new file
SSL VPN

Information About SSL VPN

- Create a directory
- Rename a directory
- Update a file
- Download a file
- Remove a file
- Rename a file

**Note**

Linux requires that the Samba application is installed before CIFS file shares can be remotely accessed.

- Web-based e-mail, such as Microsoft Outlook Web Access (OWA) 2003 (using HTTP and HTTPS) with Web Distributed Authoring and Versioning (WebDAV) extensions—provides a link that allows the remote user to connect to the exchange server and read web-based e-mail.

**Thin-Client Mode**

Thin-client mode, also called TCP port forwarding, assumes that the client application uses TCP to connect to a well-known server and port. In thin-client mode, the remote user downloads a Java applet by clicking the link provided on the portal page, or the Java applet is downloaded automatically (see “Options for Configuring HTTP Proxy and the Portal Page” and “Options for Configuring HTTP Proxy and the Portal Page”). The Java applet acts as a TCP proxy on the client machine for the services that you configure on the gateway.

The applications that are supported in thin-client mode are mainly e-mail-based (SMTP, POP3, and Internet Map Access Protocol version 4 [IMAP4] applications.

**Note**

The TCP port-forwarding proxy works only with the Sun Microsystems Java Runtime Environment (JRE) version 1.4 or later versions. A Java applet is loaded through the browser that verifies the JRE version. The Java applet will refuse to run if a compatible JRE version is not detected.

The Java applet initiates an HTTP request from the remote user client to the SSL VPN gateway. The name and port number of the internal e-mail server is included in the HTTP request (POST or CONNECT). The SSL VPN gateway creates a TCP connection to that internal e-mail server and port.

The Java applet starts a new SSL connection for every client connection.

You should observe the following restrictions when using thin-client mode:

- The remote user must allow the Java applet to download and install.
- You cannot use thin-client mode for applications such as FTP, where the ports are negotiated dynamically. You can use TCP port forwarding only with static ports.

**Note**

There is a known compatibility issue with the encryption type and Java. If the Java port-forwarding applet does not download properly and the configuration line `ssl encryption 3des-sha1 aes-sha1` is present, you should remove the line from the webvpn gateway subconfiguration.
Options for Configuring HTTP Proxy and the Portal Page

Effective with Cisco IOS Release 12.4(11)T, administrators have more options for configuring the HTTP proxy and the portal page. If HTTP proxy is enabled, the Java applet acts as the proxy for the browser of the user, thereby connecting the client workstation with the gateway. The home page of the user (as defined by the user group) is opened automatically or, if configured by the administrator, the user is directed to a new website.

HTTP proxy supports both HTTP and HTTPS.

Benefits of Configuring HTTP Proxy
HTTP supports all client-side web technologies (including HTML, Cascading Style Sheets [CSS], JavaScript, VBScript, ActiveX, Java, and flash), HTTP Digest authentication, and client certificate authentication. Remote users can use their own bookmarks, and there is no limit on cookies. Because there is no mangling involved and the client can cache the objects, performance is much improved over previous options for configuring the HTTP proxy and portal page.

Illustrations of Port Forwarding with and Without an HTTP Proxy Configuration
Figure 3 illustrates TCP port forwarding without HTTP proxy configured.

In Figure 3, the following steps must occur:
1. User downloads the proxy applet.
2. Applet updates the registry to add HTTP as a Remote Procedure Call (RPC) transport.
3. Applet examines the registry to determine the exchange (and local catalog) server and create server entries that refer to those servers.
4. Applet opens local port 80 and listens for connections.
5. User starts Outlook, and Outlook connects to 10.0.0.254:80.
6. Applet opens a connection to the secure gateway and delivers the requests from Outlook.
7. Secure gateway examines the requests to determine the end-point exchange server.
8. Data flows from Outlook, through the applet and the secure gateway, to the exchange server.
10. User closes the applet. Before closing, the applet undoes configuration Steps 3 and 4. Figure 4 illustrates TCP port forwarding when HTTP proxy is configured.

**Figure 4**  **HTTP Proxy**

In Figure 4, the following steps occur:

1. Proxy applet is downloaded automatically.
2. Applet saves the original proxy configuration of the browser.
3. Applet updates the proxy configuration of the browser to be the local loopback address with an available local port (by default, port 8080).
4. Applet opens the available local port and listens for connections.
5. Applet, if so configured, opens the home page of the user, or the user browses to a new website.
6. Applet accepts and looks at the HTTP or HTTPS request to determine the destination web server.
7. Applet opens a connection to the secure gateway and delivers the requests from the browser.
8. Secure gateway examines the requests to determine the end-point web server.
9. Data flows from the browser, through the applet and the secure gateway, to the web server.
10. User closes applet. Before closing, the applet undoes configuration Steps 2 and 3.

**Note**

HTTP proxy can also be enabled on a AAA server. See the section “SSL VPN RADIUS Attribute-Value Pairs” (port-forward-http-proxy and port-forward-http-proxy-url attributes).

**Tunnel Mode**

In a typical clientless remote access scenario, remote users establish an SSL tunnel to move data to and from the internal networks at the application layer (for example, web and e-mail). In tunnel mode, remote users use an SSL tunnel to move data at the network (IP) layer. Therefore, tunnel mode supports most IP-based applications. Tunnel mode supports many popular corporate applications (for example, Microsoft Outlook, Microsoft Exchange, Lotus Notes E-mail, and Telnet).

The tunnel connection is determined by the group policy configuration. The Cisco AnyConnect VPN Client is downloaded and installed on the remote user PC, and the tunnel connection is established when the remote user logs into the SSL VPN gateway.
By default, the Cisco AnyConnect VPN Client is removed from the client PC after the connection is closed. However, you have the option to keep the Cisco AnyConnect VPN Client installed on the client PC.

SSL VPN Features

SSL VPN includes the following features:

- Access Control Enhancements, page 10
- AnyConnect Client Support, page 10
- Application ACL Support, page 11
- Automatic Applet Download, page 11
- Backend HTTP Proxy, page 11
- Front-Door VRF Support, page 11
- Full-Tunnel CEF Support, page 12
- GUI Enhancements, page 12
- Internationalization, page 18
- Netegrity Cookie-Based Single SignOn Support, page 20
- NTLM Authentication, page 20
- RADIUS Accounting, page 20
- Stateless High Availability with Hot Standby Router Protocol, page 21
- TCP Port Forwarding and Thin Client, page 22
- URL Obfuscation, page 24
- URL Rewrite Splitter, page 24
- User-Level Bookmarking, page 24

Access Control Enhancements

Effective with Cisco IOS Release 12.4(20)T, administrators can configure automatic authentication and authorization for users. Users provide their usernames and passwords via the gateway page URL and do not have to reenter their usernames and passwords from the login page. Authorization is enhanced to support more generic authorization, including local authorization. In previous releases, only RADIUS authorization was supported.

For information about configuring this feature, see the section “Configuring Automatic Authentication and Authorization.”

AnyConnect Client Support

Effective with Cisco IOS Release 12.4(20)T, AnyConnect Client support has been added for several client-side platforms, such as Microsoft Windows, Apple-Mac, and Linux. The ability to install AnyConnect in a standalone mode is also added. In addition, the Release 12.4(20)T allows you to install multiple AnyConnect VPN client packages to a gateway. For information on configuring multiple packages, see the section “Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files.”
Application ACL Support

Effective with Cisco IOS Release 12.4(11)T, this feature provides administrators with the flexibility to fine-tune access control on the application layer level, for example, on the basis of a URL.

For information about configuring this feature, see the sections “Configuring ACL Rules” and “Associating an ACL Attribute with a Policy Group.”

Automatic Applet Download

Effective with Cisco IOS Release 12.4(9)T, administrators have the option of automatically downloading the port-forwarding Java applet. This feature must be configured on a group policy basis.

Note

Users still have to allow the Java applet to be downloaded. The dialog box pops up, asking for permission.

To configure the automatic download, see the section “Configuring an SSL VPN Policy Group.”

Backend HTTP Proxy

This feature, added in Cisco IOS Release 12.4(20)T, allows administrators to route user requests through a backend HTTP proxy, providing more flexibility and controllability than routing requests through internal web servers. This feature adds the following new authentication, authorization, and accounting (AAA) attributes:

http-proxy-server
http-proxy-server-port

For information about configuring this feature, see the section “Configuring a Backend HTTP Proxy.”

Front-Door VRF Support

Effective with Cisco IOS Release 12.4(15)T, front-door virtual routing and forwarding (FVRF) support, coupled with the already supported internal virtual routing and forwarding (IVRF), provides for increased security. The feature allows the SSL VPN gateway to be fully integrated into a Multiprotocol Label Switching (MPLS) or non-MPLS network (wherever the VRFs are deployed). The virtual gateway can be placed into a VRF that is separate from the Internet to avoid internal MPLS and IP network exposure. This placement reduces the vulnerability of the router by separating the Internet routes or the global routing table. Clients can now reach the gateway by way of the FVRF, which can be separate from the global VRF. The backend, or IVRF, functionality remains the same.

This FVRF feature provides for overlapping IP addresses.

Figure 5 is a scenario in which FVRF has been applied.
To configure FVRF, see “Configuring FVRF” section on page 78.

**Full-Tunnel CEF Support**

Effective with Cisco IOS Release 12.4(20)T, Full-Tunnel Cisco Express Forwarding (CEF) support has been added for better throughput performance than in earlier releases. This feature is enabled by default. To turn off full-tunnel CEF support, use the `no webvpn cef` command.

>Note>

To take full advantage of CEF support, the hardware crypto engine is required.

For an example of output showing CEF-processed packets, see the section “CEF-Processed Packets: Example, page 100.”

**GUI Enhancements**

In Cisco IOS Release 12.4(15)T, ergonomic improvements were made to the GUI user interface of the Cisco IOS SSL VPN gateway. The improved customization of the user interface provides for greater flexibility and the ability to tailor portal pages for individualized looks. Enhancements were made to the following web screens:

- Login screen
- Portal page
**Login Screen**

*Figure 6* is an example of a typical login screen.

*Figure 6  Typical Login Screen*

**Banner**

The banner is a small pop-up box (see *Figure 7*) that appears after the user is logged in and before the portal page appears.

The message in the pop-up box is configured using the `banner` command.
Customizing a Login Page

Login screens can be customized by an administrator. Figure 8 shows the fields that can be customized. For information about setting various elements of the login page, see the document *Cisco IOS Security Command Reference*, Release 12.4T, for the `logo`, `title`, `title-color`, `login-message`, `text-color`, `secondary-color`, `login-photo`, and `color` commands.

**Figure 7** Banner

![Banner Image]

**Figure 8** Login Page with Callouts of the Fields That Can Be Customized
Portal Page

The portal page (Figure 9) is the main page for the SSL VPN functionality. You can customize this page to contain the following:

- Custom logo (the default is the Cisco bridge logo)
- Custom title (the default is “WebVPN Services”)
- Custom banner (the default is an empty string)
- Custom colors (the default is a combination of white and greens)
- List of web server links (can be customized)

Note
The Bookmark links are listed under the Personal folder, and the server links are listed under Network File in Figure 9.

- URL entry box (may be present or can be hidden using the `hide-url-bar` command)
- Thin Client link (may or may not be present)

Note
The Application Access box allows you to download and install the Tunnel Connection and Thin Client Application.

- Links for Help, Home (that is, the portal page), and Logout

Items that you have not configured are not displayed on the portal page.

Note
E-mail access is supported by thin-client mode, which is downloaded using the Thin Client link.

Figure 9 is an example of a typical portal page.
Figure 9  Typical Portal Page

Customizing a Portal Page

Portal pages can be customized by an administrator. Figure 10 shows various fields, including the fields that can be customized by an administrator. The fields that can be customized by an administrator are as follows:

- Title
- Logo
- Secondary color
- Administrator-defined bookmarks
- Color
Table 2 provides information about various fields on the portal page. For information about setting elements such as color or titles, see command information in the Cisco IOS Security Command Reference, Release 12.4T, for the `logo, title, title-color, functions, port-forward, color, secondary-text-color, url-list, secondary-color, and hide-url-bar` commands.

**Table 2  Information About Fields on the Portal Page**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User-level bookmark add icon</td>
<td>If a user clicks it, a dialog box is added so that a new bookmark can be added to the Personal folder.</td>
</tr>
<tr>
<td>Network File location bar</td>
<td>A user can enter the file server here. Both of the <code>functions file-access</code> and <code>functions file-entry</code> commands must be configured for the input box to appear.</td>
</tr>
<tr>
<td>Header</td>
<td>Shares the same color value as the title.</td>
</tr>
<tr>
<td>Last login</td>
<td>Timestamp of the last login.</td>
</tr>
<tr>
<td>Browse network</td>
<td>Allows a user to browse the file network. Both commands <code>functions file-access</code> and <code>functions file-browse</code> must be configured for the icon to appear.</td>
</tr>
<tr>
<td>Tunnel Connection</td>
<td>A user can choose when to start the tunnel connection by configuring the <code>functions svc-enabled</code> command.</td>
</tr>
</tbody>
</table>
Internationalization

The Internationalization feature provides multilanguage support for messages initiated by the headend for SSL VPN clients, such as Cisco Secure Desktop (CSD) and SSL VPN Client (SVC). With the Internationalization feature, administrators can import their own attribute files in an XML format so that other languages can be imported using an editor that supports multilanguages.

Figure 11 shows a portal page in English. Users can select any language you have imported for certain SSL VPN web pages (currently: login message, title page, and URL lists).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>Port forwarding</td>
<td>Downloads the applet and starts port forwarding.</td>
</tr>
<tr>
<td>User-level bookmark edit icon</td>
<td>Allows a user to edit or delete an existing bookmark.</td>
</tr>
<tr>
<td>User-level bookmarks</td>
<td>A user can add a bookmark by using the plus icon (see below)</td>
</tr>
<tr>
<td>Administrator-defined bookmarks</td>
<td>Administrator-defined URL lists cannot be edited by the user.</td>
</tr>
<tr>
<td>URL address bar</td>
<td>A new window is opened when a user clicks Go.</td>
</tr>
</tbody>
</table>

Table 2  Information About Fields on the Portal Page (continued)
Figure 11  Portal Page in English

Figure 12 shows that an administrator has imported files in Japanese. A user has selected Japanese as the language for certain SSL VPN web pages (currently: login message, title, and URL lists).

Figure 12  Portal Page in Japanese
For information about configuring this feature, see the “Configuring Internationalization” section on page 84. For examples relating to this feature, see the “Internationalization: Examples” section on page 103.

Max-User Limit Message

When a user tries to log in to a Web VPN context and the maximum user limit has been reached, he or she receives an “Max-user limit reached” message.

Netegrity Cookie-Based Single SignOn Support

The Netegrity SiteMinder product provides a Single SignOn (SSO) feature that allows a user to log on to a single time for various web applications. The benefit of this feature is that users are prompted to log on only once. This feature is accomplished by setting a cookie in the browser of a user when the user initially logs on.

Effective with Cisco IOS Release 12.4(11)T, Netegrity cookie-based SSO is integrated with SSL VPN. It allows administrators to configure an SSO server that sets a SiteMinder cookie in the browser of a user when the user initially logs on. This cookie is validated by a SiteMinder agent on subsequent user requests to resources that are protected by a SiteMinder realm. The agent decrypts the cookie and verifies whether the user has already been authenticated.

For information about configuring SSO Netegrity Cookie Support and associating it with a policy group using the CLI, see the sections “Configuring SSO Netegrity Cookie Support for a Virtual Context” and “Associating an SSO Server with a Policy Group,” respectively.

An SSO server can also be associated with a policy group using RADIUS attributes, as in the following example:

webvpn:sso-server-name=server1

For a list of RADIUS attribute-value (AV) pairs that support SSL VPN, see the section “Configuring RADIUS Attribute Support for SSL VPN.”

NTLM Authentication

NT LAN Manager (NTLM) is supported for SSL VPN effective with Cisco IOS Release 12.4(9)T. The feature is configured by default.

RADIUS Accounting

Effective with Cisco IOS Release 12.4(9)T, this feature provides for RADIUS accounting of SSL VPN user sessions.

For information about configuring SSL VPN RADIUS accounting for SSL VPN user sessions, see the section “Configuring RADIUS Accounting for SSL VPN User Sessions.”

For more information about configuring RADIUS accounting, see the “Configuring RADIUS” chapter in the Cisco IOS Security Configuration Guide, Release 12.4 at the following URL:

For a list of RADIUS AV pairs that support SSL VPN, see the section “Configuring RADIUS Attribute Support for SSL VPN.”
Stateless High Availability with Hot Standby Router Protocol

Hot Standby Router Protocol (HSRP) provides high network availability by routing IP traffic from hosts on ethernet networks without having to rely on the availability of any single router. HSRP is particularly useful for hosts that do not support a router discovery protocol, such as ICMP Router Discovery Protocol (IRDP), and that do not have the functionality to switch to a new router when their selected router reloads or loses power. Without this functionality, a router that loses its default gateway because of a router failure is unable to communicate with the network.

HSRP is configurable on LAN interfaces using standby command-line interface (CLI). It is now possible to use the standby IP address from an interface as the local IPsec identity, or local tunnel endpoint.

By using the standby IP address as the SSL VPN gateway address, failover can be applied to VPN routers by using HSRP. Remote SSLVPN users connect to the local VPN gateway using the standby address that belongs to the active device in the HSRP group. In the event of failover, the standby device takes over ownership of the standby IP address and begins to service remote VPN users.

Using the Stateless High Availability with Hot Standby Router Protocol feature, the remote user has to be aware of only the HSRP standby address instead of a list of gateway addresses.

Figure 13 shows the enhanced HSRP functionality topology. Traffic is serviced by the active Router P, the active device in the standby group. In the event of failover, traffic is diverted to Router S, the original standby device. Router S assumes the role of the new active router and takes ownership of the standby IP address.

For information about configuring Stateless High Availability with HSRP, see “Configuring Stateless High Availability with HSRP for SSL VPN” section on page 83.

Note

In case of a failover, HSRP does not facilitate SSL VPN state information transference between VPN gateways. Without this state transference, existing SSL VPN sessions with the remote users will be deleted, requiring users to reauthenticate and establish SSL VPN sessions with the new active gateway.
TCP Port Forwarding and Thin Client

**Note**
This feature requires the JRE version 1.4 or later releases to properly support SSL connections.

**Note**
Because this feature requires installing JRE and configuring the local clients, and because doing so requires administrator permissions on the local system, it is unlikely that remote users will be able to use applications when they connect from public remote systems.

When the remote user clicks the Start button of the Thin Client Application (under “Application Access), a new window is displayed. This window initiates the downloading of a port-forwarding applet. Another window is then displayed. This window asks the remote user to verify the certificate with which this applet is signed. When the remote user accepts the certificate, the applet starts running, and port-forwarding entries are displayed (see Figure 14). The number of active connections and bytes that are sent and received is also listed on this window.

**Note**
When remote users launch Thin Client, their system may display a dialog box regarding digital certificates, and this dialog box may appear behind other browser windows. If the remote user connection hangs, tell the remote user to minimize the browser windows to check for this dialog box.

You should have configured IP addresses, Domain Name System (DNS) names, and port numbers for the e-mail servers. The remote user can then launch the e-mail client, which is configured to contact the above e-mail servers and send and receive e-mails. POP3, IMAP, and SMTP protocols are supported.

The window attempts to close automatically if the remote user is logged out using JavaScript. If the session terminated and a new port forwarding connection is established, the applet displays an error message.
Users should always close the Thin Client window when finished using applications by clicking the close icon. Failure to quit the window properly can cause Thin Client or the applications to be disabled. See the section “Application Access—Recovering from Hosts File Errors” in the document SSL VPN Remote User Guide.

Table 3 lists remote system requirements for Thin Client.

<table>
<thead>
<tr>
<th>Remote User System Requirements</th>
<th>Specifications or Use Suggestions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client applications installed.</td>
<td>—</td>
</tr>
<tr>
<td>Cookies enabled on browser.</td>
<td>—</td>
</tr>
<tr>
<td>Administrator privileges.</td>
<td>You must be the local administrator on your PC.</td>
</tr>
<tr>
<td>Sun Microsystems JRE version 1.4 or later installed.</td>
<td>SSL VPN automatically checks for JRE whenever the remote user starts Thin Client. If it is necessary to install JRE, a pop-up window displays directing remote users to a site where it is available.</td>
</tr>
</tbody>
</table>
URL Obfuscation

The URL Obfuscation feature provides administrators with the ability to obfuscate, or mask, sensitive portions of an enterprise URL, such as IP addresses, hostnames, or part numbers. For example, if URL masking is configured for a user, the URL in the address bar could have the port and hostname portion garbled, as in this example:

https://slvpn-gateway.examplecompany.com/http/cF9HxnBjRmSFEzBWpDtfXfigzL559MQo51Qj/cgi-bin/submit.p

For information about configuring this feature, see the section “Associating an SSO Server with a Policy Group.”

URL Rewrite Splitter

Effective with Cisco IOS Release 12.4(20)T, the URL Rewrite Splitter feature allows administrators to mangle selective URLs. Mangling is a CPU-intensive and time-consuming process, so mangling only selective URLs can result in a savings of memory and time.

For information about configuring this feature, see the section “Configuring a URL Rewrite Splitter.”

User-Level Bookmarking

Effective with Cisco IOS Release 12.4(15)T, users can bookmark URLs while connected through an SSL VPN tunnel. Users can access the bookmarked URLs by clicking the URLs.
User-level bookmarking is turned by default. There is no way to turn it off. To set the storage location, administrators can use the `user-profile location` command. If the `user-profile location` command is not configured, the location `flash:/webvpn/{context name}/` is used.

**Other SSL VPN Features**

Table 4 lists the requirements for various SSL VPN features.

<table>
<thead>
<tr>
<th>Task</th>
<th>Remote User System Requirements</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Browsing</td>
<td>Usernames and passwords for protected websites</td>
<td>Users should log out on SSL VPN sessions when they are finished.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The look and feel of web browsing with SSL VPN might be different from what users are accustomed to. For example, when they are using SSL VPN, the following should be noted:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The SSL VPN title bar appears above each web page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Websites can be accessed as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>– Entering the URL in the Enter Web Address field on the SSL VPN home page</td>
</tr>
<tr>
<td></td>
<td></td>
<td>– Clicking a preconfigured website link on the SSL VPN home page</td>
</tr>
<tr>
<td></td>
<td></td>
<td>– Clicking a link on a webpage accessed by one of the previous two methods</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Also, depending on how a particular account was configured, the following might have occurred:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Some websites are blocked.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Only the websites that appear as links on the SSL VPN home page are available.</td>
</tr>
<tr>
<td>Network Browsing and File Management</td>
<td>File permissions configured for shared remote access</td>
<td>Only shared folders and files are accessible through SSL VPN.</td>
</tr>
<tr>
<td></td>
<td>Server name and passwords are necessary for protected file servers</td>
<td>A user might not be familiar with how to locate his or her files through the network of an organization.</td>
</tr>
<tr>
<td></td>
<td>Domain, workgroup, and server names where folders and files reside</td>
<td>Note: The user should not interrupt the Copy File to Server operation or navigate to a different window while the copying is in progress. Interrupting this operation can cause an incomplete file to be saved on the server.</td>
</tr>
</tbody>
</table>
Using e-mail: Thin Client

Same requirements as for Thin Client (see the “TCP Port Forwarding and Thin Client” section on page 22)

<table>
<thead>
<tr>
<th>Task</th>
<th>Remote User System Requirements</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note</strong></td>
<td>If a user is using an IMAP client and loses the e-mail server connection or is unable to make a new connection, the user should close the IMAP application and restart SSL VPN.</td>
<td></td>
</tr>
<tr>
<td>Other Mail Clients</td>
<td>Microsoft Outlook Express versions 5.5 and 6.0 have been tested.</td>
<td>SSL VPN should support other SMTPS, POP3S, or IMAP4S e-mail programs, such as Netscape Mail, Lotus Notes, and Eudora, but they have not been verified.</td>
</tr>
</tbody>
</table>

Table 4: SSL VPN Remote User System Requirements (continued)

Platform Support

For information about platform support for the SSL VPN feature, see the data sheet Cisco IOS SSL VPN (“Feature Availability” section).

Licensing

Cisco IOS SSL VPN is a licensed feature available on Cisco routers running the Cisco IOS Advanced Security feature set. Each security bundle entitles you to a certain number of free users. Beyond that, you need to purchase additional feature licenses. For more information about licensing, see the bulletin Cisco IOS SSL VPN Licensing Information.

How to Configure SSL VPN Services on a Router

This section contains the following tasks and shows whether they are required or optional:

Configuring and Enabling SSL VPN Services
- Configuring an SSL VPN Gateway, page 29 (required)
- Configuring a Generic SSL VPN Gateway, page 32 (optional)
- Configuring an SSL VPN Context, page 32 (required)
- Configuring an SSL VPN Policy Group, page 37 (required)

Configuring AAA-Related Features for SSL VPN
- Configuring Local AAA Authentication for SSL VPN User Sessions, page 39 (optional)
- Configuring AAA for SSL VPN Users Using a Secure Access Control Server, page 41 (optional)
- Configuring RADIUS Accounting for SSL VPN User Sessions, page 43 (optional)
- Monitoring and Maintaining RADIUS Accounting for an SSL VPN Session, page 43 (optional)
- Configuring RADIUS Attribute Support for SSL VPN, page 44 (optional)

Customizing and Enabling SSL VPN Features
- Configuring a URL List for Clientless Remote Access, page 47 (optional)
- Configuring Microsoft File Shares for Clientless Remote Access, page 49 (optional)
- Configuring Citrix Application Support for Clientless Remote Access, page 52 (optional)
- Configuring Application Port Forwarding, page 53 (optional)
- Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files, page 56 (optional)
- Configuring Cisco Secure Desktop Support, page 58 (optional)
How to Configure SSL VPN Services on a Router

- Configuring Cisco AnyConnect VPN Client Full Tunnel Support, page 59 (optional)
- Configuring Advanced SSL VPN Tunnel Features, page 64 (optional)
- Configuring VRF Virtualization, page 67 (optional)
- Configuring ACL Rules, page 68 (optional)
- Associating an ACL Attribute with a Policy Group, page 71 (optional)
- Configuring SSO Netegrity Cookie Support for a Virtual Context, page 72 (optional)
- Associating an SSO Server with a Policy Group, page 74 (optional)
- Configuring URL Obfuscation (Masking), page 74 (optional)
- Adding a CIFS Server URL List to an SSL VPN Context and Attaching It to a Policy Group, page 75 (optional)
- Configuring User-Level Bookmarks, page 77 (optional)
- Configuring FVRF, page 78 (optional)
- Disabling Full-Tunnel CEF, page 79 (optional)
- Configuring Automatic Authentication and Authorization, page 80 (optional)
- Configuring a URL Rewrite Splitter, page 81 (optional)
- Configuring a Backend HTTP Proxy, page 82 (optional)
- Configuring Stateless High Availability with HSRP for SSL VPN, page 83 (optional)
- Configuring Internationalization, page 84 (optional)

Monitoring and Maintaining SSL VPN Features
- Using SSL VPN Clear Commands, page 91 (optional)
- Verifying SSL VPN Configurations, page 92 (optional)
- Using SSL VPN Debug Commands, page 94 (optional)

Configuring an SSL VPN Gateway

The SSL VPN gateway acts as a proxy for connections to protected resources. Protected resources are accessed through an SSL-encrypted connection between the gateway and a web-enabled browser on a remote device, such as a personal computer. Entering the `webvpn gateway` command places the router in SSL VPN gateway configuration mode. The following are accomplished in this task:

- The gateway is configured with an IP address.
- A port number is configured to carry HTTPS traffic (443 is default).
- A hostname is configured for the gateway.
- Crypto encryption and trust points are configured.
- The gateway is configured to redirect HTTP traffic (port 80) over HTTPS.
- The gateway is enabled.
SSL VPN Encryption

The SSL VPN provides remote-access connectivity from almost any Internet-enabled location using only a web browser and its native SSL encryption. The **ssl encryption** command is configured to restrict the encryption algorithms that SSL uses in Cisco IOS software.

**Note**
There is a known compatibility issue with the encryption type and Java. If the Java port-forwarding applet does not download properly and the configuration line `ssl encryption 3des-sha1 aes-sha1` is present, you should remove the line from the webvpn gateway subconfiguration.

SSL VPN Trustpoints

The configuration of the **ssl trustpoint** command is required only if you need to configure a specific CA certificate. A self-signed certificate is automatically generated when an SSL VPN gateway is put in service.

SUMMARY STEPS

**Required Steps**

1. `enable`
2. `configure terminal`
3. `webvpn gateway name`

**Optional Steps**

4. `hostname name`
5. `ip address number [port number] [standby name]`
6. `http-redirect [port number]`
7. `ssl encryption [3des-sha1] [aes-sha1] [rc4-md5]`
8. `ssl trustpoint name`
9. `inservice`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router&gt; enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
---|---
**Step 3**
webvpn gateway name | Enters webvpn gateway configuration mode to configure an SSL VPN gateway.  
- Only one gateway is configured in an SSL VPN-enabled network.
**Example:**  
Router(config)# webvpn gateway GW_1

**Step 4**
hostname name | Configures the hostname for an SSL VPN gateway.
**Example:**  
Router(config-webvpn-gateway)# hostname VPN_1

**Step 5**
ip address number [port number] [standby name] | Configures a proxy IP address on an SSL VPN gateway.  
- **port**—Specifies the port number for proxy traffic. A number from 1 to 65535 can be entered for this argument.  
- **standby**—Indicates that the gateway is standby. A redundancy group name must be entered for the name argument.
**Example:**  
Router(config-webvpn-gateway)# ip address 10.1.1.1

**Step 6**
http-redirect [port number] | Configures HTTP traffic to be carried over HTTPS.  
- When this command is enabled, the SSL VPN gateway listens on port 80 and redirects HTTP traffic over port 443 or the port number specified with the **port** keyword.
**Example:**  
Router(config-webvpn-gateway)# http-redirect

**Step 7**
ssl encryption [3des-shal] [aes-shal] [rc4-md5] | Specifies the encryption algorithm that the SSL protocol uses for SSL VPN connections.  
- The ordering of the algorithms specifies the preference.
**Example:**  
Router(config-webvpn-gateway)# ssl encryption rc4-md5

**Step 8**
ssl trustpoint name | (Optional if a self-signed certificate is to be used.) Configures the certificate trust point on an SSL VPN gateway.  
**Tip**  
Entering the **no** form of this command configures the SSL VPN gateway to revert to using an autogenerated self-signed certificate.
**Example:**  
Router(config-webvpn-gateway)# ssl trustpoint CA_CERT

**Step 9**
inservice | Enables an SSL VPN gateway.  
A gateway cannot enabled or put “in service” until a proxy IP address has been configured.
**Example:**  
Router(config-webvpn-gateway)# inservice

### What to Do Next

SSL VPN context and policy group configurations must be configured before an SSL VPN gateway can be operationally deployed. Proceed to the section “Configuring an SSL VPN Context” to see information on SSL VPN context configuration.
Configuring a Generic SSL VPN Gateway

To configure a generic SSL VPN gateway, perform the following steps in privileged EXEC mode.

**Note**
The advantage of this configuration over the one in the configuration task “Configuring an SSL VPN Gateway” is that basic commands and context can be configured quickly using just the `webvpn enable` command.

**SUMMARY STEPS**

1. `enable`
2. `webvpn enable gateway-addr ip-address`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>webvpn enable name gateway_IP-address</code></td>
<td>Enables an SSL VPN gateway.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router# webvpn enable gateway-addr 10.1.1.1</code></td>
<td></td>
</tr>
</tbody>
</table>

**Configuring an SSL VPN Context**

The SSL VPN context defines the virtual configuration of the SSL VPN. Entering the `webvpn context` command places the router in SSL VPN configuration mode. The following are accomplished in this task:

- A gateway and domain is associated.
- The AAA authentication method is specified.
- A group policy is associated.
- The remote user portal (web page) is customized.
- A limit on the number users sessions is configured.
- The context is enabled.

**Context Defaults**

The `ssl authenticate verify all` command is enabled by default when a context configuration is created. The context cannot be removed from the router configuration while an SSL VPN gateway is in an enabled state (in service).
Configuring a Virtual Host

A virtual hostname is specified when multiple virtual hosts are mapped to the same IP address on the SSL VPN gateway (similar to the operation of a canonical domain name). The virtual hostname differentiates host requests on the gateway. The host header in the HTTP message is modified to direct traffic to the virtual host. The virtual hostname is configured with the `gateway` command in `webvpn` context configuration mode.

Prerequisites

The SSL VPN gateway configuration has been completed.

SUMMARY STEPS

**Required Steps**

1. `enable`
2. `configure terminal`
3. `webvpn context name`

**Optional Steps**

4. `aaa authentication { domain name | list name }`
5. `policy group name`
6. `exit`
7. `default-group-policy name`
8. `exit`
9. `gateway name [ domain name | virtual-host name ]`
10. `inservice`
11. `login-message [ message-string ]`
12. `logo [ file filename | none ]`
13. `max-users number`
14. `secondary-color color`
15. `secondary-text-color { black | white }`
16. `title [ title-string ]`
17. `title-color color`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable  | Enables privileged EXEC mode.  
  * Enter your password if prompted. |
| **Example:**      |         |
|                   | Router> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**      |         |
|                   | Router# configure terminal |
| **Step 3** webvpn context name | Enters webvpn context configuration mode to configure the SSL VPN context.  
  **Tip** The context can be optionally named using the domain or virtual hostname. This is recommended as a best practice. It simplifies the management of multiple context configurations. |
| **Example:**      |         |
|                   | Router(config)# webvpn context context1 |
| **Step 4** aaa authentication {domain name | list name} | Specifies a list or method for SSL VPN remote-user authentication.  
  **Tip** If this command is not configured, the SSL VPN gateway will use global authentication, authorization, and accounting (AAA) parameters (if configured) for remote-user authentication. |
| **Example:**      |         |
|                   | Router(config-webvpn-context)# aaa authentication domain SERVER_GROUP |
| **Step 5** policy group name | Creates a policy group within the SSL VPN context and enters webvpn group policy configuration mode.  
  * Used to define a policy that can be applied to the user. |
| **Example:**      |         |
|                   | Router(config-webvpn-context)# policy group ONE |
| **Step 6** exit  | Exits webvpn group policy configuration mode. |
| **Example:**      |         |
|                   | Router(webvpn-group-policy)# exit |
| **Step 7** default-group-policy name | Associates a group policy with an SSL VPN context configuration.  
  * This command is configured to attach the policy group to the SSL VPN context when multiple group policies are defined under the context.  
  * This policy will be used as default, unless a AAA server pushes an attribute that specifically requests another group policy. |
| **Example:**      |         |
|                   | Router(webvpn-group-policy)# default-group-policy ONE |
| **Step 8** exit  | Exits webvpn group policy configuration mode. |
| **Example:**      |         |
|                   | Router(webvpn-group-policy)# exit |
### Command or Action

**Step 9**

`gateway name [domain name | virtual-host name]`

Example:

`Router(config-webvpn-context)# gateway GW_1 domain cisco.com`

**Purpose**

Associates an SSL VPN gateway with an SSL VPN context.

- The gateway configured in the first configuration task table is associated with the SSL VPN context in this configuration step.

**Step 10**

`inservice`

Example:

`Router(config-webvpn-gateway)# inservice`

**Purpose**

Enables an SSL VPN context configuration.

- The context is put “in service” by entering this command. However, the context is not operational until it is associated with an enabled SSL VPN gateway.

**Step 11**

`login-message [message-string]`

Example:

`Router(config-webvpn-context)# login-message “Please enter your login credentials”`

**Purpose**

Configures a message for the user login text box displayed on the login page.

**Step 12**

`logo [file filename | none]`

Example:

`Router(config-webvpn-context)# logo file flash:/mylogo.gif`

**Purpose**

Configures a custom logo to be displayed on the login and portal pages of an SSL VPN.

- The source image file for the logo is a gif, jpg, or png file that is up to 255 characters in length (filename) and up to 100 KB in size.
- The file is referenced from a local file system, such as flash memory. An error message will be displayed if the file is not referenced from a local file system.
- No logo will be displayed if the image file is removed from the local file system.

**Step 13**

`max-users number`

Example:

`Router(config-webvpn-context)# max-users 500`

**Purpose**

Limits the number of connections to an SSL VPN that will be permitted.
### Command or Action

| Step 14 | secondary-color color |

**Example:**
- `Router(config-webvpn-context)# secondary-color darkseagreen`
- `Router(config-webvpn-context)# secondary-color #8FBC8F`
- `Router(config-webvpn-context)# secondary-color 143,188,143`

Configures the color of the secondary title bars on the login and portal pages of an SSL VPN.
- The value for the `color` argument is entered as a comma-separated red, green, blue (RGB) value, an HTML color value (beginning with a pound sign [#]), or the name of the color that is recognized in HTML (no spaces between words or characters). The value is limited to 32 characters. The value is parsed to ensure that it matches one of the following formats (using Perl regex notation):
  - `\#/x{6}`
  - `\d{1,3},\d{1,3},\d{1,3 }` (and each number is from 1 to 255)
  - `\w+`
- The default color is purple.
- The example shows the three forms that the color can be configured.

| Step 15 | secondary-text-color (black | white) |

**Example:**
- `Router(config-webvpn-context)# secondary-text-color white`

Configures the color of the text on the secondary bars of an SSL VPN.
- The color of the text on the secondary bars must be aligned with the color of the text on the title bar.
- The default color is black.

| Step 16 | title [title-string] |

**Example:**
- `Router(config-webvpn-context)# title "Secure Access: Unauthorized users prohibited"`

Configures the HTML title string that is shown in the browser title and on the title bar of an SSL VPN.
- The optional form of the `title` command is entered to configure a custom text string. If this command is issued without entering a text string, a title will not be displayed in the browser window. If the `no` form of this command is used, the default title string “WebVPN Service” is displayed.
How to Configure SSL VPN Services on a Router

Configuring an SSL VPN Policy Group

The policy group is a container that defines the presentation of the portal and the permissions for resources that are configured for a group of remote users. Entering the `policy group` command places the router in webvpn group policy configuration mode. After it is configured, the group policy is attached to the SSL VPN context configuration by configuring the `default-group-policy` command. The following tasks are accomplished in this configuration:

- The presentation of the SSL VPN portal page is configured.
- A NetBIOS server list is referenced.
- A port-forwarding list is referenced.
- The idle and session timers are configured.
- A URL list is referenced.

Outlook Web Access 2003

OWA 2003 is supported by the SSL VPN gateway upon competition of this task. The Outlook Exchange Server must be reachable by the SSL VPN gateway via TCP/IP.
# URL-List Configuration

A URL list can be configured under the SSL VPN context configuration and then separately for each individual policy group configuration. Individual URL list configurations must have unique names.

## SUMMARY STEPS

### Required Steps
1. `enable`
2. `configure terminal`
3. `webvpn context name`
4. `policy group name`

### Optional Steps
5. `banner string`
6. `hide-url-bar`
7. `nbns-list name`
8. `port-forward name [auto-download] | [http-proxy [proxy-url {homepage-url}]]`
9. `timeout {idle seconds | session seconds}`
10. `url-list name`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** `enable` | Enables privileged EXEC mode.  
  - Enter your password if prompted.  |
| **Example:**  
  `Router> enable` | |
| **Step 2** `configure terminal` | Enters global configuration mode.  |
| **Example:**  
  `Router# configure terminal` | |
| **Step 3** `webvpn context name` | Enters webvpn context configuration mode to configure the SSL VPN context.  |
| **Example:**  
  `Router(config)# webvpn context context1` | |
| **Step 4** `policy group name` | Enters webvpn group policy configuration mode to configure a group policy.  |
| **Example:**  
  `Router(config-webvpn-context)# policy group ONE` | |
| **Step 5** `banner string` | Configures a banner to be displayed after a successful login.  |
| **Example:**  
  `Router(config-webvpn-group)# banner "Login Successful"` | |
### What to Do Next

At the completion of this task, the SSL VPN gateway and context configurations are operational and enabled (in service), and the policy group has been defined. The SSL VPN gateway is operational for clientless remote access (HTTPS only). Proceed to the next section to see information about configuring AAA for remote-user connections.

### Configuring Local AAA Authentication for SSL VPN User Sessions

The steps in this task show how to configure a local AAA database for remote-user authentication. AAA is configured in global configuration mode. In this task, the `aaa authentication` command is not configured under the SSL VPN context configuration. Omitting this command from the SSL VPN context configuration causes the SSL VPN gateway to use global authentication parameters by default.
Prerequisites

SSL VPN gateway and context configurations are enabled and operational.

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. username {name secret [0 | 5] password}
5. aaa authentication login default local

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>

<td></td>
</tr>
<tr>
<td></td>
<td>default local</td>
</tr>
</tbody>
</table>

What to Do Next

The database that is configured for remote-user authentication on the SSL VPN gateway can be a local database, as shown in this task, or the database can be accessed through any RADIUS or TACACS+ AAA server.

It is recommended that you use a separate AAA server, such as a Cisco ACS. A separate AAA server provides a more robust security solution. It allows you to configure unique passwords for each remote user and accounting and logging for remote-user sessions. Proceed to the next section to see more information.
Configuring AAA for SSL VPN Users Using a Secure Access Control Server

The steps in this task show how to configure AAA using a separate RADIUS or TACACS+ server. AAA is configured in global configuration mode. The authentication list/method is referenced in the SSL VPN context configuration with the `aaa authentication` command. The steps in this task configure AAA using a RADIUS server.

**Prerequisites**

- SSL VPN gateway and context configurations are enabled and operational.
- A RADIUS or TACACS+ AAA server is operational and reachable from the SSL VPN gateway.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa group server {radius group-name | tacacs+ group-name}`
5. `server ip-address [auth-port port-number] [acct-port port-number]`
6. `exit`
7. `aaa authentication login {default | list-name} method1 [method2...]
8. `radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string] [alias {hostname | ip-address}]`
9. `webvpn context name`
10. `aaa authentication {domain name | list name}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| enable           | Enables privileged EXEC mode. |
| **Example:**     |         |
| `Router> enable` |         |
| **Step 2**
| `configure terminal` | Enters global configuration mode. |
| **Example:**     |         |
| `Router# configure terminal` |         |
| **Step 3**
| `aaa new-model` | Enables the AAA access control model. |
| **Example:**     |         |
| `Router(config)# aaa new-model` |         |
### Command or Action

**Step 4**

```bash
aaa group server (radius group-name | tacacs+ group-name)
```

**Example:**

```
Router(config)# aaa group server radius myServer
```

**Purpose:**
Configures a RADIUS or TACACS+ server group and specifies the authentication list or method, and enters server-group configuration mode.

**Step 5**

```bash
server ip-address [auth-port port-number] [acct-port port-number]
```

**Example:**

```
Router(config-sg-radius)# server 10.1.1.20 auth-port 1645 acct-port 1646
```

**Purpose:**
Configures the IP address of the AAA group server.

**Step 6**

```bash
exit
```

**Example:**

```
Router(config-sg-radius)# exit
```

**Purpose:**
Exits server-group configuration mode.

**Step 7**

```bash
aaa authentication login {default | list-name} method1 [method2...]
```

**Example:**

```
Router(config)# aaa authentication login default local group myServer
```

**Purpose:**
Sets AAA login parameters.

**Step 8**

```bash
radius-server host (hostname | ip-address) [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string] [alias (hostname | ip-address)]
```

**Example:**

```
Router(config)# radius-server host 10.1.1.20 auth-port 1645 acct-port 1646
```

**Purpose:**
Specifies a host as the group server.

**Step 9**

```bash
webvpn context name
```

**Example:**

```
Router(config)# webvpn context context1
```

**Purpose:**
Enters SSL VPN configuration mode to configure the SSL VPN context.

**Step 10**

```bash
aaa authentication {domain name | list name}
```

**Example:**

```
Router(config-webvpn-context)# aaa authentication domain myServer
```

**Purpose:**
Configures AAA authentication for SSL VPN sessions.

### What to Do Next

Proceed to the section “Configuring RADIUS Attribute Support for SSL VPN” to see RADIUS attribute-value pair information introduced to support this feature.
Configuring RADIUS Accounting for SSL VPN User Sessions

To configure RADIUS accounting for SSL VPN user sessions, perform the following steps.

Prerequisites

- Before configuring RADIUS accounting for SSL VPN user sessions, you should first have configured AAA-related commands (in global configuration mode) and have set the accounting list.

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. webvpn aaa accounting-list aaa-list

DETAILED STEPS

<table>
<thead>
<tr>

Configuring RADIUS Attribute Support for SSL VPN

This section lists RADIUS attribute-value (AV) pair information introduced to support SSL VPN. For information on using RADIUS AV pairs with Cisco IOS software, see the “Configuring RADIUS” chapter in theCisco IOS Security Configuration Guide at the following URL:

Table 5 shows information about SSL VPN RADIUS attribute-value pairs.

Note

All SSL VPN attributes (except for the standard IETF RADIUS attributes) start with `webvpn:` as follows:

- `webvpn:urllist-name=cisco`
- `webvpn:nbnslist-name=cifs`
- `webvpn:default-domain=cisco.com`

</tbody>
</table>
What to Do Next

Proceed to the next section to see information about configuring clientless remote access to file shares.

Configuring Microsoft File Shares for Clientless Remote Access

In clientless remote access mode, files and directories created on Microsoft Windows servers can be accessed by the remote client through the HTTPS-enabled browser. When enabled, a list of file server and directory links are displayed on the portal page after login. The administrator can customize permissions on the SSL VPN gateway to provide limited read-only access for a single file or full-write access and network browsing capabilities. The following access capabilities can be configured:

- Network browse (listing of domains)
- Domain browse (listing of servers)
- Server browse (listing of shares)
- Listing files in a share
- Downloading files
- Modifying files
- Creating new directories
- Creating new files
- Deleting files

Common Internet File System Support

CIFS is the protocol that provides access to Microsoft file shares and support for common operations that allow shared files to be accessed or modified.

NetBIOS Name Service Resolution

Windows Internet Name Service (WINS) uses NetBIOS name resolution to map and establish connections between Microsoft servers. A single server must be identified by its IP address in this configuration. Up to three servers can be added to the configuration. If multiple servers are added, one server should be configured as the master browser.

Samba Support

Microsoft file shares can be accessed through the browser on a Linux system that is configured to run Samba.

Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- A Microsoft file server is operational and reachable from the SSL VPN gateway over TCP/IP.
Restrictions

- Only file shares configured on Microsoft Windows 2000 or XP servers are supported.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. webvpn context *name*
4. nbns-list *name*
5. nbns-server *ip-address* [master] [timeout *seconds*] [retries *number*]
6. exit
7. policy group *name*
8. nbns-list *name*
9. functions {file-access | file-browse | file-entry | svc-enabled | svc-required}

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:** | Router> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | Router# configure terminal |
| **Step 3** webvpn context *name* | Enters webvpn context configuration mode to configure the SSL VPN context. |
| **Example:** | Router(config)# webvpn context context1 |
| **Step 4** nbns-list *name* | Enters webvpn nbslist configuration mode to configure an NBNS server list for CIFS name resolution. |
| **Example:** | Router(config-webvpn-context)# nbns-list SERVER_LIST |
| **Step 5** nbns-server *ip-address* [master] [timeout *seconds*] [retries *number*] | Adds a server to an NBNS server list and enters webvpn nbslist configuration mode.  
- The server specified with the ip-address argument can be a primary domain controller (PDC) in a Microsoft network.  
- When multiple NBNS servers are specified, a single server is configured as master browser.  
- Up to three NBNS server statements can be configured. |
| **Example:** | Router(config-webvpn-nbnslist)# nbns-server 172.16.1.1 master  
Router(config-webvpn-nbnslist)# nbns-server 172.16.2.2 timeout 10 retries 5  
Router(config-webvpn-nbnslist)# nbns-server 172.16.3.3 timeout 10 retries 5 |
### Command or Action | Purpose
---|---
**Step 6** | exit
Example:  
Router(config-webvpn-nbnslist)# exit  
Exits webvpn nbnslist configuration mode and enters webvpn context configuration mode.
**Step 7** | policy group name
Example:  
Router(config-webvpn-context)# policy group ONE  
Enters webvpn group policy configuration mode to configure a group policy.
**Step 8** | nbns-list name
Example:  
Router(config-webvpn-group)# nbns-list SERVER_LIST  
Attaches a NBNS server list to a policy group configuration.
**Step 9** | functions (file-access | file-browse | file-entry | svc-enabled | svc-required)
Example:  
Router(config-webvpn-group)# functions file-access  
Router(config-webvpn-group)# functions file-browse  
Router(config-webvpn-group)# functions file-entry  
Configures access for Microsoft file shares.  
- Entering the **file-access** keyword enables network file share access. File servers in the server list are listed on the SSL VPN portal page when this keyword is enabled.  
- Entering the **file-browse** keyword enables browse permissions for server and file shares. The file-access function must be enabled in order to also use this function.  
- Entering the **file-entry** keyword enables “modify” permissions for files in the shares listed on the SSL VPN portal page.

### Examples

#### NBNS Server List Example
The following example, starting in global configuration mode, configures a server list for NBNS resolution:

```plaintext
Router(config)# webvpn context context1  
Router(config-webvpn-context)# nbns-list SERVER_LIST  
Router(config-webvpn-nbnslist)# nbns-server 172.16.1.1 master  
Router(config-webvpn-nbnslist)# nbns-server 172.16.2.2 timeout 10 retries 5  
Router(config-webvpn-nbnslist)# nbns-server 172.16.3.3 timeout 10 retries 5  
Router(config-webvpn-nbnslist)# exit
```

#### File Share Permissions Example
The following example attaches the server list to and enables full file and network access permissions for policy group ONE:

```plaintext
Router(config-webvpn-context)# policy group ONE  
Router(config-webvpn-group)# nbns-list SERVER_LIST  
Router(config-webvpn-group)# functions file-access  
Router(config-webvpn-group)# functions file-browse  
Router(config-webvpn-group)# functions file-entry  
Router(config-webvpn-group)# end
```
What to Do Next

Proceed to the next section to see information about configuring clientless remote access for Citrix-enabled applications.

Configuring Citrix Application Support for Clientless Remote Access

Clientless Citrix support allows the remote user to run Citrix-enabled applications through the SSL VPN as if the application were locally installed (similar to traditional thin-client computing). Citrix applications run on a MetaFrame XP server (or server farm). The SSL VPN gateway provides access to the remote user. The applications run in real time over the SSL VPN. This task shows how to enable Citrix support for policy group remote users.

ICA Client

The Independent Computing Architecture (ICA) client carries keystrokes and mouse clicks from the remote user to the MetaFrame XP server. ICA traffic is carried over TCP port number 1494. This port is opened when a Citrix application is accessed. If multiple application are accessed, the traffic is carried over a single TCP session.

Prerequisites

- A Citrix Metaframe XP server is operational and reachable from the SSL VPN gateway over TCP/IP.
- SSL VPN gateway and context configurations are enabled and operational.

SUMMARY STEPS

1. enable
2. configure terminal
3. access-list access-list-number {permit | deny} protocol source destination
4. webvpn context name
5. policy group name
6. citrix enabled
7. filter citrix extended-acl

DETAILED STEPS

<table>

<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### How to Configure SSL VPN Services on a Router

The following example, starting in global configuration mode, enables Citrix application support for remote users with a source IP address in the 192.168.1.0/24 network:

```
Router (config)# access-list 100 permit ip 192.168.1.0 0.255.255.255 any
```

### What to Do Next

Support for standard applications that use well-known port numbers, such as e-mail and Telnet, can be configured using the port forwarding feature. Proceed to the next section to see more information.

### Configuring Application Port Forwarding

Application port forwarding is configured for thin client mode SSL VPN. Port forwarding extends the cryptographic functions of the SSL-protected browser to provide remote access to TCP and UDP-based applications that use well-known port numbers, such as POP3, SMTP, IMAP, Telnet, and SSH.

When port forwarding is enabled, the hosts file on the SSL VPN client is modified to map the application to the port number configured in the forwarding list. The application port mapping is restored to default when the user terminates the SSL VPN session.

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;access-list access-list-number (permit</td>
<td>deny)&lt;br&gt;protocol source destination</td>
</tr>
<tr>
<td><strong>Examples:</strong>&lt;br&gt;Router (config)# access-list 100 permit ip 192.168.1.0 0.255.255.255 any</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;webvpn context name</td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
<tr>
<td><strong>Examples:</strong>&lt;br&gt;Router (config)# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;policy group name</td>
<td>Enters webvpn group policy configuration mode to configure a group policy.</td>
</tr>
<tr>
<td><strong>Examples:</strong>&lt;br&gt;Router (config-webvpn-context)# policy group ONE</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong>&lt;br&gt;citrix enabled</td>
<td>Enables Citrix application support for remote users in a policy group.</td>
</tr>
<tr>
<td><strong>Examples:</strong>&lt;br&gt;Router (config-webvpn-group)# citrix enabled</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong>&lt;br&gt;filter citrix extended-acl</td>
<td>Configures a Citrix Thin Client filter.</td>
</tr>
<tr>
<td><strong>Examples:</strong>&lt;br&gt;Router (config-webvpn-group)# filter citrix 100</td>
<td>*An extended access list is configured to define the Thin Client filter. This filter is used to control remote user access to Citrix applications.</td>
</tr>
</tbody>
</table>

### Examples

The following example, starting in global configuration mode, enables Citrix application support for remote users with a source IP address in the 192.168.1.0/24 network:

```
Router (config)# access-list 100 permit ip 192.168.1.0 0.255.255.255 any
Router (config)# webvpn context context1
Router (config-webvpn-context)# policy group ONE
Router (config-webvpn-group)# citrix enabled
Router (config-webvpn-group)# filter citrix 100
```
Administrative Privileges on the Remote Client

When enabling port forwarding, the SSL VPN gateway will modify the hosts file on the PC of the remote user. Some software configurations and software security applications will detect this modification and prompt the remote user to select “Yes” to permit. To permit the modification, the remote user must have local administrative privileges.

![Note]

There is a known compatibility issue with the encryption type and Java. If the Java port-forwarding applet does not download properly and the configuration line `ssl encryption 3des-sha1 aes-sha1` is present, you should remove the line from the `webvpn` gateway subconfiguration.

Prerequisites

SSL VPN gateway and SSL VPN context configurations are enabled and operational.

SUMMARY STEPS

1. enable
2. configure terminal
3. `webvpn context name`
4. `port-forward name`
5. `local-port {number remote-server name remote-port number description text-string}`
6. exit
7. `policy group name`
8. `port-forward name`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Router(config-webvpn-group)# port-forward EMAIL</td>
<td></td>
</tr>
</tbody>
</table>
Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files

The SSL VPN gateway is preconfigured to distribute Cisco Secure Desktop (CSD) and/or Cisco AnyConnect VPN Client software package files to remote users. The files are distributed only when CSD or Cisco AnyConnect VPN Client support is needed. The administrator performs the following tasks to prepare the gateway:

- The current software package is downloaded from www.cisco.com.
- The package file is copied to a local file system.
- The package file is installed for distribution by configuring the `webvpn install` command.

**Note**

Effective with Cisco IOS Release 12.4(20)T, multiple packages can be downloaded to a gateway.

Remote Client Software Installation Requirements

The remote user must have administrative privileges, and the JRE for Windows version 1.4 or later must be installed before the CSD client package can be installed.

For Cisco AnyConnect VPN Client software installation, the remote user must have either the Java Runtime Environment for Windows (version 1.4 or later), or the browser must support or be configured to permit Active X controls.

Software Package Download

CSD and Cisco AnyConnect VPN Client software packages should be installed for distribution on the SSL VPN gateway. Download the latest version that supports your device and the image you are using (consult a compatibility matrix for your particular setup).

The CSD software package can be downloaded at the following URL:

- [http://www.cisco.com/cgi-bin/tablebuild.pl/securedesktop](http://www.cisco.com/cgi-bin/tablebuild.pl/securedesktop)

The Cisco AnyConnect VPN Client software package can be downloaded at the following URL:

- [http://www.cisco.com/cgi-bin/tablebuild.pl/anyconnect](http://www.cisco.com/cgi-bin/tablebuild.pl/anyconnect)

The Cisco SSL VPN Client software package can be downloaded at the following URL:

- [http://www.cisco.com/cgi-bin/tablebuild.pl/sslvpnclient](http://www.cisco.com/cgi-bin/tablebuild.pl/sslvpnclient)

**Note**

You will be prompted to enter your login name and password to download these files from Cisco.com.

Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- Software installation packages are copied to a local files system, such as flash memory.
SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn install [csd location-name | svc location-name [sequence sequence-number]]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 webvpn install [csd location-name</td>
<td>svc location-name [sequence sequence-number]]</td>
</tr>
<tr>
<td>Example: Router(config)# webvpn install svc flash:/webvpn/svc.pkg</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Example: Router(config)# Router (config)# webvpn install svc vpn-2_i386-Release-2.0.0077-k9.pkg sequence 6</td>
<td></td>
</tr>
<tr>
<td>Router (config)# webvpn install svc vpn-3_powerpc-Release-2.0.0077-k9.pkg sequence 8</td>
<td></td>
</tr>
<tr>
<td>Router (config)# webvpn install svc svc_1.pkg sequence 4</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following example, starting in global configuration mode, installs the Cisco AnyConnect VPN Client package to an SSL VPN gateway:

Router(config)# webvpn install svc flash:/webvpn/svc.pkg
SSL VPN Package SSL-VPN-Client : installed successfully

The following example, starting in global configuration mode, installs the CSD package to an SSL VPN gateway:

Router(config)# webvpn install csd flash:/securedesktop_10_1_0_9.pkg
SSL VPN Package Cisco-Secure-Desktop : installed successfully

The following example shows that Package B is being installed to an SSL VPN gateway:

Router (config)# webvpn install svc flash:/webvpn/packageB sequence 2
What to Do Next

Support for CSD and Cisco AnyConnect VPN Client can be enabled for remote users after the gateway has been prepared to distribute CSD or Cisco AnyConnect VPN Client software.

Configuring Cisco Secure Desktop Support

CSD provides a session-based interface where sensitive data can be shared for the duration of an SSL VPN session. All session information is encrypted. All traces of the session data are removed from the remote client when the session is terminated, even if the connection is terminated abruptly. CSD support for remote clients is enabled in this task.

Java Runtime Environment

The remote user (PC or device) must have administrative privileges, and the JRE for Windows version 1.4 or later must be installed before the CSD client packages can be installed.

Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
- The CSD software package is installed for distribution on the SSL VPN gateway.

See the “Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files” section if you have not already prepared the SSL VPN gateway to distribute CSD software.

Restrictions

- Only Microsoft Windows 2000, Windows XP, Windows Vista, Apple-Mac, and Linux are supported on the remote client.

SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. csd enable
**DETAILED STEPS**

**What to Do Next**

Upon completion of this task, the SSL VPN gateway has been configured to provide clientless and thin client support for remote users. The SSL VPN feature also has the capability to provide full VPN access (similar to IPsec). Proceed to the next section to see more information.

**Configuring Cisco AnyConnect VPN Client Full Tunnel Support**

The Cisco AnyConnect VPN Client is an application that allows a remote user to establish a full VPN connection similar to the type of connection that is established with an IPsec VPN. Cisco AnyConnect VPN Client software is pushed (downloaded) and installed automatically on the PC of the remote user. The Cisco AnyConnect VPN Client uses SSL to provide the security of an IPsec VPN without the complexity required to install IPsec in your network and on remote devices. The following tasks are completed in this configuration:

- An access list is applied to the tunnel to restrict VPN access.
- Cisco AnyConnect VPN Client tunnel support is enabled.
- An address pool is configured for assignment to remote clients.
- The default domain is configured.
- DNS is configured for Cisco AnyConnect VPN Client tunnel clients.
- Dead peer timers are configured the SSL VPN gateway and remote users.
- The login home page is configured.
- The Cisco AnyConnect VPN Client software package is configured to remain installed on the remote client.
- Tunnel key refresh parameters are defined.
Remote Client Software from the SSL VPN Gateway

The Cisco AnyConnect VPN Client software package is pushed from the SSL VPN gateway to remote clients when support is needed. The remote user (PC or device) must have either the Java Runtime Environment for Windows (version 1.4 later), or the browser must support or be configured to permit Active X controls. In either scenario, the remote user must have local administrative privileges.

The Address Pool

The address pool is first defined with the `ip local pool` command in global configuration mode. The standard configuration assumes that the IP addresses in the pool are reachable from a directly connected network.

Address Pools for Nondirectly Connected Networks

If you need to configure an address pool for IP addresses from a network that is not directly connected, perform the following steps:

1. Create a local loopback interface and configure it with an IP address and subnet mask from the address pool.
2. Configure the address pool with the `ip local pool` command. The range of addresses must fall under the subnet mask configured in Step 1.
3. Set up the route. If you are using the Routing Information Protocol (RIP), configure the `router rip` command and then the `network` command, as usual, to specify a list of networks for the RIP process. If you are using the Open Shortest Path First (OSPF) protocol, configure the `ip ospf network point-to-point` command in the loopback interface. As a third choice (instead of using the RIP or OSPF protocol), you can set up static routes to the network.
4. Configure the `svc address-pool` command with the name configured in Step 2.

See the examples in this section for a complete configuration example.

A Manual Entry to the IP Forwarding Table

If the SSL VPN software client is unable to update the IP forwarding table on the PC of the remote user, the following error message will be displayed in the router console or syslog:

```
Error : SSL VPN client was unable to Modify the IP forwarding table ......
```

This error can occur if the remote client does not have a default route. You can work around this error by performing the following steps:

1. Open a command prompt (DOS shell) on the remote client.
2. Enter the `route print` command.
3. If a default route is not displayed in the output, enter the `route` command followed by the `add` and `mask` keywords. Include the default gateway IP address at the end of the route statement. See the following example:

```
C:\>route ADD 0.0.0.0 MASK 0.0.0.0 10.1.1.1
```

Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
The Cisco AnyConnect VPN Client software package is installed for distribution on the SSL VPN gateway.

The remote client has administrative privileges. Administrative privileges are required to download the SSL VPN software client.

See the “Configuring the SSL VPN Gateway to Distribute CSD and Cisco AnyConnect VPN Client Package Files” section if you have not already prepared the SSL VPN gateway to distribute SSL VPN software.

**Restrictions**

Only Microsoft Windows 2000, Windows XP, Windows Vista, Apple-Mac, and Linux are supported on the remote client.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. webvpn context name
4. policy group name
5. filter tunnel extended-acl
6. functions {file-access | file-browse | file-entry | svc-enabled | svc-required}
7. svc address-pool name
8. svc default-domain name
9. svc dns-server {primary | secondary} ip-address
10. svc dpd-interval {client | gateway} seconds
11. svc homepage string
12. svc keep-client-installed
13. svc rekey {method {new-tunnel | ssl} | time seconds}

**DETAILED STEPS**

<table>

  Router(config)# webvpn context context1 | |
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> Policy group name</td>
<td>Enters webvpn group policy configuration mode to configure a group policy.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-context)# policy group ONE</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> Filter tunnel extended-acl</td>
<td>Configures an SSL VPN tunnel access filter.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-group)# filter tunnel 101</td>
<td>The tunnel access filter is used control network and application level access. The tunnel filter is also defined in an extended access list.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Functions (file-access</td>
<td>Configures Cisco AnyConnect VPN Client tunnel mode support.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-group)# functions svc-enabled</td>
<td>- Entering the <code>svc-enabled</code> keyword enables tunnel support for the remote user. If the Cisco AnyConnect VPN Client software package fails to install, the remote user can continue to use clientless mode or thin-client mode.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-group)# functions svc-required</td>
<td>- Entering the <code>svc-required</code> keyword enables only tunnel support for the remote user. If the Cisco AnyConnect VPN Client software package fails to install (on the PC of the remote user), the other access modes cannot be used.</td>
</tr>
<tr>
<td><strong>Step 7</strong> Svc address-pool name</td>
<td>Configures configure a pool of IP addresses to assign to remote users in a policy group.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-group)# svc address-pool ADDRESSES</td>
<td>- The address pool is first defined with the <code>ip local pool</code> command in global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> Svc default-domain name</td>
<td>Configures the default domain for a policy group.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-group)# svc default-domain cisco.com</td>
<td>- If you are configuring an address pool for a network that is not directly connected, an address from the pool must be configured on a locally loopback interface. See the third example at the end of this section.</td>
</tr>
<tr>
<td><strong>Step 9</strong> Svc dns-server primary</td>
<td>Configures DNS servers for policy group remote users.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-group)# svc dns-server primary 192.168.3.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> Svc dpd-interval gateway</td>
<td>Configures the dead peer detection (DPD) timer value for the gateway or client.</td>
</tr>
<tr>
<td>Example: Router(config-webvpn-group)# svc dpd-interval gateway 30</td>
<td>- The DPD timer is reset every time a packet is received over the SSL VPN tunnel from the gateway or remote user.</td>
</tr>
</tbody>
</table>
### Examples

#### Tunnel Filter Configuration

The following example, starting in global configuration mode, configures a deny access filter for any host from the 172.16.2/24 network:

```bash
Router(config)# access-list 101 deny ip 172.16.2.0 0.0.0.255 any
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# filter tunnel 101
Router(config-webvpn-group)# end
```

#### Address Pool (Directly Connected Network) Configuration

The following example, starting in global configuration mode, configures the 192.168.1/24 network as an address pool:

```bash
Router(config)# ip local pool ADDRESSES 192.168.1.1 192.168.1.254
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# svc address-pool ADDRESSES
Router(config-webvpn-group)# end
```

#### Address Pool (Nondirectly Connected Network) Configuration

The following example, starting in global configuration mode, configures the 172.16.1/24 network as an address pool. Because the network is not directly connected, a local loopback interface is configured.

```bash
Router(config)# interface loopback 0
Router(config-int)# ip address 172.16.1.126 255.255.255.0
Router(config-int)# no shutdown
Router(config-int)# exit
Router(config)# ip local pool ADDRESSES 172.16.1.1 172.16.1.254
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# svc address-pool ADDRESSES
Router(config-webvpn-group)# end
```
Full Tunnel Configuration

The following example, starting in global configuration mode, configures full Cisco AnyConnect VPN Client tunnel support on an SSL VPN gateway:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# functions svc-enabled
Router(config-webvpn-group)# functions svc-required
Router(config-webvpn-group)# svc default-domain cisco.com
Router(config-webvpn-group)# svc dns-server primary 192.168.3.1
Router(config-webvpn-group)# svc dns-server secondary 192.168.4.1
Router(config-webvpn-group)# svc dpd-interval gateway 30
Router(config-webvpn-group)# svc dpd-interval client 300
Router(config-webvpn-group)# svc homepage www.cisco.com
Router(config-webvpn-group)# svc keep-client-installed
Router(config-webvpn-group)# svc rekey method new-tunnel
Router(config-webvpn-group)# svc rekey time 3600
Router(config-webvpn-group)# end
```

What to Do Next

Proceed to the next section to see advanced Cisco AnyConnect VPN Client tunnel configuration information.

Configuring Advanced SSL VPN Tunnel Features

This section describes advanced Cisco AnyConnect VPN Client tunnel configurations. The following configuration steps are completed in this task:

- Split tunnel support and split DNS resolution are enabled on the SSL VPN gateway.
- SSL VPN gateway support for Microsoft Internet Explorer proxy settings is configured.
- WINS resolution is configured for Cisco AnyConnect VPN Client tunnel clients.

Microsoft Internet Explorer Proxy Configuration

The SSL VPN gateway can be configured to pass or bypass Microsoft Internet Explorer (MSIE) proxy settings. Only HTTP proxy settings are supported by the SSL VPN gateway. MSIE proxy settings have no effect on any other supported browser.

Split Tunneling

Split tunnel support allows you to configure a policy that permits specific traffic to be carried outside of the Cisco AnyConnect VPN Client tunnel. Traffic is either included (resolved in tunnel) or excluded (resolved through the Internet Service Provider [ISP] or WAN connection). Tunnel resolution configuration is mutually exclusive. An IP address cannot be both included and excluded at the same time. Entering the `local-lans` keyword permits the remote user to access resources on a local LAN, such as network printer.

Prerequisites

- SSL VPN gateway and context configurations are enabled and operational.
• The Cisco AnyConnect VPN Client software package is installed for distribution on the SSL VPN gateway.

Restrictions

• Only Microsoft Windows 2000, Windows XP, Windows Vista, Apple-Mac, and Linux are supported on the remote client.

SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. policy group name
5. svc split exclude {{ip-address mask | local-lans} | include ip-address mask}
6. svc split dns name
7. svc msie-proxy {exception host | option {auto | bypass-local | none}}
8. svc msie-proxy server host
9. svc wins-server {primary | secondary} ip-address

SSL VPN
How to Configure SSL VPN Services on a Router

Examples

Split DNS Configuration

The following example, starting in global configuration mode, configures the following DNS names to be resolved in the Cisco AnyConnect VPN Client tunnel:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# svc split dns www.example.com
```

---

### Command or Action

<tr>
<td></td>
<td>Router(config-webvpn-group)# svc split exclude</td>
<td></td>
</tr>
<tr>
<td></td>
<td>192.168.1.1 0.0.0.255</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc split include</td>
<td></td>
</tr>
<tr>
<td></td>
<td>172.16.1.0 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><code>svc split dns name</code></td>
<td>Configures the SSL VPN gateway to resolve the specified fully qualified DNS names through the Cisco AnyConnect VPN Client tunnel.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc split dns <a href="http://www.examplecompany.com">www.examplecompany.com</a></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc split dns myexample.com</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>`svc msie-proxy {exception host</td>
<td>option {auto</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc msie-proxy option auto</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc msie-proxy exception <a href="http://www.examplecompany.com">www.examplecompany.com</a></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc msie-proxy exception 10.20.20.1</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td><code>svc msie-proxy server host</code></td>
<td>Specifies an MSIE proxy server for policy group remote users.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc msie-proxy server 10.10.10.1:80</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>`svc wins-server {primary</td>
<td>secondary} ip-address`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc wins-server primary 172.31.1.1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-webvpn-group)# svc wins-server secondary 172.31.2.1</td>
<td></td>
</tr>
</tbody>
</table>
Including and Excluding IP Prefixes
The following example configures a list of IP addresses to be resolved over the tunnel (included) and a list to be resolved outside of the tunnel (excluded):

Router(config-webvpn-group)# svc split dns myexample.com
Router(config-webvpn-group)# svc split exclude 192.168.1.0 255.255.255.0
Router(config-webvpn-group)# svc split include 172.16.1.0 255.255.255.0

MSIE Proxy Configuration
The following example configures MSIE proxy settings:

Router(config-webvpn-group)# svc msie-proxy option auto
Router(config-webvpn-group)# svc msie-proxy exception www.example.com
Router(config-webvpn-group)# svc msie-proxy exception 10.20.20.1
Router(config-webvpn-group)# svc msie-proxy server 10.10.10.1:80

WINS Server Configuration
The following example configures primary and secondary WINS servers for the policy group:

Router(config-webvpn-group)# svc wins-server primary 172.31.1.1
Router(config-webvpn-group)# svc wins-server secondary 172.31.2.1
Router(config-webvpn-group)# svc wins-server secondary 172.31.3.1
Router(config-webvpn-group)# end

Configuring VRF Virtualization
VRF Virtualization allows you to associate a traditional VRF with an SSL VPN context configuration. This feature allows you to apply different configurations and reuse address space for different groups of users in your organization.

Prerequisites

- A VRF has been configured in global configuration mode.
- SSL VPN gateway and context configurations are enabled and operational.
- A policy group has been configured and associated with the WebVPN context.

Restrictions

- Only a single VRF can be configured for each SSL VPN context configuration.

SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. vrf-name name
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> webvpn context name</td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> vrf-name name</td>
<td>Associates a VRF with an SSL VPN context.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-webvpn-context)# vrf-name BLUE</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example, starting in global configuration mode, associates the VRF under the SSL VPN context configuration:

```
Router(config)# ip vrf BLUE
Router(config-vrf)# rd 10.100.100.1
Router(config-vrf)# exit
Router(config)# webvpn context BLUE
Router(config-webvpn-context)# policy group BLUE
Router(config-webvpn-group)# exit
Router(config-webvpn-context)# default-group-policy BLUE
Router(config-webvpn-context)# vrf-name BLUE
Router(config-webvpn-context)# end
```

**Configuring ACL Rules**

To configure ACL rules on the application layer level for an individual user, perform the following tasks.

**Note**

- The ACL rules can be overridden for an individual user when the user logs on to the gateway (using AAA policy attributes).
- If a user session has no ACL attribute configured, all application requests from that user session are permitted by default.
Prerequisites

Before configuring the ACL rules, you must have first configured the time range using the `time-range` command (this prerequisite is in addition to optionally configuring the time range, in the task table below, as part of the `permit` or `deny` entries).

Restrictions

There is no limitation on the maximum number of filtering rules that can be configured for each ACL entry, but keeping the number below 50 should have no significant impact on router performance.

SUMMARY STEPS

Required Steps
1. `enable`  
2. `configure terminal`  
3. `webvpn context name`  
4. `acl acl-name`  
5. `permit [url [any | url-string]] [ip | tcp | udp | http | https | cifs] [any | source-ip source-mask] [any | destination-ip destination-mask] [time-range time-range-name] [syslog]`  
   or  
   `deny [url [any | url-string]] [ip | tcp | udp | http | https | cifs] [any | source-ip source-mask] [any | destination-ip destination-mask] [time-range time-range-name] [syslog]`

Optional Steps
6. `add position acl-entry`  
7. `error-url access-deny-page-url`  
8. `error-msg message-string`  
9. `list`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required Steps</strong></td>
<td></td>

<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>webvpn context name</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>acl acl-name</code></td>
</tr>
</tbody>
</table>
| **Step 5**           | `permit [url [any | url-string]] [ip | tcp | udp | http | https | cifs] [any | source-ip source-mask] [any | destination-ip destination-mask] [time-range time-range-name] [syslog]`  
   or  
   `deny [url [any | url-string]] [ip | tcp | udp | http | https | cifs] [any | source-ip source-mask] [any | destination-ip destination-mask] [time-range time-range-name] [syslog]`  

**Enables privileged EXEC mode.**

- Enter your password if prompted.

**Enters global configuration mode.**
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>webvpn context name</td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
</tbody>
</table>
|      | **Example:**  
Router (config)# webvpn context context1 | |
| 4    | acl acl-name | Defines the ACL and enters webvpn acl configuration modes. |
|      | **Example:**  
Router (config-webvpn-context)# acl acl1 | |
| 5    | permit [url [any | url-string]] [ip | tcp | udp | http | https | cifs] [any | source-ip source-mask] [any | destination-ip destination-mask] time-range {time-range-name} [syslog]  
or  
deny [url [any | url-string]] [ip | tcp | udp | http | https | cifs] [any | source-ip source-mask] [any | destination-ip destination-mask] time-range {time-range-name} [syslog] | Sets conditions in a named SSL VPN access list that will permit or deny packets. |
|      | **Example:**  
Router (config-webvpn-acl)# permit url any | |

### Optional Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>add position acl-entry</td>
<td>Adds an ACL entry at a specified position.</td>
</tr>
</tbody>
</table>
|      | **Example:**  
Router (config-webvpn-acl)# add 3 permit url any | |
| 7    | error-url access-deny-page-url | Defines a URL as an ACL violation page.  
- If the error-url command is configured, the user is redirected to a predefined URL for every request that is not allowed. If the error-url command is not configured, the user gets a standard, gateway-generated error page. |
|      | **Example:**  
Router (config-webvpn-acl)# error-url "http://www.example.com" | |
| 8    | error-msg message-string | Displays a specific error message when a user logs on and his or her request is denied. |
|      | **Example:**  
Router (config-webvpn-acl)# error-msg "If you have any questions, please contact <a href=mailto:employee1@example.com>Employee1</a>." | |
| 9    | list | Lists the currently configured ACL entries sequentially and assigns a position number. |
|      | **Example:**  
Router (config-webvpn-acl)# list | |
# Associating an ACL Attribute with a Policy Group

To associate an ACL attribute with a policy group, perform the following steps.

**Note**

- Associating an ACL attribute for an individual user must be performed as part of a AAA operation.
- The ACL rules can be overridden for an individual user when the user logs on to the gateway (using AAA policy attributes).
- If a user session has no ACL attribute configured, all application requests from that user session are permitted by default.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `webvpn context name`
4. `policy group name`
5. `exit`
6. `acl acl-name`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>webvpn context name</code></td>
<td>Configures the SSL VPN context and enters webvpn context configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router (config)# webvpn context context1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>policy group name</code></td>
<td>Defines a policy that can be applied to the user and enters webvpn policy group configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router (config-webvpn-context)# policy group group1</code></td>
<td></td>
</tr>
</tbody>
</table>
Monitoring and Maintaining ACLs

To monitor and maintain your ACL configuration, perform the following steps.

SUMMARY STEPS

1. enable
2. debug webvpn acl

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5 exit</td>
<td>Exits webvpn policy group configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-webvpn-group)# exit</td>
</tr>
<tr>
<td>Step 6 acl acl-name</td>
<td>Defines the ACL and enters webvpn acl configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-webvpn-context)# acl acl1</td>
</tr>
</tbody>
</table>

Configuring SSO Netegrity Cookie Support for a Virtual Context

To configure SSO Netegrity cookie support, perform the following steps.

Prerequisites

- A Cisco plug-in must first be installed on a Netegrity server.

SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. sso-server name
5. **web-agent-url** *url*

6. **secret-key** *key-name*

7. **max-retry-attempts** *number-of-retries*

8. **request-timeout** *number-of-seconds*

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:** Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Router# configure terminal | |
| **Step 3** webvpn context *name* | Enters webvpn context configuration mode to configure the SSL VPN context. |
| **Example:** Router (config)# webvpn context context1 | |
| **Step 4** sso-server *name* | Creates a SSO server name under an SSL VPN context and enters webvpn sso server configuration mode |
| **Example:** Router (config-webvpn-context)# sso-server "test-sso-server" | |
| **Step 5** web-agent-url *url* | Configures the Netegrity agent URL to which SSO authentication requests will be dispatched. |
| **Example:** Router (config-webvpn-sso-server)# web-agent-url http://www.example.comwebvpn/ | |
| **Step 6** secret-key *key-name* | Configures the policy server secret key that is used to secure authentication requests. |
| **Example:** Router (config-webvpn-sso-server)# secret-key "12345" | |
| **Step 7** max-retry-attempts *number-of-retries* | Sets the maximum number of retries before SSO authentication fails. |
| **Example:** Router (config-webvpn-sso-server)# max-retry-attempts 3 | |
| **Step 8** request-timeout *number-of-seconds* | Sets the number of seconds before an authentication request times out. |
| **Example:** Router (config-webvpn-sso-server)# request-timeout 15 | |
Associating an SSO Server with a Policy Group

To associate an SSO server with a policy group, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `webvpn context name`
4. `policy group name`
5. `sso-server name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> webvpn context name</td>
<td>Configures the SSL VPN context and enters webvpn context configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> policy group name</td>
<td>Configures a group policy and enters webvpn group policy configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-context)# policy group ONE</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> sso-server name</td>
<td>Attaches an SSO server to a policy group.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-group-webvpn)# sso-server &quot;test-sso-server&quot;</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring URL Obfuscation (Masking)**

To configure URL obfuscation, masking, for a policy group, perform the following steps.
SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. policy group name
5. mask-urls

DETAILED STEPS

Adding a CIFS Server URL List to an SSL VPN Context and Attaching It to a Policy Group

To add a CIFS server URL list to an SSL VPN context and attach it to a policy group, perform the following steps.

Prerequisites

Before adding a CIFS server URL list to an SSL VPN context, you must have already set up the Web VPN context using the webvpn context command, and you must be in webvpn context configuration mode.
### SUMMARY STEPS

1. `cifs-url-list name`
2. `heading text-string`
3. `url-text name`
4. `exit`
5. `policy group name`
6. `cifs-url-list name`
7. `exit`
8. `exit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>cifs-url-list name</code></td>
<td>Enters webvpn URL list configuration mode to configure a list of CIFS server URLs to which a user has access on the portal page of an SSL VPN.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-context) cifs-url-list cl</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>heading text-string</code></td>
<td>Configures the heading that is displayed above URLs listed on the portal page of an SSL VPN.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-url) heading &quot;cifs-url&quot;</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>url-text name</code></td>
<td>Adds an entry to a URL list.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-url)# url-text &quot;SSLVPN-SERVER2&quot; url-value &quot;\SLVPN-SERVER2&quot;</td>
<td>More than one entry can be added by reentering the <code>url-text</code> command for each subsequent entry.</td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>exit</code></td>
<td>Exits webvpn URL list configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-url)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>policy group name</code></td>
<td>Enters webvpn group policy configuration mode to configure a group policy.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# policy group ONE</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>cifs-url-list name</code></td>
<td>Attaches a URL list to a policy group.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-group)# cifs-url-list &quot;cl&quot;</td>
<td></td>
</tr>
</tbody>
</table>
Configuring User-Level Bookmarks

To configure user-level bookmarks, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. user-profile location flash:directory

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> webvpn context name</td>
<td>Configures the SSL VPN context and enters webvpn context configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router (config)# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> user-profile location flash:directory</td>
<td>Stores bookmarks on a directory.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router (config-webvpn-context)# user-profile location flash:webvpn/sslvpn/vpn_context/</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring FVRF

To configure FVRF so that the SSL VPN gateway is fully integrated into an MPLS network, perform the following steps.

### Prerequisites

As the following configuration task shows, IP VRF must be configured before the FVRF can be associated with the SSL VPN gateway. For more information about configuring IP VRF, see the subsection “Configuring IP VRF (ip vrf command)” in the “Related Documents” section.

### SUMMARY STEPS

1. enable
2. configure terminal
3. ip vrf vrf-name
4. exit
5. webvpn gateway name
6. vrfname name
7. exit
8. exit

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router&gt; enable</strong></td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router# configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>ip vrf vrf-name</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router (config)# ip vrf vrf_1</strong></td>
</tr>
<tr>
<td></td>
<td>Defines a VPN VRF instance and enters VRF configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>  The vrf-name argument specified here must be the same as the name argument in Step 6.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router (config-vrf)# exit</strong></td>
</tr>
<tr>
<td></td>
<td>Exits VRF configuration mode.</td>
</tr>
</tbody>
</table>
### Disabling Full-Tunnel CEF

To disable full-tunnel CEF support, perform the following tasks:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

#### Example

**Note**  
The command `no webvpn cef` disables all Web VPN CEF support, not just full-tunnel CEF support.

### SUMMARY STEPS

1. enable
2. configure terminal
3. no webvpn cef

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
How to Configure SSL VPN Services on a Router

Configuring Automatic Authentication and Authorization

To configure automatic authentication and authorization so that a user needs to log in only one time, at login, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `webvpn context name`
4. `aaa authentication auto`
5. `authorization list name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>webvpn context name</code></td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config)# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>aaa authentication auto</code></td>
<td>Allows automatic authentication for users. Users provide their usernames and passwords via the gateway page URL and do not have to again enter their usernames and passwords from the login page.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config-webvpn-context)# aaa authentication auto</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>authorization list name</code></td>
<td>Allows user attributes to get “pushed” during authentication.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config-webvpn-context)# aaa authorization list name</td>
<td></td>
</tr>
</tbody>
</table>
# Configuring a URL Rewrite Splitter

To configure a URL rewrite splitter, perform the following tasks.

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `webvpn context name`
4. `url rewrite`
5. `host host-name`
6. `ip ip-address`
7. `unmatched-action [direct-access | redirect]`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>webvpn context name</code></td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>url rewrite</code></td>
<td>Allows you to mangle selective URL requests and enters URL rewrite mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-context)# url rewrite</td>
<td><strong>Note</strong> One of the commands <code>host</code> or <code>ip</code> is required. The <code>unmatched-action</code> command is optional.</td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>host host-name</code></td>
<td>Hostname of the site to be mangled.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-url-rewrite)# host <a href="http://www.examplecompany.com">www.examplecompany.com</a></td>
<td><strong>Note</strong> One of the commands <code>host</code> or <code>ip</code> is required. The <code>unmatched-action</code> command is optional.</td>
</tr>
</tbody>
</table>
Configuring a Backend HTTP Proxy

To configure a backend HTTP proxy, perform the following tasks.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `webvpn context name`
4. `policy group name`
5. `http proxy-server {ip-address | dns-name} port port-number`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Example:          |         |
| Router> enable    |         |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example:          |         |
| Router# configure terminal |         |
| **Step 3** webvpn context name | Enters webvpn context configuration mode to configure the SSL VPN context. |
| Example:          |         |
| Router (config)# webvpn context context1 |         |
How to Configure SSL VPN Services on a Router

To configure stateless High Availability with HSRP for SSL VPN, perform the following steps.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface type slot/port
4. standby number ip ip-address
5. standby number name standby-name
6. exit
7. webvpn gateway name
8. ip address number port port-number standby name

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1.   | enable            | Enables privileged EXEC mode.  
|      |                   | • Enter your password if prompted. |
| 2.   | configure terminal| Enters global configuration mode. |
| 3.   | interface type slot/port | Configures an interface type and enters interface configuration mode. |

**Example:**

```
Router (config)# interface gateway 0/0
```
How to Configure SSL VPN Services on a Router

Configuring Internationalization

To configure multilanguage support messages initiated by the headend for SSL VPN clients, such as CSD and SVC, the following tasks are required or optional:

- Generating the Template Browser Attribute File, page 84 (required)
- Importing the Browser Attribute File, page 85 (required)
- Verifying That the Browser Attribute File Was Imported Correctly, page 86 (optional)
- Creating the Language File, page 87 (required)
- Importing the Language File, page 87 (required)
- Verifying That the Language File Was Imported Correctly, page 88 (optional)
- Creating the URL List, page 89 (required)
- Importing the File into the URL List and Binding It to a Policy Group, page 90 (required)
- Verifying That the URL List File Was Bound Correctly to the Policy Group, page 91 (optional)

Generating the Template Browser Attribute File

To generate the template browser attribute file, perform the following steps.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>standby number ip ip-address</code></td>
<td>Configures a standby IP address.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config-if)# standby 0 ip 10.1.1.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>standby number name standby-name</code></td>
<td>Configures a standby name.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config-if)# standby 0 name SSLVPN</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><code>exit</code></td>
<td>Exits interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config-if)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td><code>webvpn gateway name</code></td>
<td>Enters webvpn gateway configuration mode to configure an SSL VPN gateway.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config)# webvpn gateway Gateway1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip address ip-address port port-number standby name</code></td>
<td>Configures a standby IP address as the proxy IP address on an SSL VPN gateway.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config)# ip address 10.1.1.1 port 443 standby SSLVPN</td>
<td><strong>Note</strong> The IP address configured here must be the same as the IP address that was configured as the standby IP address (<code>standby number ip ip-address</code>).</td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. enable
2. `webvpn create template browser-attribute device:
3. Copy the browser attribute file to another device for editing.
4. Copy the edited file back to the storage device.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>webvpn create template browser-attribute device:</code></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# webvpn create template browser-attribute flash:</code></td>
<td>Generates the browser attribute template XML file (battr_tpl.xml).</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Copy the browser attribute file to another device on which you can edit the language being configured.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Copy the edited file back to the storage device.</td>
</tr>
</tbody>
</table>

What to Do Next

Proceed to the “Importing the Browser Attribute File” section on page 85.

Importing the Browser Attribute File

To import the browser attribute file from the storage device, perform the following steps.

SUMMARY STEPS

1. enable
2. `configure terminal`
3. `webvpn context name`
4. `browser-attribute import device:file-name`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td>Step 3 webvpn context name</td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config)# webvpn context context1</td>
</tr>
<tr>
<td>Step 4 browser-attribute import device;file-name</td>
<td>Imports the edited browser attribute file from the storage device.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router (config-webvpn-context)# browser-attribute import flash:battr_tpl.xml</td>
</tr>
</tbody>
</table>

What to Do Next

Proceed to the “Verifying That the Browser Attribute File Was Imported Correctly” section on page 86.

Verifying That the Browser Attribute File Was Imported Correctly

To verify that the browser attribute file was imported correctly, perform the following steps.

SUMMARY STEPS

1. enable
2. show running-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 show running-config</td>
<td>Verifies that the browser attribute file was imported correctly.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show running-config</td>
</tr>
</tbody>
</table>
What to Do Next

Proceed to the “Creating the Language File” section on page 87.

Creating the Language File

To create the language file, perform the following steps.

SUMMARY STEPS

1. `enable`
2. `webvpn create template language device:`
3. Copy the language lang.js file to a PC for editing.
4. Copy the edited language lang.js file to the storage device.
5. `webvpn create template language {japanese | customize language-name device:file}`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>webvpn create template language device:</code></td>
<td>Creates the language template file lang.js.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# <code>webvpn create template language flash:</code></td>
<td>Note A lang.js file does not have to be created if the language is English or Japanese.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Copy the language lang.js file to a PC for editing.</td>
<td>For an example of how to copy the language file to another PC, see “Copying the Language File to Another PC for Editing: Example” section on page 105.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Copy the edited language lang.js file to the storage device.</td>
<td>For an example of how to copy the edited file to the storage device, see “Copying the Edited Language File to the Storage Device: Example” section on page 105.</td>
</tr>
<tr>
<td><strong>Step 5</strong> `webvpn create template language {japanese</td>
<td>customize language-name device:file}`</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# <code>webvpn create template language japanese</code></td>
<td></td>
</tr>
</tbody>
</table>

What to Do Next

Proceed to the “Importing the Language File” section on page 87.

Importing the Language File

To import the language file, perform the following steps.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>webvpn create template language device:</code></td>
<td>Creates the language template file lang.js.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# <code>webvpn create template language flash:</code></td>
<td>Note A lang.js file does not have to be created if the language is English or Japanese.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Copy the language lang.js file to a PC for editing.</td>
<td>For an example of how to copy the language file to another PC, see “Copying the Language File to Another PC for Editing: Example” section on page 105.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Copy the edited language lang.js file to the storage device.</td>
<td>For an example of how to copy the edited file to the storage device, see “Copying the Edited Language File to the Storage Device: Example” section on page 105.</td>
</tr>
<tr>
<td><strong>Step 5</strong> `webvpn create template language {japanese</td>
<td>customize language-name device:file}`</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# <code>webvpn create template language japanese</code></td>
<td></td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. language {japanese | customize language-name device:file}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 webvpn context name</td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td>Step 4 language {japanese</td>
<td>customize language-name device:file}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router (config-webvpn-context)# language Japanese</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Router (config-webvpn-context)# language customize myfile flash:lang.js</td>
<td></td>
</tr>
</tbody>
</table>

What to Do Next

Proceed to the “Verifying That the Language File Was Imported Correctly” section on page 88.

Verifying That the Language File Was Imported Correctly

To verify that the language file was imported correctly, perform the following steps.

SUMMARY STEPS

1. enable
2. show running-config
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example:          |         |
| Router> enable    |         |
| Step 2 show running-config | Verifies that the language file was imported correctly. |
| Example:          |         |
| Router# show running-config | |

What to Do Next

Proceed to the “Creating the URL List” section on page 89.

Creating the URL List

To create the URL list, perform the following steps.

SUMMARY STEPS

1. enable
2. webvpn create template url-list device:
3. Copy the XML file to a PC for editing.
4. Copy the edited url-list XML file back to the storage device.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example:          |         |
| Router> enable    |         |
| Step 2 webvpn create template url-list device: | Creates the url-list template. |
| Example:          |         |
| Router)# webvpn create template url-list flash: | |
| Step 3 Copy the XML file to a PC for editing. | For an example of how to copy an XML file to a PC for editing, see the “URL List: Examples” section on page 105. |
| Step 4 Copy the edited url-list XML file back to the storage device. | For an example of how to copy the edited url-list XML file back to a storage device, see the “URL List: Examples” section on page 105. |
What to Do Next

Proceed to the “Importing the File into the URL List and Binding It to a Policy Group” section on page 90.

Importing the File into the URL List and Binding It to a Policy Group

To import the file into the URL list and bind it to a policy group, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. webvpn context name
4. url-list name
5. import device:file
6. exit
7. policy group name
8. url-list name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1 enable</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2 configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3 webvpn context name</strong></td>
<td>Enters webvpn context configuration mode to configure the SSL VPN context.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# webvpn context context1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4 url-list name</strong></td>
<td>Enters webvpn URL list configuration mode to configure a list of URLs to which a user has access on the portal page of an SSL VPN and attaches the URL list to a policy group.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-context)# url-list testlist</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5 import device:file</strong></td>
<td>Imports the user-defined URL list.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-webvpn-url)# import flash:testlist</td>
<td></td>
</tr>
</tbody>
</table>
Verifying That the URL List File Was Bound Correctly to the Policy Group

To verify that the URL list file was bound correctly to the policy group, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `show running-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Verifies that the url-list file was bound correctly to the policy group.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# show running-config</td>
<td></td>
</tr>
</tbody>
</table>

**Using SSL VPN Clear Commands**

This section describes `clear` commands that are used to perform the following tasks:

- Clear NBNS cache information

---

**What to Do Next**

Proceed to the “Verifying That the URL List File Was Bound Correctly to the Policy Group” section on page 91.
- Clear remote user sessions
- Clear (or reset) SSL VPN application and access counters

SUMMARY STEPS

1. enable
2. clear webvpn nbns [context {name | all}]
3. clear webvpn session [user name] context {name | all}
4. clear webvpn stats [[cifs | citrix | mangle | port-forward | sso | tunnel] [context {name | all}]]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> clear webvpn nbns [context {name</td>
<td>all}]</td>
</tr>
<tr>
<td>Example: Router# clear webvpn nbns context all</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> clear webvpn session [user name] context {name</td>
<td>all}</td>
</tr>
<tr>
<td>Example: Router# clear webvpn session context all</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> clear webvpn stats [[cifs</td>
<td>citrix</td>
</tr>
<tr>
<td>Example: Router# clear webvpn stats</td>
<td></td>
</tr>
</tbody>
</table>

Verifying SSL VPN Configurations

This section describes show commands that are used to verify the following:
- SSL VPN gateway configuration
- SSL VPN context configuration
- CSD and Cisco AnyConnect VPN Client installation status
- NetBIOS name services information
- SSL VPN group policy configuration
- SSL VPN user session information
- SSL VPN application statistics
SUMMARY STEPS

1. enable
2. show webvpn context [name]
3. show webvpn gateway [name]
4. show webvpn install {file name | package {csd | svc} | status {csd | svc}}
5. show webvpn nbns {context [all | name]}
6. show webvpn policy group name context [all | name]
7. show webvpn session {{[user name] context [all | name]}
8. show webvpn stats [cifs | citrix | mangle | port-forward | sso | tunnel] [detail] [context [all | name]]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| 2    | show webvpn context [name] | Displays the operational status and configuration parameters for SSL VPN context configurations. |
| 3    | show webvpn gateway [name] | Displays the status of the SSL VPN gateway. |
| 4    | show webvpn install {file name | package {csd | svc} | status {csd | svc}} | Displays the installation status of Cisco AnyConnect VPN Client or CSD client software packages. |
| 5    | show webvpn nbns {context [all | name]} | Displays information in the NetBIOS Name Service (NBNS) cache. |
| 6    | show webvpn policy group name context [all | name] | Displays the context configuration associated with a policy group. |
Using SSL VPN Debug Commands

To monitor and manage your SSL VPN configurations, perform the following steps.

**SUMMARY STEPS**

1. **enable**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# debug webvpn</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong> show webvpn session {[user name] context (all</td>
<td>name)}</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show webvpn session context all</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> show webvpn stats [cifs</td>
<td>citrix</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# show webvpn stats tunnel detail context all</td>
<td></td>
</tr>
</tbody>
</table>
Remote User Guide

For information specifically for the remote user, see the document *SSL VPN Remote User Guide*.

Configuration Examples for SSL VPN

This section includes the following configuration examples:

- Configuring a Generic SSL VPN Gateway: Example, page 95
- Configuring an ACL: Example, page 96
- Configuring HTTP Proxy: Example, page 96
- RADIUS Accounting for SSL VPN Sessions: Example, page 97
- URL Obfuscation (Masking): Example, page 97
- Adding a CIFS Server URL List and Attaching It to a Policy List: Example, page 98
- Typical SSL VPN Configuration: Example, page 98
- CEF-Processed Packets: Example, page 100
- Multiple AnyConnect VPN Client Package Files: Examples, page 100
- Local Authorization: Example, page 101
- URL Rewrite Splitter: Example, page 102
- Backend HTTP Proxy: Example, page 102
- Stateless High Availability with HSRP: Example, page 102
- Internationalization: Examples, page 103
- debug Command Output: Examples, page 106
- show Command Output: Examples, page 106

Configuring a Generic SSL VPN Gateway: Example

The following output example shows that a generic SSL VPN gateway has been configured in privileged EXEC mode:

```
Router# show running-config

webvpn gateway SSL_gateway2
   ip address 10.1.1.1. port 442
   ssl trustpoint TP_self_signed_4138349635
   inservice

webvpn context SSL_gateway2
   ssl authenticate verify all
   !

policy group default
default-group-policy default
gateway SSL_gateway2
   inservice
```

Configuring an ACL: Example

The following output example shows the ACL is “acl1.” It has been associated with policy group “default.”

Router# show running-config

webvpn context context1
  ssl authenticate verify all
  !
  acl "acl1"
    error-msg "warning!!!..."
    permit url "http://www.example1.com"
    deny url "http://www.example2.com"
    permit http any any
  !
  nbns-list l1
  nbns-server 10.1.1.20
  !
  cifs-url-list "c1"
    heading "cifs-url"
    url-text "SSL VPN-SERVER2" url-value "\SSL VPN-SERVER2"
    url-text "SSL SERVER2" url-value "\\SSL-SERVER2"
  !
  policy group default
  acl "acl1"
  cifs-url-list "c1"
  nbns-list "l1"
  functions file-access
  functions file-browse
  functions file-entry
  default-group-policy default
  gateway public
  inservice
  !

Configuring HTTP Proxy: Example

The following output example shows that HTTP proxy has been configured and that the portal (home) page from URL “http://www.example.com” will automatically download the home page of the user:

Router# show running-config

webvpn context myContext
  ssl authenticate verify all
  !
  !
  port-forward "email"
    local-port 20016 remote-server "ssl-server1.SSL VPN-ios.com" remote-port 110
    description "POP-ssl-server1"
  !
  policy group myPolicy
    port-forward "email" auto-download http-proxy proxy-url "http://www.example.com"
    inservice
RADIUS Accounting for SSL VPN Sessions: Example

The following output example shows that RADIUS accounting has been configured for SSL VPN user sessions:

Router# `show running-config`

```
version 12.4
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname host1
!
!aaa new-model
!
!aaa accounting network SSL VPNaaa start-stop group radius
aaa accounting update periodic 1
aaa session-id common
ip subnet-zero
ip cef
!
!no ip domain lookup
ip domain name cisco.com
ip name-server 172.16.2.133
ip name-server 172.16.11.48
!

  exec-timeout 0 0
line aux 0
line vty 0 4

!

webvpn gateway GW1
  ip address 172.19.216.141 port 443
  inservice
!
webvpn gateway SSL VPN
  no inservice
!
webvpn install svc flash:/webvpn/svc.pkg
webvpn aaa accounting-list SSL VPNaaa
!
webvpn context Default_context
  ssl encryption
  ssl authenticate verify all
!
no inservice
!
```

URL Obfuscation (Masking): Example

The following output example shows that URL obfuscation (masking) has been configured for policy group “gp_urlobf.”

Router: `show running-config`

```
```
Adding a CIFS Server URL List and Attaching It to a Policy List: Example

The following output example shows that the CIFS server URLs “SSLVPN-SERVER2” and “SSL-SERVER2” have been added as portal page URLs to which a user has access. The output also shows that the two servers have been attached to a policy group.

```plaintext
webvpn context context_1
  ssl authenticate verify all
  acl "acl1"
    error-msg "warning!!!..."
    permit url "http://www.example1.com"
    deny url "http://www.example2.com"
    permit http any any
  !
  nbns-list l1
    nbns-server 10.1.1.20
  !
  cifs-url-list "c1"
    heading "cifs-url"
    url-text "SSLVPN-SERVER2" url-value "\SSLVPN-SERVER2"
    url-text "SSL-SERVER2" url-value "\SSL-SERVER2"
  !
  policy group default
    acl "acl1"
    cifs-url-list "c1"
    nbns-list "l1"
    functions file-access
    functions file-browse
    functions file-entry
default-group-policy default
  gateway public
  inservice
  !
```

Typical SSL VPN Configuration: Example

The following output is an example of an SSL VPN configuration that includes most of the features that are available using SSL VPN:

```plaintext
Router# show running-config
hostname sslvpn
!
!
aaa new-model
!
!
aaa authentication login default local group radius
```
crypto pki trustpoint Gateway

**CEF-Processed Packets: Example**

The following output example from the `show webvpn stats` command shows information about CEF-processed packets:

```
Router# show webvpn stats
```

User session statistics:
- Active user sessions : 56
- Peak user sessions  : 117
- Active user TCP conns : 0
- Session alloc failures : 0
- VPN session timeout  : 0
- User cleared VPN sessions : 0
- Exceeded total user limit : 0
- Client process rcvd pkts : 1971
- Client process sent pkts : 921291
- Client CEF received pkts : 1334
- Client CEF rcv punt pkts : 1944439
- Client CEF sent pkts : 21070

**Multiple AnyConnect VPN Client Package Files: Examples**

The following example shows that three AnyConnect VPN Client packages have been installed to a gateway and shows the resulting `show webvpn install` command output:
Router (config)# webvpn install svc vpn-Darwin_i386-Release-2.0.0077-k9.pkg sequence 6
Router (config)# webvpn install svc vpn-Darwin_powerpc-Release-2.0.0077-k9.pkg sequence 8
Router (config)# webvpn install svc svc_1.pkg sequence 4

Router# show webvpn install status svc

SSLVPN Package SSL-VPN-Client version installed:
CISCO STC win2k+
2,0,0148
SSLVPN Package SSL-VPN-Client version installed:
CISCO STC Darwin_i386
2,0,0
Wed Nov  8 04:01:57 MST 2006
SSLVPN Package SSL-VPN-Client version installed:
CISCO STC Darwin_powerpc
2,0,0
Wed Nov  8 03:54:50 MST 2006

The following example shows (1) that three AnyConnect VPN client packages have been configured and (2) typical output from the show-running config command:

Router# show running-config | begin webvpn
webvpn install svc flash:/webvpn/svc_4.pkg sequence 4
! webvpn install svc flash:/webvpn/svc_6.pkg sequence 6
! webvpn install svc flash:/webvpn/svc_9.pkg sequence 9

Local Authorization: Example

The following example shows that local authorization has been configured:

aaa new-model
!
aaa authentication login default local
aaa authorization network default local
!
 aaa attribute list l2
   attribute type banner "user2"
!
aaa attribute list l1
   attribute type banner "user1"
   attribute type urllist-name "my-url-list"
!
username user1 password 0 passwd1
username user1 aaa attribute list l1
username user2 password 0 passwd2
username user2 aaa attribute list 12
!
webvpn context best
    ssl authenticate verify all
!

gateway public domain d1
inservice

URL Rewrite Splitter: Example

The following example shows that URL mangling has been configured for a specific host and IP address. The unmatched action has been defined as direct access.

webvpn context e1
!
url rewrite
    host "www.examplecompany.com"
    ip 10.1.0.0 255.255.0.0
    unmatched-action direct-access
!

Backend HTTP Proxy: Example

The following example shows that a backend HTTP proxy has been configured:

webvpn context e1
!
policy group g1
    http proxy-server "1.1.1.1" port 2034
default-group-policy g1

Stateless High Availability with HSRP: Example

Figure 15 shows the topology of a typical stateless High Availability with HSRP setup. Router 1 and Router 2 are configured for HSRP on Gateway Webvpn. The example below Figure 13 shows the actual configuration.
Figure 15 Stateless High Availability with HSRP Setup

Router 1 Configuration
Router# configure terminal
Router config)# interface gateway 0/1
Router (config-if)# standby 0 ip 10.1.1.1
Router (config-if)# standby 0 name SSLVPN
Router (config-if)# exit
Router (config)# webvpn gateway Webvpn
Router (config-webvpn-gateway)# ip address 10.1.1.1 port 443 standby SSLVPN

Router 2 Configuration
Router# configure terminal
Router (config)# interface gateway 0/0
Router (config-if)# standby 0 ip 10.1.1.1
Router (config-if)# standby 0 name SSLVPN2
Router (config-if)# exit
Router (config)# webvpn gateway Webvpn
Router (config-webvpn-gateway)# ip address 10.1.1.1 port 443 standby SSLVPNigh2

Internationalization: Examples

The following configuration and output examples display various aspects of the Internationalization feature. This section contains the following examples:

- Generated Browser Attribute Template: Example, page 104
- Copying the Browser Attribute File to Another PC for Editing: Example, page 104
- Copying the Edited File to flash: Example, page 104
- Output Showing That the Edited File Was Imported: Example, page 104
- Copying the Language File to Another PC for Editing: Example, page 105
- Copying the Edited Language File to the Storage Device: Example, page 105
- Language Template Created: Example, page 105
- URL List: Examples, page 105
Generated Browser Attribute Template: Example

The following is an example of a generated browser attribute template:

```xml
<?xml version="1.0" encoding="utf-8"?>
<!--
- Template file for browser attributes import
<color> - primary color
<scolor> - secondary color
<tcolor> - text color
<stcolor> - secondary text color
<lmsg> - login message
<title> - browser title
<ticolor> - title color
Default value will be used if the field is not defined
-->
<settings>
<color>#003333</color>
<scolor>#336666</scolor>
<tcolor>white</tcolor>
<stcolor>black</stcolor>
<lmsg>Welcome to<p>Cisco Systems WebVPN Service</lmsg>
<title>WebVPN Service</title>
<ticolor>#003333</ticolor>
</settings>
```

Copying the Browser Attribute File to Another PC for Editing: Example

The following example shows how to copy a browser attribute file to another PC for editing:

Router# copy flash: tftp:
Source filename [battr_tpl.xml]? [battr_tpl.xml]
Address or name of remote host []? 10.1.1.30
Destination filename [battr_tpl.xml]? [battr_tpl.xml]
!!
677 bytes copied in 0.004 secs (169250 bytes/sec)

Copying the Edited File to flash: Example

The following example shows how to copy an edited attribute file to flash:

Router# copy tftp: {edited battr_tpl.xml file} flash:

Output Showing That the Edited File Was Imported: Example

The following show running-config output shows that the browser attribute file was correctly copied to flash:

Router# show running-config

webvpn context g
browser-attribute import flash:battr_tpl.xml
ssl authenticate verify all
Copying the Language File to Another PC for Editing: Example

The following example shows how to copy a language file to another PC for editing:

Router# copy flash: tftp:
Source filename [lang.js]? [lang.js]
Address or name of remote host []? 10.1.1.30
Destination filename [lang.js]?
!!
10649 bytes copied in 0.028 secs (380321 bytes/sec)

Copying the Edited Language File to the Storage Device: Example

The following example shows how to copy the edited language file to flash:

Router# copy tftp: (edited lang.js file) flash:

Language Template Created: Example

The following show running-config command output shows that the language file “lang.js” has been imported correctly:

Router: show running-config

policy group default
  functions file-access
  functions file-browse
  functions file-entry
  functions svc-enabled
  mask-urls
  svc address-pool "mypool"
  svc keep-client-installed
  svc split include 10.1.1.0 255.255.255.0
  default-group-policy default
  gateway g
  language customize mylang flash:lang.js
  inservice

URL List: Examples

The following example shows that the URL list template file has been copied to another PC for editing:

Router# copy flash: tftp:
Source filename [url_list_tpl.xml]?
Address or name of remote host []? 10.1.1.30
Destination filename [url_list_tpl.xml]

The following example shows that the URL template file has been copied to flash:

Router# copy tftp: (edited url_list_tpl.xml file) flash:

The following show running-config command output shows that URL list file has been imported into the url-list and that it has been bound to the policy group:

Router# show running-config

policy group default
  url-list "test"
  functions file-access
  functions file-browse
  functions file-entry
functions svc-enabled
mask-urls
svc address-pool "mypool"
svc keep-client-installed
svc split include 10.1.1.0 255.255.255.0
default-group-policy default
gateway g
language customize mylang flash:lang.js
in-service

**debug Command Output: Examples**

**Configuring SSO: Example**

The following output example displays ticket creation, session setup, and response handling information for an SSO configuration:

```plaintext
Router# debug webvpn sso

*Jun 12 20:37:01.052: WV_SSO: Set session cookie with SSO redirect
*Jun 12 20:37:01.056: WV-SSO: Set SSO auth flag
*Jun 12 20:37:01.056: WV-SSO: Attach credentials - building auth ticket
*Jun 12 20:37:01.060: WV-SSO: user: [user11], secret: [secret123], version: [1.0], login time: [BCEFC86D], session key: [C077F97A], SHA1 hash: [B07D0A924DB33988D423AE9F937C15A66A04819]
*Jun 12 20:37:01.060: WV-SSO: auth_ticket:
user11:1.0@C077F97A@BCEFC86D@B07D0A924DB33988D423AE9F937C15A66A04819
*Jun 12 20:37:01.060: WV-SSO: Base64 credentials for the auth_ticket:

```

**show Command Output: Examples**

The following examples display information about various SSL VPN features and scenarios:

- show webvpn context Example, page 107
- show webvpn gateway Example, page 107
- show webvpn gateway Example, page 107
- show webvpn install file Example, page 108
- show webvpn install package svc Example, page 108
- show webvpn install status svc Example, page 108
- show webvpn nbns context all Example, page 108
show webvpn policy Example, page 109
show webvpn policy Example (with NTLM disabled), page 109
show webvpn session Example, page 109
show webvpn session user Example, page 110
show webvpn stats Example, page 110
show webvpn stats sso Examples, page 112
F VRF show Command Output Example, page 112

show webvpn context Example
The following is sample output from the `show webvpn context` command:

```
Router# show webvpn context

Codes: AS - Admin Status, OS - Operation Status
       VHost - Virtual Host

Context Name    Gateway Domain/VHost   VRF    AS    OS
--------------- ----------- --------- ------- --------
Default_context n/a     n/a        n/a     down  down
con-1           gw-1     one        -       up    up
con-2           -        -          -       down  down
```

show webvpn context name Example
The following is sample output from the `show webvpn context` command, entered with the name of a specific SSL VPN context:

Router# show webvpn context context1

Admin Status: up
Operation Status: up
CSD Status: Disabled
Certificate authentication type: All attributes (like CRL) are verified
AAA Authentication List not configured
AAA Authentication Domain not configured
Default Group Policy: PG_1
Associated WebVPN Gateway: GW_ONE
Domain Name: DOMAIN_ONE
Maximum Users Allowed: 10000 (default)
NAT Address not configured
VRF Name not configured

show webvpn gateway Example
The following is sample output from the `show webvpn gateway` command:

```
Router# show webvpn gateway

Gateway Name Admin Operation
---------- ----- ------
GW_1       up     up
GW_2       down   down
```

show webvpn gateway name Example
The following is sample output from the `show webvpn gateway` command, entered with a specific SSL VPN gateway name:

Router# show webvpn gateway GW_1
Admin Status: up
Operation Status: up
IP: 10.1.1.1, port: 443
SSL Trustpoint: TP-self-signed-26793562

**show webvpn install file Example**

The following is sample output from the `show webvpn install` command, entered with the `file` keyword:

```
Router# show webvpn install file \webvpn\stc\version.txt

SSL VPN File \webvpn\stc\version.txt installed:
CISCO STC win2k+ 1.0.0
1,0,116
Fri 06/03/2005 03:02:46.43
```

**show webvpn install package svc Example**

The following is sample output from the `show webvpn install` command, entered with the `package svc` keywords:

```
Router# show webvpn install package svc

SSL VPN Package SSL-VPN-Client installed:
File: \webvpn\stc\1\binaries\detectvm.class, size: 555
File: \webvpn\stc\1\binaries\java.htm, size: 309
File: \webvpn\stc\1\binaries\main.js, size: 8049
File: \webvpn\stc\1\binaries\ocx.htm, size: 244
File: \webvpn\stc\1\binaries\setup.cab, size: 176132
File: \webvpn\stc\1\binaries\stc.exe, size: 94696
File: \webvpn\stc\1\binaries\stcjava.cab, size: 7166
File: \webvpn\stc\1\binaries\stcjava.jar, size: 4846
File: \webvpn\stc\1\binaries\stcweb.cab, size: 13678
File: \webvpn\stc\1\binaries\update.txt, size: 11
File: \webvpn\stc\1\empty.html, size: 153
File: \webvpn\stc\1\images\alert.gif, size: 2042
File: \webvpn\stc\1\images\buttons.gif, size: 1842
File: \webvpn\stc\1\images\loading.gif, size: 313
File: \webvpn\stc\1\images\title.gif, size: 2739
File: \webvpn\stc\1\index.html, size: 4725
File: \webvpn\stc\1\index.html, size: 325
File: \webvpn\stc\1\version.txt, size: 63
Total files: 18
```

**show webvpn install status svc Example**

The following is sample output from the `show webvpn install` command, entered with the `status svc` keywords:

```
Router# show webvpn install status svc

SSL VPN Package SSL-VPN-Client version installed:
CISCO STC win2k+ 1.0.0
1,0,2,127
Fri 07/22/2005 12:14:45.43
```

**show webvpn nbns context all Example**

The following sample output from the `show webvpn nbns` command, entered with the `context all` keywords:

```
Router# show webvpn nbns context all

<table>
<thead>
<tr>
<th>NetBIOS name</th>
<th>IP Address</th>
<th>Timestamp</th>
</tr>
</thead>
</table>
```
show webvpn policy Example
The following is sample output from the `show webvpn policy` command:

Router# show webvpn policy group ONE context all
WEBVPN: group policy = ONE ; context = SSL VPN
  idle timeout = 2100 sec
  session timeout = 43200 sec
  citrix disabled
  dpd client timeout = 300 sec
  dpd gateway timeout = 300 sec
  keep SSL VPN client installed = disabled
  rekey interval = 3600 sec
  rekey method =
  lease duration = 43200 sec
WEBVPN: group policy = ONE ; context = SSL VPN_TWO
  idle timeout = 2100 sec
  session timeout = 43200 sec
  citrix disabled
  dpd client timeout = 300 sec
  dpd gateway timeout = 300 sec
  keep SSL VPN client installed = disabled
  rekey interval = 3600 sec
  rekey method =
  lease duration = 43200 sec

show webvpn policy Example (with NTLM disabled)
The following is sample output from the `show webvpn policy` command. NTLM authentication has been disabled.

Router# show webvpn policy group ntlm context ntlm
WEBVPN: group policy = ntlm; context = ntlm
  url list name = "ntlm-server"
  idle timeout = 2100 sec
  session timeout = 43200 sec
  functions =
    httpauth-disabled
    file-access
    svc-enabled

  citrix disabled
  dpd client timeout = 300 sec
  dpd gateway timeout = 300 sec
  keep SSL VPN client installed = disabled
  rekey interval = 3600 sec
  rekey method =
  lease duration = 43200 sec

show webvpn session Example
The following is sample output from the `show webvpn session` command. The output is filtered to display user session information for only the specified context.

Router# show webvpn session context SSL VPN
WebVPN context name: SSL VPN

<table>
<thead>
<tr>
<th>Client_Login_Name</th>
<th>Client_IP_Address</th>
<th>No_of_Connections</th>
<th>Created</th>
<th>Last_Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>user1</td>
<td>10.2.1.220</td>
<td>2</td>
<td>04:47:16</td>
<td>00:01:26</td>
</tr>
<tr>
<td>user2</td>
<td>10.2.1.221</td>
<td>2</td>
<td>04:48:36</td>
<td>00:01:56</td>
</tr>
</tbody>
</table>

**show webvpn session user Example**

The following is sample output from the `show webvpn session` command. The output is filtered to display session information for a specific user.

Router# `show webvpn session user user1 context all`

WebVPN user name = user1 ; IP address = 10.2.1.220; context = SSL VPN

No of connections: 0
Created 00:00:19, Last-used 00:00:18
CSD enabled
CSD Session Policy
  CSD Web Browsing Allowed
  CSD Port Forwarding Allowed
  CSD Full Tunneling Disabled
  CSD FILE Access Allowed
User Policy Parameters
  Group name = ONE
Group Policy Parameters
  url list name = "Cisco"
  idle timeout = 2100 sec
  session timeout = 41200 sec
  port forward name = "EMAIL"
  tunnel mode = disabled
citrix disabled
dpd client timeout = 300 sec
dpd gateway timeout = 300 sec
keep stc installed = disabled
rekey interval = 3600 sec
rekey method = ssl
lease duration = 3600 sec

**show webvpn stats Example**

The following is sample output from the `show webvpn stats` command entered with the `detail` and `context` keywords:

Router# `show webvpn stats detail context SSL VPN`

WebVPN context name : SSL VPN

User session statistics:
  Active user sessions : 0
  Peak user sessions : 0
  Active user TCP conns : 0

SSL VPN Configuration Examples for SSL VPN

show webvpn stats sso Examples

The following output example displays statistics for an SSO server:

webvpn# show webvpn stats sso

Single Sign On statistics:
Auth Requests : 4 Pending Auth Requests : 0
Successful Requests : 1 Failed Requests : 3
Retransmissions : 0 DNS Errors : 0
Connection Errors : 0 Request Timeouts : 0
Unknown Responses :

The following output example displays extra information about SSO servers that are configured for the SSL VPN context:

Router# show webvpn context test_sso

Context SSO server: sso-server
Web agent URL : "http://example1.examplecompany.com/vpnauth/"
Policy Server Secret : "Secret123"
Request Re-tries : 5, Request timeout: 15-second

The following output example displays extra information about a SSO server that is configured for the policy group of the SSL VPN context:

Router# show webvpn policy group sso context test_sso

WV: group policy = sso ; context = test_sso
idle timeout = 2100 sec
session timeout = 41200 sec
sso server name = "server1"
citrix disabled
dpd client timeout = 300 sec
dpd gateway timeout = 300 sec
keep SSL VPN client installed = disabled
rekey interval = 3600 sec
rekey method =
lease duration = 43200 sec

F VRF show Command Output Example

The following output example shows that FVRF has been configured:
Router# `show webvpn gateway mygateway`

Admin Status: down  
Operation Status: down  
Error and Event Logging: Disabled  
GW IP address not configured  
SSL Trustpoint: TP-self-signed-788737041  
FVRF Name: vrf_1

Feature Information for SSL VPN

Table 6 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

Table 6 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 6  Feature Information for SSL VPN

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSL VPN</td>
<td>12.4(6)T</td>
<td>This feature enhances SSL VPN support in Cisco IOS software. This feature provides a comprehensive solution that allows easy access to a broad range of web resources and web-enabled applications using native HTTP over SSL (HTTPS) browser support. SSL VPN introduced three modes of SSL VPN access: clientless, thin-client, and full-tunnel client support. The following command was introduced in Cisco IOS Release 12.4(15)T: <code>cifs-url-list</code>.</td>
</tr>
</tbody>
</table>
| Access Control Enhancements| 12.4(20)T | This feature allows administrators to configure automatic authentication and authorization for users. Users provide their usernames and passwords via the gateway page URL and do not have to reenter their usernames and passwords from the login page. Authorization is enhanced to support more generic authorization, including local authorization. The following sections provide information about this feature:  
  - Access Control Enhancements, page 10  
  - Configuring Automatic Authentication and Authorization, page 80  
  - Local Authorization: Example, page 101  
  The following commands were introduced by this feature: `aaa authentication auto` and `aaa authorization list`. |

<thead>
<tr>
<th>Feature</th>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Application ACL Support** | 12.4(11)T | This feature provides administrators with the flexibility to fine tune access control on the Application Layer level. The following sections provide information about this feature:  
  - Application ACL Support, page 11  
  - Configuring ACL Rules, page 68  
  - Associating an ACL Attribute with a Policy Group, page 71  
  - Configuring an ACL: Example, page 96  
  The following commands were introduced by this feature: acl, add, error-msg, error-url, and list. |
| **Auto Applet Download**  | 12.4(9)T | This feature provides administrators with the option of automatically downloading the port-forwarding applet under the policy group. The following section provides information about this feature:  
  - Options for Configuring HTTP Proxy and the Portal Page, page 8  
  The following command was modified by this feature: port-forward (policy group) |
| **Backend HTTP Proxy**     | 12.4(20)T | This feature allows administrators to route user requests through a backend HTTP proxy, providing more flexibility and controllability than routing through internal web servers. The following sections provide information about this feature:  
  - Backend HTTP Proxy, page 11  
  - Configuring a Backend HTTP Proxy, page 82  
  - Backend HTTP Proxy: Example, page 102  
  The following command was added by this feature: http proxy-server |

<table>
<thead>
<tr>
<th>Feature Information for SSL VPN</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco AnyConnect VPN Client</td>
<td>12.4(15)T</td>
</tr>
<tr>
<td></td>
<td>This feature is the next-generation SSL VPN Client. The feature provides remote users with secure VPN connections to the router platforms supported by SSL VPN and to the Cisco 5500 Series Adaptive Security Appliances. Users having Cisco IOS software releases before Release 12.4(15)T see SSL VPN Client GUI. Users having Release 12.4(15)T and later releases see Cisco AnyConnect VPN Client GUI. The task configurations in this document for tunnel mode apply to SVC and AnyConnect VPN Client. For more information about the Cisco AnyConnect VPN Client feature, see the documents Cisco AnyConnect VPN Client Administrator Guide and Release Notes for Cisco AnyConnect VPN Client, Version 2.0. Note Many of the features listed in the documents Cisco AnyConnect VPN Client Administrator Guide and Release Notes for Cisco AnyConnect VPN Client, Version 2.0 apply only to the Cisco ASA 5500 Series Adaptive Security Appliances. For a list of features that do not currently apply to other Cisco platforms, see the restriction in the “Cisco AnyConnect VPN Client” section on page 3 of this document.</td>
</tr>

| Debug Infrastructure                             | 12.4(11)T | Updates to the `webvpn debug` command provide administrators with the ability to turn debugging on for any one user or group.  
The following keywords were introduced by this feature: `acl`, `entry`, `sso`, and `verbose`.  
The following keyword options were added for the `http` keyword: `authentication`, `trace`, and `verbose`.  
The `verbose` keyword option was added for the `citrix`, `cookie`, `tunnel`, and `webservice` keywords.  
The `port-forward` keyword was deleted effective with this release, and the `detail` keyword option for the `tunnel` keyword was deleted. |
| Front-Door VRF Support                           | 12.4(15)T | Coupled with the already supported internal VRF, this feature allows the SSL VPN gateway to be fully integrated into an MPLS network.  
The following sections provide information about this feature:  
- [Front-Door VRF Support, page 11](#)  
- [Configuring FVRF, page 78](#) |
| Full-Tunnel CEF Support                          | 12.4(20)T | This feature provides better performance for full-tunnel packets.  
The following sections provide information about this feature:  
- [Full-Tunnel CEF Support, page 12](#)  
- [Disabling Full-Tunnel CEF, page 79](#)  
- [CEF-Processed Packets: Example, page 100](#) |
| GUI Enhancements                                 | 12.4(15)T | These enhancements provide updated examples and explanation of the Web VPN GUIs.  
The following section provides information about these updates:  
- [GUI Enhancements, page 12](#) |
| Internationalization                            | 12.4(22)T | The Internationalization feature provides multilanguage support for SSL VPN clients, such as Cisco Secure Desktop (CSD) and SSL VPN Client (SVC).  
The following section provides information about these updates:  
- [Internationalization, page 18](#)  
- [Configuring Internationalization, page 84](#)  
- [Internationalization: Examples, page 103](#)  
The following commands were introduced: `browser-attribute import`, `import`, `language`, `webvpn create template`. |

AutoSecure

By using a single command-line interface (CLI), the AutoSecure feature allows a user to perform the following functions:

- Disable common IP services that can be exploited for network attacks
- Enable IP services and features that can aid in the defense of a network when under attack.

This feature also simplifies the security configuration of a router and hardens the router configuration.

- Additional References, page 13
- Command Reference, page 14
Information About AutoSecure

To configure the AutoSecure feature, you should understand the following concepts:

- **Benefits of AutoSecure, page 2**
- **Secure Management Plane, page 3**
- **Secure Forwarding Plane, page 5**

Benefits of AutoSecure

**Simplified Router Security Configuration**
AutoSecure is valuable to customers without special Security Operations Applications because it allows them to quickly secure their network without thorough knowledge of all the Cisco IOS features.

This feature eliminates the complexity of securing a router by creating a new CLI that automates the configuration of security features and disables certain features enabled by default that could be exploited for security holes.

**Enhanced Password Security**
AutoSecure provides the following mechanisms to enhance security access to the router:

- The ability to configure a required minimum password length, which can eliminate common passwords that are prevalent on most networks, such as “lab” and “cisco.”

  To configure a minimum password length, use the `security passwords min-length` command.

- Syslog messages are generated after the number of unsuccessful attempts exceeds the configured threshold.

  To configure the number of allowable unsuccessful login attempts (the threshold rate), use the `security passwords min-length` command.

**Roll-Back and System Logging Message Support**
In Cisco IOS Release 12.3(8)T, support for roll-back of the AutoSecure configuration is introduced.

Roll-back enables a router to revert back to its preautosecure configuration state if the AutoSecure configuration fails.

*Note*
Prior to Cisco IOS Release 12.3(8)T, roll-back of the AutoSecure configuration is unavailable; thus, you should always save the running configuration before configuring AutoSecure.

System Logging Messages capture any changes or tampering of the AutoSecure configuration that were applied on the running configuration. That is, more detailed audit trail information is provided when autosecure is executed.
Secure Management Plane

Securing the management plane is one of two focus areas for the AutoSecure feature. (The other focus area is described in the following section, “Secure Forwarding Plane.”) Securing the management plane is done by turning off certain global and interface services that can be potentially exploited for security attacks and turning on global services that help mitigate the threat of attacks. Secure access and secure logging are also configured for the router.

⚠️ Caution
If your device is managed by a network management (NM) application, securing the management plane could turn off some services like HTTP server and disrupt the NM application support.

The following subsections define how AutoSecure helps to secure the management plane:

- Disable Global Services
- Disable Per Interface Services
- Enable Global Services
- Secure Access to the Router
- Log for Security

Disable Global Services

After enabling this feature (via the `auto secure` command), the following global services will be disabled on the router without prompting the user:

- Finger—Collects information about the system (reconnaissance) before an attack. If enabled, the information can leave your device vulnerable to attacks.
- PAD—Enables all packet assembler and disassembler (PAD) commands and connections between PAD devices and access servers. If enabled, it can leave your device vulnerable to attacks.
- Small Servers—Causes TCP and User Datagram Protocol (UDP) diagnostic port attacks: a sender transmits a volume of fake requests for UDP diagnostic services on the router, consuming all CPU resources.
- Bootp Server—Bootp is an insecure protocol that can be exploited for an attack.
- HTTP Server—Without secure-http or authentication embedded in the HTTP server with an associated ACL, the HTTP server is insecure and can be exploited for an attack. (If you must enable the HTTP server, you will be prompted for the proper authentication or access list.)

⚠️ Note
If you are using Security Device Manager (SDM), you must manually enable the HTTP server via the `ip http server` command.

- Identification Service—An unsecure protocol, defined in RFC 1413, that allows one to query a TCP port for identification. An attacker can access private information about the user from the ID server.
- CDP—If a large number of Cisco Discovery Protocol (CDP) packets are sent to the router, the available memory of the router can be consumed, causing the router to crash.

⚠️ Caution
NM applications that use CDP to discover network topology will not be able to perform discovery.
• NTP—Without authentication or access-control, Network Time Protocol (NTP) is insecure and can be used by an attacker to send NTP packets to crash or overload the router. (If you want to turn on NTP, you must configure NTP authentication using Message Digest 5 (MD5) and the `ntp access-group` command. If NTP is enabled globally, disable it on all interfaces on which it is not needed.)

• Source Routing—Provided only for debugging purposes, so source routing should be disabled in all other cases. Otherwise, packets may slip away from some of the access control mechanisms that they should have gone through.

Disable Per Interface Services

After enabling this feature, the following per interface services will be disabled on the router without prompting the user:

• ICMP redirects—Disabled on all interfaces. Does not add a useful functionality to a correctly configured to network, but it could be used by attackers to exploit security holes.

• ICMP unreachables—Disabled on all interfaces. Internet Control Management Protocol (ICMP) unreachables are a known cause for some ICMP-based denial of service (DoS) attacks.

• ICMP mask reply messages—Disabled on all interfaces. ICMP mask reply messages can give an attacker the subnet mask for a particular subnetwork in the internetwork.

• Proxy-Arp—Disabled on all interfaces. Proxy-Arp requests are a known cause for DoS attacks because the available bandwidth and resources of the router can be consumed in an attempt to respond to the repeated requests that are sent by an attacker.

• Directed Broadcast—Disabled on all interfaces. Potential cause of SMURF attacks for DoS.

• Maintenance Operations Protocol (MOP) service—Disabled on all interfaces.

Enable Global Services

After enabling this feature, the following global services will be enabled on the router without prompting the user:

• The `service password-encryption` command—Prevents passwords from being visible in the configuration.

• The `service tcp-keepalives-in` and `service tcp-keepalives-out` commands—Ensures that abnormally terminated TCP sessions are removed.

Secure Access to the Router

Caution

If your device is managed by an NM application, securing access to the router could turn off vital services and may disrupt the NM application support.

After enabling this feature, the following options in which to secure access to the router are available to the user:

• If a text banner does not exist, users will be prompted to add a banner. This feature provides the following sample banner:

  Authorized access only
  This system is the property of ABC Enterprise
  Disconnect IMMEDIATELY if you are not an authorized user!
  Contact abc@xyz.com +99 876 543210 for help.
The login and password (preferably a secret password, if supported) are configured on the console, AUX, vty, and tty lines. The `transport input` and `transport output` commands are also configured on all of these lines. (Telnet and secure shell (SSH) are the only valid transport methods.) The `exec-timeout` command is configured on the console and AUX as 10.

When the image on the device is a crypto image, AutoSecure enables SSH and secure copy (SCP) for access and file transfer to and from the router. The `timeout seconds` and `authentication-retries integer` options for the `ip ssh` command are configured to a minimum number. (Telnet and FTP are not affected by this operation and remain operational.)

If the AutoSecure user specifies that their device does not use Simple Network Management Protocol (SNMP), one of the following functionalities will occur:

- In interactive mode, the user is asked whether to disable SNMP regardless of the values of the community strings, which act like passwords to regulate access to the agent on the router.
- In non-interact mode, SNMP will be disabled if the community string is “public” or “private.”

**Note** After AutoSecure has been enabled, tools that use SNMP to monitor or configure a device will be unable to communicate with the device via SNMP.

If authentication, authorization, and accounting (AAA) is not configured, configure local AAA. AutoSecure will prompt users to configure a local username and password on the router.

**Log for Security**

After this feature is enabled, the following logging options, which allow you to identify and respond to security incidents, are available:

- Sequence numbers and time stamps for all debug and log messages. This option is useful when auditing logging messages.
- Logging messages can be generated for login-related events; for example, the message “Blocking Period when Login Attack Detected” will be displayed when a login attack is detected and the router enters “quiet mode.” (Quiet mode means that the router will not allows any login attempts via Telnet, HTTP, or SSH.)

For more information on login system messages, see the Cisco IOS Release 12.3(4)T feature module *Cisco IOS Login Enhancements*.

- The `logging console critical` command, which sends system logging (syslog) messages to all available TTY lines and limits messages based on severity.
- The `logging buffered` command, which copies logging messages to an internal buffer and limits messages logged to the buffer based on severity.
- The `logging trap debugging` command, which allows all commands with a severity higher than debugging to be sent to the logging server.

**Secure Forwarding Plane**

To minimize the risk of attacks on the router forward plane, AutoSecure provides the following functions:
How to Configure AutoSecure

This section contains the following procedures:

- Configuring AutoSecure, page 6 (required)
- Configuring Additional Security, page 7 (required)
- Verifying AutoSecure, page 8 (optional)

Configuring AutoSecure

To configure AutoSecure, you must perform the following tasks.

The auto secure Command

The **auto secure** command takes you through a semi-interactive session (also known as the AutoSecure dialogue) to secure the management and forwarding planes. This command gives you the option to secure just the management or the forwarding plane; if neither option is selected, the dialogue will ask you to configure both planes.

This command also allows you to go through all noninteractive configuration portions of the dialogue before the interactive portions. The noninteractive portions of the dialogue can be enabled by selecting the optional **no-interact** keyword.

**Caution** Although the **auto secure** command helps to secure a router, it does not guarantee the complete security of the router.
Restrictions

The AutoSecure configuration can be configured at run time or setup time. If any related configuration is modified after AutoSecure has been enabled, the AutoSecure configuration may not be fully effective.

SUMMARY STEPS

1. enable
2. auto secure [management | forwarding] [no-interact | full] [ntp | login | ssh | firewall | tcp-intercept]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> auto secure [management</td>
<td>forwarding] [no-interact</td>
</tr>
<tr>
<td></td>
<td>• <strong>management</strong>—Only the management plane will be secured.</td>
</tr>
<tr>
<td></td>
<td>• <strong>forwarding</strong>—Only the forwarding plane will be secured.</td>
</tr>
<tr>
<td></td>
<td>• <strong>no-interact</strong>—The user will not be prompted for any interactive configurations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>full</strong>—The user will be prompted for all interactive questions. This is the default.</td>
</tr>
</tbody>
</table>

Command or Action Purpose

**Configuring Additional Security**

To enable enhanced security access to your router, perform the following steps:

SUMMARY STEPS

1. enable
2. configure terminal
3. security passwords min-length length
4. enable password {password | [encryption-type] encrypted-password}
5. security authentication failure rate threshold-rate log
How to Configure AutoSecure

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>

<td>Configures the number of allowable unsuccessful login attempts.</td>
</tr>
<tr>
<td>Example:</td>
<td>threshold-rate—Number of allowable unsuccessful login attempts.</td>
</tr>
<tr>
<td></td>
<td>log—Syslog authentication failures if the rate exceeds the threshold.</td>
</tr>
</tbody>
</table>

Verifying AutoSecure

To verify that the AutoSecure feature is working successfully, perform the following optional steps:

SUMMARY STEPS

1. enable
2. show auto secure config
Configuration Examples for AutoSecure

This section provides the following configuration example:
- AutoSecure Configuration Dialogue: Example, page 9

AutoSecure Configuration Dialogue: Example

The following example is a sample AutoSecure dialogue. After you enable the auto secure command, the feature will automatically prompt you with a similar dialogue unless you enable the no-interact keyword. (For information on which features are disabled and which features are enabled, see the sections, “Secure Management Plane” and “Secure Forwarding Plane” earlier in this document.)

Router# auto secure
--- AutoSecure Configuration ---

*** AutoSecure configuration enhances the security of the router but it will not make router absolutely secure from all security attacks ***

All the configuration done as part of AutoSecure will be shown here. For more details of why and how this configuration is useful, and any possible side effects, please refer to Cisco documentation of AutoSecure.
At any prompt you may enter ‘?’ for help.
Use ctrl-c to abort this session at any prompt.

Gathering information about the router for AutoSecure

Is this router connected to internet? [no]:y
Enter the number of interfaces facing internet [1]:
  Interface  IP-Address OK? Method Status
  Protocol
   FastEthernet0/1  10.1.1.1 YES NVRAM up down
   FastEthernet1/0  10.2.2.2 YES NVRAM up down
   FastEthernet1/1  10.0.0.1 YES NVRAM up up
   Loopback0 unassigned YES NVRAM up up
   FastEthernet0/0  10.0.0.2 YES NVRAM up down

Enter the interface name that is facing internet:FastEthernet0/0
Securing Management plane services..

Disabling service finger
Disabling service pad
Disabling udp & tcp small servers
Enabling service password encryption
Enabling service tcp-keepalives-in
Enabling service tcp-keepalives-out
Disabling the cdp protocol

Disabling the bootp server
Disabling the http server
Disabling the finger service
Disabling source routing
Disabling gratuitous arp
Enable secret is either not configured or is same as enable password
Enter the new enable secret:abc123
Configuring aaa local authentication
Configuring console, Aux and vty lines for local authentication, exec-timeout, transport

Configure SSH server? [yes]:
Enter the domain-name:cisco.com

Configuring interface specific AutoSecure services
Disabling the following ip services on all interfaces:

- no ip redirects
- no ip proxy-arp
- no ip unreachables
- no ip directed-broadcast
- no ip mask-reply

Disabling mop on Ethernet interfaces

Securing Forwarding plane services..

Enabling CEF (it might have more memory requirements on some low end platforms)

Enabling unicast rpf on all interfaces connected to internet

Configure CBAC Firewall feature? [yes/no]:yes

This is the configuration generated:

no service finger
no service pad
no service udp-small-servers
no service tcp-small-servers
service password-encryption
service tcp-keepalives-in

Cisco IOS Login Enhancements (Login Block)

The Cisco IOS Login Enhancements (Login Block) feature allows users to enhance the security of a router by configuring options to automatically block further login attempts when a possible denial-of-service (DoS) attack is detected.

The login block and login delay options introduced by this feature can be configured for Telnet or SSH virtual connections. By enabling this feature, you can slow down “dictionary attacks” by enforcing a “quiet period” if multiple failed connection attempts are detected, thereby protecting the routing device from a type of denial-of-service attack.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.
Information About Cisco IOS Login Enhancements

To use login enhancements, you should understand the following concepts:

- Protecting Against Denial of Service and Dictionary Login Attacks
- Login Enhancements Functionality Overview, page 3

Protecting Against Denial of Service and Dictionary Login Attacks

Connecting to a routing device for the purposes of administering (managing) the device, at either the User or Executive level, is most frequently performed using Telnet or SSH (secure shell) from a remote console (such as a PC). SSH provides a more secure connection option because communication traffic between the user's device and the managed device are encrypted. The Login Block capability, when enabled, applies to both Telent connections and SSH connections. Beginning in Release versions 12.3(33)SRB2, 12.2(33)SXH2, and 12.4(15)T1, the Login Block capability also applies to HTTP connections.

The automated activation and logging of the Login Block and Quiet Period capabilities introduced by this feature are designed to further enhance the security of your devices by specifically addressing two well known methods that individuals use to attempt to disrupt or compromise networked devices.

If the connection address of a device is discovered and is reachable, a malicious user may attempt to interfere with the normal operations of the device by flooding it with connection requests. This type of attack is referred to as an attempted Denial-of-Service, because it is possible that the device may become too busy trying to process the repeated login connection attempts to properly handle normal routing services or will not be able to provide the normal login service to legitimate system administrators.

The primary intention of a dictionary attack, unlike a typical DoS attack, is to actually gain administrative access to the device. A dictionary attack is an automated process to attempt to login by attempting thousands, or even millions, of username/password combinations. (This type of attack is called a “dictionary attack” because it typically uses, as a start, every word found in a typical dictionary as a possible password.) As scripts or programs are used to attempt this access, the profile for such attempts is typically the same as for DoS attempts; multiple login attempts in a short period of time.

By enabling a detection profile, the routing device can be configured to react to repeated failed login attempts by refusing further connection request (login blocking). This block can be configured for a period of time, called a “quiet period”. Legitimate connection attempts can still be permitted during a quiet period by configuring an access-list (ACL) with the addresses that you know to be associated with system administrators.
Cisco IOS Login Enhancements (Login Block)

Information About Cisco IOS Login Enhancements

Login Enhancements Functionality Overview

To better configure security for virtual login connections, the following requirements have been added to the login process:

- Delays Between Successive Login Attempts
- Login Shutdown If DoS Attacks Are Suspected
- Generation of System Logging Messages for Login Detection

Delays Between Successive Login Attempts

A Cisco IOS device can accept virtual connections as fast as they can be processed. Introducing a delay between login attempts helps to protect the Cisco IOS software-based device against malicious login connections such as dictionary attacks and DoS attacks. Delays can be enabled in one of the following ways:

- Via the auto secure command. If you enable the AutoSecure feature, the default login delay time of one second is automatically enforced.
- Via the login block-for command. You must enter this command before issuing the login delay command. If you enter only the login block-for command, the default login delay time of one second is automatically enforced.
- Via the new global configuration mode command, login delay, which allows you to specify a the login delay time to be enforced, in seconds.

Login Shutdown If DoS Attacks Are Suspected

If the configured number of connection attempts fail within a specified time period, the Cisco IOS device will not accept any additional connections for a “quiet period.” (Hosts that are permitted by a predefined access-control list [ACL] are excluded from the quiet period.)

The number of failed connection attempts that trigger the quiet period can be specified via the new global configuration mode command login block-for. The predefined ACL that is excluded from the quiet period can be specified via the new global configuration mode command login quiet-mode access-class.

This functionality is disabled by default, and it is not enabled if autosecure if enabled.

Generation of System Logging Messages for Login Detection

After the router switches to and from quiet mode, logging messages are generated. Also, if configured, logging messages are generated upon every successful or failed login request.

Logging messages can be generated for successful login requests via the new global configuration command login on-success; the login on-failure command generates logs for failed login requests.

Logging messages for failed login attempts are automatically enabled when the auto secure command is issued; they are not automatically enabled for successful login attempts via autosecure.

Note: Currently, only system logging (syslog) messages can be generated for login-related events. Support for SNMP notifications (traps) will be added in a later release.
System Logging Messages for a Quiet Period

The following logging message is generated after the router switches to quiet-mode:

00:04:07:%SEC_LOGIN-1-QUIET_MODE_ON: Still time left for watching failures is 158 seconds, [user:sfd] [Source:10.4.2.11] [localport:23] [Reason:Invalid login], [ACL:22] at 16:17:23 UTC Wed Feb 26 2003

The following logging message is generated after the router switches from quiet mode back to normal mode:

00:09:07:%SEC_LOGIN-5-QUIET_MODE_OFF: Quiet Mode is OFF, because block period timed out at 16:22:23 UTC Wed Feb 26 2003

System Logging Messages for Successful and Failed Login Requests

The following logging message is generated upon a successful login request:

00:04:32:%SEC_LOGIN-5-LOGIN_SUCCESS: Login Success [user:test] [Source:10.4.2.11] [localport:23] at 20:55:40 UTC Fri Feb 28 2003

The following logging message is generated upon a failed login request:

00:03:34:%SEC_LOGIN-4-LOGIN_FAILED: Login failed [user:sdfs] [Source:10.4.2.11] [localport:23] [Reason:Invalid login] at 20:54:42 UTC Fri Feb 28 2003

How to Configure Cisco IOS Login Enhancements

This section contains the following procedures:

- Configuring Login Parameters, page 4 (Required)
- Verifying Login Parameters, page 6 (Optional)

Configuring Login Parameters

Use this task to configure your Cisco IOS device for login parameters that help detect suspected DoS attacks and slow down dictionary attacks.

Login Parameter Defaults

All login parameters are disabled by default. You must issue the `login block-for` command, which enables default login functionality, before using any other login commands. After the `login block-for` command is enabled, the following defaults are enforced:

- A default login delay of one second
- All login attempts made via Telnet or SSH are denied during the quiet period; that is, no ACLs are exempt from the login period until the `login quiet-mode access-class` command is issued.

SUMMARY STEPS

1. enable
2. configure terminal
3. login block-for `seconds attempts tries within seconds`
4. login quiet-mode access-class `{acl-name | acl-number}`
5. `login delay seconds`
6. `login on-failure log [every login]`
7. `login on-success log [every login]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** `enable` | Enables privileged EXEC mode.  
- Enter your password if prompted.  
| Example:  
`Router> enable` |
| **Step 2** `configure terminal` | Enters global configuration mode.  
| Example:  
`Router# configure terminal` |
| **Step 3** `login block-for seconds attempts tries within seconds` | Configures your Cisco IOS device for login parameters that help provide DoS detection.  
**Note** This command must be issued before any other login command can be used.  
| Example:  
`Router(config)# login block-for 100 attempts 2 within 100` |
| **Step 4** `login quiet-mode access-class (acl-name | acl-number)` | (Optional) Specifies an ACL that is to be applied to the router when it switches to quiet mode.  
If this command is not enabled, all login requests will be denied during quiet mode.  
| Example:  
`Router(config)# login quiet-mode access-class myacl` |
| **Step 5** `login delay seconds` | (Optional) Configures a delay between successive login attempts.  
| Example:  
`Router(config)# login delay 10` |
| **Step 6** `login on-failure log [every login]` | (Optional) Generates logging messages for failed login attempts.  
| Example:  
`Router(config)# login on-failure log` |
| **Step 7** `login on-success log [every login]` | (Optional) Generates logging messages for successful login attempts.  
| Example:  
`Router(config)# login on-success log every 5` |

**What to Do Next**

After you have configured login parameters on your router, you may wish to verify the settings. To complete this task, see the following section “Verifying Login Parameters.”
Verifying Login Parameters

Use this task to verify the applied login configuration and present login status on your router.

SUMMARY STEPS

1. enable
2. show login [failures]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
| **Example:**      | • Enter your password if prompted.  
| Router> enable    |         |
| Step 2 show login [failures] | Displays login parameters.  
| **Example:**      | • **failures**—Displays information related only to failed login attempts.  
| Router# show login|         |

Examples

The following sample output from the **show login** command verifies that no login parameters have been specified:

Router# show login

No login delay has been applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps.

Router NOT enabled to watch for login Attacks

The following sample output from the **show login** command verifies that the **login block-for** command is issued. In this example, the command is configured to block login hosts for 100 seconds if 16 or more login requests fail within 100 seconds; five login requests have already failed.

Router# show login

A default login delay of 1 seconds is applied.  
No Quiet-Mode access list has been configured.  
All successful login is logged and generate SNMP traps.  
All failed login is logged and generate SNMP traps.

Router enabled to watch for login Attacks.
If more than 15 login failures occur in 100 seconds or less, logins will be disabled for 100 seconds.

Router presently in Watch-Mode, will remain in Watch-Mode for 95 seconds.  
Present login failure count 5.
The following sample output from the `show login` command verifies that the router is in quiet mode. In this example, the `login block-for` command was configured to block login hosts for 100 seconds if 3 or more login requests fail within 100 seconds.

Router# show login

A default login delay of 1 seconds is applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps.

Router enabled to watch for login Attacks.
If more than 2 login failures occur in 100 seconds or less, logins will be disabled for 100 seconds.

Router presently in Quiet-Mode, will remain in Quiet-Mode for 93 seconds.
Denying logins from all sources.

The following sample output from `show login failures` command shows all failed login attempts on the router:

Router# show login failures

<table>
<thead>
<tr>
<th>Username</th>
<th>Source IPAddr</th>
<th>Port</th>
<th>Count</th>
<th>TimeStamp</th>
</tr>
</thead>
<tbody>
<tr>
<td>try1</td>
<td>10.1.1.1</td>
<td>23</td>
<td>1</td>
<td>21:52:49 UTC Sun Mar 9 2003</td>
</tr>
<tr>
<td>try2</td>
<td>10.1.1.2</td>
<td>23</td>
<td>1</td>
<td>21:52:52 UTC Sun Mar 9 2003</td>
</tr>
</tbody>
</table>

The following sample output from `show login failures` command verifies that no information is presently logged:

Router# show login failures

*** No logged failed login attempts with the device.***

### Configuration Examples for Login Parameters

This section includes the following example:

- Setting Login Parameters: Example, page 7

### Setting Login Parameters: Example

The following example shows how to configure your router to enter a 100 second quiet period if 15 failed login attempts is exceeded within 100 seconds; all login requests will be denied during the quiet period except hosts from the ACL “myacl.” Also, logging messages will be generated for every 10th failed login and every 15th successful login.

Router(config)# login block-for 100 attempts 15 within 100
Router(config)# login quiet-mode access-class myacl
Router(config)# login on-failure log every 10
Router(config)# login on-success log every 15

Cisco IOS Resilient Configuration

The Cisco IOS Resilient Configuration feature enables a router to secure and maintain a working copy of the running image and configuration so that those files can withstand malicious attempts to erase the contents of persistent storage (NVRAM and flash).

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Contents

- Restrictions for Cisco IOS Resilient Configuration, page 2
- Information About Cisco IOS Resilient Configuration, page 2
- How to Use Cisco IOS Resilient Configuration, page 3
- Additional References, page 6
- Command Reference, page 7
Restrictions for Cisco IOS Resilient Configuration

- This feature is available only on platforms that support a Personal Computer Memory Card International Association (PCMCIA) Advanced Technology Attachment (ATA) disk. There must be enough space on the storage device to accommodate at least one Cisco IOS image (two for upgrades) and a copy of the running configuration. IOS Files System (IFS) support for secure file systems is also needed by the software.
- It may be possible to force removal of secured files using an older version of Cisco IOS software that does not contain file system support for hidden files.
- This feature can be disabled only by using a console connection to the router. With the exception of the upgrade scenario, feature activation does not require console access.
- You cannot secure a bootset with an image loaded from the network. The running image must be loaded from persistent storage to be secured as primary.
- Secured files will not appear on the output of a `dir` command issued from an executive shell because the IFS prevents secure files in a directory from being listed. ROM monitor (ROMMON) mode does not have any such restriction and can be used to list and boot secured files. The running image and running configuration archives will not be visible in the Cisco IOS `dir` command output. Instead, use the `show secure bootset` command to verify archive existence.

Information About Cisco IOS Resilient Configuration

Before using Cisco IOS Resilient Configuration, you should understand the following concept:

- Feature Design of Cisco IOS Resilient Configuration, page 2

Feature Design of Cisco IOS Resilient Configuration

A great challenge of network operators is the total downtime experienced after a router has been compromised and its operating software and configuration data erased from its persistent storage. The operator must retrieve an archived copy (if any) of the configuration and a working image to restore the router. Recovery must then be performed for each affected router, adding to the total network downtime.

The Cisco IOS Resilient Configuration feature is intended to speed up the recovery process. The feature maintains a secure working copy of the router image and the startup configuration at all times. These secure files cannot be removed by the user. This set of image and router running configuration is referred to as the primary bootset.

The following factors were considered in the design of Cisco IOS Resilient Configuration:

- The configuration file in the primary bootset is a copy of the running configuration that was in the router when the feature was first enabled.
- The feature secures the smallest working set of files to preserve persistent storage space. No extra space is required to secure the primary Cisco IOS image file.
- The feature automatically detects image or configuration version mismatch.
- Only local storage is used for securing files, eliminating scalability maintenance challenges from storing multiple images and configurations on TFTP servers.
- The feature can be disabled only through a console session.
How to Use Cisco IOS Resilient Configuration

This section contains the following procedures:
- Archiving a Router Configuration, page 3
- Restoring an Archived Router Configuration, page 4

Archiving a Router Configuration

This task describes how to save a primary bootset to a secure archive in persistent storage.

SUMMARY STEPS

1. enable
2. configure terminal
3. secure boot-image
4. secure boot-config
5. end
6. show secure bootset

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> secure boot-image</td>
<td>Enables Cisco IOS image resilience.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# secure boot-image</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> secure boot-config</td>
<td>Stores a secure copy of the primary bootset in persistent storage.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# secure boot-config</td>
<td></td>
</tr>
</tbody>
</table>
This section provides the following output example:

- **Sample Output for the show secure bootset Command, page 4**

Sample Output for the show secure bootset Command
The following example displays sample output from the `show secure bootset` command:

```
Router# show secure bootset
IOS resilience router id JMX0704L5GH
IOS image resilience version 12.3 activated at 08:16:51 UTC Sun Jun 16 2002
Secure archive slot0:c3745-js2-mz type is image (elf) []
  file size is 25469248 bytes, run size is 25634900 bytes
  Runnable image, entry point 0x80008000, run from ram

IOS configuration resilience version 12.3 activated at 08:17:02 UTC Sun Jun 16 2002
Secure archive slot0:.runcfg-20020616-081702.ar type is config
configuration archive size 1059 bytes
```

Restoring an Archived Router Configuration

This task describes how to restore a primary bootset from a secure archive after the router has been tampered with (by an NVRAM erase or a disk format).

**Note**

To restore an archived primary bootset, Cisco IOS image resilience must have been enabled and a primary bootset previously archived in persistent storage.

**SUMMARY STEPS**

1. `reload`
2. `dir [filesystem:]`
3. `boot [partition-number:][filename]`
4. `no`
5. `enable`
6. `configure terminal`
Cisco IOS Resilient Configuration

How to Use Cisco IOS Resilient Configuration

7. `secure boot-config [restore filename]`
8. `end`

Image Verification

The Image Verification feature allows users to automatically verify the integrity of Cisco IOS images. Thus, users can be sure that the image is protected from accidental corruption, which can occur at any time during transit, starting from the moment the files are generated by Cisco until they reach the user.

Restrictions for Image Verification

Cisco IOS Release 12.2(18)S and 12.0(26)S Only
Image Verification is applied to and attempted on any file; however, if the file is not an image file, image verification will not occur and you will see the following error, “SIGNATURE-NOT-FOUND.”

Cisco IOS Release 12.3(4)T Only
Image Verification is applied only to image files. If any other file type is copied or verified, you will not receive a warning that image verification did occur, and the command (copy or verify) will silently succeed.

Information About Image Verification

To use image authentication for your Cisco IOS images, you should understand the following concepts:

- Benefit of Image Verification, page 2
- How Image Verification Works, page 2

Benefit of Image Verification

The efficiency of Cisco IOS routers is improved because the routers can now automatically detect when the integrity of an image is accidentally corrupted as a result of transmission errors or disk corruption.

How Image Verification Works

Because a production image undergoes a sequence of transfers before it is copied into the memory of a router, the integrity of the image is at risk of accidental corruption every time a transfer occurs. When downloading an image from Cisco.com, a user can run a message-digest5 (MD5) hash on the downloaded image and verify that the MD5 digest posted on Cisco.com is the same as the MD5 digest that is computed on the user’s server. However, many users choose not to run an MD5 digest because it is 128-bits long and the verification is manual. Image verification allows the user to automatically validate the integrity of all downloaded images, thereby, significantly reducing user interaction.

How to Use Image Verification

This section contains the following procedures:

- Globally Verifying the Integrity of an Image, page 3
- Verifying the Integrity of an Image That Is About to Be Copied, page 4
- Verifying the Integrity of an Image That Is About to Be Reloaded, page 4
Globally Verifying the Integrity of an Image

The file verify auto command enables image verification globally; that is, all images that are to be copied (via the copy command) or reloaded (via the reload command) are automatically verified. Although both the copy and reload commands have a /verify keyword that enables image verification, you must issue the keyword each time you want to copy or reload an image. The file verify auto command enables image verification by default, so you no longer have to specify image verification multiple times.

If you have enabled image verification by default but prefer to disable verification for a specific image copy or reload, the /noverify keyword, along with either the copy or the reload command, will override the file verify auto command.

Use this task to enable automatic image verification.

SUMMARY STEPS

1. enable
2. configure terminal
3. file verify auto
4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: enable</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: configure terminal</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td>Step 3 file verify auto</td>
<td>Enables automatic image verification.</td>
</tr>
<tr>
<td>Example: file verify auto</td>
<td>Router(config)# file verify auto</td>
</tr>
<tr>
<td>Step 4 exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example: exit</td>
<td>Router(config)# exit</td>
</tr>
<tr>
<td></td>
<td>You must exit global configuration mode if you are going to copy or reload an image.</td>
</tr>
</tbody>
</table>

What to Do Next

After issuing the file verify auto command, you do not have to issue the /verify keyword with the copy or the reload command because each image that is copied or reloaded will be automatically verified.
Verifying the Integrity of an Image That Is About to Be Copied

When issuing the `copy` command, you can verify the integrity of the copied file by entering the `/verify` keyword. If the integrity check fails, the copied file will be deleted. If the file that is about to be copied does not have an embedded hash (an old image), you will be prompted whether or not to continue with the copying process. If you choose to continue, the file will be successfully copied; if you choose not to continue, the copied file will be deleted.

Without the `/verify` keyword, the `copy` command could copy a file that is not valid. Thus, after the `copy` command has been successfully executed, you can issue the `verify` command at any time to check the integrity of the files that are in the storage of the router.

Use this task to verify the integrity of an image before it is copied onto a router.

**SUMMARY STEPS**

1. `enable`
2. `copy [/erase] [/verify | /noverify] source-url destination-url`
3. `verify [/md5 [md5-value]] filesystem:[file-url]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Router&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> `copy [/erase] [/verify</td>
<td>/noverify] source-url destination-url`</td>
</tr>
<tr>
<td>Example: <code>Router# copy /verify tftp://10.1.1.1/jdoo/c7200-js-mz disk0:</code></td>
<td>• <code>/verify</code>—Verifies the signature of the destination file. If verification fails, the file will be deleted.</td>
</tr>
<tr>
<td></td>
<td>• <code>/noverify</code>—Does not verify the signature of the destination file before the image is copied.</td>
</tr>
<tr>
<td><strong>Note</strong> /noverify is often issued if the file verify auto command is enabled, which automatically verifies the signature of all images that are copied.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>verify [/md5 [md5-value]] filesystem:[file-url]</code></td>
<td>(Optional) Verifies the integrity of the images in the router’s storage.</td>
</tr>
<tr>
<td>Example: <code>Router# verify bootflash://c7200-kboot-mz.121-8a.E</code></td>
<td></td>
</tr>
</tbody>
</table>

Verifying the Integrity of an Image That Is About to Be Reloaded

By issuing the `reload` command with the `/verify` keyword, the image that is about to be loaded onto your system will be checked for integrity. If the `/verify` keyword is specified, image verification will occur before the system initiates the reboot. Thus, if verification fails, the image will not be loaded.
Because different platforms obtain the file that is to be loaded in various ways, the file specified in BOOTV AR will be verified. If a file is not specified, the first file on each subsystem will be verified.

On certain platforms, because of variables such as the configuration register, the file that is verified may not be the file that is loaded.

Use this task to verify the integrity of an image before it is reloaded onto a router.

**SUMMARY STEPS**

1. enable
2. reload 
   [warm] [/verify | /noverify] text
   [warm] [/verify | /noverify] in [hh:mm [text]]
   [warm] [/verify | /noverify] at hh:mm [month day | day month] [text]
   [warm] [/verify | /noverify] cancel

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
</tbody>
</table>
| **Step 2** reload 
   [warm] [/verify | /noverify] text
   [warm] [/verify | /noverify] in [hh:mm [text]]
   [warm] [/verify | /noverify] at hh:mm [month day | day month] [text]
   [warm] [/verify | /noverify] cancel | Reloads the operating system. |
| Example: Router# reload /verify | - /verify—Verifies the signature of the destination file. If verification fails, the file will be deleted. |
| | - /noverify—Does not verify the signature of the destination file before the image is reloaded. |
| **Note** /noverify is often issued if the file verify auto command is enabled, which automatically verifies the signature of all images that are copied.

**Configuration Examples for Image Verification**

This section contains the following configuration examples:

- Global Image Verification: Example, page 6
- Image Verification via the copy Command: Example, page 6
- Image Verification via the reload Command: Example, page 6
- verify Command Sample Output: Example, page 7
Global Image Verification: Example

The following example shows how to enable automatic image verification. After enabling this command, image verification will automatically occur for all images that are either copied (via the `copy` command) or reloaded (via the `reload` command).

```
Router(config)# file verify auto
```

Image Verification via the copy Command: Example

The following example shows how to specify image verification before copying an image:

```
Router# copy /verify tftp://10.1.1.1/jdoe/c7200-js-mz disk0:
```

Accessing tftp://10.1.1.1/jdoe/c7200-js-mz...
Loading jdoe/c7200-js-mz from 10.1.1.1 (via FastEthernet0/0):!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
[OK - 19879944 bytes]

Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html. For information
about all Cisco IOS commands, go to the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or to the Cisco IOS Master Commands List.

New Command
- file verify auto

Modified Commands
- copy
- reload
- verify
IP Source Tracker

The IP Source Tracker feature allows you to gather information about the traffic that is flowing to a host that is suspected of being under attack. This feature also allows you to easily trace an attack to its entry point into the network.

Restrictions for IP Source Tracker

Packets Can Be Dropped for Routers
IP source tracking is designed to track attacks against hosts. Packets can be dropped if the line card or port adapter CPU is overwhelmed. Therefore, when used to track an attack against a router, IP source tracking can drop control packets, such as Border Gateway Protocol (BGP) updates.

Engine 0 and 1 Performances Affected on Cisco 12000 Series
There is no performance impact for packets destined to nontracked IP addresses on Engine 2 and Engine 4 line cards because the IP source tracker affects only tracked destinations. Engine 0 and Engine 1 performances are affected because on these engines all packets are switched by the CPU.

Note
On Cisco 7500 series routers, there is no performance impact on destinations that are not tracked.

Information About IP Source Tracker

To configure source tracking, you should understand the following concepts:

- Identifying and Tracking Denial of Service Attacks, page 2
- Using IP Source Tracker, page 3
- Benefits of IP Source Tracker, page 4

Identifying and Tracking Denial of Service Attacks

One of the many challenges faced by customers today is the tracking and blocking denial-of-service (DoS) attacks. Counteracting a DoS attack involves intrusion detection, source tracking, and blocking. This functionality addresses the need for source tracking.

To trace attacks, NetFlow and access control lists (ACLs) have been used. To block attacks, committed access rate (CAR) and ACLs have been used. Support for these features on the Cisco 12000 series Internet router has depended on the type of line card used. Support for these features on the Cisco 7500 series routers depends upon the type of port adapter used. There is, therefore, a need to develop a way to receive information that both traces the source of an attack and is supported on all line cards and port adapters.

Normally, when you identify the host that is subject to a DoS attack, you must determine the network ingress point to effectively block the attack. This process starts at the router closest to the host.

For example, in Figure 124, you would start at Router A and try to determine the next upstream router to examine. Traditionally, you would apply an output ACL to the interface connecting to the host to log packets that match the ACL. The logging information is dumped to the router console or system log. You then have to analyze this information, and possibly go through several ACLs in succession to identify the input interface for the attack. In this case the information points back to Router B.

You then repeat this process on Router B, which leads back to Router C, an ingress point into the network. At this point you can use ACLs or CAR to block the attack. This procedure can require applying several ACLs that generate an excessive amount of output to analyze, making this procedure cumbersome and error prone.
Using IP Source Tracker

IP source tracker provides an easier, more scalable alternative to output ACLs for tracking DoS attacks, and it works as follows:

- After you identify the destination being attacked, enable tracking for the destination address on the whole router by entering the `ip source-track` command.
- Each line card creates a special Cisco Express Forwarding (CEF) entry for the destination address being tracked. For line cards or port adapters that use specialized Application-Specific Integrated Circuit (ASICs) for packet switching, the CEF entry is used to punt packets to the line card’s or port adapter’s CPU.
- Each line card CPU collects information about the traffic flow to the tracked destination.
- The data generated is periodically exported to the router. To display a summary of the flow information, enter the `show ip source-track summary` command. To display more detailed information for each input interface, enter the `show ip source-track` command.
- Statistics provide a breakdown of the traffic to each tracked IP address. This breakdown allows you to determine which upstream router to analyze next. You can shut down the IP source tracker on the current router by entering the `no ip source-track` command, and reopen it on the upstream router.
- Repeat Step 1 to Step 5 until you identify the source of the attack.
- Apply CAR or ACLs to limit or stop the attack.

IP Source Tracker: Hardware Support

IP source tracking is supported on all Engine 0, 1, 2, and 4 line cards in the Cisco 12000 series Internet router. It is also supported on all port adapters and RSPs that have CEF switching enabled on Cisco 7500 series routers.
Benefits of IP Source Tracker

Complete Tracking Information Provided
IP source tracking generates all the necessary information in an easy-to-use format to track the network entry point of a DoS attack.

Tracking an Unlimited Number of IPs Simultaneously
IP source tracking allows you to track multiple IPs at the same time. By default there is no limit. To limit the number of IPs that are simultaneously tracked, use the `ip source-track address-limit` command.

Complete Network Coverage for Cisco 12000 Series and Cisco 7500 Series Routers as of 12.0(26)S
Because IP source tracking is supported on all line cards on the Cisco 12000 series routers and on all port adapters on Cisco 7500 series routers, it allows you to track DoS attacks across your entire network.

**Note**
For Cisco IOS Release 12.0(21)S and 12.0(22)S, IP source tracking is supported only on Engine 0, 1, 2, and 4 line cards on Cisco 12000 series routers; that is, Engine 3 is not supported.

How to Configure IP Source Tracker

This section contains the following procedures:
- Configuring IP Source Tracking, page 4 (required)
- Verifying IP Source Tracking, page 5 (optional)

Configuring IP Source Tracking

To configure IP source tracking for a host under attack, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip source-track ip-address`
4. `ip source-track address-limit number`
5. `ip source-track syslog-interval number`
6. `ip source-track export-interval number`
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:** Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Router# configure terminal | |
| **Step 3** ip source-track ip-address | Enables IP source tracking for a specified host. |
| **Example:** Router(config)# ip source-track 100.10.0.1 | |
| **Step 4** ip source-track address-limit number | (Optional) Limits the number of hosts that can be simultaneously tracked at any given time.  
  **Note** If this command is not enabled, there is no limit to the number of hosts that can be tracked. |
| **Example:** Router(config)# ip source-track address-limit 10 | |
| **Step 5** ip source-track syslog-interval number | (Optional) Sets the time interval, in minutes, used to generate syslog messages that indicate IP source tracking is enabled.  
  **Note** If this command is not enabled, system log messages are not generated. |
| **Example:** Router(config)# ip source-track syslog-interval 2 | |
| **Step 6** ip source-track export-interval number | (Optional) Sets the time interval, in seconds, used to export IP tracking statistics that are collected in the line cards to the gigabit route processor (GRP) and the port adapters to the route switch processor (RSP).  
  **Note** If this command is not enabled, traffic flow information is exported to the GRP and RSP every 30 seconds. |
| **Example:** Router(config)# ip source-track export-interval 30 | |

### What to Do Next

After you have configured source tracking on your network device, you can verify your configuration and source tracking statistics, such as traffic flow. To complete this task, see the following section “Verifying IP Source Tracking.”

### Verifying IP Source Tracking

To verify the status of source tracking, such as packet processing and traffic flow information, perform the following steps.
How to Configure IP Source Tracker

SUMMARY STEPS

1. enable
2. show ip source-track [ip-address] [summary | cache]
3. show ip source-track export flows

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

Configuration Examples for IP Source Tracker

This section includes the following examples:

- Configuring IP Source Tracking: Example, page 7
- Verifying Source Interface Statistics for All Tracked IP Addresses: Example, page 7
- Verifying a Flow Statistic Summary for All Tracked IP Addresses: Example, page 7
- Verifying Detailed Flow Statistics Collected by a Line Card: Example, page 8
- Verifying Flow Statistics Exported from Line Cards and Port Adapters: Example, page 8

Configuring IP Source Tracking: Example

The following example shows how to configure IP source tracking on all line cards and port adapters in the router. In this example, each line card or port adapter collects traffic flow data to host address 100.10.0.1 for 2 minutes before creating an internal system log entry; packet and flow information recorded in the system log is exported for viewing to the route processor or switch processor every 60 seconds.

Router# configure interface
Router(config)# ip source-track 100.10.0.1
Router(config)# ip source-track syslog-interval 2
Router(config)# ip source-track export-interval 60

Verifying Source Interface Statistics for All Tracked IP Addresses: Example

The following example displays a summary of the traffic flow statistics that are collected on each source interface for tracked host addresses.

Router# show ip source-track

<table>
<thead>
<tr>
<th>Address</th>
<th>SrcIF</th>
<th>Bytes</th>
<th>Pkts</th>
<th>Bytes/s</th>
<th>Pkts/s</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.0.1</td>

The following new commands are pertinent to this feature.

- `ip source-track`
- `ip source-track address-limit`
- `ip source-track export-interval`
- `ip source-track syslog-interval`
- `show ip source-track`
- `show ip source-track export flows`

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
IP Traffic Export

The IP Traffic Export feature allows users to configure their router to export IP packets that are received on multiple, simultaneous WAN or LAN interfaces. The unaltered IP packets are exported on a single LAN or VLAN interface, thereby, easing deployment of protocol analyzers and monitoring devices.

Restrictions for IP Traffic Export

Platform Restriction
IP traffic export is intended only for software switching platforms; distributed architectures are not supported.

IP Packet Forwarding Performance Impact
When IP traffic export is enabled, a delay is incurred on the outbound interface when packets are captured and transmitted across the interface. Performance delays increase with the increased number of interfaces that are monitored and the increased number of destination hosts.

Exported Traffic Limitation
- The MAC address of the device that is receiving the exported traffic must be on the same VLAN or directly connected to one of the router interfaces. (Use the `show arp` command to determine the MAC address of device that is directly connected to an interface.)
- The outgoing interface for exported traffic must be Ethernet (10/100/1000). (Incoming (monitored) traffic can traverse any interface.)

Information About IP Traffic Export

To use the IP traffic export, you should understand the following concept:
- Benefits of IP Traffic Export, page 2

Benefits of IP Traffic Export

Simplified IDS Deployment
Without the ability to export IP traffic, the Intrusion Detection System (IDS) probe must be inline with the network device to monitor traffic flow. IP traffic export eliminates the probe placement limitation, allowing users to place an IDS probe in any location within their network or direct all exported traffic to a VLAN that is dedicated for network monitoring. Allowing users to choose the optimal location of their IDS probe reduces processing burdens.

Also, because packet processing that was once performed on the network device can now be performed away from the network device, the need to enable IDS with the Cisco IOS software can be eliminated.

IP Traffic Export Functionality Benefits
Users can configure their router to perform the following tasks:
- Filter copied packets via an access control list (ACL)
- Filter copied packets via sampling, which allows you to export one in every few packets in which you are interested. Use this option when it is not necessary to export all incoming traffic. Also, sampling is useful when a monitored ingress interface can send traffic faster than the egress interface can transmit it.
- Configure bidirectional traffic on an interface. (By default, only incoming traffic is exported.)
How to Use IP Traffic Export

This section contains the following procedures:

- Configuring IP Traffic Export, page 3
- Displaying IP Traffic Export Configuration Data, page 5

Configuring IP Traffic Export

Use this task to configure IP traffic export profiles, which enable IP traffic to be exported on an ingress interface and allow you to specify profile attributes, such as the outgoing interface for exporting traffic.

Note

Packet exporting is performed before packet switching or filtering.

IP Traffic Export Profiles Overview

All packet export configurations are specified via IP traffic export profiles, which consist of IP-traffic-export-related command-line interfaces (CLIs) that control various attributes for both incoming and outgoing exported IP traffic. You can configure a router with multiple IP traffic export profiles. (Each profile must have a different name.) You can apply different profiles on different interfaces.

The two different IP traffic export profiles are as follows:

- The global configuration profile, which is configured via the `ip traffic-export profile` command.
- The IP traffic export submode configuration profile, which is configured via any of the following router IP Traffic Export (RITE) commands—`bidirectional`, `incoming`, `interface`, `mac-address`, and `outgoing`.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip traffic-export profile profile-name`
4. `interface interface-name`
5. `bidirectional`
6. `mac-address H.H.H`
7. `incoming {access-list {standard | extended | named} | sample one-in-every packet-number}`
8. `outgoing {access-list {standard | extended | named} | sample one-in-every packet-number}`
9. `exit`
10. `interface type number`
11. `ip traffic-export apply profile-name`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Example:**  
Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**  
Router# configure terminal | |
| **Step 3** ip traffic-export profile profile-name | Creates or edits an IP traffic export profile, enables the profile on an ingress interface, and enters RITE configuration mode. |
| **Example:**  
Router(config)# ip traffic-export profile my_rite | |
| **Step 4** interface interface-name | Specifies the outgoing (monitored) interface for exported traffic.  
**Note** If you do not issue this command, the profile will not recognize an interface in which to send the captured IP traffic. |
| **Example:**  
Router(config-rite)# interface FastEthernet 0/1 | |
| **Step 5** bidirectional | (Optional) Exports incoming and outgoing IP traffic on the monitored interface.  
**Note** If this command is not enabled, only incoming traffic is exported. |
| **Example:**  
Router(config-rite)# bidirectional | |
| **Step 6** mac-address H.H.H | Specifies the 48-bit address of the destination host that is receiving the exported traffic.  
**Note** If you do not issue this command, the profile will not recognize a destination host in which to send the exported packets. |
| **Example:**  
Router(config-rite)# mac-address 00a.8aab.90a0 | |
| **Step 7** incoming access-list {standard | extended | named} | (Optional) Configures filtering for incoming traffic.  
After you have created a profile via the **ip traffic-export profile** command, this functionality is enabled by default. |
| **Example:**  
Router(config-rite)# incoming access-list my_acl | |
| **Step 8** outgoing access-list {standard | extended | named} | (Optional) Configures filtering for outgoing export traffic.  
**Note** If you issue this command, you must also issue the **bidirectional** command, which enables outgoing traffic to be exported. However, only routed traffic (such as passthrough traffic) is exported; that is, traffic that originates from the network device is not exported. |
| **Example:**  
Router(config-rite)# outgoing sample one-in-every 50 | |
| **Step 9** exit | Exits RITE configuration mode. |
Creating an IP Traffic Export Profile

The `interface` and `mac-address` commands are required to successfully create a profile. If these commands are not issued, you will receive the following profile incomplete message if the `show running config` command is issued:

```
ip traffic-export profile newone
! No outgoing interface configured
! No destination mac-address configured
```

Applying an IP Traffic Export Profile to an interface

The following system logging messages should appear immediately after you activate and deactivate a profile from an interface (via the `ip traffic-export apply profile` command):

- Activated profile:
  
  `%RITE-5-ACTIVATE: Activated IP traffic export on interface FastEthernet 0/0.`

- Deactivated profile:
  
  `%RITE-5-DEACTIVATE: Deactivated IP traffic export on interface FastEthernet 0/0.`

If you attempt to apply an incomplete profile to an interface, you will receive the following message:

```
Router(config-if)# ip traffic-export apply newone
RITE: profile newone has missing outgoing interface
```

What to Do Next

After you have configured a profile and enabled the profile on an ingress interface, you can monitor IP traffic exporting events and verify your profile configurations. To complete these steps, refer to the following task “Displaying IP Traffic Export Configuration Data.”

Displaying IP Traffic Export Configuration Data

This task allows you to verify IP traffic export parameters such as the monitored ingress interface, which is where the IP traffic is exported, and outgoing and incoming IP packet information, such as configured ACLs. You can also use this task to monitor packets that are captured and then transmitted across an interface to a destination host. Use this optional task to help you troubleshoot any problems with your exported IP traffic configurations.
SUMMARY STEPS

1. enable
2. debug ip traffic-export events
3. show ip traffic-export [interface interface-name | profile profile-name]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 debug ip traffic-export events</td>
<td>Enables debugging messages for exported IP traffic packets events.</td>
</tr>
<tr>
<td>Example: debug ip traffic-export events</td>
<td></td>
</tr>
<tr>
<td>Step 3 show ip traffic-export [interface interface-name</td>
<td>profile profile-name]</td>
</tr>
<tr>
<td>Example: show ip traffic-export</td>
<td>• interface interface-name—Only data associated with the monitored ingress interface is shown.</td>
</tr>

<td></td>
<td>• profile profile-name—Only flow statistics, such as exported packets and the number of bytes, are shown.</td>
</tr>
</tbody>
</table>

Examples

The following sample output from the show ip traffic-export command is for the profile “one.” This example is for a single, configured interface. If multiple interfaces are configured, the information shown below is displayed for each interface.

Router# show ip traffic-export

Router IP Traffic Export Parameters
Monitored Interface FastEthernet0/0
Export Interface FastEthernet0/1
Destination MAC address 0030.7131.abfc
bi-directional traffic export is off
Input IP Traffic Export Information
  Packets/Bytes Exported 0/0
  Packets Dropped 0
  Sampling Rate one-in-every 1 packets
No Access List configured
Profile one is Active

Configuration Examples for IP Traffic Export

This section includes the following configuration example:

- Exporting IP Traffic Configuration: Example, page 7
Exporting IP Traffic Configuration: Example

Figure 1 and the following sample output from the `show running-config` command illustrate how to configure Router 2 to export the incoming traffic from Router 1 to IDS:

```
Router2# show running-config

- **debug ip traffic-export events**
- **incoming**
- **interface (RITE)**
- **ip traffic-export apply**
- **ip traffic-export profile**
- **mac-address (RITE)**
- **outgoing**
- **show ip traffic-export**

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
Role-Based CLI Access

The Role-Based CLI Access feature allows the network administrator to define “views,” which are a set of operational commands and configuration capabilities that provide selective or partial access to Cisco IOS EXEC and configuration (Config) mode commands. Views restrict user access to Cisco IOS command-line interface (CLI) and configuration information; that is, a view can define what commands are accepted and what configuration information is visible. Thus, network administrators can exercise better control over access to Cisco networking devices.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for Role-Based CLI Access” section on page 14.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Contents

- Prerequisites for Role-Based CLI Access, page 2
- Restrictions for Role-Based CLI Access, page 2
- Information About Role-Based CLI Access, page 2
- How to Use Role-Based CLI Access, page 3
- Configuration Examples for Role-Based CLI Access, page 9
- Additional References, page 12
- Command Reference, page 13
Prerequisites for Role-Based CLI Access

Your image must support CLI views.

Restrictions for Role-Based CLI Access

Lawful Intercept Images Limitation
Because CLI views are a part of the Cisco IOS parser, CLI views are a part of all platforms and Cisco IOS images. However, the lawful intercept view is available only in images that contain the lawful intercept subsystem.

Maximum Number of Allowed Views
The maximum number of CLI views and superviews, including one lawful intercept view, that can be configured is 15. (This does not include the root view.)

Information About Role-Based CLI Access

To create and use views, you should understand the following concepts:

- Benefits of Using CLI Views, page 2
- Root View, page 2
- View Authentication via a New AAA Attribute, page 3

Benefits of Using CLI Views

Views: Detailed Access Control
Although users can control CLI access via both privilege levels and enable mode passwords, these functions do not provide network administrators with the necessary level of detail needed when working with Cisco IOS routers and switches. CLI views provide a more detailed access control capability for network administrators, thereby, improving the overall security and accountability of Cisco IOS software.

As of Cisco IOS Release 12.3(11)T, network administrators can also specify an interface or a group of interfaces to a view; thereby, allowing access on the basis of specified interfaces.

Root View

When a system is in “root view,” it has all of the access privileges as a user who has level 15 privileges. If the administrator wishes to configure any view to the system (such as a CLI view, a superview, or a lawful intercept view), the system must be in root view.

The difference between a user who has level 15 privileges and a root view user is that a root view user can configure a new view and add or remove commands from the view. Also, when you are in a CLI view, you have access only to the commands that have been added to that view by the root view user.
View Authentication via a New AAA Attribute

View authentication is performed by an external authentication, authorization, and accounting (AAA) server via the new attribute “cli-view-name.”

AAA authentication associates only one view name to a particular user; that is, only one view name can be configured for a user in an authentication server.

How to Use Role-Based CLI Access

This section contains the following procedures:
- Configuring a CLI View, page 3 (required)
- Configuring a Lawful Intercept View, page 5 (optional)
- Configuring a Superview, page 7 (optional)
- Monitoring Views and View Users, page 9 (optional)

Configuring a CLI View

Use this task to create a CLI view and add commands or interfaces to the view, as appropriate.

Prerequisites

Before you create a view, you must perform the following tasks:
- Enable AAA via the `aaa new-model` command.
- Ensure that your system is in root view—not privilege level 15.

SUMMARY STEPS

1. `enable view`
2. `configure terminal`
3. `parser view view-name`
4. `secret 5 encrypted-password`
5. `commands parser-mode {include | include-exclusive | exclude} [all] [interface interface-name | command]`
6. `exit`
7. `exit`
8. `enable [privilege-level] [view view-name]`
9. `show parser view [all]`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable view | Enables root view.  
- Enter your privilege level 15 password (for example, root password) if prompted. |
| **Example:** Router> enable view | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Router# configure terminal | |
| **Step 3** parser view view-name | Creates a view and enters view configuration mode. |
| **Example:** Router(config)# parser view first | |
| **Step 4** secret 5 encrypted-password | Associates a command-line interface (CLI) view or superview with a password.  
**Note** You must issue this command before you can configure additional attributes for the view. |
| **Example:** Router(config-view)# secret 5 secret | |
| **Step 5** commands parser-mode (include | Adds commands or interfaces to a view.  
- **parser-mode**—The mode in which the specified command exists.  
- **include**— Adds a command or an interface to the view and allows the same command or interface to be added to an additional view.  
- **include-exclusive**— Adds a command or an interface to the view and excludes the same command or interface from being added to all other views.  
- **exclude**— Excludes a command or an interface from the view; that is, customers cannot access a command or an interface.  
- **all**—A “wildcard” that allows every command in a specified configuration mode that begins with the same keyword or every subinterface for a specified interface to be part of the view.  
- **interface interface-name**— Interface that is added to the view.  
- **command**—Command that is added to the view. |
| interface-name | interface-name | command] | |
| **Example:** Router(config-view)# commands exec include show version | |
| **Step 6** exit | Exits view configuration mode. |
| **Example:** Router(config-view)# exit | |
Troubleshooting Tips

After you have successfully created a view, a system message such as the following will be displayed:

%PARSER-6-VIEW_CREATED: view ‘first’ successfully created.

After you have successfully deleted a view, a system message such as the following will be displayed:

%PARSER-6-VIEW_DELETED: view ‘first’ successfully deleted.

You must associate a password with a view. If you do not associate a password, and you attempt to add commands to the view via the `commands` command, a system message such as the following will be displayed:

%Password not set for view <viewname>.

Configuring a Lawful Intercept View

Use this task to initialize and configure a view for lawful-intercept-specific commands and configuration information. (Only an administrator or a user who has level 15 privileges can initialize a lawful intercept view.)

About Lawful Intercept Views

Like a CLI view, a lawful intercept view restricts access to specified commands and configuration information. Specifically, a lawful intercept view allows a user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of simple network management protocol (SNMP) commands that store information about calls and users.
Commands available in lawful intercept view belong to one of the following categories:

- Lawful intercept commands that should not be made available to any other view or privilege level
- CLI views that are useful for lawful intercept users but do not have to be excluded from other views or privilege levels

**Prerequisites**

Before you initialize a lawful intercept view, ensure that the privilege level is set to 15 via the `privilege` command.

**SUMMARY STEPS**

1. `enable view`
2. `configure terminal`
3. `li-view li-password user username password password`
4. `username [lawful-intercept] name [privilege privilege-level | view view-name] password password`  
5. `parser view view-name`
6. `secret 5 encrypted-password`
7. `name new-name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable view | Enables root view.  
- Enter your privilege level 15 password (for example, root password) if prompted. |
| Example:  
`Router> enable view` | |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example:  
`Router# configure terminal` | |
| **Step 3** li-view li-password user username password password | Initializes a lawful intercept view.  
After the li-view is initialized, you must specify at least one user via `user username password password` options. |
| Example:  
`Router(config)# li-view lipass user li_admin password li_adminpass` | |
| **Step 4** username [lawful-intercept [name] [privilege privilege-level | view view-name] password password | Configures lawful intercept users on a Cisco device. |
| Example:  
`Router(config)# username lawful-intercept li-user1 password li-user1pass` | |
Role-Based CLI Access

How to Use Role-Based CLI Access

Troubleshooting Tips

To display information for all users who have access to a lawful intercept view, issue the `show users lawful-intercept` command. (This command is available only to authorized lawful intercept view users.)

Configuring a Superview

Use this task to create a superview and add at least one CLI view to the superview.

About Superviews

A superview consists of one or more CLI views, which allow users to define what commands are accepted and what configuration information is visible. Superviews allow a network administrator to easily assign all users within configured CLI views to a superview instead of having to assign multiple CLI views to a group of users.

Superviews contain the following characteristics:

- A CLI view can be shared among multiple superviews.
- Commands cannot be configured for a superview; that is, you must add commands to the CLI view and add that CLI view to the superview.
- Users who are logged into a superview can access all of the commands that are configured for any of the CLI views that are part of the superview.
- Each superview has a password that is used to switch between superviews or from a CLI view to a superview.
- If a superview is deleted, all CLI views associated with that superview will not be deleted too.

Adding CLI Views to a Superview

You can add a view to a superview only after a password has been configured for the superview (via the `secret` command). Thereafter, issue the `view` command in view configuration mode to add at least one CLI view to the superview.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5 <code>parser view view-name</code></td>
<td>(Optional) Enters view configuration mode, which allows you to change the lawful intercept view password or the lawful intercept view name.</td>
</tr>
<tr>
<td>Example: <code>Router(config)# parser view li view name</code></td>
<td></td>
</tr>
<tr>
<td>Step 6 <code>secret 5 encrypted-password</code></td>
<td>(Optional) Changes an existing password for a lawful intercept view.</td>
</tr>
<tr>
<td>Example: <code>Router(config-view)# secret 5 secret</code></td>
<td></td>
</tr>
<tr>
<td>Step 7 <code>name new-name</code></td>
<td>(Optional) Changes the name of a lawful intercept view. If this command is not issued, the default name of the lawful intercept view is “li-view.”</td>
</tr>
<tr>
<td>Example: <code>Router(config-view)# name second</code></td>
<td></td>
</tr>
</tbody>
</table>
Before adding a CLI view to a superview, ensure that the CLI views that are added to the superview are valid views in the system; that is, the views have been successfully created via the parser view command.

**SUMMARY STEPS**

1. enable view
2. configure terminal
3. parser view superview-name superview
4. secret 5 encrypted-password
5. view view-name
6. exit
7. exit
8. show parser view [all]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable view</td>
<td>Enables root view.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable view</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> parser view superview-name superview</td>
<td>Creates a superview and enters view configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# parser view su_view1 superview</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> secret 5 encrypted-password</td>
<td>Associates a CLI view or superview with a password.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>You must issue this command before you can configure additional attributes for the view.</td>
</tr>
<tr>
<td>Router(config-view)# secret 5 secret</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> view view-name</td>
<td>Adds a normal CLI view to a superview.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Issue this command for each CLI view that is to be added to a given superview.</td>
</tr>
<tr>
<td>Router(config-view)# view view_three</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits view configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-view)# exit</td>
<td></td>
</tr>
</tbody>
</table>
To display debug messages for all views—root, CLI, lawful intercept, and super, use the `debug parser view` command in privileged EXEC mode.

### Configuration Examples for Role-Based CLI Access

This section contains the following configuration examples:

- Configuring a CLI View: Example, page 9
- Verifying a CLI View: Example, page 10
- Configuring a Lawful Intercept View: Example, page 11
- Configuring a Superview: Example, page 12

### Configuring a CLI View: Example

The following example shows how to configure two CLI views, “first” and “second.” Thereafter, you can verify the CLI view in the running configuration.

```plaintext
Router(config)# parser view first
00:11:40:%PARSER-6-VIEW_CREATED:view 'first' successfully created.
Router(config-view)# secret 5 firstpass
Router(config-view)# command exec include show version
Router(config-view)# command exec include configure terminal
Router(config-view)# command exec include all show ip
Router(config-view)# exit
```

```plaintext
Router(config)# parser view second
00:13:42:%PARSER-6-VIEW_CREATED:view 'second' successfully created.
Router(config-view)# secret 5 secondpass
Router(config-view)# command exec include-exclusive show ip interface
Router(config-view)# command exec include logout
Router(config-view)# exit
```

---

**Monitoring Views and View Users**

To display debug messages for all views—root, CLI, lawful intercept, and super, use the `debug parser view` command in privileged EXEC mode.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td><code>exit</code></td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>8</td>
<td><code>show parser view</code></td>
<td>(Optional) Displays information about the view that the user is currently in.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# <code>exit</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# <code>show parser view</code></td>
<td></td>
</tr>
</tbody>
</table>

**Note** Although this command is available for both root and lawful intercept users, the `all` keyword is available only to root users. However, the `all` keyword can be configured by a user in root view to be available for users in lawful intercept view and CLI view.

---

**Command or Action**

- **Purpose**: Exits global configuration mode.
- **Purpose**: (Optional) Displays information about the view that the user is currently in.
- **Example**: Router(config)# `exit`
- **Example**: Router# `show parser view`
Role-Based CLI Access

Configuration Examples for Role-Based CLI Access

Router(config-view)# do show run | beg view
parser view first
secret 5 $1$MCmh$QuZaU8PIMP1ff9sFCZvgW/
commands exec include configure terminal
commands exec include configure
commands exec include all show ip
commands exec include show version
commands exec include show
!
parser view second
secret 5 $1$iP2M$R16BXKecMEiQesxLyqygW.
commands exec include-exclusive show ip interface
commands exec include show ip
commands exec include show
commands exec include logout
!

Verifying a CLI View: Example

After you have configured the CLI views “first” and “second,” you can issue the enable view command to verify which commands are available in each view. The following example shows which commands are available inside the CLI view “first” after the user has logged into this view. (Because the show ip command is configured with the all option, a complete set of suboptions is shown, except the show ip interface command, which is using the include-exclusive keyword in the second view.)

Router# enable view first
Password:

00:28:23:%PARSER-6-VIEW_SWITCH:successfully set to view 'first'.
Router# ?
Exec commands:
  configure Enter configuration mode
  enable Turn on privileged commands
  exit Exit from the EXEC
  show Show running system information

Router# show ?

  ip       IP information
  parser   Display parser information
  version  System hardware and software status

Router# show ip ?

  access-lists List IP access lists
  accounting The active IP accounting database
  aliases IP alias table
  arp       IP ARP table
  as-path-access-list List AS path access lists
  bgp       BGP information
  cache     IP fast-switching route cache
  casa      display casa information
  cef       Cisco Express Forwarding
  community-list List community-list
  dfp       DFP information
  dhcp      Show items in the DHCP database
  drp       Director response protocol
  dvmrp     DVMRP information
  eigrp     IP-EIGRP show commands
  extcommunity-list List extended-community list
Configuring a Lawful Intercept View: Example

The following example shows how to configure a lawful intercept view, add users to the view, and verify the users that were added:

! Initialize the LI-View.
Router(config-view)# li-view lipass user li_admin password li_adminpass
00:19:25:%PARSER-6-LI_VIEW_INIT:LI-View initialized.
Router(config-view)# end

! Enter the LI-View; that is, check to see what commands are available within the view.
Router# enable view li-view
Password:

Router#
00:22:57:%PARSER-6-VIEW_SWITCH:Successfully set to view 'li-view'.
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# parser view li-view
Router(config-view)# ?
View commands:
commands Configure commands for a view
default Set a command to its defaults
exit Exit from view configuration mode
name New LI-View name = This option only resides in LI View.
no Negate a command or set its defaults
password Set a password associated with CLI views

Router(config-view)#

! NOTE: LI View configurations are never shown as part of ‘running-configuration’.

! Configure LI Users.
Router(config)# username lawful-intercept li-user1 password li-user1pass
Router(config)# username lawful-intercept li-user2 password li-user2pass

! Displaying LI User information.
Router# show users lawful-intercept

li_admin
li-user1
li-user2
Router#
Configuring a Superview: Example

The following sample output from the `show running-config` command shows that “view_one” and “view_two” have been added to superview “su_view1,” and “view_three” and “view_four” have been added to superview “su_view2”:

```
parser view su_view1 superview
 secret 5 <encoded password>
 view view_one
 view view_two
!
parser view su_view2 superview
 secret 5 <encoded password>
 view view_three
 view view_four
!
```

Feature Information for Role-Based CLI Access

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS, Catalyst OS, and Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note
Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Configuring Security with Passwords, Privilege Levels, and Login Usernames for CLI Sessions on Networking Devices

Cisco IOS based networking devices provide several features that can be used to implement basic security for CLI sessions using only the operating system running on the device. These features include the following:

- Different levels of authorization for CLI sessions to control access to commands that can modify the status of the networking device versus commands that are used to monitor the device
- Assigning passwords to CLI sessions
- Requiring users log in to a networking device with a username
- Changing the privilege levels of commands to create new authorization levels for CLI sessions.

This module is a guide to implementing a baseline level of security for your networking devices. It focuses on the least complex options available for implementing a baseline level of security. If you have networking devices installed in your network with no security options configured, or you are about to install a networking device and you need help understanding the how to implement a baseline of security, this document will help you.

Module History

This module was first published on May 2nd, 2005, and last updated on May 2nd, 2005.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all features. To find information about feature support and configuration, use the “Feature Information for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices” section on page 42.

Contents

- Restrictions for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices, page 2
Restrictions for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

Your networking device must not be configured to use any local or remote authentication, authorization, and accounting (AAA) security features. This document describes only the non-AAA security features that can be configured locally on the networking device.

For information how to configure AAA security features that can be run locally on a networking device, or for information on how to configure remote AAA security using TACACS+ or RADIUS servers, see the *Cisco IOS Security Configuration Guide*, Release 12.4.

Information About Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

To configure router security with passwords, CLI privilege levels and usernames, you should understand the following concepts:

- Benefits of Creating a Security Scheme for Your Networking Device, page 3
- Cisco IOS CLI Modes, page 3
- Cisco IOS CLI Sessions, page 10
- Protect Access to Cisco IOS EXEC Modes, page 11
- Cisco IOS Password Encryption Levels, page 11
- Cisco IOS CLI Session Usernames, page 13
- Cisco IOS Privilege Levels, page 13
- Cisco IOS Password Configuration, page 14
Benefits of Creating a Security Scheme for Your Networking Device

The foundation of a good security scheme in the network is the protection of the user interfaces of the networking devices from unauthorized access. Protecting access to the user interfaces on your networking devices prevents unauthorized users from making configuration changes that can disrupt the stability of your network or compromise your network security.

The Cisco IOS features described in this document can be combined in many different ways to create a unique security scheme for each of your networking devices. Here are some possible examples that you can configure:

- You can enable non administrative users to run a subset of the administrative commands available on the networking device by lowering the entitlement level for the commands to the non administrative privilege level. This can be useful for the following scenarios:
  - ISPs that want their first-line technical support staff to perform tasks such as enabling new interfaces for new customers or resetting the connection for a customer whose connection has stopped passing traffic. See the “Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example” section on page 38 section for an example of how to do this.
  - When you want your first-line technical support staff to have the ability to clear console port sessions that were disconnected improperly from a terminal server. See the “Configuring and Verifying a Networking Device to Allow Non Administrative Users to Clear Remote CLI Sessions: Example” section on page 37 section for an example of how to do this.
  - When you want your first-line technical support staff to have the ability to view, but not change, the configuration of a networking device to facilitate troubleshooting a networking problem. See the “Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example” section on page 38 section for an example of how to do this.

Cisco IOS CLI Modes

To aid in the configuration of Cisco devices, the Cisco IOS command-line interface is divided into different command modes. Each command mode has its own set of commands available for the configuration, maintenance, and monitoring of router and network operations. The commands available to you at any given time depend on the mode you are in. Entering a question mark (?) at the system prompt (router prompt) allows you to obtain a list of commands available for each command mode.

The use of specific commands allows you to navigate from one command mode to another. The standard order in which a user would access the modes is as follows: user EXEC mode; privileged EXEC mode; global configuration mode; specific configuration modes; configuration submodes; and configuration subsubmodes.

Note

The default configuration of a Cisco IOS software based networking device only allows you to configure passwords to protect access to user EXEC mode (for local, and remote CLI sessions) and privileged EXEC mode. This document describes how you can provide additional levels of security by protecting access to other modes, and commands, using a combination of usernames, passwords and the privilege command.

Most EXEC mode commands are one-time commands, such as show or more commands, which show the current configuration status, and clear commands, which clear counters or interfaces. EXEC mode commands are not saved across reboots of the router.
From privileged EXEC mode, you can enter global configuration mode. In this mode, you can enter commands that configure general system characteristics. You also can use global configuration mode to enter specific configuration modes. Configuration modes, including global configuration mode, allow you to make changes to the running configuration. If you later save the configuration, these commands are stored across router reboots.

From global configuration mode you can enter a variety of protocol-specific or feature-specific configuration modes. The CLI hierarchy requires that you enter these specific configuration modes only through global configuration mode. For example, interface configuration mode, is a commonly used configuration mode.

From configuration modes, you can enter configuration submodes. Configuration submodes are used for the configuration of specific features within the scope of a given configuration mode. As an example, this chapter describes the subinterface configuration mode, a submode of the interface configuration mode.

ROM monitor mode is a separate mode used when the router cannot boot properly. If your system (router, switch, or access server) does not find a valid system image to load when it is booting, the system will enter ROM monitor mode. ROM monitor (ROMMON) mode can also be accessed by interrupting the boot sequence during startup. ROMMON is not covered in this document because it does not have any security features available in it.

The following sections contain detailed information on these command modes:

- User EXEC Mode
- Privileged EXEC Mode
- Global Configuration Mode
- Interface Configuration Mode
- Subinterface Configuration Mode

**User EXEC Mode**

When you start a session on a router, you generally begin in user EXEC mode, which is one of two access levels of the EXEC mode. For security purposes, only a limited subset of EXEC commands are available in user EXEC mode. This level of access is reserved for tasks that do not change the configuration of the router, such as determining the router status.

If your device is configured to require users to log-in the log-in process will require a username and a password. You may try three times to enter a password before the connection attempt is refused.

User EXEC mode is set by default to privilege level 1. Privileged EXEC mode is set by default to privilege level 15. For more information see the “Privileged EXEC Mode” section on page 6. When you are logged into a networking device in user EXEC mode your session is running at privilege level 1. By default the EXEC commands at privilege level 1 are a subset of those available at privilege level 15. When you are logged into a networking device in privileged EXEC mode your session is running at privilege level 15. You can move commands to any privilege level between 1 and 15 using the `privilege` command. See the “Cisco IOS Privilege Levels” section on page 13 for more information on privilege levels and the `privilege` command.

In general, the user EXEC commands allow you to connect to remote devices, change terminal line settings on a temporary basis, perform basic tests, and list system information.

To list the available user EXEC commands, use the following command:
Configuring Security with Passwords, Privilege Levels, and Login Usernames for CLI Sessions on Networking Devices

The user EXEC mode prompt consists of the host name of the device followed by an angle bracket (>), as shown in the following example:

Router>

The default host name is generally Router, unless it has been changed during initial configuration using the setup EXEC command. You also change the host name using the hostname global configuration command.

Note

Examples in Cisco IOS documentation assume the use of the default name of “Router.” Different devices (for example, access servers) may use a different default name. If the routing device (router, access server, or switch) has been named with the hostname command, that name will appear as the prompt instead of the default name.

To list the commands available in user EXEC mode, enter a question mark (?) as shown in the following example:

Router> ?

Exec commands:

- <1-99> Session number to resume
- connect Open a terminal connection
- disconnect Disconnect an existing telnet session
- enable Turn on privileged commands
- exit Exit from Exec mode
- help Description of the interactive help system
- lat Open a lat connection
- lock Lock the terminal
- login Log in as a particular user
- logout Exit from Exec mode and log out
- menu Start a menu-based user interface
- mbranch Trace multicast route for branch of tree
- mrbranch Trace reverse multicast route to branch of tree
- mtrace Trace multicast route to group
- name-connection Name an existing telnet connection
- pad Open a X.29 PAD connection
- ping Send echo messages
- resume Resume an active telnet connection
- show Show running system information
- systat Display information about terminal lines
- telnet Open a telnet connection
- terminal Set terminal line parameters
- tn3270 Open a tn3270 connection
- trace Trace route to destination
- where List active telnet connections
- x3 Set X.3 parameters on PAD

The list of commands will vary depending on the software feature set and router platform you are using.

Note

You can enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive. However, Cisco IOS documentation convention is to always present commands in lowercase.
Privileged EXEC Mode

In order to have access to all commands, you must enter privileged EXEC mode, which is the second level of access for the EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. In privileged EXEC mode, you can enter any EXEC command, because privileged EXEC mode is a superset of the user EXEC mode commands.

Because many privileged EXEC mode commands set operating parameters, privileged EXEC level access should be password protected to prevent unauthorized use. The privileged EXEC command set includes those commands contained in user EXEC mode. Privileged EXEC mode also provides access to configuration modes through the configure command, and includes advanced testing commands, such as debug.

Privileged EXEC mode is set by default to privilege level 15. User EXEC mode is set by default to privilege level 1. For more information see the “User EXEC Mode” section on page 4. When you are logged into a networking device in privileged EXEC mode your session is running at privilege level 15. When you are logged into a networking device in user EXEC mode your session is running at privilege level 1. By default the EXEC commands at privilege level 15 are a superset of those available at privilege level 1. You can move commands to any privilege level between 1 and 15 using the privilege command. See the “Cisco IOS Privilege Levels” section on page 13 for more information on privilege levels and the privilege command.

The privileged EXEC mode prompt consists of the host name of the device followed by a pound sign (#), as shown in the following example:

Router#

To access privileged EXEC mode, use the following command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Password</td>
<td></td>
</tr>
<tr>
<td>Router# exit</td>
<td>• If a privileged EXEC mode password has been configured</td>
</tr>
<tr>
<td></td>
<td>the system will prompt you for a password after you issue</td>
</tr>
<tr>
<td></td>
<td>the enable command.</td>
</tr>
<tr>
<td></td>
<td>• Use the exit command to leave privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Privileged EXEC mode is sometimes referred to as “enable mode,” because the enable command is used to enter the mode.

If a password has been configured on the system, you will be prompted to enter it before being allowed access to privileged EXEC mode. The password is not displayed on the screen and is case sensitive. If an enable password has not been set, privileged EXEC mode can be accessed only by a local CLI session (terminal connected to the console port).

If you attempt to access privileged EXEC mode on a router over a remote connection, such as a telnet connection, and you have not configured a password for privileged EXEC mode you will see the % No password set error message. For more information on remote connections see the “Remote CLI Sessions” section on page 10. The system administrator uses the enable secret or enable password global configuration commands to set the password that restricts access to privileged EXEC mode. For information on configuring a password for privileged EXEC mode, see the “Protecting Access to Privileged Exec Mode” section on page 20.

To return to user EXEC mode, use the following command:
Configuring Security with Passwords, Privilege Levels, and Login Usernames for CLI Sessions on Networking Devices

The following example shows the process of accessing privileged EXEC mode:

Router> enable
Password:<letmein>
Router#

Note that the password will not be displayed as you type, but is shown here for illustrational purposes. To list the commands available in privileged EXEC mode, issue the ? command at the prompt. From privileged EXEC mode you can access global configuration mode, which is described in the following section.

Global Configuration Mode

The term “global” is used to indicate characteristics or features that affect the system as a whole. Global configuration mode is used to configure your system globally, or to enter specific configuration modes to configure specific elements such as interfaces or protocols. Use the configure terminal privileged EXEC command to enter global configuration mode.

To access global configuration mode, use the following command in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# configure terminal</td>
<td>From privileged EXEC mode, enters global configuration mode.</td>
</tr>
</tbody>
</table>

The following example shows the process of entering global configuration mode from privileged EXEC mode:

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#

Note that the system prompt changes to indicate that you are now in global configuration mode. The prompt for global configuration mode consists of the host-name of the device followed by (config) and the pound sign (#). To list the commands available in privileged EXEC mode, issue the ? command at the prompt.

Commands entered in global configuration mode update the running configuration file as soon as they are entered. In other words, changes to the configuration take effect each time you press the Enter or Return key at the end of a valid command. However, these changes are not saved into the startup configuration file until you issue the copy running-config startup-config EXEC mode command. This behavior is explained in more detail later in this document.
As shown in the example above, the system dialogue prompts you to end your configuration session (exit configuration mode) by pressing the Control (Ctrl) and “z” keys simultaneously; when you press these keys, ^Z is printed to the screen. You can actually end your configuration session by entering the Ctrl-Z key combination, using the end command, using the Ctrl-C key combination. The end command is the recommended way to indicate to the system that you are done with the current configuration session.

Caution

If you use Ctrl-Z at the end of a command line in which a valid command has been typed, that command will be added to the running configuration file. In other words, using Ctrl-Z is equivalent to hitting the Enter (Carriage Return) key before exiting. For this reason, it is safer to end your configuration session using the end command. Alternatively, you can use the Ctrl-C key combination to end your configuration session without sending a Carriage Return signal.

You can also use the exit command to return from global configuration mode to EXEC mode, but this only works in global configuration mode. Pressing Ctrl-Z or entering the end command will always take you back to EXEC mode regardless of which configuration mode or configuration submode you are in.

To exit global configuration command mode and return to privileged EXEC mode, use one of the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# end</td>
<td>Ends the current configuration session and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ^Z</td>
<td>Exits the current command mode and returns to the preceding mode. For example, exits from global configuration mode to privileged EXEC mode.</td>
</tr>
<tr>
<td>Router(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

From global configuration mode, you can enter a number of protocol-specific, platform-specific, and feature-specific configuration modes.

Interface configuration mode, described in the following section, is an example of a configuration mode you can enter from global configuration mode.

**Interface Configuration Mode**

One example of a specific configuration mode you enter from global configuration mode is interface configuration mode.

Many features are enabled on a per-interface basis. Interface configuration commands modify the operation of an interface such as an Ethernet, FDDI, or serial port. Interface configuration commands always follow an interface global configuration command, which defines the interface type.

For details on interface configuration commands that affect general interface parameters, such as bandwidth or clock rate, refer to the Release 12.2 *Cisco IOS Interface Configuration Guide*. For protocol-specific commands, refer to the appropriate Cisco IOS software command reference.

To access and list the interface configuration commands, use the following command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# interface type number</td>
<td>Specifies the interface to be configured, and enters interface configuration mode.</td>
</tr>
</tbody>
</table>
In the following example, the user enters interface configuration mode for serial interface 0. The new prompt, `hostname(config-if)#`, indicates interface configuration mode.

```
Router(config)# interface serial 0
Router(config-if)#
```

To exit interface configuration mode and return to global configuration mode, enter the `exit` command. Configuration submodes are configuration modes entered from other configuration modes (besides global configuration mode). Configuration submodes are for the configuration of specific elements within the configuration mode. One example of a configuration submode is subinterface configuration mode, described in the following section.

### Subinterface Configuration Mode

From interface configuration mode, you can enter subinterface configuration mode. Subinterface configuration mode is a submode of interface configuration mode. In subinterface configuration mode you can configure multiple virtual interfaces (called subinterfaces) on a single physical interface. Subinterfaces appear to be distinct physical interfaces to the various protocols.

For detailed information on how to configure subinterfaces, refer to the appropriate documentation module for a specific protocol in the Cisco IOS software documentation set.

To access subinterface configuration mode, use the following command in interface configuration mode:

```
Router(config-if)# interface type number
```

In the following example, a subinterface is configured for serial line 2, which is configured for Frame Relay encapsulation. The subinterface is identified as “2.1” to indicate that it is subinterface 1 of serial interface 2. The new prompt `hostname(config-subif)#` indicates subinterface configuration mode. The subinterface can be configured to support one or more Frame Relay PVCs.

```
Router(config)# interface serial 2
Router(config-if)# encapsulation frame-relay
Router(config-if)# interface serial 2.1
Router(config-subif)#
```

To exit subinterface configuration mode and return to interface configuration mode, use the `exit` command. To end your configuration session and return to privileged EXEC mode, press Ctrl-Z or enter the `end` command.
Cisco IOS CLI Sessions

This section describes the following concepts:

- Local CLI Sessions, page 10
- Remote CLI Sessions, page 10
- Terminal Lines are Used for Local and Remote CLI Sessions, page 10

Local CLI Sessions

Local CLI sessions require direct access to the console port of the networking device. Local CLI sessions start in user EXEC mode. See the “Cisco IOS CLI Modes” section on page 3 for more information on the different modes that are supported on your networking device. All of the tasks required to configure and manage a networking device can be done using a local CLI session. The most common method for establishing a local CLI session is to connect the serial port on a PC to the console port of the networking device and then to launch a terminal emulation application on the PC. The type of cable and connectors required and the settings for the terminal emulation application on the PC are dependant on the type of networking device that you are configuring. See the documentation for your networking device for more information on setting it up for a local CLI session.

Remote CLI Sessions

Remote CLI sessions are created between a host such as a PC and a networking device such as a router over a network using a remote terminal access application such as Telnet and Secure Shell (SSH). Local CLI sessions start in user EXEC mode. See the “Cisco IOS CLI Modes” section on page 3 for more information on the different modes that are supported on your networking device. Most of the tasks required to configure and manage a networking device can be done using a remote CLI session. The exceptions are tasks that interact directly with the console port (such as recovering from a corrupted operating system (OS) by uploading a new OS image over the console port) and interacting with the networking device when it is in ROM Monitor Mode.

This document explains how to configure security for remote Telnet sessions. Telnet is the most common method for accessing a remote CLI session on a networking device.

Note

SSH is a more secure alternative to Telnet. SSH provides encryption for the session traffic between your local management device such as a PC and the networking device that you are managing. Encrypting the session traffic with SSH prevents hackers that might intercept the traffic from being able to decode it. See Secure Shell Version 2 Support (http://www.cisco.com/en/US/products/sw/iosswrel/ps5207/products_feature_guide09186a00802045dc.html) for more information on using SSH.

Terminal Lines are Used for Local and Remote CLI Sessions

Cisco networking devices use the word lines to refer to the software components that manage local and remote CLI sessions. You use the line console 0 global configuration command to enter line configuration mode to configure options, such as a password, for the console port.

Router# configure terminal
Router(config)# line console 0
Router(config-line)# password password-string
Remote CLI sessions use lines that are referred to as virtual teletypewriter (VTY) lines. You use the `line vty line-number [ending-line-number]` global configuration command to enter line configuration mode to configure options, such as a password, for remote CLI sessions.

```
Router# configure terminal
Router(config)# line vty 0 4
Router(config-line)# password password-string
```

### Protect Access to Cisco IOS EXEC Modes

Cisco IOS provides the ability to configure passwords that protect access to the following:

- Protecting Access to User EXEC Mode, page 11
- Protecting Access to Privileged EXEC mode, page 11

### Protecting Access to User EXEC Mode

The first step in creating a secure environment for your networking device is protecting access to user EXEC mode by configuring passwords for local and remote CLI sessions.

You protect access to user EXEC mode for local CLI sessions by configuring a password on the console port. See the “Configuring and Verifying a Password for Local CLI Sessions” section on page 18.

You protect access to user EXEC mode for remote CLI sessions by configuring a password on the virtual terminal lines (VTYs). See the “Configuring and Verifying a Password for Remote CLI Sessions” section on page 15 for instructions on how to configure passwords for remote CLI sessions.

### Protecting Access to Privileged EXEC mode

The second step in creating a secure environment for your networking device is protecting access to privileged EXEC mode with a password. The method for protecting access to privileged EXEC mode is the same for local and remote CLI sessions.

You protect access to privileged EXEC mode by configuring a password for it. This is sometimes referred to as the enable password because the command to enter privileged EXEC mode is `enable`.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Router> enable
Password
Router#
```

- Enter your password if prompted. The password will not be shown in the terminal window.
- The “>” at the end of the prompt string is changed to a “#” to indicate that you are in privileged EXEC mode.

### Cisco IOS Password Encryption Levels

Some of the passwords that you configure on your networking device are saved in the configuration in plain text. This means that if you store a copy of the configuration file on a disk, anybody with access to the disk can discover the passwords by reading the configuration file. The following password types are stored as plain text in the configuration by default:
• Console passwords for local CLI sessions
• Virtual terminal line passwords for remote CLI sessions
• Username passwords using the default method for configuring the password
• Privileged EXEC mode password when it is configured with the `enable password password` command
• Authentication key chain passwords used by RIPv2 and EIGRP
• BGP passwords for authenticating BGP neighbors
• OSPF authentication keys for authenticating OSPF neighbors
• ISIS passwords for authenticating ISIS neighbors

This excerpt from a router configuration file shows examples of passwords and authentication keys that are stored as clear text.

```
! enable password 093Jb6D
! username gjones password 0 kV9#Ij3
! key chain trees
   key 1
      key-string willow
! interface Ethernet1/0.1
   ip address 172.16.6.1 255.255.255.0
   ip router isis
   ip rip authentication key-chain trees
   ip authentication key-chain eigrp 1 trees
   ip ospf authentication-key j7876
   no snmp trap link-status
   isis password u7865k
!
line vty 0 4
   password V9jA5M
!
```

You can encrypt these clear text passwords in the configuration file by using the `service password-encryption` command. This should be considered only a minimal level of security because the encryption algorithm used by the `service password-encryption` command to encrypt passwords creates text strings that are decrypted using tools that are publicly available. You should still protect access to any electronic or paper copies of your configuration files after you use the `service password-encryption` command.

The `service password-encryption` command does not encrypt the passwords when they are sent to the remote device. Anybody with a network traffic analyzer who has access to your network can capture these passwords from the packets as they are transmitted between the devices. See the “Configuring Password Encryption for Clear Text Passwords” section on page 22 for more information on encrypting clear text passwords in configuration files.

Many of the Cisco IOS features that use clear text passwords can also be configured to use the more secure MD5 algorithm. The MD5 algorithm creates a text string in the configuration file that is much more difficult to decrypt. The MD5 algorithm does not send the password to the remote device. This prevents people using a traffic analyzer to capture traffic on your network from being able to discover your passwords.

You can determine the type of password encryption that has been used by the number that is stored with the password string in the configuration file of the networking device. The number 5 in the configuration excerpt below indicates that the enable secret password has been encrypted using the MD5 algorithm.
The number 7 in the excerpt below indicates that the enable password has been encrypted using the less secure algorithm used by the `service password-encryption` command.

```
! enable secret 5 $1$fGCS$rKYbR6.28xo4qC13vghWQ0
!
```

---

**Cisco IOS CLI Session Usernames**

After you have protected access to user EXEC mode and privileged EXEC mode by configuring passwords for them you can further increase the level of security on your networking device by configuring usernames to limit access to CLI sessions to your networking device to specific users.

Usernames that are intended to be used for managing a networking device can be modified with additional options such as:

- Automatically starting a CLI session at a specific privilege level. See “Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff” section on page 30.

- Running a CLI command automatically. See “Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example” section on page 38.

---

**Cisco IOS Privilege Levels**

The default configuration for Cisco IOS based networking devices uses privilege level 1 for user EXEC mode and privilege level 15 for privileged EXEC. The commands that can be run in user EXEC mode at privilege level 1 are a subset of the commands that can be run in privileged EXEC mode at privilege 15.

The `privilege` command is used to move commands from one privilege level to another. For example, some ISPs allow their first level technical support staff to enable and disable interfaces to activate new customer connections or to restart a connection that has stopped transmitting traffic. See the “Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example” section on page 38 for an example of how to configure this option.

The `privilege` command can also be used to assign a privilege level to a username so that when a user logs in with the username, the session will run at the privilege level specified by the `privilege` command. For example if you want your technical support staff to view the configuration on a networking device to help them troubleshoot network problems without being able to modify the configuration, you can create a username, configure it with privilege level 15, and configure it to run the `show running-config` command automatically. When a user logs in with the username the running configuration will be displayed automatically. The user’s session will be logged out automatically after the user has viewed the last line of the configuration. See the “Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example” section on page 38 for an example of how to configure this option.
These command privileges can also be implemented when using AAA with TACACS+ and RADIUS. For example, TACACS+ provides two ways to control the authorization of router commands on a per-user or per-group basis. The first way is to assign privilege levels to commands and have the router verify with the TACACS+ server whether or not the user is authorized at the specified privilege level. The second way is to explicitly specify in the TACACS+ server, on a per-user or per-group basis, the commands that are allowed. For more information about implementing AAA with TACACS+ and RADIUS, see the technical note How to Assign Privilege Levels with TACACS+ and RADIUS.

Cisco IOS Password Configuration

Cisco IOS software does not prompt you to repeat any passwords that you configure to verify that you have entered the passwords exactly as you intended. New passwords, and changes to existing passwords, go into effect immediately after you press the Enter key at the end of a password configuration command string. If you make a mistake when you enter a new password and have saved the configuration on the networking device to its startup configuration file and exited privileged EXEC mode before you realize that you made a mistake, you may find that you are no longer able to manage the device.

The following are common situations that can happen:

- You make a mistake configuring a password for local CLI sessions on the console port.
  - If you have properly configured access to your networking device for remote CLI sessions, you can Telnet to it and reconfigure the password on the console port.

- You make a mistake configuring a password for remote Telnet or SSH sessions.
  - If you have properly configured access to your networking device for local CLI sessions, you can connect a terminal to it and reconfigure the password for the remote CLI sessions.

- You make a mistake configuring a password for privileged EXEC mode (enable password or enable secret password).
  - You will have to perform a lost password recovery procedure.

- You make a mistake configuring your username password, and the networking device requires that you log into it with your username.
  - If you do not have access to another account name, you will have to perform a lost password recovery procedure.

To protect yourself from having to perform a lost password recovery procedure open two CLI sessions to the networking device and keep one of them in privilege EXEC mode while you reset the passwords using the other session. You can use the same device (PC or terminal) to run the two CLI sessions or two different devices. You can use a local CLI session and a remote CLI session or two remote CLI sessions for this procedure. The CLI session that you use to configure the password can also be used to verify that the password was changed properly. The other CLI session that you keep in privileged EXEC mode can be used to change the password again if you made a mistake the first time you configured it.

You should not save password changes that you have made in the running configuration to the startup configuration until you have verified that your password was changed successfully. If you discover that you made a mistake configuring a password, and you were not able to correct the problem using the second CLI session technique described above, you can power cycle the networking device so that it returns to the previous passwords that are stored in the startup configuration.
How To Configure Security with Passwords, Privilege Levels and Login Usernames for CLI Sessions on Networking Devices

This section contains the following procedures:

- Protecting Access to User Exec Mode, page 15
- Protecting Access to Privileged Exec Mode, page 20
- Configuring Security Options with Passwords, Privilege Levels and usernames to Manage Access to CLI Sessions and CLI Commands, page 25
- Recovering from a Lost or Misconfigured Password for Local CLI Sessions, page 33
- Recovering from a Lost or Misconfigured Password for Remote CLI Sessions, page 34
- Recovering from a Lost or Misconfigured Passwords for Privileged EXEC Mode, page 35

Protecting Access to User Exec Mode

This section contains the following procedures:

- Configuring and Verifying a Password for Remote CLI Sessions, page 15
- Configuring and Verifying a Password for Local CLI Sessions, page 18

Configuring and Verifying a Password for Remote CLI Sessions

This task will assign a password for remote CLI sessions. After you have completed this task the networking device will prompt you for a password the next time that you start a remote CLI session with it.

Cisco IOS based networking devices require that you have a password configured for remote CLI sessions. If you attempt to start a remote CLI session with a device that doesn’t have a password configured for remote CLI sessions you will see a message that a password is required and has not been set. The remote CLI session will be terminated by the remote host.

Prerequisites

If you have not previously configured a password for remote CLI sessions, you must perform this task over a local CLI session using a terminal or a PC running a terminal emulation application, attached to the console port.

Your terminal, or terminal emulation application, must be configured with the settings that are used by the console port on the networking device. The console ports on most Cisco networking devices require the following settings: 9600 baud, 8 data bits, 1 stop bit, no parity, and flow control is set to “none.” See the documentation for your networking device if these settings do not work for your terminal.

To perform the verification step (Step 6) for this task, your networking device must have an interface that is in an operational state. The interface must have a valid IP address.

Restrictions

If you have not previously configured a password for remote CLI sessions, you must perform this task over a local CLI session using a terminal attached to the console port.
SUMMARY STEPS

1. enable
2. configure terminal
3. line vty line-number [ending-line-number]
4. password password
5. end
6. telnet ip-address
7. exit
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1     | enable            | Enables privileged EXEC mode.  
  |                   | • Enter your password if prompted. |
| 2     | configure terminal| Enters global configuration mode. |
| 3     | line vty line-number [ending-line-number] | Enters line configuration mode. |
| 4     | password password | The argument *password* is a character string that specifies the line password. The following rules apply to the *password* argument:  
  |                   | • The first character cannot be a number.  
  |                   | • The string can contain any alphanumeric characters, including spaces, up to 80 characters. You cannot specify the password in the format number-space-anything.  
  |                   | • Passwords are case sensitive. |
| 5     | end               | Exits the current configuration mode and returns to privileged EXEC mode. |
| 6     | telnet ip-address | Start a remote CLI session with the networking device from your current CLI session using the IP address of an interface in the networking device that is in an operational state (interface up, line protocol up).  
  |                   | • Enter the password that you configured is step 4 when prompted.  
  |                   | **Note** This procedure is often referred to as a starting a recursive Telnet session because you are initiating a remote Telnet session with the networking device from the networking device itself. |
| 7     | exit              | Terminates the remote CLI session (recursive Telnet session) with the networking device. |

### Troubleshooting Tips

Repeat this task if you made a mistake configuring the remote CLI session password.
What to Do Next

Proceed to the “Configuring and Verifying a Password for Local CLI Sessions” section on page 18.

Configuring and Verifying a Password for Local CLI Sessions

This task will assign a password for local CLI sessions over the console port. After you have completed this task, the networking device will prompt you for a password the next time that you start a local CLI session on the console port.

This task can be performed over a local CLI session using the console port or a remote CLI session. If you want to perform the optional step of verifying that you configured the password correctly you should perform this task using a local CLI session using the console port.

Prerequisites

If you want to perform the optional step of verifying the local CLI session password, you must perform this task using a local CLI session. You must have a terminal or a PC running a terminal emulation program, connected to the console port of the networking device. Your terminal must be configured with the settings that are used by the console port on the networking device. The console ports on most Cisco networking devices require the following settings: 9600 baud, 8 data bits, 1 stop bit, no parity, and flow control is set to “none.” See the documentation for your networking device if these settings do not work for your terminal.

SUMMARY STEPS

1. enable
2. configure terminal
3. line console 0
4. password password
5. end
6. exit
7. Press the Enter key, and enter the password from Step 4 when prompted.
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:**  
  Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**  
  Router# configure terminal | |
| **Step 3** line console 0 | Enters line configuration mode and selects the console port as the line that you are configuring. |
| **Example:**  
  Router(config)# line console 0 | |
| **Step 4** password password | The argument `password` is a character string that specifies the line password. The following rules apply to the `password` argument:  
  - The first character cannot be a number.  
  - The string can contain any alphanumeric characters, including spaces, up to 80 characters. You cannot specify the password in the format `number-space-anything`.  
  - Passwords are case sensitive. |
| **Example:**  
  Router(config-line)# password Ji8F5Z | |
| **Step 5** end | Exits the current configuration mode and returns to privileged EXEC mode. |
| **Example:**  
  Router(config-line)# end | |
| **Step 6** exit | Exits privileged EXEC mode. |
| **Example:**  
  Router# exit | |
| **Step 7** Press the Enter key. | (Optional) Initiates the local CLI session on the console port.  
  - Enter the password that you configured is step 4 when prompted to verify that it was configured correctly.  
  **Note** This step can be performed only if you are using a local CLI session to perform this task. |

Troubleshooting Tips

If your new password is not accepted proceed to the “Recovering from a Lost or Misconfigured Password for Local CLI Sessions” section on page 33 for instructions on what to do next.

What to Do Next

Proceed to the “Protecting Access to Privileged Exec Mode” section on page 20.
Protecting Access to Privileged Exec Mode

This section contains the following procedures:

- Configuring and Verifying the Enable Password, page 20 (optional)
- Configuring Password Encryption for Clear Text Passwords, page 22 (optional)
- Configuring and Verifying the Enable Secret Password, page 23 (recommended)

Configuring and Verifying the Enable Password

Cisco no longer recommends that you use the `enable password` command to configure a password for privileged EXEC mode. The password that you enter with the `enable password` command is stored as plain text in the configuration file of the networking device. You can encrypt the password for the `enable password` command in the configuration file of the networking device using the `service password-encryption` command. However, the encryption level used by the `service password-encryption` command can be decrypted using tools available on the Internet.

Instead of using the `enable password` command, Cisco recommends using the `enable secret` command because it encrypts the password that you configure with it with strong encryption. For more information on password encryption issues see the “Cisco IOS Password Encryption Levels” section on page 11. For information on configuring the `enable secret` command see the “Configuring and Verifying the Enable Secret Password” section on page 23.

Restrictions

The networking device must not have a password configured by the `enable secret` command in order to perform this task successfully. If you have already configured a password for privileged EXEC mode using the `enable secret` command, the password configured takes precedence over the password that you configure in this task using the `enable password` command.

You cannot use the same password for the `enable secret` command and the `enable password` command.

SUMMARY STEPS

1. enable
2. configure terminal
3. enable password password
4. end
5. exit
6. enable
Configuring Security with Passwords, Privilege Levels, and Login Usernames for CLI Sessions on Networking Devices

What to Do Next

Encrypt the clear text enable password in the configuration file of the networking device using the procedure described in “Configuring Password Encryption for Clear Text Passwords” section on page 22.

Configuring Password Encryption for Clear Text Passwords

Cisco IOS stores passwords in clear text in network device configuration files for several features such as passwords for local and remote CLI sessions, and passwords for neighbor authentication for routing protocols. Clear text passwords are a security risk because anybody with access to archived copies of the configuration files can discover the passwords that are stored as clear text. The service password-encryption command can be used to encrypt clear text commands in the configuration files of networking devices. See the “Cisco IOS Password Encryption Levels” section on page 11 for more information.

Perform the following steps to configure password encryption for passwords that are stored as clear text in the configuration files of your networking device.

Prerequisites

You must have at least one feature that uses clear text passwords configured on your networking device for this command to have any immediate effect.

SUMMARY STEPS

1. enable
2. configure terminal
3. service password-encryption
4. end

Configuring and Verifying the Enable Secret Password

Cisco recommends that you use the **enable secret** command, instead of the **enable password** command to configure a password for privileged EXEC mode. The password created by the **enable secret** command is encrypted with the more secure MD5 algorithm.

Restrictions

You cannot use the same password for the **enable secret** command and the **enable password** command.

SUMMARY STEPS

1. enable
2. configure terminal
3. enable secret password
   or
   enable secret 5 previously-encrypted-password
4. end
5. exit
6. enable

Configuring Security Options with Passwords, Privilege Levels and usernames to Manage Access to CLI Sessions and CLI Commands

The tasks in this section describe how to configure your networking device to permit the use of a subset of privileged EXEC mode commands by users who should not have access to all of the commands available in privileged EXEC mode.

These tasks are beneficial for companies that have multiple levels of network support staff and the company wants the staff at each level to have access to a different subset of the privileged EXEC mode commands.

In this task the users who should not have access to all of the commands available in privileged EXEC mode are referred to as the first-line technical support staff.

This section contains the following procedures:

- Configuring the Networking Device for the First-Line Technical Support Staff, page 25
- Verifying the Configuration for the First-Line Technical Support Staff, page 28
- Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff, page 30

Configuring the Networking Device for the First-Line Technical Support Staff

This task describes how to configure the networking device for first-line technical support users. First-line technical support staff are usually not allowed to run all of the commands available in privileged EXEC mode (privilege level 15) on a networking device. They are prevented from running commands that they are not authorized for by not being granted access to the password assigned to privileged EXEC mode or to other roles that have been configured on the networking device.
The **privilege** command is used to move commands from one privilege level to another in order to create the additional levels of administration of a networking device that is required by companies that have different levels of network support staff with different skill levels.

The default configuration of a Cisco IOS device permits two types of users to access the CLI. The first type of user is a person who is only allowed to access user EXEC mode. The second type of user is a person who is allowed access to privileged EXEC mode. A user who is only allowed to access user EXEC mode is not allowed to view or change the configuration of the networking device, or to make any changes to the operational status of the networking device. On the other hand, a user who is allowed access to privileged EXEC mode can make any change to a networking device that is allowed by the CLI.

In this task the two commands that normally run at privilege level 15 are reset to privilege level 7 using the privilege command in order that first-line technical support users will be allowed to run the two commands. The two commands for which the privilege levels will be reset are the **clear counters** command and **reload** command.

- The **clear counters** command is used to reset the counter fields on interfaces for statistics such as packets received, packets transmitted, and errors. When a first-line technical support user is troubleshooting an interface related connectivity issue between networking devices, or with remote users connecting to the network, it is useful to reset the interface statistics to zero and then monitor the interfaces for a period of time to see if the values in the interface statistics counters change.

- The **reload** command is used initiate a reboot sequence for the networking device. One common use of the reload command by first-line technical support staff is to cause the networking device to reboot during a maintenance window so that it loads a new operating system that was previously copied onto the networking device’s file system by a user with a higher level of authority.

Any user that is permitted to know the **enable secret** password that is assigned to the first-line technical support user role privilege level can access the networking device as a first-line technical support user. You can add an additional level of security by configuring a username on the networking device and requiring that the users know the username and the password. Configuring a username as an additional level of security is described in the “Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff” section on page 30.

**Privilege Command Enhancement**

Before Cisco IOS Releases 12.0(22)S and 12.2(13)T, each command in a privilege level had to be specified with a separate **privilege** command. In Cisco IOS Releases 12.0(22)S, 12.2(13)T, and later releases, a “wildcard” option specified by the new keyword **all** was introduced that allows you to configure access to multiple commands with only one **privilege** command. By using the new **all** keyword, you can specify a privilege level for all commands which begin with the string you enter. In other words, the **all** keyword allows you to grant access to all command-line options and suboptions for a specified command.

For example, if you wanted to create a privilege level to allow users to configure all commands which begin with **service-module t1** (such as **service-module t1 linecode** or **service-module t1 clock source**) you can use the **privilege interface all level 2 service-module t1** command instead of having to specify each **service-module t1** command separately.

If the command specified in the privilege command (used with the **all** keyword) enables a configuration submode, all commands in the submode of that command will also be set to the specified privilege level.

**Restrictions**

The **all** “wildcard” keyword option for the **privilege** command is not supported in versions of Cisco IOS software prior to Cisco IOS Releases 12.0(22)S and, 12.2(13)T.
You must not have the `aaa new-model` command enabled on the networking device. You must not have the `login local` command configured for the local CLI sessions over the console port or the remote CLI sessions.

### Note
For clarity, only the arguments and keywords that are relevant for each step are shown in the syntax for the steps in this task. See the Cisco IOS command reference book for your Cisco IOS release for further information on the additional arguments and keywords that can be used with these commands.

### Caution
Do not use the no form of the `privilege` command to reset the privilege level of a command to its default because it might not return the configuration to the correct default state. Use the `reset` keyword for the `privilege` command instead to return a command to its default privilege level. For example, to remove the `privilege exec level reload` command from the configuration and return the `reload` command to its default privilege of 15, use the `privilege exec reset reload` command.

### SUMMARY STEPS
1. `enable password`
2. `configure terminal`
3. `enable secret level level password`
4. `privilege exec level level command-string`
5. `privilege exec all level level command-string`
6. `end`

### DETAILED STEPS

#### Step 1
`enable password`
Enters privileged EXEC mode. Enter the password when prompted.

```
Router> enable
```  

#### Step 2
`configure terminal`
Enters global configuration mode.

```
Router# configure terminal
```  

#### Step 3
`enable secret level level password`
Configures a new enable secret password for privilege level 7.

```
Router(config)# enable secret level 7 Zy72sKj
```  

#### Step 4
`privilege exec level level command-string`
Changes the privilege level of the `clear counters` command from privilege level 15 to privilege level 7.

```
Router(config)# privilege exec level 7 clear counters
```  

#### Step 5
`privilege exec all level level command-string`
Changes the privilege level of the `reload` command from privilege level 15 to privilege level 7.

```
Router(config)# privilege exec all level 7 reload
```
How To Configure Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking

Step 6  
end  
Exits global configuration mode. 
Router(config)# end

Verifying the Configuration for the First-Line Technical Support Staff

This task describes how to verify that the network device is configured correctly for the first-line technical support staff.

Prerequisites

The following commands must have been modified to run at privilege level 7 for this task:

- clear counters
- reload

SUMMARY STEPS

1. **enable level password**
2. **show privilege**
3. **clear counters**
4. **clear ip route ***
5. **reload in time**
6. **reload cancel**
7. **disable**
8. **show privilege**

DETAILED STEPS

Step 1 **enable level password**
Logs the user into the networking device at the privilege level specified for the level argument.  
Router> enable 7 Zy72sKj

Step 2 **show privilege**
Displays the privilege level of the current CLI session  
Router# show privilege  
Current privilege level is 7

Step 3 **clear counters**
The clear counters command clears the interface counters. This command has been changed from privilege level 15 to privilege level 7.  
Router# clear counters  
Clear *show interface* counters on all interfaces [confirm]  
Router#  
02:41:37: %CLEAR-5-COUNTERS: Clear counter on all interfaces by console
Step 4 clear ip route *
The ip route argument string for the clear command should not be allowed because it was not changed from privilege level 15 to privilege level 7.

Router# clear ip route *
^%
Invalid input detected at '^' marker.

Router#

Step 5 reload in time
The reload command causes the networking device to reboot.

Router# reload in 10
Reload scheduled in 10 minutes by console
Proceed with reload? [confirm]
Router#

***
*** --- SHUTDOWN in 0:10:00 ---
***

02:59:50: %SYS-5-SCHEDULED_RELOAD: Reload requested for 23:08:30 PST Sun Mar 20

Step 6 reload cancel
The reload cancel terminates a reload that was previously setup with the the reload in time command.

Router# reload cancel

***
*** --- SHUTDOWN ABORTED ---
***

04:34:08: %SYS-5-SCHEDULED_RELOAD.cancelled: Scheduled reload cancelled at 15:38:46 PST Sun Mar 27 2005

Step 7 disable
Exits the current privilege level and returns to privilege level 1.

Router# disable

Step 8 show privilege
Displays the privilege level of the current CLI session

Router> show privilege
Current privilege level is 1

Troubleshooting Tips
If your configuration does not work the way that you want it to and you want to remove the privilege commands from the configuration, use the reset keyword for the privilege command to return the commands to their default privilege level. For example, to remove the command privilege exec level reload command from the configuration and return the reload command to its default privilege of 15 use the privilege exec reset reload command.
What to Do Next

If you want to add an additional level of security by requiring that the first level technical staff use a login name, proceed to the “Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff” section on page 30.

Configuring and Verifying the Networking Device to Require a Username for the First-Line Technical Support Staff

This task configures the networking device to require that the first-line technical support staff login to the networking device with a login name of admin. The admin username configured in this task is assigned the privilege level of 7 which will allow users who log in with this name to run the commands that were reassigned to privilege level 7 in the previous task. When a user successfully logs in with the admin username, the CLI session will automatically enter privilege level 7.

Enhanced Username Password Security

Before Cisco IOS Releases 12.0(18)S and 12.2(8)T, two types of passwords were associated with usernames: Type 0, which is a clear text password visible to any user who has access to privileged mode on the router, and type 7, which has a password encrypted by the service password encryption command.

In Cisco IOS Releases 12.0(18)S, 12.2(8)T, and later releases, the new secret keyword for the username command allows you to configure Message Digest 5 (MD5) encryption for username passwords.

Prerequisites

The following commands must have been modified to run at privilege level 7 for this task:

- clear counters
- reload

See the “Configuring the Networking Device for the First-Line Technical Support Staff” section on page 25 for instructions on how to change the privilege level for a command.

Restrictions

MD5 encryption for the username command is not supported in versions of Cisco IOS software prior to Cisco IOS Releases 12.0(18)S and 12.2(8)T.

You must not have the aaa-new model command enabled on the networking device. You must not have the login local command configured for the local CLI sessions over the console port or the remote CLI sessions.

Note

For clarity, only the arguments and keywords that are relevant for each step are shown in the syntax for the steps in this task. Refer to the Cisco IOS command reference book for your Cisco IOS release for further information on the additional arguments and keywords that can be used with these commands.

SUMMARY STEPS

1. enable password
2. configure terminal
3. `username username privilege level secret password`
4. `end`
5. `disable`
6. `login username password`
7. `show privilege`
8. `clear counters`
9. `clear ip route *`
10. `reload in 10`
11. `reload cancel`
12. `disable`
13. `show privilege`

**DETAILED STEPS**

**Step 1** `enable t6D77Cdkq`
Enters privileged EXEC mode. Enter the password when prompted.

`Router> enable`

**Step 2** `configure terminal`
Enters global configuration mode.

`Router# configure terminal`

**Step 3** `username username privilege level secret password`
Creates a username and applies MD5 encryption to the `password` text string.

`Router(config)# username admin privilege 7 secret Kd65x2a`

**Step 4** `end`
Exits global configuration mode.

`Router(config)# end`

**Step 5** `disable`
Exits the current privilege level and returns to user EXEC mode.

`Router# disable`

**Step 6** `login username`
Logs in the user. Enter the username and password you configured in step 3 when prompted.

`Router> login admin`

**Step 7** `show privilege`
The `show privilege` command displays the privilege level of the CLI session.

`Router# show privilege`

Current privilege level is 7

**Step 8** `clear counters`
The **clear counters** command clears the interface counters. This command has been changed from privilege level 15 to privilege level 7.

```
Router# clear counters
Clear "show interface" counters on all interfaces [confirm]
```

```
Router# 02:41:37: %CLEAR-5-COUNTERS: Clear counter on all interfaces by console
```

**Step 9**  
**clear ip route** *

The *ip route* argument string for the **clear** command is not allowed because it was not changed from privilege level 15 to privilege level 7.

```
Router# clear ip route *

^% Invalid input detected at '^' marker.
```

```
Router#
```

**Step 10**  
**reload in time**

The **reload** command causes the networking device to reboot.

```
Router# reload in 10
Reload scheduled in 10 minutes by console
Proceed with reload? [confirm]
```

```
Router# 02:59:50: %SYS-5-SCHEDULED_RELOAD: Reload requested for 23:08:30 PST Sun Mar 20
```

**Step 11**  
**reload cancel**

The **reload cancel** command terminates a reload that was previously setup with the **reload in time** command.

```
Router# reload cancel

***
*** --- SHUTDOWN in 0:10:00 ---
***
```

```
04:34:08: %SYS-5-SCHEDULED_RELOAD_CANCELLED: Scheduled reload cancelled at 15:38:46 PST Sun Mar 27 2005
```

**Step 12**  
**disable**

Exits the current privilege level and returns to user EXEC mode.

```
Router# disable
```

**Step 13**  
**show privilege**

Displays the privilege level of the current CLI session

```
Router> show privilege
Current privilege level is 1
```
Recovering from a Lost or Misconfigured Password for Local CLI Sessions

There are three methods that can be used to recover from a lost or misconfigured password for local CLI sessions over console port. The method that you will use depends on the current configuration of your networking device.

- **Networking Device Is Configured to Allow Remote CLI Sessions, page 33**
- **Networking Device Is Not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Not Been Saved to the Startup Configuration File, page 33**
- **Networking Device is not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Been Saved to the Startup Configuration File, page 33**

**Networking Device Is Configured to Allow Remote CLI Sessions**

The fastest method to recover from a lost, or misconfigured password for local CLI sessions is to establish a remote CLI session with the networking device and repeat the “Configuring and Verifying a Password for Local CLI Sessions” section on page 18. Your networking device must be configured to allow remote CLI sessions and you must know the remote CLI session password to perform this procedure.

**Networking Device Is Not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Not Been Saved to the Startup Configuration File**

If you cannot establish a remote session to your networking device, and you have not saved the misconfigured local CLI session password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous local CLI session password is restored.

**Caution**

Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.

**Networking Device is not Configured to Allow Remote CLI Sessions and the Local CLI Session Password Has Been Saved to the Startup Configuration File**

If you can not establish a remote CLI session with the networking device, and you have saved the misconfigured local CLI session password to the startup configuration, or you have lost the local CLI session password, you must perform a password recovery procedure. Password recovery procedures are device specific. You must locate the document that describes the procedure for your type of networking device.

There are three methods for locating a password recovery procedure document for your networking device:

- Many networking devices have a Password Recovery subsection in the Troubleshoot and Alerts section of their product support page on Cisco’s Technical Support website (http://www.cisco.com/tac). Navigate to the Troubleshoot and Alerts section of the product support page for your networking device and look for the Password Recovery subsection.
If you do not find the password recovery document for your networking device on its product support page try searching for the text string “password recovery” on Cisco’s Technical Support website (http://www.cisco.com/tac). Enclose the text string in double quotes. You can improve the search results by adding an additional text string that matches the model number, series number or platform name for your networking device, For example searching on the string “password recovery” 12000 will provide search results that give documents with the words password, recovery” and 12000 in the title a higher ranking.

If the product support page for your networking device does not have a password recovery document, and you can not find the correct document by searching for it, you can try the Cisco’s Network Professionals Connection (http://www.cisco.com/go/netpro).

Recovering from a Lost or Misconfigured Password for Remote CLI Sessions

There are three methods that can be used to recover from a lost, or misconfigured remote CLI session password. The method that you will use depends on the current configuration of your networking device.

- Networking Device Is Configured to Allow Local CLI Sessions, page 34
- Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Not Been Saved to the Startup Configuration File, page 34
- Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Been Saved to the Startup Configuration File, page 35

Networking Device Is Configured to Allow Local CLI Sessions

The fastest method to recover from a lost, or misconfigured password for remote CLI sessions is to establish a local CLI session with the networking device and repeat the “Configuring and Verifying a Password for Remote CLI Sessions” section on page 15. Your networking device must be configured to allow local CLI sessions and you must know the local CLI session password to perform this procedure.

Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Not Been Saved to the Startup Configuration File

If you cannot establish a local CLI session to your networking device, and you have not saved the misconfigured remote CLI session password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous remote CLI session password is restored.

Caution

Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.
Networking Device Is Not Configured to Allow Local CLI Sessions and the Remote CLI Session Password Has Been Saved to the Startup Configuration File

If you cannot establish a local CLI session with the networking device, and you have saved the misconfigured remote CLI session password to the startup configuration, or you have lost the remote CLI session password, you must perform a password recovery procedure. Password recovery procedures are device specific. You must locate the document that describes the procedure for your type of networking device.

There are three methods for locating a password recovery procedure document for your networking device:

- Many networking devices have a Password Recovery subsection in the Troubleshoot and Alerts section of their product support page on Cisco’s Technical Support website (http://www.cisco.com/tac). Navigate to the Troubleshoot and Alerts section of the product support page for your networking device and look for the Password Recovery subsection.
- If you do not find the password recovery document for your networking device on its product support page try searching for the text string “password recovery” on Cisco’s Technical Support website (http://www.cisco.com/tac). Enclose the text string in double quotes. You can improve the search results by adding an additional text string that matches the model number, series number or platform name for your networking device. For example searching on the string “password recovery” 12000 will provide search results that give documents with the words password, recovery” and 12000 in the title a higher ranking.
- If the product support page for your networking device does not have a password recovery document, and you cannot find the correct document by searching for it, you can try the Cisco’s Network Professionals Connection (http://www.cisco.com/go/netpro).

Recovering from a Lost or Misconfigured Passwords for Privileged EXEC Mode

There are two methods that can be used to recover from a lost, or misconfigured Privileged EXEC Mode password. The method that you will use depends on the current configuration of your networking device.

- A Misconfigured Privileged EXEC Mode Password Has Not Been Saved to the Startup Configuration File, page 35
- A Misconfigured Privileged EXEC Mode Password Has Been Saved to the Startup Configuration File, or the Privileged EXEC Mode Password Has Been Lost, page 36

A Misconfigured Privileged EXEC Mode Password Has Not Been Saved to the Startup Configuration File

If you have not saved the misconfigured privileged EXEC mode password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous privileged EXEC mode password is restored.

⚠️ Caution

Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.
A Misconfigured Privileged EXEC Mode Password Has Been Saved to the Startup Configuration File, or the Privileged EXEC Mode Password Has Been Lost

If you have saved the misconfigured privileged EXEC mode password to the startup configuration, or you have lost the privileged EXEC mode password, you must perform a password recovery procedure. Password recovery procedures are device specific. You must locate the document that describes the procedure for your type of networking device.

There are three methods for locating a password recovery procedure document for your networking device:

- Many networking devices have a Password Recovery subsection in the Troubleshoot and Alerts section of their product support page on Cisco’s Technical Support website (http://www.cisco.com/tac). Navigate to the Troubleshoot and Alerts section of the product support page for your networking device and look for the Password Recovery subsection.

- If you do not find the password recovery document for your networking device on its product support page try searching for the text string “password recovery” on Cisco’s Technical Support website (http://www.cisco.com/tac). Enclose the text string in double quotes. You can improve the search results by adding an additional text string that matches the model number, series number or platform name for your networking device. For example searching on the string “password recovery” 12000 will provide search results that give documents with the words password, recovery” and 12000 in the title a higher ranking.

- If the product support page for your networking device does not have a password recovery document, and you can not find the correct document by searching for it, you can try the Cisco’s Network Professionals Connection (http://www.cisco.com/go/netpro).

Configuration Examples for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

This section contains the following configuration examples:

- Configuring and Verifying a Networking Device to Allow Non Administrative Users to Clear Remote CLI Sessions: Example, page 37

- Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example, page 38

- Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example, page 38
Configuring and Verifying a Networking Device to Allow Non Administrative Users to Clear Remote CLI Sessions: Example

The following example shows how to configure a networking device to allow a non administrative user to clear remote CLI session virtual terminal (VTY) lines.

The first section is an an excerpt of the running configuration for this example. The following sections show you how this example is used.

The following section is an excerpt of the running-configuration:

```plaintext
! privilege exec level 7 clear line
! no aaa new-model
!
username admin privilege 7 secret 5 $1$tmIw$1aM7sadKhWMptkVTzxNW1J.
!
privilege exec level 7 clear line
!
! the privilege exec level 7 clear command below is entered automatically
! when you enter the privilege exec level 7 clear line command above, do
! not enter it again
!
privilege exec level 7 clear
!
```

The following section using the `login` command shows the user logging in to the networking device with the username of admin:

```
R1> login
Username: admin
Password:
```

The following section using the `show privilege` command shows that the current privilege level is 7:

```
R1# show privilege
Current privilege level is 7
R1#
```

The following section using the `show user` command shows that two users (admin and root) are currently logged in to the networking device:

```
R1# show user
Line       User       Host(s)              Idle       Location
*  0 con 0     admin      idle                 00:00:00
  2 vty 0     root       idle                 00:00:17 172.16.6.2

Interface    User               Mode         Idle     Peer Address

The following section using the `clear line` 2 command terminates the remote CLI session in use by the username root:

```
R1# clear line 2
[confirm]
[OK]
```

The following section using the `show user` command shows that admin is the only user currently logged in to the networking device:
Configuring and Verifying a Networking Device to Allow Non Administrative Users to View the Running Configuration Automatically: Example

The following example shows how to configure the networking device to allow a non administrative users (no access to privileged EXEC mode) to view the running configuration automatically. This example requires that the username is configured for privilege level 15 because many of the commands in the configuration file can be viewed only by users who have access to privilege level 15.

The solution is to temporarily allow the user access to privilege level 15 while running the `show running-config` command and then terminating the CLI session when the end of the configuration file has been viewed. In this example the networking device will automatically terminate the CLI session when the end of the configuration file has been viewed. No further configuration steps are required.

⚠️ Caution

You must include the `noescape` keyword for the `username` command to prevent the user from entering an escape character that will terminate viewing the configuration file and leave the session running at privilege level 15.

! username viewconf privilege 15 noescape secret 5 $1$zA9C$TDWD/Q0zwp/5xRwRq0g/. username viewconf autocommand show running-config

Configuring and Verifying a Networking Device to Allow Non Administrative Users to Shutdown and Enable Interfaces: Example

The following example shows how to configure a networking device to allow non administrative users to shutdown and enable interfaces.

The first section is an an excerpt of the running configuration for this example. The following sections show you how this example is used.

The following section is an excerpt of the running-configuration:

```bash
no aaa new-model
username admin privilege 7 secret 5 $1$tmIw$1aM7sadKhWMPkVTzyNw1J.
privilege interface all level 7 shutdown
privilege interface all level 7 no shutdown
privilege configure level 7 interface
privilege exec level 7 configure terminal
! the privilege exec level 7 configure command below is entered automatically
! when you enter the privilege exec level 7 configure terminal command above, do
! not enter it again
! `the privilege
```
privilege exec level 7 configure
!

The following section using the `login` command shows the user logging in to the networking device with the username of admin:

R1> login
Username: admin
Password:

The following section using the `show privilege` command shows that the current privilege level is 7:

R1# show privilege
Current privilege level is 7
R1#

The following section using the `show user` command shows that admin is the only user currently logged in to the networking device:

R1# show user
 Line   User   Host(s)   Idle   Location
 *  0 con 0  admin  idle  00:00:00

Interface  User  Mode  Idle  Peer Address

The following section shows that the admin user is permitted to shutdown and enable an interface:

R1# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
R1(config)# interface ethernet 1/0
R1(config-if)# shutdown
R1(config-if)# no shutdown
R1(config-if)# exit
R1#

Where to Go Next

Once you have established a baseline of security for your networking devices you can consider more advanced options such as:

- **Role-Based CLI Access**—The role-based CLI access feature offers a more comprehensive set of options than the `privilege` command (described in this document) for network managers who want to allow different levels of technical support staff to have different levels of access to CLI commands.

- **AAA Security**—Many Cisco networking devices offer an advanced level of security using authentication, authorization and accounting (AAA) features. All of the tasks described in this document, and other - more advanced security features - can be implemented using AAA on the networking device in conjunction with a remote TACACS+ or RADIUS server. For information how to configure AAA security features that can be run locally on a networking device, or for information on how to configure remote AAA security using TACACS+ or RADIUS servers, see the *Cisco IOS Security Configuration Guide*, Release 12.4.

Feature Information for Configuring Security with Passwords, Privilege Levels and, Login Usernames for CLI Sessions on Networking Devices

Table 70 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Releases 12.2(1) or 12.0(3)S or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For details on when support for specific command was introduced, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

**Table 70 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.**

No Service Password-Recovery

The No Service Password-Recovery feature is a security enhancement that prevents anyone with console access from accessing the router configuration and clearing the password. It also prevents anyone from changing the configuration register values and accessing NVRAM.

Information About No Service Password-Recovery

To configure the No Service Password-Recovery feature, you should understand the following concepts:

- Cisco Password Recovery Procedure, page 2
- Configuration Registers and System Boot Configuration, page 2

Cisco Password Recovery Procedure

The Cisco IOS software provides a password recovery procedure that relies upon gaining access to ROMMON mode using the Break key during system startup. In ROMMON mode, the router software can be reloaded at which time prompting a new system configuration that includes a new password.

The current password recovery procedure enables anyone with console access, the ability to access the router and its network. The No Service Password-Recovery feature prevents the completion of the Break key sequence and the entering of ROMMON mode during system startups and reloads.

Configuration Registers and System Boot Configuration

The lowest four bits of the configuration register (bits 3, 2, 1, and 0) form the boot field. The boot field determines if the router boots manually from ROM or automatically from Flash or the network. For example, when the configuration register boot field value is set to any value from 0x2 to 0xF, the router uses the boot field value to form a default boot filename for autobooting from a network server.

Bit 6, when set, ignores the startup configuration, while bit 8 enables a break. To use this feature, the configuration register must be set to autoboot before it can be enabled. Any other configuration register setting will prevent the feature from being enabled.

Note

By default, the no confirm prompt and message are not displayed after reloads.

How to Enable No Service Password-Recovery

This section contains the following procedures:

- Upgrading the ROMMON Version, page 3 (required)
- Verifying the Upgraded ROMMON Version, page 5 (optional)
- Enabling No Service Password-Recovery, page 5 (required)
- Recovering a Device, page 6 (required)
Upgrading the ROMMON Version

If your router or access server does not find a valid system image to load, the system will enter ROMMON mode. ROMMON mode can also be accessed by interrupting the boot sequence during startup.

Another method for entering ROMMON mode is to set the configuration register so that the router automatically enters ROMMON mode when it boots. For information about setting the configuration register value, refer to the *Cisco IOS Configuration Fundamentals and Network Management Configuration Guide*, Release 12.3.

Perform this task to upgrade your version of ROMMON.

**SUMMARY STEPS**

1. reload
2. set tftp-file ip-address ip-subnet-mask default-gateway tftp-server
3. sync
4. tftpdlnd -u
5. boot
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>reload</td>
<td>Reloads a Cisco IOS image. After issuing this command and responding to the system prompts as necessary, the system will begin reloading the system software image. While the system is reloading, press the Break key or a Break key-combination during the first 60 seconds of system startup. Pressing the Break key interrupts the boot sequence and puts the router into ROMMON mode. <strong>Note</strong> The default Break key combination is Ctrl-C, but this may be configured differently on your system.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
</tbody>
</table>
| set tftp-file ip-address ip-subnet-mask default-gateway tftp-server | Displays all the created variables. The arguments are as follows:  
  - *tftp-file*—Location of the new ROMMON image on the TFTP server. The length of the filename is a maximum of 45 characters.  
  - *ip-address*—IP address on the router to connect to the TFTP server.  
  - *ip-subnet-mask*—IP subnet mask of the router.  
  - *default-gateway*—IP address of the gateway of the TFTP server.  
  - *tftp-server*—IP address of the TFTP server from which the image will be downloaded.  
  **Note** This command is not supported on the Cisco 800 series routers. |
| **Step 3**        |         |
| sync              | Saves the changes to the image. |
| **Step 4**        |         |
| tftpdnld -u       | Downloads the new ROMMON image from the TFTP server. Reset if prompted. |
| **Step 5**        |         |
| boot              | Boots the router with the Cisco IOS image in flash memory. |

*Example:*  
**Step 1:**  
Router> reload  
**Step 2:**  
ROMMON> set tftpabc 10.10.0.0 255.0.0.0 10.1.1.0 10.29.32.0  
**Step 3:**  
ROMMON> sync  
**Step 4:**  
ROMMON> tftpdnld -u  
**Step 5:**  
ROMMON> boot
Verifying the Upgraded ROMMON Version

To verify that you have downloaded a new version of ROMMON, use the `show version` command:

```
Router# show version
Cisco IOS Software, C828 Software (C828-K9OS&6-M), Version 12.3 (20040702:094716)
[userid 168]
Copyright (c) 1986-2004 by Cisco Systems, Inc.
ROM: System Bootstrap, Version 12.2(11)YV1, Release Software (fc1)
Router uptime is 22 minutes
System returned to ROM by reload
```

Enabling No Service Password-Recovery

Perform this task to enable the No Service Password-Recovery feature.

**Note**

As a precaution, a valid Cisco IOS image should reside in flash memory before this feature is enabled.

If you plan to enter the `no service password-recovery` command, we recommend that you save a copy of the system configuration file in a location away from the switch or router. If you are using a switch that is operating in VTP transparent mode, we recommend that you also save a copy of the vlan.dat file in a location away from the switch.

**Prerequisites**

Always disable the feature before downgrading to an image that does not support this feature, because you cannot reset after the downgrade.

The configuration register boot bit must be enabled so that there is no way to break into ROMMON when this command is configured. Cisco IOS software should prevent the user from configuring the boot field in the config register.

Bit 6, which ignores the startup configuration and bit 8, which enables a break, should be set.

The Break key should be disabled while the router is booting up and disabled in Cisco IOS software when this feature is enabled.

**SUMMARY STEPS**

1. `enable`
2. `show version`
3. `configure terminal`
4. `config-register value`

5. `no service password-recovery`

6. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router&gt; enable</code></td>
</tr>
<tr>
<td>Enables privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>show version</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router# show version</code></td>
</tr>
<tr>
<td>Displays information about the system software, including configuration register settings. The configuration register must be set to autoboot before entering the <code>no service password-recovery</code> command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router# configure terminal</code></td>
</tr>
<tr>
<td>Enters global configuration mode.</td>
<td></td>
</tr>
<tr>

<td>config-register value</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# config-register 0x2012</code></td>
</tr>
<tr>
<td>(Optional) Changes the configuration register setting.</td>
<td></td>
</tr>
<tr>
<td>• If necessary, change the configuration register setting so the router is set to autoboot.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>no service password-recovery</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# no service password-recovery</code></td>
</tr>
<tr>
<td>Disables password-recovery capability at the system console.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>exit</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# exit</code></td>
</tr>
<tr>
<td>Exits global configuration mode and returns to EXEC mode.</td>
<td></td>
</tr>
</tbody>
</table>

**Recovering a Device**

To recover a device once the No Service Password-Recovery feature has been enabled, press the Break key within 5 seconds after the image decompresses during the boot. You are prompted to confirm the Break key action. When you confirm the action, the startup configuration is erased, the password-recovery procedure is enabled, and the router boots with the factory default configuration.

If you do not confirm the Break key action, the router boots normally with the No Service Password-Recovery feature enabled.
**Examples**

This section provides the following examples of the process:

- **Confirmed Break, page 7**
- **Unconfirmed Break, page 8**

**Confirmed Break**

Configuration Examples for No Service Password-Recovery

This section provides the following configuration example:

- Disabling Password Recovery: Example, page 11
Disabling Password Recovery: Example

The following example shows how to obtain the configuration register setting (which is set to autoboot), disable password recovery capability, and then verify that the configuration persists through a system reload:

Router# show version

Cisco Internetwork Operating System Software
IOS (tm) 5300 Software (C7200-P-M), Version 12.3(8)YA, RELEASE SOFTWARE (fc1)
TAC Support: http://www.cisco.com/tac
Copyright (c) 1986-2004 by Cisco Systems, Inc.
Compiled Wed 05-Mar-04 10:16 by xxx
Image text-base: 0x60008954, data-base: 0x61964000

ROM: System Bootstrap, Version 12.3(8)YA, RELEASE SOFTWARE (fc1)

125440K bytes of ATA PCMCIA card at slot 0 (Sector size 512 bytes).
8192K bytes of Flash internal SIMM (Sector size 256K).
Configuration register is 0x2102

Router# configure terminal

Router(config)# no service password-recovery

WARNING:
Executing this command will disable the password recovery mechanism.
Do not execute this command without another plan for password recovery.

Are you sure you want to continue? [yes/no]: yes

Router(config)# exit

Router# reload

Proceed with reload? [confirm] yes

00:01:54: %SYS-5-RELOAD: Reload requested
System Bootstrap, Version 12.3...
Copyright (c) 1994-2004 by cisco Systems, Inc.
C7400 platform with 262144 Kbytes of main memory

PASSWORD RECOVERY FUNCTIONALITY IS DISABLED

.

Remote Authentication Dial-In User Service (RADIUS) attributes are used to define specific authentication, authorization, and accounting (AAA) elements in a user profile, which is stored on the RADIUS daemon. This appendix lists the RADIUS attributes currently supported.

In This Appendix

This appendix contains the following sections:

- RADIUS Attributes Overview
- RADIUS IETF Attributes
- RADIUS Vendor-Proprietary Attributes
- RADIUS Vendor-Specific Attributes (VSA) and RADIUS Disconnect-Cause Attribute Values
- RADIUS Disconnect-Cause Attribute Values

RADIUS Attributes Overview

This section contains information important to understanding how RADIUS attributes exchange AAA information between a client and server and includes the following sections:

- IETF Attributes Versus VSAs
- RADIUS Packet Format
RADIUS Attributes Overview

IETF Attributes Versus VSAs

RADIUS Internet Engineering Task Force (IETF) attributes are the original set of 255 standard attributes that are used to communicate AAA information between a client and a server. Because IETF attributes are standard, the attribute data is predefined and well known; thus all clients and servers who exchange AAA information via IETF attributes must agree on attribute data such as the exact meaning of the attributes and the general bounds of the values for each attribute.

RADIUS vendor-specific attributes (VSAs) derived from one IETF attribute—vendor-specific (attribute 26). Attribute 26 allows a vendor to create an additional 255 attributes however they wish. That is, a vendor can create an attribute that does not match the data of any IETF attribute and encapsulate it behind attribute 26; thus, the newly created attribute is accepted if the user accepts attribute 26.

For more information on VSAs, refer to the section “RADIUS Vendor-Specific Attributes (VSA) and RADIUS Disconnect-Cause Attribute Values” later in this appendix.

RADIUS Packet Format

The data between a RADIUS server and a RADIUS client is exchanged in RADIUS packets. The data fields are transmitted from left to right.

Figure 125 shows the fields within a RADIUS packet.

For a diagram of VSAs, which is an extension of Figure 125, refer to Figure 1.

Figure 125 RADIUS Packet Diagram

```
0 | 8 | 16 | 24 | Byte count
0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 = 32 bits
```

Each RADIUS packet contains the following information:

- **Code**—The code field is one octet; it identifies one of the following types of RADIUS packets:
  - Access-Request (1)
  - Access-Accept (2)
  - Access-Reject (3)
  - Accounting-Request (4)
  - Accounting-Response (5)
• Identifier—The identifier field is one octet; it helps the RADIUS server match requests and responses and detect duplicate requests.
• Length—The length field is two octets; it specifies the length of the entire packet.
• Authenticator—The authenticator field is 16 octets. The most significant octet is transmitted first; it is used to authenticate the reply from the RADIUS server. Two types of authenticators are as follows:
  – Request-Authentication: Available in Access-Request and Accounting-Request packets

**RADIUS Packet Types**

The following list defines the various types of RADIUS packet types that can contain attribute information:

Access-Request—Sent from a client to a RADIUS server. The packet contains information that allows the RADIUS server to determine whether to allow access to a specific network access server (NAS), which will allow access to the user. Any user performing authentication must submit an Access-Request packet. Once an Access-Request packet is received, the RADIUS server must forward a reply.

Access-Accept—Once a RADIUS server receives an Access-Request packet, it must send an Access-Accept packet if all attribute values in the Access-Request packet are acceptable. Access-Accept packets provide the configuration information necessary for the client to provide service to the user.

Access-Reject—Once a RADIUS server receives an Access-Request packet, it must send an Access-Reject packet if any of the attribute values are not acceptable.

Access-Challenge—Once the RADIUS server receives an Access-Accept packet, it can send the client an Access-Challenge packet, which requires a response. If the client does not know how to respond or if the packets are invalid, the RADIUS server discards the packets. If the client responds to the packet, a new Access-Request packet should be sent with the original Access-Request packet.

Accounting-Request—Sent from a client to a RADIUS accounting server, which provides accounting information. If the RADIUS server successfully records the Accounting-Request packet, it must submit an Accounting Response packet.

Accounting-Response—Sent by the RADIUS accounting server to the client to acknowledge that the Accounting-Request has been received and recorded successfully.

**RADIUS Files**

Understanding the types of files used by RADIUS is important for communicating AAA information from a client to a server. Each file defines a level of authentication or authorization for the user: The dictionary file defines which attributes the user’s NAS can implement; the clients file defines which users are allowed to make requests to the RADIUS server; the users files defines which user requests the RADIUS server will authenticate based on security and configuration data.

- Dictionary File
- Clients File
- Users File
Dictionary File

A dictionary file provides a list of attributes that are dependent upon which attributes your NAS supports. However, you can add your own set of attributes to your dictionary for custom solutions. It defines attribute values, thereby allowing you to interpret attribute output such as parsing requests. A dictionary file contains the following information:

- **Name**—The ASCII string “name” of the attribute, such as User-Name.
- **ID**—The numerical “name” of the attribute; for example, User-Name attribute is attribute 1.
- **Value type**—Each attribute can be specified as one of the following five value types:
  - **binary**—0 to 254 octets.
  - **date**—32-bit value in big endian order. For example, seconds since 00:00:00 GMT, JAN. 1, 1970.
  - **ipaddr**—4 octets in network byte order.
  - **integer**—32-bit value in big endian order (high byte first).
  - **string**—0 to 253 octets.

When the data type for a particular attribute is an integer, you can optionally expand the integer to equate to some string. The follow sample dictionary includes an integer-based attribute and its corresponding values:

```
# dictionary sample of integer entry
#
ATTRIBUTE       Service-Type            6 integer
VALUE           Service-Type            Login 1
VALUE           Service-Type            Framed 2
VALUE           Service-Type            Callback-Login 3
VALUE           Service-Type            Callback-Framed 4
VALUE           Service-Type            Outbound 5
VALUE           Service-Type            Administrative 6
VALUE           Service-Type            NAS-Prompt 7
VALUE           Service-Type            Authenticate-Only 8
VALUE           Service-Type            Callback-NAS-Prompt 9
VALUE           Service-Type            Call-Check 10
VALUE           Service-Type            Callback-Administrative 11
```

Clients File

A clients file is important because it contains a list of RADIUS clients that are allowed to send authentication and accounting requests to the RADIUS server. To receive authentication, the name and authentication key the client sends the server must be an exact match with the data contained in clients file.

The following is an example of a clients file. The key, as shown in this example, must be the same as the `radius-server key SomeSecret` command.

```
#Client Name    Key
#----------------  ---------------
10.1.2.3:256: test
nas01: bananas
nas02: MoNkBys
nas07.foo.com: SomeSecret
```
Users File

A RADIUS users file contains an entry for each user that the RADIUS server will authenticate; each entry, which is also referred to as a user profile, establishes an attribute the user can access.

The first line in any user profile is always a “user access” line; that is, the server must check the attributes on the first line before it can grant access to the user. The first line contains the name of the user, which can be up to 252 characters, followed by authentication information such as the password of the user.

Additional lines, which are associated with the user access line, indicate the attribute reply that is sent to the requesting client or server. The attributes sent in the reply must be defined in the dictionary file.

When looking at a user file, please note the the data to the left of the equal (=) character is an attribute defined in the dictionary file, and the data to the right of the equal character is the configuration data.

Note

A blank line cannot appear anywhere within a user profile.

The following is an example of a RADIUS user profile (Merit Daemon format). In this example, the user name is cisco.com, the password is cisco, and the user can access five tunnel attributes.

```
# This user profile includes RADIUS tunneling attributes
cisco.com  Password="cisco" Service-Type=Outbound
  Tunnel-Type = :1:L2TP
  Tunnel-Medium-Type = :1:IP
  Tunnel-Server-Endpoint = :1:10.0.0.1
  Tunnel-Password = :1:"welcome"
  Tunnel-Assignment-ID = :1:"nas"
```

Supporting Documentation

For more information on RADIUS IETF and Vendor-Proprietary Attributes, refer to the following documents:

- Cisco AAA Implementation Case Study
- IETF RADIUS RFCs
  - RFC 2865, Remote Authentication Dial In User Service (RADIUS)
  - RFC 2866, RADIUS Accounting
  - RFC 2867, RADIUS Accounting Modifications for Tunnel Protocol Support
  - RFC 2868, RADIUS Attributes for Tunnel Protocol Support
  - RFC 2869, RADIUS Extensions
- RADIUS Vendor-Specific Attributes Voice Implementation Guide
RADIUS IETF Attributes

Note

In the Cisco IOS Release 12.2 for RADIUS tunnel attributes, 32 tagged tunnel sets are supported for L2TP.

This section contains the following sections:

- Supported RADIUS IETF Attributes
- Comprehensive List of RADIUS Attribute Descriptions

Supported RADIUS IETF Attributes

Table 71 lists Cisco-supported IETF RADIUS attributes and the Cisco IOS release in which they are implemented. In cases where the attribute has a security server-specific format, the format is specified. Refer to Table 72 for a description of each listed attribute.

Note

Attributes implemented in special (AA) or early development (T) releases will be added to the next mainline image.

1. This RADIUS attribute complies with the following two draft IETF documents: RFC 2868 RADIUS Attributes for Tunnel Protocol Support and RFC 2867 RADIUS Accounting Modifications for Tunnel Protocol Support.

2. This RADIUS attribute complies with RFC 2865 and RFC 2868.
Comprehensive List of RADIUS Attribute Descriptions

Table 72 lists and describes IETF RADIUS attributes. In cases where the attribute has a security server-specific format, the format is specified.

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>User-Name</td>
<td>Indicates the name of the user being authenticated by the RADIUS server.</td>
</tr>
<tr>
<td>2</td>
<td>User-Password</td>
<td>Indicates the user’s password or the user’s input following an Access-Challenge. Passwords longer than 16 characters are encrypted using RFC 2865 specifications.</td>
</tr>
<tr>
<td>3</td>
<td>CHAP-Password</td>
<td>Indicates the response value provided by a PPP Challenge-Handshake Authentication Protocol (CHAP) user in response to an Access-Challenge.</td>
</tr>
<tr>
<td>4</td>
<td>NAS-IP Address</td>
<td>Specifies the IP address of the network access server that is requesting authentication. The default value is 0.0.0.0/0.</td>
</tr>
</tbody>
</table>
| 5      | NAS-Port         | Indicates the physical port number of the network access server that is authenticating the user. The NAS-Port value (32 bits) consists of one or two 16-bit values (depending on the setting of the `radius-server extended-portnames` command). Each 16-bit number should be viewed as a 5-digit decimal integer for interpretation as follows:

  For asynchronous terminal lines, async network interfaces, and virtual async interfaces, the value is `00ttt`, where `ttt` is the line number or async interface unit number.

  For ordinary synchronous network interface, the value is `10xxx`.

  For channels on a primary rate ISDN interface, the value is `2ppcc`.

  For channels on a basic rate ISDN interface, the value is `3bb0c`.

  For other types of interfaces, the value is `6nnss`. |
### RADIUS IETF Attributes

<td>• 4: Gandalf-proprietary single-link/multilink protocol</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 5: Xylogics-proprietary IPX/SLIP</td>
</tr>
<tr>
<td>8</td>
<td>Framed-IP-Address</td>
<td>Indicates the IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the access-request. To enable this command, use the <strong>radius-server attribute 8 include-in-access-req</strong> command in global configuration mode.</td>
</tr>
<tr>
<td>9</td>
<td>Framed-IP-Netmask</td>
<td>Indicates the IP netmask to be configured for the user when the user is a router to a network. This attribute value results in a static route being added for Framed-IP-Address with the mask specified.</td>
</tr>
</tbody>
</table>
### Table 72  RADIUS IETF Attributes (continued)

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Framed-Routing</td>
<td>Indicates the routing method for the user when the user is a router to a network. Only “None” and “Send and Listen” values are supported for this attribute. Routing method is indicated by a numeric value as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 0: None</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 1: Send routing packets</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 2: Listen for routing packets</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 3: Send routing packets and listen for routing packets</td>
</tr>
<tr>
<td>11</td>
<td>Filter-Id</td>
<td>Indicates the name of the filter list for the user and is formatted as follows: %d, %d.in, or %d.out. This attribute is associated with the most recent service-type command. For login and EXEC, use %d or %d.out as the line access list value from 0 to 199. For Framed service, use %d or %d.out as interface output access list, and %d.in for input access list. The numbers are self-encoding to the protocol to which they refer.</td>
</tr>
<tr>
<td>12</td>
<td>Framed-MTU</td>
<td>Indicates the maximum transmission unit (MTU) that can be configured for the user when the MTU is not negotiated by PPP or some other means.</td>
</tr>
<tr>
<td>13</td>
<td>Framed-Compression</td>
<td>Indicates a compression protocol used for the link. This attribute results in a “/compress” being added to the PPP or SLIP autocmd generated during EXEC authorization. Not currently implemented for non-EXEC authorization. Compression protocol is indicated by a numeric value as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 0: None</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 1: VJ-TCP/IP header compression</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 2: IPX header compression</td>
</tr>
<tr>
<td>14</td>
<td>Login-IP-Host</td>
<td>Indicates the host to which the user will connect when the Login-Service attribute is included. (This begins immediately after login.)</td>
</tr>
<tr>
<td>15</td>
<td>Login-Service</td>
<td>Indicates the service that should be used to connect the user to the login host. Service is indicated by a numeric value as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 0: Telnet</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 1: Rlogin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 2: TCP-Clear</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 3: PortMaster</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 4: LAT</td>
</tr>
<tr>
<td>16</td>
<td>Login-TCP-Port</td>
<td>Defines the TCP port with which the user is to be connected when the Login-Service attribute is also present.</td>
</tr>
<tr>
<td>18</td>
<td>Reply-Message</td>
<td>Indicates text that might be displayed to the user via the RADIUS server. You can include this attribute in user files; however, you cannot exceed a maximum of 16 Replyp-Message entries per profile.</td>
</tr>
<tr>
<td>19</td>
<td>Callback-Number</td>
<td>Defines a dialing string to be used for callback.</td>
</tr>
<tr>
<td>20</td>
<td>Callback-ID</td>
<td>Defines the name (consisting of one or more octets) of a place to be called, to be interpreted by the network access server.</td>
</tr>
</tbody>
</table>
RADIUS Attributes Overview and RADIUS IETF Attributes

RADIUS IETF Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>Framed-Route</td>
<td>Provides routing information to be configured for the user on this network access server. The RADIUS RFC format (net/bits [router [metric]]) and the old style dotted mask (net mask [router [metric]]) are supported. If the router field is omitted or 0, the peer IP address is used. Metrics are currently ignored. This attribute is access-request packets.</td>
</tr>
<tr>
<td>23</td>
<td>Framed-IPX-Network</td>
<td>Defines the IPX network number configured for the user.</td>
</tr>
<tr>
<td>24</td>
<td>State</td>
<td>Allows state information to be maintained between the network access server and the RADIUS server. This attribute is applicable only to CHAP challenges.</td>
</tr>
<tr>
<td>25</td>
<td>Class</td>
<td>(Accounting) Arbitrary value that the network access server includes in all accounting packets for this user if supplied by the RADIUS server.</td>
</tr>
<tr>
<td>26</td>
<td>Vendor-Specific</td>
<td>Allows vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option using the format recommended in the specification. Cisco's vendor-ID is 9, and the supported option has vendor-type 1, which is named “cisco-avpair.” The value is a string of the format: protocol : attribute sep value “Protocol” is a value of the Cisco “protocol” attribute for a particular type of authorization. “Attribute” and “value” are an appropriate AV pair defined in the Cisco TACACS+ specification, and “sep” is “=” for mandatory attributes and “*” for optional attributes. This allows the full set of features available for TACACS+ authorization to also be used for RADIUS. For example: cisco-avpair= &quot;ip:addr-pool=first&quot; cisco-avpair= &quot;shell:priv-lvl=15&quot; The first example causes Cisco’s “multiple named ip address pools” feature to be activated during IP authorization (during PPP’s IPCP address assignment). The second example causes a user logging in from a network access server to have immediate access to EXEC commands. Table 71 lists supported vendor-specific RADIUS attributes (IETF attribute 26). The “TACACS+ Attribute-Value Pairs” appendix provides a complete list of supported TACACS+ attribute-value (AV) pairs that can be used with IETF attribute 26. (RFC 2865)</td>
</tr>
<tr>
<td>27</td>
<td>Session-Timeout</td>
<td>Sets the maximum number of seconds of service to be provided to the user before the session terminates. This attribute value becomes the per-user “absolute timeout.”</td>
</tr>
<tr>
<td>28</td>
<td>Idle-Timeout</td>
<td>Sets the maximum number of consecutive seconds of idle connection allowed to the user before the session terminates. This attribute value becomes the per-user “session-timeout.”</td>
</tr>
<tr>
<td>29</td>
<td>Termination-Action</td>
<td>Termination is indicated by a numeric value as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0: Default</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1: RADIUS request</td>
</tr>
<tr>
<td>30</td>
<td>Called-Station-Id</td>
<td>(Accounting) Allows the network access server to send the telephone number the user called as part of the Access-Request packet (using Dialed Number Identification Service [DNIS] or similar technology). This attribute is only supported on ISDN, and modem calls on the Cisco AS5200 if used with PRI.</td>
</tr>
</tbody>
</table>
### Table 72  RADIUS IETF Attributes (continued)

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Calling-Station-Id</td>
<td>(Accounting) Allows the network access server to send the telephone number the call came from as part of the Access-Request packet (using Automatic Number Identification or similar technology). This attribute has the same value as “remote-addr” from TACACS+. This attribute is only supported on ISDN, and modem calls on the Cisco AS5200 if used with PRI.</td>
</tr>
<tr>
<td>32</td>
<td>NAS-Identifier</td>
<td>String identifying the network access server originating the Access-Request. Use the <code>radius-server attribute 32 include-in-access-req</code> global configuration command to send RADIUS attribute 32 in an Access-Request or Accounting-Request. By default, the FQDN is sent in the attribute when the format is not specified.</td>
</tr>
<tr>
<td>33</td>
<td>Proxy-State</td>
<td>Attribute that can be sent by a proxy server to another server when forwarding Access-Requests; this must be returned unmodified in the Access-Accept, Access-Reject or Access-Challenge and removed by the proxy server before sending the response to the network access server.</td>
</tr>
<tr>
<td>34</td>
<td>Login-LAT-Service</td>
<td>Indicates the system with which the user is to be connected by LAT. This attribute is only available in the EXEC mode.</td>
</tr>
<tr>
<td>35</td>
<td>Login-LAT-Node</td>
<td>Indicates the node with which the user is to be automatically connected by LAT.</td>
</tr>
<tr>
<td>36</td>
<td>Login-LAT-Group</td>
<td>Identifies the LAT group codes that this user is authorized to use.</td>
</tr>
<tr>
<td>37</td>
<td>Framed-AppleTalk-Link</td>
<td>Indicates the AppleTalk network number that should be used for serial links to the user, which is another AppleTalk router.</td>
</tr>
<tr>
<td>38</td>
<td>Framed-AppleTalk-Network</td>
<td>Indicates the AppleTalk network number that the network access server uses to allocate an AppleTalk node for the user.</td>
</tr>
<tr>
<td>39</td>
<td>Framed-AppleTalk-Zone</td>
<td>Indicates the AppleTalk Default Zone to be used for this user.</td>
</tr>
<tr>
<td>40</td>
<td>Acct-Status-Type</td>
<td>(Accounting) Indicates whether this Accounting-Request marks the beginning of the user service (start) or the end (stop).</td>
</tr>
<tr>
<td>41</td>
<td>Acct-Delay-Time</td>
<td>(Accounting) Indicates how many seconds the client has been trying to send a particular record.</td>
</tr>
<tr>
<td>42</td>
<td>Acct-Input-Octets</td>
<td>(Accounting) Indicates how many octets have been received from the port over the course of this service being provided.</td>
</tr>
<tr>
<td>43</td>
<td>Acct-Output-Octets</td>
<td>(Accounting) Indicates how many octets have been sent to the port in the course of delivering this service.</td>
</tr>
<tr>
<td>44</td>
<td>Acct-Session-Id</td>
<td>(Accounting) A unique accounting identifier that makes it easy to match start and stop records in a log file. Acct-Session ID numbers restart at 1 each time the router is power cycled or the software is reloaded. To send this attribute in access-request packets, use the <code>radius-server attribute 44 include-in-access-req</code> command in global configuration mode.</td>
</tr>
<tr>
<td>45</td>
<td>Acct-Authentic</td>
<td>(Accounting) Indicates how the user was authenticated, whether by RADIUS, the network access server itself, or another remote authentication protocol. This attribute is set to “radius” for users authenticated by RADIUS; “remote” for TACACS+ and Kerberos; or “local” for local, enable, line, and if-needed methods. For all other methods, the attribute is omitted.</td>
</tr>
<tr>
<td>46</td>
<td>Acct-Session-Time</td>
<td>(Accounting) Indicates how long (in seconds) the user has received service.</td>
</tr>
<tr>
<td>47</td>
<td>Acct-Input-Packets</td>
<td>(Accounting) Indicates how many packets have been received from the port over the course of this service being provided to a framed user.</td>
</tr>
</tbody>
</table>
### RADIUS IETF Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>48</td>
<td>Acct-Output-Packets</td>
<td>(Accounting) Indicates how many packets have been sent to the port in the course of delivering this service to a framed user.</td>
</tr>
<tr>
<td>49</td>
<td>Acct-Terminate-Cause</td>
<td>(Accounting) Reports details on why the connection was terminated. Termination causes are indicated by a numeric value as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. User request</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Lost carrier</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Lost service</td>

</tr>
<tr>
<td></td>
<td></td>
<td>17. User error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>18. Host request</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong>: For attribute 49, Cisco IOS supports values 1 to 6, 9, 12, and 15 to 18.</td>
</tr>
<tr>
<td>50</td>
<td>Acct-Multi-Session-Id</td>
<td>(Accounting) A unique accounting identifier used to link multiple related sessions in a log file. Each linked session in a multilink session has a unique Acct-Session-Id value, but shares the same Acct-Multi-Session-Id.</td>
</tr>
<tr>
<td>51</td>
<td>Acct-Link-Count</td>
<td>(Accounting) Indicates the number of links known in a given multilink session at the time an accounting record is generated. The network access server can include this attribute in any accounting request that might have multiple links.</td>
</tr>
<tr>
<td>52</td>
<td>Acct-Input-Gigawords</td>
<td>Indicates how many times the Acct-Input-Octets counter has wrapped around $2^{32}$ over the course of the provided service.</td>
</tr>
<tr>
<td>53</td>
<td>Acct-Output-Gigawords</td>
<td>Indicates how many times the Acct-Output-Octets counter has wrapped around $2^{32}$ while delivering service.</td>
</tr>
</tbody>
</table>
### Table 72  RADIUS IETF Attributes (continued)

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>55</td>
<td>Event-Timestamp</td>
<td>Records the time that the event occurred on the NAS; the timestamp sent in attribute 55 is in seconds since January 1, 1970 00:00 UTC. To send RADIUS attribute 55 in accounting packets, use the <code>radius-server attribute 55 include-in-acct-req</code> command. <strong>Note</strong> Before the Event-Timestamp attribute can be sent in accounting packets, you must configure the clock on the router. (For information on setting the clock on your router, refer to section “Performing Basic System Management” in the chapter “System Management” of the <em>Cisco IOS Configuration Fundamentals Configuration Guide</em>.) To avoid configuring the clock on the router every time the router is reloaded, you can enable the <code>clock calendar-valid</code> command. (For information on this command, refer to the chapter “Basic System Management Commands” in the <em>Cisco IOS Configuration Fundamentals Command Reference</em>.</td>
</tr>
<tr>
<td>60</td>
<td>CHAP-Challenge</td>
<td>Contains the Challenge Handshake Authentication Protocol challenge sent by the network access server to a PPP CHAP user.</td>
</tr>
</tbody>
</table>
| 61     | NAS-Port-Type    | Indicates the type of physical port the network access server is using to authenticate the user. Physical ports are indicated by a numeric value as follows:  
- 0: Asynchronous  
- 1: Synchronous  
- 2: ISDN-Synchronous  
- 3: ISDN-Asynchronous (V.120)  
- 4: ISDN-Asynchronous (V.110)  
- 5: Virtual |
| 62     | Port-Limit       | Sets the maximum number of ports provided to the user by the NAS. |
| 63     | Login-LAT-Port   | Defines the port with which the user is to be connected by LAT. |
| 64     | Tunnel-Type\(^1\) | Indicates the tunneling protocol(s) used. Cisco IOS software supports two possible values for this attribute: L2TP and L2F. If this attribute is not set, L2F is used as a default. |
| 65     | Tunnel-Medium-Type\(^1\) | Indicates the transport medium type to use to create a tunnel. This attribute has only one available value for this release: IP. If no value is set for this attribute, IP is used as the default. |
### RADIUS IETF Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| 66     | Tunnel-Client-Endpoint            | Contains the address of the initiator end of the tunnel. It may be included in both Access-Request and Access-Accept packets to indicate the address from which a new tunnel is to be initiated. If the Tunnel-Client-Endpoint attribute is included in an Access-Request packet, the RADIUS server should take the value as a hint; the server is not obligated to honor the hint, however. This attribute should be included in Accounting-Request packets that contain Acct-Status-Type attributes with values of either Start or Stop, in which case it indicates the address from which the tunnel was initiated. This attribute, along with the Tunnel-Server-Endpoint and Acct-Tunnel-Connection-ID attributes, may be used to provide a globally unique means to identify a tunnel for accounting and auditing purposes. An enhancement has been added for the network access server to accept a value of 127.0.0.X for this attribute such that:

- 127.0.0.0 would indicate that loopback0 IP address is to be used
- 127.0.0.1 would indicate that loopback1 IP address is to be used
- ... 127.0.0.X would indicate that loopbackX IP address is to be used for the actual tunnel client endpoint IP address. This enhancement adds scalability across multiple network access servers. |
<p>| 67     | Tunnel-Server-Endpoint            | Indicates the address of the server end of the tunnel. The format of this attribute varies depending on the value of Tunnel-Medium-Type. Because this release only supports IP as a tunnel medium type, the IP address or the host name of LNS is valid for this attribute.                                                                                                                                               |
| 68     | Acct-Tunnel-Connection-ID         | Indicates the identifier assigned to the tunnel session. This attribute should be included in Accounting-Request packets that contain an Acct-Status-Type attribute having the value Start, Stop, or any of the values described above. This attribute, along with the Tunnel-Client-Endpoint and Tunnel-Server-Endpoint attributes, may be used to provide a means to uniquely identify a tunnel session for auditing purposes. |
| 69     | Tunnel-Password                   | Defines the password to be used to authenticate to a remote server. This attribute is converted into different AAA attributes based on the value of Tunnel-Type: AAA_ATTR_l2tp_tunnel_pw (L2TP), AAA_ATTR_nas_password (L2F), and AAA_ATTR_gw_password (L2F). By default, all passwords received are encrypted, which can cause authorization failures when a NAS attempts to decrypt a non-encrypted password. To enable attribute 69 to receive non-encrypted passwords, use the radius-server attribute 69 clear global configuration command. |
| 70     | ARAP-Password                     | Identifies an Access-Request packet containing a Framed-Protocol of ARAP.                                                                                                                                                                                                                                                                 |
| 71     | ARAP-Features                     | Includes password information that the NAS should send to the user in an ARAP “feature flags” packet.                                                                                                                                                                                                                                   |
| 72     | ARAP-Zone-Access                  | Indicates how the ARAP zone list for the user should be used.                                                                                                                                                                                                                                                                            |
| 73     | ARAP-Security                     | Identifies the ARAP Security Module to be used in an Access-Challenge packet.                                                                                                                                                                                                                                                            |
| 74     | ARAP-Security-Data                | Contains the actual security module challenge or response. It can be found in Access-Challenge and Access-Request packets.                                                                                                                                                                                                             |
| 75     | Password-Retry                    | Indicates how many times a user may attempt authentication before being disconnected.                                                                                                                                                                                                                                                 |</p>
<table>

<th>IETF Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>76</td>
<td>Prompt</td>
<td>Indicates to the NAS whether it should echo the user’s response as it is entered or not echo it. (0=no echo, 1=echo)</td>
</tr>
<tr>
<td>77</td>
<td>Connect-Info</td>
<td>Provides additional call information for modem calls. This attribute is generated in start and stop accounting records.</td>
</tr>
<tr>
<td>78</td>
<td>Configuration-Token</td>
<td>Indicates a type of user profile to be used. This attribute should be used in large distributed authentication networks based on proxy. It is sent from a RADIUS Proxy Server to a RADIUS Proxy Client in an Access-Accept; it should not be sent to a NAS.</td>
</tr>
<tr>
<td>79</td>
<td>EAP-Message</td>
<td>Encapsulates Extended Access Protocol (EAP) packets that allow the NAS to authenticate dial-in users via EAP without having to understand the EAP protocol.</td>
</tr>
<tr>
<td>80</td>
<td>Message-Authenticator</td>
<td>Prevents spoofing Access-Requests using CHAP, ARAP, or EAP authentication methods.</td>
</tr>
<tr>
<td>81</td>
<td>Tunnel-Private-Group-ID</td>
<td>Indicates the group ID for a particular tunneled session.</td>
</tr>
<tr>
<td>82</td>
<td>Tunnel-Assignment-ID</td>
<td>Indicates to the tunnel initiator the particular tunnel to which a session is assigned.</td>
</tr>
<tr>
<td>83</td>
<td>Tunnel-Preference</td>
<td>Indicates the relative preference assigned to each tunnel. This attribute should be included if more than one set of tunneling attributes is returned by the RADIUS server to the tunnel initiator.</td>
</tr>
<tr>
<td>84</td>
<td>ARAP-Challenge-Response</td>
<td>Contains the response to the challenge of the dial-in client.</td>
</tr>
<tr>
<td>85</td>
<td>Acct-Interim-Interval</td>
<td>Indicates the number of seconds between each interim update in seconds for this specific session. This value can only appear in the Access-Accept message.</td>
</tr>
<tr>
<td>86</td>
<td>Acct-Tunnel-Packets-Lost</td>
<td>Indicates the number of packets lost on a given link. This attribute should be included in Accounting-Request packets that contain an Acct-Status-Type attribute having the value Tunnel-Link-Stop.</td>
</tr>
<tr>
<td>87</td>
<td>NAS-Port-ID</td>
<td>Contains a text string which identifies the port of the NAS that is authenticating the user.</td>
</tr>
<tr>
<td>88</td>
<td>Framed-Pool</td>
<td>Contains the name of an assigned address pool that should be used to assign an address for the user. If a NAS does not support multiple address pools, the NAS should ignore this attribute.</td>
</tr>
<tr>
<td>90</td>
<td>Tunnel-Client-Auth-ID</td>
<td>Specifies the name used by the tunnel initiator (also known as the NAS) when authenticating tunnel setup with the tunnel terminator. Supports L2F and L2TP protocols.</td>
</tr>
<tr>
<td>91</td>
<td>Tunnel-Server-Auth-ID</td>
<td>Specifies the name used by the tunnel terminator (also known as the Home Gateway) when authenticating tunnel setup with the tunnel initiator. Supports L2F and L2TP protocols.</td>
</tr>
<tr>
<td>200</td>
<td>IETF-Token-Immediate</td>
<td>Determines how RADIUS treats passwords received from login-users when their file entry specifies a hand-held security card server. The value for this attribute is indicated by a numeric value as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0: No, meaning that the password is ignored.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1: Yes, meaning that the password is used for authentication.</td>
</tr>
</tbody>
</table>

1. This RADIUS attribute complies with the following two IETF documents: RFC 2868, RADIUS Attributes for Tunnel Protocol Support and RFC 2867, RADIUS Accounting Modifications for Tunnel Protocol Support.
Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.

© 2007 Cisco Systems, Inc. All rights reserved.
The IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the network access server and the RADIUS server. However, some vendors have extended the RADIUS attribute set for specific applications. This document provides Cisco IOS support information for these vendor-proprietary RADIUS attributes.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Feature Information for RADIUS Vendor-Proprietary Attributes” section on page 13. Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Supported Vendor-Proprietary RADIUS Attributes

Table 73 lists Cisco-supported vendor-proprietary RADIUS attributes and the Cisco IOS release in which they are implemented. In cases where the attribute has a security server-specific format, the format is specified. Refer to Table 74 for a list of descriptions.
Attributes implemented in special (AA) or early development (T) releases will be added to the next mainline image.

### Table 74  Vendor-Proprietary RADIUS Attributes (continued)

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Proprietary Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>187</td>
<td>Multilink-ID</td>
<td>Reports the identification number of the multilink bundle when the session closes. This attribute applies to sessions that are part of a multilink bundle. The Multilink-ID attribute is sent in authentication-response packets.</td>
</tr>
<tr>
<td>188</td>
<td>Num-In-Multilink</td>
<td>Reports the number of sessions remaining in a multilink bundle when the session reported in an accounting-stop packet closes. This attribute applies to sessions that are part of a multilink bundle. The Num-In-Multilink attribute is sent in authentication-response packets and in some accounting-request packets.</td>
</tr>
<tr>
<td>189</td>
<td>First-Dest</td>
<td>Records the destination IP address of the first packet received after authentication.</td>
</tr>
<tr>
<td>190</td>
<td>Pre-Input-Octets</td>
<td>Records the number of input octets before authentication. The Pre-Input-Octets attribute is sent in accounting-stop records.</td>
</tr>
<tr>
<td>191</td>
<td>Pre-Output-Octets</td>
<td>Records the number of output octets before authentication. The Pre-Output-Octets attribute is sent in accounting-stop records.</td>
</tr>
<tr>
<td>192</td>
<td>Pre-Input-Packets</td>
<td>Records the number of input packets before authentication. The Pre-Input-Packets attribute is sent in accounting-stop records.</td>
</tr>
<tr>
<td>193</td>
<td>Pre-Output-Packets</td>
<td>Records the number of output packets before authentication. The Pre-Output-Packets attribute is sent in accounting-stop records.</td>
</tr>
<tr>
<td>194</td>
<td>Maximum-Time</td>
<td>Specifies the maximum length of time (in seconds) allowed for any session. After the session reaches the time limit, its connection is dropped.</td>
</tr>
<tr>
<td>195</td>
<td>Disconnect-Cause</td>
<td>Specifies the reason a connection was taken offline. The Disconnect-Cause attribute is sent in accounting-stop records. This attribute also causes stop records to be generated without first generating start records if disconnection occurs before authentication is performed. For more information, refer to the table of Disconnect-Cause Attribute Values and their meanings.</td>
</tr>
<tr>
<td>196</td>
<td>Connect-Progress</td>
<td>Indicates the connection state before the connection is disconnected.</td>
</tr>
<tr>
<td>197</td>
<td>Data-Rate</td>
<td>Specifies the average number of bits per second over the course of the connection’s lifetime. The Data-Rate attribute is sent in accounting-stop records.</td>
</tr>
<tr>
<td>198</td>
<td>PreSession-Time</td>
<td>Specifies the length of time, in seconds, from when a call first connects to when it completes authentication. The PreSession-Time attribute is sent in accounting-stop records.</td>
</tr>
<tr>
<td>199</td>
<td>Token-Idle</td>
<td>Indicates the maximum amount of time (in minutes) a cached token can remain alive between authentications.</td>
</tr>
<tr>
<td>201</td>
<td>Require-Auth</td>
<td>Defines whether additional authentication is required for class that has been CLID authenticated.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Proprietary Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>202</td>
<td>Number-Sessions</td>
<td>Specifies the number of active sessions (per class) reported to the RADIUS accounting server.</td>
</tr>
<tr>
<td>203</td>
<td>Authen-Alias</td>
<td>Defines the RADIUS server’s login name during PPP authentication.</td>
</tr>
<tr>
<td>204</td>
<td>Token-Expired</td>
<td>Defines the lifetime of a cached token.</td>
</tr>
<tr>
<td>205</td>
<td>Menu-Selector</td>
<td>Defines a string to be used to cue a user to input data.</td>
</tr>
<tr>
<td>206</td>
<td>Menu-Item</td>
<td>Specifies a single menu-item for a user-profile. Up to 20 menu items can be assigned per profile.</td>
</tr>
<tr>
<td>207</td>
<td>PW-Warntime</td>
<td>(Ascend 5) No description available.</td>
</tr>
<tr>
<td>208</td>
<td>PW-Lifetime</td>
<td>Enables you to specify on a per-user basis the number of days that a password is valid.</td>
</tr>
<tr>
<td>209</td>
<td>IP-Direct</td>
<td>When you include this attribute in a user’s file entry, a framed route is installed to the routing and bridging tables. <strong>Note</strong> Packet routing is dependent upon the entire table, not just this newly installed entry. The inclusion of this attribute does not guarantee that all packets should be sent to the specified IP address; thus, this attribute is not fully supported. These attribute limitations occur because the Cisco router cannot bypass all internal routing and bridging tables and send packets to a specified IP address.</td>
</tr>
<tr>
<td>210</td>
<td>PPP-VJ-Slot-Comp</td>
<td>Instructs the Cisco router not to use slot compression when sending VJ-compressed packets over a PPP link.</td>
</tr>
<tr>
<td>211</td>
<td>PPP-VJ-1172</td>
<td>Instructs PPP to use the 0x0037 value for VJ compression.</td>
</tr>
<tr>
<td>212</td>
<td>PPP-Async-Map</td>
<td>Gives the Cisco router the asynchronous control character map for the PPP session. The specified control characters are passed through the PPP link as data and used by applications running over the link.</td>
</tr>
<tr>
<td>213</td>
<td>Third-Prompt</td>
<td>Defines a third prompt (after username and password) for additional user input.</td>
</tr>
<tr>
<td>214</td>
<td>Send-Secret</td>
<td>Enables an encrypted password to be used in place of a regular password in outdial profiles.</td>
</tr>
<tr>
<td>215</td>
<td>Receive-Secret</td>
<td>Enables an encrypted password to be verified by the RADIUS server.</td>
</tr>
<tr>
<td>216</td>
<td>IPX-Peer-Mode</td>
<td>(Ascend 5) No description available.</td>
</tr>
<tr>
<td>217</td>
<td>IP-Pool-Definition</td>
<td>Defines a pool of addresses using the following format: X a.b.c Z; where X is the pool index number, a.b.c is the pool’s starting IP address, and Z is the number of IP addresses in the pool. For example, 3 10.0.0.1 5 allocates 10.0.0.1 through 10.0.0.5 for dynamic assignment.</td>
</tr>
<tr>
<td>218</td>
<td>Assign-IP-Pool</td>
<td>Tells the router to assign the user and IP address from the IP pool.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Proprietary Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>219</td>
<td>FR-Direct</td>
<td>Defines whether the connection profile operates in Frame Relay redirect mode.</td>
</tr>
<tr>
<td>220</td>
<td>FR-Direct-Profile</td>
<td>Defines the name of the Frame Relay profile carrying this connection to the Frame Relay switch.</td>
</tr>
<tr>
<td>221</td>
<td>FR-Direct-DLCI</td>
<td>Indicates the DLCI carrying this connection to the Frame Relay switch.</td>
</tr>
<tr>
<td>222</td>
<td>Handle-IPX</td>
<td>Indicates how NCP watchdog requests will be handled.</td>
</tr>
<tr>
<td>223</td>
<td>Netware-Timeout</td>
<td>Defines, in minutes, how long the RADIUS server responds to NCP watchdog packets.</td>
</tr>
<tr>
<td>224</td>
<td>IPX-Alias</td>
<td>Allows you to define an alias for IPX routers requiring numbered interfaces.</td>
</tr>
<tr>
<td>225</td>
<td>Metric</td>
<td>No description available.</td>
</tr>
<tr>
<td>226</td>
<td>PRI-Number-Type</td>
<td>No description available.</td>
</tr>
<tr>
<td>227</td>
<td>Dial-Number</td>
<td>Defines the number to dial.</td>
</tr>
<tr>
<td>228</td>
<td>Route-IP</td>
<td>Indicates whether IP routing is allowed for the user’s file entry.</td>
</tr>
<tr>
<td>229</td>
<td>Route-IPX</td>
<td>Allows you to enable IPX routing.</td>
</tr>
<tr>
<td>230</td>
<td>Bridge</td>
<td>No description available.</td>
</tr>
<tr>
<td>231</td>
<td>Send-Auth</td>
<td>Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.</td>
</tr>
<tr>
<td>232</td>
<td>Send-Passwd</td>
<td>Enables the RADIUS server to specify the password that is sent to the remote end of a connection on outgoing calls.</td>
</tr>
<tr>
<td>233</td>
<td>Link-Compression</td>
<td>Defines whether to turn on or turn off “stac” compression over a PPP link.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Link compression is defined as a numeric value as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0: None</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1: Stac</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 2: Stac-Draft-9</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 3: MS-Stac</td>
</tr>
<tr>
<td>234</td>
<td>Target-Util</td>
<td>Specifies the load-threshold percentage value for bringing up an additional channel when PPP multilink is defined.</td>
</tr>
<tr>
<td>235</td>
<td>Maximum-Channels</td>
<td>Specifies allowed/allocatable maximum number of channels.</td>
</tr>
<tr>
<td>236</td>
<td>Inc-Channel-Count</td>
<td>No description available.</td>
</tr>
<tr>
<td>237</td>
<td>Dec-Channel-Count</td>
<td>No description available.</td>

<tbody>
<tr>
<td>242</td>
<td>Data-Filter</td>
<td>Defines per-user IP data filters. These filters are retrieved only when a call is placed using a RADIUS outgoing profile or answered using a RADIUS incoming profile. Filter entries are applied on a first-match basis; therefore, the order in which filter entries are entered is important.</td>
</tr>
<tr>
<td>243</td>
<td>Call-Filter</td>
<td>Defines per-user IP data filters. On a Cisco router, this attribute is identical to the Data-Filter attribute.</td>
</tr>
<tr>
<td>244</td>
<td>Idle-Limit</td>
<td>Specifies the maximum time (in seconds) that any session can be idle. When the session reaches the idle time limit, its connection is dropped.</td>
</tr>
<tr>
<td>245</td>
<td>Preempt-Limit</td>
<td>No description available.</td>
</tr>
<tr>
<td>246</td>
<td>Callback</td>
<td>Allows you to enable or disable callback.</td>
</tr>
<tr>
<td>247</td>
<td>Data-Svc</td>
<td>No description available.</td>
</tr>
<tr>
<td>248</td>
<td>Force-56</td>
<td>Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.</td>
</tr>
<tr>
<td>249</td>
<td>Billing Number</td>
<td>No description available.</td>
</tr>

For more information on vendor-propritary RADIUS attributes, refer to the section “Configuring Router for Vendor-Proprietary RADIUS Server Communication” in the chapter “Configuring RADIUS.”
Feature Information for RADIUS Vendor-Proprietary Attributes

Table 75 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 75 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

<table>
<thead>

</thead>
<tbody>
<tr>
<td>RADIUS Vendor-Proprietary Attributes</td>
<td>12.2(1)XE</td>
<td>The IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the network access server and the RADIUS server. However, some vendors have extended the RADIUS attribute set for specific applications. This document provides Cisco IOS support information for these vendor-proprietary RADIUS attributes. In 12.2(1) XE, this feature was introduced.</td>

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the network access server and the RADIUS server by using the vendor-specific attribute (attribute 26). Attribute 26 encapsulates vendor specific attributes, thereby, allowing vendors to support their own extended attributes otherwise not suitable for general use.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for RADIUS Vendor-Specific Attributes (VSA) and RADIUS Disconnect-Cause Attribute Values” section on page 14.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Information About RADIUS Vendor-Specific Attributes (VSA) and RADIUS Disconnect-Cause Attribute Values

The Cisco RADIUS implementation supports one vendor-specific option using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named “cisco-avpair.” The value is a string of the following format:

```
protocol : attribute sep value *
```

“Protocol” is a value of the Cisco “protocol” attribute for a particular type of authorization; protocols that can be used include IP, IPX, VPDN, VOIP, SHELL, RSVP, SIP, AIRNET, OUTBOUND. “Attribute” and “value” are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and “sep” is “=” for mandatory attributes and “*” for optional attributes. This allows the full set of features available for TACACS+ authorization to also be used for RADIUS.

For example, the following AV pair causes Cisco’s “multiple named ip address pools” feature to be activated during IP authorization (during PPP’s IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

If you insert an “*”, the AV pair “ip:addr-pool=first” becomes optional. Note that any AV pair can be made optional.

```
cisco-avpair= "ip:addr-pool*first"
```

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

Attribute 26 contains the following three elements:

- Type
- Length
- String (also known as data)
  - Vendor-Id
  - Vendor-Type
  - Vendor-Length
  - Vendor-Data

Figure 1 shows the packet format for a VSA encapsulated “behind” attribute 26.
It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor's definition of that attribute.

Table 2 lists supported vendor-specific RADIUS attributes (IETF attribute 26). Table 1 describes significant fields listed in the Table 2.

**Table 1**  
**Vendor-Specific Attributes Table Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>All attributes listed in the following table are extensions of IETF attribute 26.</td>
</tr>
<tr>
<td>Vendor-Specific Command Codes</td>
<td>A defined code used to identify a particular vendor. Code 9 defines Cisco VSAs, 311 defines Microsoft VSAs, and 529 defines Ascend VSAs.</td>
</tr>
<tr>
<td>Sub-Type Number</td>
<td>The attribute ID number. This number is much like the ID numbers of IETF attributes, except it is a “second layer” ID number encapsulated behind attribute 26.</td>
</tr>
<tr>
<td>Attribute</td>
<td>The ASCII string name of the attribute.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the attribute.</td>
</tr>
</tbody>
</table>

<td></td>
<td>(cont.)</td>
</tr>
</tbody>
</table>

Note (vendor-data)
26 9 1 l2tp-drop-out-of-order Respects sequence numbers on data packets by dropping those that are received out of order. This does not ensure that sequence numbers will be sent on data packets, just how to handle them if they are received.

26 9 1 l2tp-hello-interval Specifies the number of seconds for the hello keepalive interval. Hello packets are sent when no data has been sent on a tunnel for the number of seconds configured here.

26 9 1 l2tp-hidden-avp When enabled, sensitive AVPs in L2TP control messages are scrambled or hidden.

26 9 1 l2tp-nosession-timeout Specifies the number of seconds that a tunnel will stay active with no sessions before timing out and shutting down.

26 9 1 tunnel-tos-reflect Copies the IP ToS field from the IP header of each payload packet to the IP header of the tunnel packet for packets entering the tunnel at the LNS.

26 9 1 l2tp-tunnel-authen If this attribute is set, it performs L2TP tunnel authentication.

26 9 1 l2tp-tunnel-password Shared secret used for L2TP tunnel authentication and AVP hiding.

26 9 1 l2tp-udp-checksum This is an authorization attribute and defines whether L2TP should perform UDP checksums for data packets. Valid values are “yes” and “no.” The default is no.

### Store and Forward Fax Attributes

26 9 3 Fax-Account-Id-Origin Indicates the account ID origin as defined by system administrator for the mmoip aaa receive-id or the mmoip aaa send-id commands.

26 9 4 Fax_Msg_Ind= Indicates a unique fax message identification number assigned by Store and Forward Fax.

26 9 5 Fax-Pages Indicates the number of pages transmitted or received during this fax session. This page count includes cover pages.

26 9 6 Fax-Coverpage-Flag Indicates whether or not a cover page was generated by the off-ramp gateway for this fax session. True indicates that a cover page was generated; false means that a cover page was not generated.

26 9 7 Fax-Modem-Time Indicates the amount of time in seconds the modem sent fax data (x) and the amount of time in seconds of the total fax session (y), which includes both fax-mail and PSTN time, in the form x/y. For example, 10/15 means that the transfer time took 10 seconds, and the total fax session took 15 seconds.

<td>Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-auth</td>
<td>Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.</td>
</tr>
</tbody>
</table>
PPP name authentication. To apply for PAP, do not configure the `ppp pap sent-name password` command on the interface. For PAP, “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For CHAP, “preauth:send-name” will be used not only for outbound authentication, but also for inbound authentication. For a CHAP inbound case, the NAS will use the name defined in “preauth:send-name” in the challenge packet to the caller box.

Note: The `send-name` attribute has changed over time: Initially, it performed the functions now provided by both the `send-name` and `remote-name` attributes. Because the `remote-name` attribute has been added, the `send-name` attribute is restricted to its current behavior.

PPP password authentication. The vendor-specific attributes (VSAs) “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For a CHAP outbound case, both “preauth:send-name” and “preauth:send-secret” will be used in the response packet.

Provides the name of the remote host for use in large-scale dial-out. Dialer checks that the large-scale dial-out remote name matches the authenticated name, to protect against accidental user RADIUS misconfiguration. (For example, dialing a valid phone number but connecting to the wrong router.)

</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>spi</td>
<td>Carries the authentication information needed by the home agent to authenticate a mobile node during registration. The information is in the same syntax as the <code>ip mobile secure host &lt;addr&gt;</code> configuration command. Basically it contains the rest of the configuration command that follows that string, verbatim. It provides the Security Parameter Index (SPI), key, authentication algorithm, authentication mode, and replay protection timestamp range.</td>
</tr>
</tbody>
</table>

For more information on configuring your NAS to recognize and use VSAs, refer to the section “Configuring Router to Use Vendor-Specific RADIUS Attributes” of the chapter “Configuring RADIUS.”

### RADIUS Disconnect-Cause Attribute Values

Disconnect-cause attribute values specify the reason a connection was taken offline. The attribute values are sent in Accounting request packets. These values are sent at the end of a session, even if the session fails to be authenticated. If the session is not authenticated, the attribute can cause stop records to be generated without first generating start records.

Table 3 lists the cause codes, values, and descriptions for the Disconnect-Cause (195) attribute.

**Note**  
The Disconnect-Cause is incremented by 1000 when it is used in RADIUS AVPairs; for example, disc-cause 4 becomes 1004.

Table 3  
**Disconnect-Cause Attribute Values**

<table>
<thead>
<tr>
<th>Cause Code</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No-Reason</td>
<td>No reason is given for the disconnect.</td>
</tr>
<tr>
<td>1</td>
<td>No-Disconnect</td>
<td>The event was not disconnected.</td>
</tr>
<tr>
<td>2</td>
<td>Unknown</td>
<td>Reason unknown.</td>
</tr>
<tr>
<td>3</td>
<td>Call-Disconnect</td>
<td>The call has been disconnected.</td>

Feature Information for RADIUS Vendor-Specific Attributes (VSA) and RADIUS Disconnect-Cause Attribute Values

Table 4 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note: Table 4 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Connect-Info RADIUS Attribute 77

The Connect-Info RADIUS Attribute 77 feature enables the Network Access Server (NAS) to report Connect-Info (attribute 77) in RADIUS accounting “start” and “stop” records that are sent to the RADIUS client (dial-in modem). These records allow the transmit and receive connection speeds, modulation, and compression to be compared in order to analyze a user session over a dial-in modem where speeds are often different at the end of the connection (after negotiation).

When the network access server (NAS) sends attribute 77 in accounting “start” and “stop” records, the connect rates can be measured across the platform. The “transmit” speed (the speed at which the NAS modem sends information) and “receive” speed (the speed at which the NAS receives information) can be recorded to determine whether user modem connections renegotiate to lower speeds shortly into a session. If the transmit and receive speeds are different from each other, attribute 77 reports both speeds, which allows the modem connection speeds that each customer gets from their session.

Attribute 77 is also used to send the Class string for broadband connections such as PPPoX, physical connection speeds for dial access, and the VRF string for any sessions on router interfaces defined with `ip vrf forwarding` command.

**Note**
This feature requires no configuration.

**Finding Feature Information in This Module**

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Connect-Info RADIUS Attribute 77” section on page 5.

**Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
Contents

- Prerequisites for Connect-Info RADIUS Attribute 77, page 2
- How to Verify the Connect-Info RADIUS Attribute 77, page 2
- Configuration Example for Connect-Info RADIUS Attribute 77, page 3
- Additional References, page 3
- Command Reference, page 4
- Feature Information for Connect-Info RADIUS Attribute 77, page 5

Prerequisites for Connect-Info RADIUS Attribute 77

Before the NAS can send attribute 77 in accounting “start” and “stop” records, you must perform the following tasks:

- Configure your NAS for authentication, authorization, and accounting (AAA) and to accept incoming modem calls.
- Enable AAA accounting by using the `aaa accounting network default start-stop group radius` command in global configuration mode.
- Change the modem poll timer by using the `modem link-info poll time` command in global configuration mode. (Changing the modem poll timer is required on all supported platforms except the Cisco AS5400).

How to Verify the Connect-Info RADIUS Attribute 77

To verify attribute 77 in your accounting “start” and “stop” records, use the `debug radius` privileged EXEC command. The following example shows that `Connect-Info` appears in the first and last accounting attributes:

```
Router# debug radius

RADIUS: code=Acct-Request id=04 len=0134
    authenticator=BE A2 F3 BD EE CE 89 C7 - 48 19 32 F5 79 84 94 D5
    T=Connect-Info[77] L=17 V="31200/33600 V34+/LAPM"
    T=Acct-Status-Type[40] L=06 V=Start [1]
    ...

RADIUS: code=Acct-Request id=07 len=0226
    authenticator=06 AC 03 10 4A 84 44 A4 - 6F D9 68 AA B3 90 44 CB
    T=Connect-Info[77] L=1F V="33600 V34+/LAPM (31200/336"
    T=Acct-Status-Type[40] L=06 V=Stop [2]
    ...
```

Note: If the modem negotiation speeds are different, the speeds are shown in a bracket format at the end of the call.
Configuration Example for Connect-Info RADIUS Attribute 77

This section provides the following configuration example:

- Configure NAS for AAA and Incoming Modem Calls Example

Configure NAS for AAA and Incoming Modem Calls Example

The following example is a sample NAS configuration for AAA and incoming modem calls:

```plaintext
interface Serial0:15
  no ip address
  isdn switch-type primary-net5
  isdn incoming-voice modem
!
interface Async1
  ip address 10.0.0.10 255.0.0.0
  encapsulation ppp
  async default routing
  async mode interactive
  no peer default ip address
  ppp authentication chap
!
line 1
  modem InOu
  transport preferred none
  transport input all
  autoselect ppp
!
```

Encrypted Vendor-Specific Attributes

First Published: February 25, 2002
Last Updated: December 3, 2007

The Encrypted Vendor-Specific Attributes feature provides users with a way to centrally manage filters at a RADIUS server and supports the following types of string vendor-specific attributes (VSAs):

- **Tagged String VSA** (similar to Cisco VSA type 1 (Cisco:AVPair (1)) except that this new VSA is tagged)
- **Encrypted String VSA** (similar to Cisco VSA type 1 except that this new VSA is encrypted)
- **Tagged and Encrypted String VSA** (similar to Cisco VSA type 1 except that this new VSA is tagged and encrypted)

Cisco:AVPairs specify additional authentication and authorization information in the form an Attribute-Value Pair (AVPair) string. When Internet Engineering Task Force (IETF) RADIUS attribute 26 (Vendor-Specific) is transmitted with a vendor-Id number of “9” and a vendor-type value of “1” (which means that it is a Cisco AVPair), the RADIUS user profile format for a Cisco AVPair looks as follows: Cisco:AVPair = “protocol:attribute=value”.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Encrypted Vendor-Specific Attributes” section on page 7.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Contents

- Prerequisites for Encrypted Vendor-Specific Attributes, page 2

- Additional References, page 5
- Command Reference, page 6
- Feature Information for Encrypted Vendor-Specific Attributes, page 7

Prerequisites for Encrypted Vendor-Specific Attributes

Before the RADIUS server can accept tagged and encrypted VSAs, you must configure your server for AAA authentication and authorization and to accept PPP calls.

Information About Encrypted Vendor-Specific Attributes

The following sections describe packet encryption formats for the different VSAs:

- Tagged String VSA
- Encrypted String VSA
- Tagged and Encrypted String VSA

Tagged String VSA

Figure 1 displays the packet format for the Tagged String VSA:

Figure 1: Tagged String VSA Format

<table>
<thead>
<tr>
<th>Tagged String VSA</th>
<th>Type (26)</th>
<th>Length</th>
<th>Vendor-ID (9)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Vendor-ID (cont.)</td>
<td>Vendor-type (1)</td>
<td>Vendor-length</td>
</tr>
<tr>
<td>Tag</td>
<td>Attribute string ....</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To retrieve the correct value, the Tag field must be parsed correctly. The value for this field can range only from 0x01 through 0x1F. If the value is not within the specified range, the RADIUS server ignores the value and considers the Tag field to be a part of the Attribute String field.

### Encrypted String VSA

Figure 2 displays the packet format for the Encrypted String VSA:

<table>
<thead>
<tr>
<th>Encrypted String VSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type (26)</td>
</tr>
<tr>
<td>Vendor-ID (cont.)</td>
</tr>
<tr>
<td>Salt</td>
</tr>
</tbody>
</table>

The Salt field ensures the uniqueness of the encryption key that is used to encrypt each instance of the VSA. The first and most significant bit of the Salt field must be set to 1.

**Note**

Vendor-type (36) indicates that the attribute is an encrypted string VSA.

### Tagged and Encrypted String VSA

Figure 3 displays the packet formats for each of the newly supported VSAs:

<table>
<thead>
<tr>
<th>Tagged and Encrypted String VSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type (26)</td>
</tr>
<tr>
<td>Vendor-ID (cont.)</td>
</tr>
<tr>
<td>*Tag</td>
</tr>
</tbody>
</table>

This VSA is similar to encrypted string VSAs except this VSA has an additional Tag field. If the Tag field is not within the valid range (0x01 through 0x1F), it is considered to be part of the Salt field.
How to Verify Encrypted Vendor-Specific Attributes

The Encrypted Vendor-Specific Attributes feature requires no configuration. To verify that RADIUS-tagged and encrypted VSAs are being sent from the RADIUS server, use the following command in privileged EXEC mode:

```
Router# debug radius
```

Displays information associated with RADIUS. The output of this command shows whether tagged and encrypted VSAs are being sent from the RADIUS server.

### Configuration Examples for Encrypted Vendor-Specific Attributes

This section provides the following configuration examples:

- NAS Configuration Example, page 4
- RADIUS User Profile with a Tagged and Encrypted VSA Example, page 4

### NAS Configuration Example

The following example shows how to configure a network access server (NAS) with a basic configuration using tagged and encrypted VSAs. (This example assumes that the configuration required to make PPP calls is already enabled.)

```
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius
!
radius-server host 10.2.2.2 auth-port 1645 acct-port 1646
radius-server key cisco
```

### RADIUS User Profile with a Tagged and Encrypted VSA Example

The following is an example of user profile on a RADIUS server that supports tagged and encrypted string VSAs:

```
mascot   Password = "cisco"
         Service-Type = NAS-Prompt,
         Framed-Protocol = PPP,
         Cisco:Cisco-Enc = "ip:route=10.0.0.0 255.0.0.0"
         Cisco.attr Cisco-Enc 36 tag-encstr(*,*)
```
### Additional References

Local AAA Server

First Published: March 28, 2005
Last Updated: January 2 2008

The Local AAA Server feature allows you to configure your router so that user authentication and authorization attributes currently available on AAA servers are available locally on the router. The attributes can be added to existing framework, such as the local user database or subscriber profile. The local AAA server provides access to the complete dictionary of Cisco IOS supported attributes.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Local AAA Server” section on page 14.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Local AAA Server

- Before using this feature, you must have the **aaa new-model** command enabled.

Information About Local AAA Server

To configure the Local AAA Server feature, you should understand the following concepts:

- **Local Authorization Attributes: Overview, page 2**
- **Local AAA Attribute Support, page 2**
- **AAA Attribute Lists, page 3**
- **Validation of Attributes, page 3**

Local Authorization Attributes: Overview

The AAA subsystem (authentication, authorization, and accounting) is responsible for managing all supported attributes that are available to the various services within the Cisco IOS software. As such, it maintains its own local dictionary of all supported attributes. However, prior to Cisco IOS Release 12.3(14)T, most of these authorization options were not available for local (on-box) authorizations.

Local AAA Attribute Support

Effective with Cisco IOS Release 12.3(14)T, you can configure your router so that AAA authentication and authorization attributes currently available on AAA servers are made available on existing Cisco IOS devices. The attributes can be added to existing framework, such as the local user database or subscriber profile. For example, an attribute list can now be added to an existing username, providing the ability for the local user database to act as a local AAA server. For situations in which the local username list is relatively small, this flexibility allows you to provide complete user authentication or authorization locally within the Cisco IOS software without having a AAA server. This ability can allow you to maintain your user database locally or provide a failover local mechanism without having to sacrifice policy options when defining local users.

A subscriber profile allows domain-based clients to have policy applied at the end-user service level. This flexibility allows common policy to be set for all users under a domain in one place and applied there whether or not user authorization is done locally. Effective with Cisco IOS Release 12.3(14)T, an attribute list can be added to the subscriber profile, allowing the profile to apply all attributes that can be applied to services using AAA servers. Attributes that are configured under the AAA attribute list are merged with the existing attributes that are generated with the existing subscriber profile and passed to the Subscriber Server Switch (SSS) framework for application.

*Note*

Accounting is still done on a AAA server and is not supported by this feature.
AAA Attribute Lists

AAA attribute lists define user profiles that are local to the router. Every attribute that is known to the AAA subsystem is made available for configuration.

The AAA attributes that are defined in the AAA attribute list are standard RADIUS or TACACS+ attributes. However, they are in the Cisco IOS internal format for that attribute. The attributes must be converted from the RADIUS format (for a RADIUS case) to the Cisco IOS AAA interface format. TACACS+ attributes are generally identical to the Cisco IOS AAA interface format.

Converting from RADIUS Format to Cisco IOS AAA Format

You can use the `show aaa attributes protocol radius` command to get the Cisco IOS AAA format of the Internet Engineering Task Force (IETF) RADIUS attribute. The `show` command output provides a complete list of all the AAA attributes that are supported.

Note

The conversion from RADIUS to internal AAA is done internally within the AAA framework. RADIUS vendor-specific attributes (VSAs) are usually accurately reflected during conversion. TACACS+ attributes are also usually identical to the local attributes and do not require the conversion process. However, IETF numbered attributes and some special VSAs often require the conversion process.

Validation of Attributes

Attributes are not validated at configuration. The AAA subsystem “knows” only the format that is expected by the services when the service defines a given attribute inside a definition file. However, it cannot validate the attribute information itself. This validation is done by a service when it first uses the attribute. This validation applies whether the AAA server is RADIUS or TACACS+. Thus, if you are not familiar with configuring a AAA server, it is advisable that you test your attribute list on a test device with the service that will be using the list before configuring and using it in a production environment.

How to Configure Local AAA Server

This section contains the following procedures:

- Defining a AAA Attribute List, page 3 (required)
- Defining a Subscriber Profile, page 6 (required)
- Monitoring and Troubleshooting a Local AAA Server, page 7 (optional)

Defining a AAA Attribute List

To define an AAA attribute list, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. `aaa attribute list list-name`
4. `attribute type {name} {value} [service service] [protocol protocol]`
5. `attribute type {name} {value} [service service] [protocol protocol]`
6. `attribute type {name} {value} [service service] [protocol protocol]`
7. `attribute type {name} {value}`
8. `attribute type {name} {value}`
9. `attribute type {name} {value}`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:**  
  Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**  
  Router# configure terminal | |
| **Step 3** aaa attribute list list-name | Defines a AAA attribute list. |
| **Example:**  
  Router (config)# aaa attribute list TEST | |
| **Step 4** attribute type (name) (value) [service service] [protocol protocol] | Defines an IP address pool to use. |
| **Example:**  
  Router (config)# attribute type addr-pool "pool name" service ppp protocol ip | |
| **Step 5** attribute type (name) (value) [service service] [protocol protocol] | Defines the loopback interface to use. |
| **Example:**  
  Router (config)# attribute type ip-unnumbered "loopback number" service ppp protocol ip | |
| **Step 6** attribute type (name) (value) [service service] [protocol protocol] | Defines the virtual route forwarding (VRF) to use. |
| **Example:**  
  Router (config)# attribute type vrf-id "vrf name" service ppp protocol ip | |
| **Step 7** attribute type (name) (value) | Defines the AAA authentication list to use. |
| **Example:**  
  Router (config)# attribute type ppp-authen-list "aaa list name" | |
| **Step 8** attribute type (name) (value) | Defines the AAA authorization list to use. |
| **Example:**  
  Router (config)# attribute type ppp-author-list "aaa list name" | |
| **Step 9** attribute type (name) (value) | Defines the AAA accounting list to use. |
| **Example:**  
  Router (config)# attribute type ppp-acct-list "aaa list name" | |
Defining a Subscriber Profile

To define a subscriber profile, perform the following steps.

**Note**

RADIUS users should use the `show aaa attributes` command to map the RADIUS version of the particular attribute to the Cisco IOS AAA version of the string attribute. See the example “Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version: Example, page 11.”

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `subscriber authorization enable`
4. `subscriber profile domain-name`
5. `service local`
6. `exit`
7. `aaa attribute list list-name`
Local AAA Server

</tbody>
</table>

Monitoring and Troubleshooting a Local AAA Server

The following debug commands may be helpful in monitoring and troubleshooting, especially to ensure that domain-based service authorization is being triggered and that location authorization is being called on the local AAA server, which triggers the service.

SUMMARY STEPS

1. enable
2. debug aaa authentication
3. debug aaa authorization
4. debug aaa per-user
5. debug ppp authentication
6. debug ppp error
7. debug ppp forward
8. debug ppp negotiation
9. debug radius
10. debug sss error
### DETAILED STEPS

Configuration Examples for Local AAA Server

This section contains the following configuration examples:

- Local AAA Server: Example, page 10
- Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version: Example, page 11

Local AAA Server: Example

The following example shows a Point to Point over Ethernet (PPPoE) group named “bba-group” that is configured for subscriber profile cisco.com (thus, any user with the domain name cisco.com will execute the subscriber profile cisco.com authorization policy). The cisco.com subscriber profile is configured to attach the AAA attribute list “TEST,” which has both “ip vrf forwarding” and “ip unnumbered” configured for PPP service under Link Control Protocol (LCP) negotiation. This configuration will essentially cause the named attributes to be applied on the session with the cisco.com domain under the bba-group “pppoe grp1.”

```
aaa authentication ppp template1 local
aaa authorization network template1 local

aaa attribute list TEST
    attribute type interface-config "ip unnumbered FastEthernet0" service ppp protocol lcp
    attribute type interface-config "ip vrf forwarding blue" service ppp protocol lcp

ip vrf blue
    description vrf blue template1
    rd 1:1
    route-target export 1:1
    route-target import 1:1

subscriber authorization enable

subscriber profile cisco.com
    service local
    aaa attribute list TEST

bba-group pppoe grp1
virtual-template 1
    service profile cisco.com

interface Virtual-Template1
    no ip address
    no snmp trap link-status
    no peer default ip address
    no keepalive
    ppp authentication pap template1
    ppp authorization template1
```

**Note**

In some versions of Cisco IOS software, it is better to use the explicit attribute instead of interface-config because it provides better scalability (full VAccess interfaces are not required, and sub interfaces could be used to provide the service). In such a case, you might configure “attribute type ip-unnumbered ‘FastEthernet0’ service ppp protocol ip” instead of “attribute type interface-config 'ip unnumbered FastEthernet0' service ppp protocol lcp.”
Mapping from the RADIUS Version of a Particular Attribute to the Cisco IOS AAA Version: Example

The following output example of the `show aaa attributes` command lists RADIUS attributes, which can be used when configuring this feature.

```
Router# show aaa attributes protocol radius
```

**IETF defined attributes:**

- **Type=4** Name=acl, **Format=Ulong**
  
  Protocol=RADIUS
  Unknown
- **Type=11** Name=Filter-Id, **Format=Binary**

Converts attribute 11 (Filter-Id) of type Binary into an internal attribute named “acl” of type Ulong. As such, one can configure this attributes locally by using the attribute type "acl."

**Cisco VSA attributes:**

- **Type=157** Name=interface-config, **Format=String**

Simply expects a string for the attribute of type "interface-config."

---

**Note**

The `aaa attribute list` command requires the Cisco IOS AAA version of an attribute, which is defined in the “Name” field above.

Per-User QoS via AAA Policy Name

First Published: March 31, 2000
Last Updated: January 2, 2008

The Per-User QoS via AAA Policy Name feature provides the ability to download a policy name that describes quality of service (QoS) parameters for a user session from a RADIUS server and apply them for the particular session.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Command Reference” section on page 6.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Contents

- Prerequisites for Per-User QoS via AAA Policy Name, page 2
- Information About Per-User QoS via AAA Policy Name, page 2
- How to Configure Per-User QoS via AAA Policy Name, page 2
- Configuration Examples for Per-User QoS via AAA Policy Name, page 3
- Additional References, page 5
- Command Reference, page 6
- Feature Information for Per-User QoS via AAA Policy Name, page 6
Prerequisites for Per-User QoS via AAA Policy Name

Before you configure the Per-User QoS via AAA Policy Name feature, you must locally define on your router the policy whose name is received from the RADIUS server.

Information About Per-User QoS via AAA Policy Name

Effective with Cisco IOS Release 12.2(15)T, separate Cisco vendor-specific attributes (VSAs) are added for the service map.

To configure the Per-User QoS via AAA Policy Name feature, you must understand the following concept:

VSAs Added for Per-User QoS via AAA Policy Name

Two new VSAs have been added for the service map, and the VSAs will bypass the parser while applying the policy for a particular user or session. The new VSAs are as follows:

- vendor-id=9 (Cisco) Vendor type 37 for upstream traffic to input policy name
- vendor-id+9 (Cisco) Vendor type 38 for downstream traffic to output policy name

How to Configure Per-User QoS via AAA Policy Name

This section contains the following procedure:

- Monitoring and Maintaining Per-User QoS via AAA Policy Name, page 2

To configure per-user QoS, use the authentication, authorization, and accounting (AAA) policy name that you have received from the RADIUS server. To configure QoS policy, refer to the documents listed in the section Related Documents.

Monitoring and Maintaining Per-User QoS via AAA Policy Name

To monitor and maintain per-user QoS using the AAA policy name, use the following debug commands:

**SUMMARY STEPS**

1. enable
2. debug aaa authorization
3. debug aaa per-user
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 debug aaa authorization</td>
<td>Displays information about AAA/TACACS+ authorization.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# debug aaa authorization</td>
<td>Displays information about AAA/TACACS+ authorization.</td>
</tr>
<tr>
<td>Step 3 debug aaa per-user</td>
<td>Displays information about per-user QoS parameters.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# debug aaa per-user</td>
<td>Displays information about per-user QoS parameters.</td>
</tr>
</tbody>
</table>

Configuration Examples for Per-User QoS via AAA Policy Name

This section provides the following configuration example:

- Per-User QoS Using the AAA Policy Name, page 3

Per-User QoS Using the AAA Policy Name

The following example shows that per-user QoS is being configured using the AAA policy name "policy_class_1_2":

class-map match-all class1
match access-group 101
class-map match-all class2
match qos-group 4
match access-group 101

policy-map policy_class_1_2
class class1
bandwidth 3000
queue-limit 30
class class2
bandwidth 2000
class class-default
bandwidth 500

peruser_qos_1    Password = "lab"
Service-Type = Framed,
Framed-Protocol = PPP,
Cisco:Cisco-avpair = “ip:sub-policy-In=ssspolicy”
ssspolicy in the above line is the name of the policy.

peruser_qos_2    Password = "lab"
Service-Type = Framed,
Framed-Protocol = PPP,
Cisco:Cisco-avpair = 'ip:sub-policy-Out=ssspolicy'

Glossary

**RADIUS**—Remote Authentication Dial-In User Service. RADIUS is a database for authenticating modem and ISDN connections and for tracking connection time.

**VSA**—vendor-specific attribute. A VSA is an attribute that has been implemented by a particular vendor. It uses the attribute Vendor-Specific to encapsulate the resulting AV pair: essentially, Vendor-Specific = protocol:attribute = value.

---

**Note**

Refer to the *Internetworking Terms and Acronyms* for terms not included in this glossary.
RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

The RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level feature allows you to customize configurations for different RADIUS server groups. This flexibility allows customized network access server- (NAS-) port formats to be used instead of global formats.

Prerequisites for RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

- You must be running a Cisco IOS image that contains the authentication, authorization, and accounting (AAA) component.

Information About RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

To configure the RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level feature, you should understand the following concept:

- RADIUS Attribute 5 Format Customization, page 2

RADIUS Attribute 5 Format Customization

Prior to Cisco IOS Release 12.3(14)T, Cisco IOS software allowed RADIUS attributes that were sent in access requests or accounting requests to be customized on a global basis. You could customize how each configurable attribute should function when communicating with a RADIUS server. Since the implementation of server groups, global attribute configurations were not flexible enough to address the different customizations that were required to support the various RADIUS servers with which a router might be interacting. For example, if you configured the global radius-server attribute nas-port format command option, every service on the router that interacted with a RADIUS server was used in the same way.

Effective with Cisco IOS Release 12.3(14)T, you can configure your router to support override flexibility for per-server groups. You can configure services to use specific named methods for different service types on a RADIUS server. The service types can be set to use their own respective service groups. This flexibility allows customized NAS-port formats to be used instead of the global formats.

How to Configure RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

This section contains the following procedures:

- Configuring the RADIUS Attribute 5 Format on a Per-Server Group Level, page 2
- Monitoring and Maintaining RADIUS Attribute 5 Format on a Per-Server Group Level, page 4

Configuring the RADIUS Attribute 5 Format on a Per-Server Group Level

To configure your router to support the RADIUS Attribute 5 format on a per-server group level, perform the following steps.
To use this per-server group capability, you must actively use a named method list within your services. You can configure one client to use a specific named method while other clients use the default format.

Prerequisites

Before performing these steps, you should first configure method lists for AAA as is applicable for your situation.

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa group server radius group-name
4. server ip-address [auth-port port-number] [acct-port port-number]
5. attribute nas-port format format-type [string]
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<td>Router# debug radius</td>
</tr>
</tbody>
</table>

Configuration Examples for RADIUS Attribute 5 (NAS-Port) Format Specified on a Per-Server Group Level

This section provides the following configuration example:

- RADIUS Attribute 5 Format Specified on a Per-Server Level: Example, page 5

RADIUS Attribute 5 Format Specified on a Per-Server Level: Example

The following configuration example shows a leased-line PPP client that has chosen to send no RADIUS Attribute 5 while the default is to use format d:

```
interface Serial2/0
no ip address
encapsulation ppp
ppp accounting SerialAccounting
ppp authentication pap

aaa accounting network default start-stop group radius
aaa accounting network SerialAccounting start-stop group group1

aaa group server radius group1
   server 10.101.159.172 auth-port 1645 acct-port 1646
   attribute nas-port none

radius-server host 10.101.159.172 auth-port 1645 acct-port 1646
   radius-server attribute nas-port format d
```

Command Reference
The following new command is pertinent to this feature.

- **attribute nas-port format**

For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List.
RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

First Published: August 12, 2002
Last Updated: January 10, 2008

The RADIUS Attribute 8 (Framed-IP-Address) in Access Requests feature makes it possible for a network access server (NAS) to provide the RADIUS server with a hint of the user IP address in advance of user authentication. An application can be run on the RADIUS server to use this hint and build a table (map) of user names and addresses. Using the mapping information, service applications can begin preparing user login information to have available upon successful user authentication.

Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for RADIUS Attribute 8 (Framed-IP-Address) in Access Requests” section on page 7.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

Sending RADIUS attribute 8 in the RADIUS access requests assumes that the login host has been configured to request its IP address from the NAS server. It also assumes that the login host has been configured to accept an IP address from the NAS.

The NAS must be configured with a pool of network addresses on the interface supporting the login hosts.

Information About RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

How This Feature Works

When a network device dials in to a NAS that is configured for RADIUS authentication, the NAS begins the process of contacting the RADIUS server in preparation for user authentication. Typically, the IP address of the dial-in host is not communicated to the RADIUS server until after successful user authentication. Communicating the device IP address to the server in the RADIUS access request allows other applications to begin to take advantage of that information.

As the NAS is setting up communication with the RADIUS server, the NAS assigns an IP address to the dial-in host from a pool of IP addresses configured at the specific interface. The NAS sends the IP address of the dial-in host to the RADIUS server as attribute 8. At that time, the NAS sends other user information, such as the user name, to the RADIUS server.

After the RADIUS server receives the user information from the NAS, it has two options:

- If the user profile on the RADIUS server already includes attribute 8, the RADIUS server can override the IP address sent by the NAS with the IP address defined as attribute 8 in the user profile. The address defined in the user profile is returned to the NAS.
- If the user profile does not include attribute 8, the RADIUS server can accept attribute 8 from the NAS, and the same address is returned to the NAS.

The address returned by the RADIUS server is saved in memory on the NAS for the life of the session. If the NAS is configured for RADIUS accounting, the accounting start packet sent to the RADIUS server includes the same IP address as in attribute 8. All subsequent accounting packets, updates (if configured), and stop packets will also include the same IP address provided in attribute 8.
Benefits

The RADIUS Attribute 8 (Framed-IP-Address) in Access Requests feature makes it possible to run applications on the RADIUS server that builds mapping tables of users and IP addresses. The server can then use the mapping table information in other applications, such as preparing customized user login pages in advance of a successful user authentication with the RADIUS server.

How to Configure RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

This section contains the following procedures:

- Configuring RADIUS Attribute 8 in Access Requests, page 3 (required)
- Verifying RADIUS Attribute 8 in Access Requests, page 4

Configuring RADIUS Attribute 8 in Access Requests

To send RADIUS attribute 8 in the access request, perform the following steps:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. radius-server attribute 8 include-in-access-req

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> radius-server attribute 8 include-in-access-req</td>
<td>Sends RADIUS attribute 8 in access-request packets.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# radius-server attribute 8 include-in-access-req</td>
<td></td>
</tr>
</tbody>
</table>
Verifying RADIUS Attribute 8 in Access Requests

To verify that RADIUS attribute 8 is being sent in access requests, perform the following steps. Attribute 8 should be present in all PPP access requests.

**SUMMARY STEPS**

1. `enable`
2. `more system:running-config`
3. `debug radius`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
  `enable` | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2**  
  `more system:running-config` | Displays the contents of the current running configuration file. (Note that the `more system:running-config` command has replaced the `show running-config` command.) |
| **Step 3**  
  `debug radius` | Displays information associated with RADIUS. The output of this command shows whether attribute 8 is being sent in access requests. |

Configuration Examples for RADIUS Attribute 8 (Framed-IP-Address) in Access Requests

This section provides the following configuration example:

- NAS Configuration That Sends the IP Address of the Dial-in Host to the RADIUS Server in the RADIUS Access Request

**NAS Configuration That Sends the IP Address of the Dial-in Host to the RADIUS Server in the RADIUS Access Request**

The following example shows a NAS configuration that sends the IP address of the dial-in host to the RADIUS server in the RADIUS access request. The NAS is configured for RADIUS authentication, authorization, and accounting (AAA). A pool of IP addresses (async1-pool) has been configured and applied at interface Async1.

```
aaa new-model
aaa authentication login default group radius
aaa authentication ppp default group radius
aaa authorization network default group radius
```
aaa accounting network default start-stop group radius
!
ip address-pool local
!
interface Async1
 peer default ip address pool async1-pool
!
ip local pool async1-pool 209.165.200.225 209.165.200.229
!
radius-server host 172.31.71.146 auth-port 1645 acct-port 1646
radius-server retransmit 3
radius-server attribute 8 include-in-access-req
radius-server key radhost<xxx>: Example

- Configuration Examples, page 5
- Command Reference, page 6
Feature Overview

The RADIUS Attribute 82: Tunnel Assignment ID feature allows the Layer 2 Transport Protocol access concentrator (LAC) to group users from different per-user or domain RADIUS profiles into the same active tunnel. Previously, Cisco IOS software assigned a separate virtual private dialup network (VPDN) tunnel for each per-user or domain RADIUS profile, even if tunnels with identical endpoints already existed. The RADIUS Attribute 82: Tunnel Assignment ID feature defines a new avpair, Tunnel-Assignment-ID, which allows the LAC to group users from different RADIUS profiles into the same tunnel if the chosen endpoint, tunnel type, and Tunnel-Assignment-ID are identical. This feature introduces new software functionality. No new commands are introduced with this feature.

Benefits

The RADIUS Attribute 82: Tunnel Assignment ID feature improves LAC and L2TP network server (LNS) performance by reducing memory usage, because fewer tunnel data structures must be maintained. This feature allows the LAC and LNS to handle a higher volume of users without negatively impacting router performance.

Restrictions

This feature is designed only for VPDN dial-in applications. It does not support VPDN dial-out.

- Cisco 7500 series
Supported Standards, MIBs, and RFCs

**Standards**
No new or modified standards are supported by this feature.

**MIBs**
No new or modified MIBs are supported by this feature.
To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:
http://tools.cisco.com/ITDIT/MIBS/servlet/index
If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:
To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:
http://www.cisco.com/register

**RFCs**
No new or modified RFCs are supported by this feature.

Prerequisites
You must be using a Cisco platform that supports VPDN to use this feature.

Configuration Tasks
None
Verifying RADIUS Attribute 82

To verify that RADIUS attribute 82 is being used by the LAC during tunnel authorization, use the following privileged EXEC command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# debug radius</td>
<td>Displays information associated with RADIUS. The output of this command shows whether attribute 82 is being sent in access requests.</td>
</tr>
</tbody>
</table>
Configuration Examples

This section provides the following configuration examples:

- LAC Configuration Example
- LNS Configuration Example
- RADIUS Configuration Example

LAC Configuration Example

The following example configures VPDN on the LAC:

```
hostname lac
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius

vpdn enable
  vpdn authen-before-forward

interface Serial2/0:23
  no ip address
  encapsulation ppp
dialer-group 1
  isdn switch-type primary-5ess
  no fair-queue
dialer-list 1 protocol ip permit

radius-server host lac-radiusd auth-port 1645 acct-port 1646
radius-server retransmit 3
radius-server key rad123
```

LNS Configuration Example

The following example configures VPDN on the LNS:

```
hostname lns
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius

vpdn enable

vpdn-group 1
  accept-dialin
  protocol any
  virtual-template 1

interface Loopback0
  ip address 10.1.1.3 255.255.255.0

interface Virtual-Template1
  ip unnumbered Loopback0
  no keepalive
  peer default ip address pool mypool
  ppp authentication chap
```
RADIUS Configuration Example

The following examples configure the RADIUS server to group sessions in a tunnel:

**Per-User Configuration**

user@router.com Password = "cisco" Service-Type = Outbound,
Tunnel-Type = :1:L2TP,
Tunnel-Server-Endpoint = :1:"10.14.10.54",
Tunnel-Assignment-Id = :1:"router"

client@router.com Password = "cisco" Service-Type = Outbound,
Tunnel-Type = :1:L2TP,
Tunnel-Server-Endpoint = :1:"10.14.10.54",
Tunnel-Assignment-Id = :1:"router"

**Domain Configuration**

eng.router.com Password = "cisco" Service-Type = Outbound,
Tunnel-Type = :1:L2TP,
Tunnel-Server-Endpoint = :1:"10.14.10.54",
Tunnel-Assignment-Id = :1:"router"

sales.router.com Password = "cisco" Service-Type = Outbound,
Tunnel-Type = :1:L2TP,
Tunnel-Server-Endpoint = :1:"10.14.10.54",
Tunnel-Assignment-Id = :1:"router"

Command Reference

This feature uses no new or modified commands. To see the command pages for the commands used with this feature, see the Cisco IOS Security Command Reference at http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html. For information about all Cisco IOS commands, see the Command Lookup Tool at http://tools.cisco.com/Support/CLILookup or the Master Command List. 
The RADIUS Attribute 104 feature allows you to specify private routes (attribute 104) in your RADIUS authorization profile. The private routes affect only packets that are received on an individual interface. The routes are stored apart from the global routing table and are not injected into any routing protocols for redistribution.

### Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at [http://www.cisco.com/go/fn](http://www.cisco.com/go/fn). You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.
Prerequisites for RADIUS Attribute 104

- You must be using a Cisco RADIUS server.
- You should be familiar with configuring RADIUS.
- You should be familiar with policy-based routing (PBR) and private routes.
- You should be familiar with configuring access control lists (ACLs).
- Before using the RADIUS Attribute 104 feature, you must configure RADIUS AAA authorization and RADIUS route download.
- The following memory bytes are required:
  - One route map—50 bytes.
  - One match-set clause—600 bytes.
  - One extended ACL—366 bytes.
  - For N number of attribute 104s, the memory requirement is 
  \((600+366)N+50=1000N\) (approximate) per user.

Restrictions for RADIUS Attribute 104

- If you already have PBR locally (statically) configured under the interface, and you specify attribute 104, the locally configured PBR will be disabled.
- If a pseudo next-hop address is involved, there must be a route available in the routing table for the next-hop address. If a route is not available, the packet will not be policy routed.
- Policy routing does not order the match-set clauses and relies on the first match, so you should specify the attributes in the order in which you want them to be matched.
- Metric numbers cannot be used in the attribute.

Information About RADIUS Attribute 104

Before using the RADIUS Attribute 104 feature, you should understand the following concepts:

- Policy-Based Routing: Background, page 2
- Attribute 104 and the Policy-Based Route Map, page 3

Policy-Based Routing: Background

PBR provides a mechanism for the forwarding, or routing of, data packets on the basis of defined policies. The policies are not wholly dependent on the destination address but rather on other factors, such as type of service, source address, precedence, port numbers, or protocol type.

Policy-based routing is applied to incoming packets. All packets that are received on an interface that has policy-based routing enabled are considered for policy-based routing. The router passes the packets through enhanced packet filters called route maps. On the basis of the criteria that are defined in the route maps, the packets are forwarded to the appropriate next hop.
Each entry in a route map statement contains a combination of match clauses and set clauses or commands. The match clauses define the criteria for whether appropriate packets meet the particular policy (that is, whether the conditions are met). The set clauses provide instruction for how the packets should be routed after they have met the match criteria. The match clause specifies which set of filters a packet must match for the corresponding set clause to be applied.

**Attribute 104 and the Policy-Based Route Map**

This section discusses the attribute 104 feature and how it works with policy-based route maps.

**RADIUS Attribute 104 Overview**

Using the RADIUS Attribute 104 feature, you can specify private routes in your RADIUS authorization profile. The private routes you specify will affect only packets that are received on an individual interface. The routes are stored apart from the global routing table and are not injected into any routing protocols for redistribution.

**Permit Route Map**

Route map statements can be marked as “permit” or “deny.” If the statement is marked “permit,” the set clause is applied to the packets that match the match criteria. For attribute 104, when you are configuring the route map, you need to mark the route map as “permit,” as follows. (To configure a route map, see the chapter “Configuring Policy-Based Routing” in the *Cisco IOS Quality of Service Solutions Configuration Guide*.)

```
route-map map-tag permit sequence-number
```

**Default Private Route**

The policy routing process proceeds through the route map until a match is found. If no match is found in the route map, the global routing table is consulted. If you have specified a default route in your user profile, any further routes beyond the default route are effectively ignored.

**Route Map Order**

You need to specify route maps on the server in the order that you want them to be applied.

**How to Apply RADIUS Attribute 104**

This section contains the following procedures:

- Applying RADIUS Attribute 104 to Your User Profile, page 4
- Verifying Route Maps, page 4
- Troubleshooting the RADIUS Profile, page 5
Applying RADIUS Attribute 104 to Your User Profile

You can apply RADIUS attribute 104 to your user profile by adding the following to the RADIUS server database.

**SUMMARY STEPS**

1. Apply RADIUS attribute 104 to your user profile.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Apply RADIUS attribute 104 to your user profile.</td>
<td>Ascend-Private-Route=&quot;dest_addr/netmask next_hop&quot;&lt;br&gt;The destination network address of the router is &quot;dest_addr/netmask&quot;, and the address of the next-hop router is &quot;next_hop.&quot;</td>
</tr>
</tbody>
</table>

**Examples**

The following is a sample user profile that creates three private routes that are associated with the caller:

```
username Password="ascend"; User-Service=Framed-User
Framed-Protocol=PPP,
Framed-Address=10.1.1.1,
Framed-Netmask=255.0.0.0,
Ascend-Private-Route="172.16.1.1/16 10.10.10.1"
Ascend-Private-Route="192.168.1.1/32 10.10.10.2"
Ascend-Private-Route="10.20.0.0/1 10.10.10.3"
Ascend-Private-Route="10.0.0.0/0 10.10.10.4"
```

Using the above profile, the private routing table for the connection contains the following routes, including a default route:

```
Destination/Mask  Gateway
172.16.1.1/16   10.10.10.1
192.168.1.1/32  10.10.10.2
10.20.20.0/1    10.10.10.3
10.0.0.0/0      10.10.10.4
```

**Verifying Route Maps**

You can use the following `show` commands to verify the route maps that have been configured.

**SUMMARY STEPS**

1. `enable`
2. `show ip policy`
3. `show route-map [map-name | dynamic [dynamic-map-name | application [application-name]] | all]`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
                    • Enter your password if prompted. |
| Step 2 show ip policy | Displays the route map that is used for policy routing. |
| Step 3 show route-map [map-name | dynamic | Displays all route maps that are configured or only the one that is specified. |
|                  [dynamic-map-name | application | all] |

Troubleshooting the RADIUS Profile

If your private route configuration is not working properly, you may want to reread the section “Policy-Based Routing: Background.” This section may help you determine what is happening to the packets. In addition, the following debug commands can be used to troubleshoot your RADIUS profile.

SUMMARY STEPS

1. enable
2. debug radius
3. debug aaa per-user
4. debug ip policy
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:** Router> enable | |
| **Step 2** debug radius | Displays information associated with RADIUS. |
| **Example:** Router# debug radius | |
| **Step 3** debug aaa per-user | Displays the attributes that are applied to each user as the user authenticates. |
| **Example:** Router# debug aaa per-user | |
| **Step 4** debug ip policy | Displays IP routing packet activity. |
| **Example:** Router# debug ip policy | |

Configuration Examples for RADIUS Attribute 104

This section includes the following configuration example:
- Route-Map Configuration in Which Attribute 104 Has Been Applied: Example, page 6

Route-Map Configuration in Which Attribute 104 Has Been Applied: Example

The following output is a typical route-map configuration to which attribute 104 has been applied:

```
Router# show route-map dynamic

route-map AAA-01/08/04-13:59.542-1-AppSpec, permit, sequence 0, identifier 1639994476
  Match clauses:
    ip address (access-lists): PBR#1 PBR#2
  Set clauses:
    Policy routing matches: 0 packets, 0 bytes
route-map AAA-01/08/04-13:59.542-1-AppSpec, permit, sequence 1, identifier 1640264784
  Match clauses:
    ip address (access-lists): PBR#3 PBR#4
  Set clauses:
    Policy routing matches: 0 packets, 0 bytes
route-map AAA-01/08/04-13:59.542-1-AppSpec, permit, sequence 2, identifier 1645563704
  Match clauses:
    ip address (access-lists): PBR#5 PBR#6
    length 10 100
  Set clauses:
    ip next-hop 10.1.1.1
    ip gateway10.1.1.1
    Policy routing matches: 0 packets, 0 bytes
Current active dynamic routemaps = 1
```

RADIUS Progress Codes

First Published: August 12, 2002
Last Updated: December 17, 2007

The RADIUS Progress Codes feature adds additional progress codes that are defined in Table 1 to RADIUS attribute 196 (Ascend-Connect-Progress), which indicates a connection state before a call is disconnected through progress codes.

Attribute 196 is sent in network, exec, and resource accounting “start” and “stop” records. This attribute can facilitate call failure debugging because each progress code identifies accounting information relevant to the connection state of a call. The attribute is activated by default; when an accounting “start” or “stop” accounting record is requested, authentication, authorization, and accounting (AAA) adds attribute 196 into the record as part of the standard attribute list. Attribute 196 is valuable because the progress codes, which are sent in accounting “start” and “stop” records, facilitate the debugging of call failures.

Note
In accounting “start” records, attribute 196 does not have a value.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Modem allocation and negotiation is complete; the call is up.</td>
</tr>
<tr>
<td>30</td>
<td>The modem is up.</td>
</tr>
<tr>
<td>33</td>
<td>The modem is waiting for result codes.</td>
</tr>
<tr>
<td>41</td>
<td>The max TNT is establishing the TCP connection by setting up a TCP clear call.</td>
</tr>
<tr>
<td>60</td>
<td>Link control protocol (LCP) is the open state with PPP and IP Control Protocol (IPCP) negotiation; the LAN session is up.</td>
</tr>
<tr>
<td>65</td>
<td>PPP negotiation occurs and, initially, the LCP negotiation occurs; LCP is in the open state.</td>
</tr>
<tr>
<td>67</td>
<td>After PPP negotiation with LCP in the open state occurs, IPCP negotiation begins.</td>
</tr>
</tbody>
</table>
Progress codes 33, 30, and 67 are generated and seen through debugs on the NAS; all other codes are generated and seen through debugs and the accounting record on the RADIUS server.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for RADIUS Progress Codes” section on page 6.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for RADIUS Progress Codes
Before attribute 196 (Ascend-Connect-Progress) can be sent in accounting “start” and “stop” records, you must perform the following tasks:

- Enable AAA.
- Enable exec, network, or resource accounting.

For information on completing these tasks, refer to the AAA sections of the Cisco IOS Security Configuration Guide, Release 12.4.

When these tasks are completed, attribute 196 is active by default.

How to Configure RADIUS Progress Codes
No configuration is required to configure RADIUS Progress Codes.
How to Verify Attribute 196

To verify attribute 196 in accounting “start” and “stop” records, perform the following steps.

**SUMMARY STEPS**

1. enable
2. debug aaa accounting
3. show radius statistics

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

Glossary

AAA—authentication, authorization, and accounting. Suite of network security services that provide the primary framework through which access control can be set up on your Cisco router or access server.

attribute—RADIUS Internet Engineering Task Force (IETF) attributes are the original set of 255 standard attributes that are used to communicate AAA information between a client and a server. Because IETF attributes are standard, the attribute data is predefined and well known; thus all clients and servers who exchange AAA information through IETF attributes must agree on attribute data such as the exact meaning of the attributes and the general bounds of the values for each attribute.

EXEC accounting—Provides information about user EXEC terminal sessions of the network access server.

IPCP—IP Control Protocol. A protocol that establishes and configures IP over PPP.

LCP—link control protocol. A protocol that establishes, configures, and tests data-link connections for use by PPP.

network accounting—Provides information for all PPP, Serial Line Internet Protocol (SLIP), or AppleTalk Remote Access Protocol (ARAP) sessions, including packet and byte counts.

PPP—Point-to-Point Protocol. Successor to SLIP that provides router-to-router and host-to-network connections over synchronous and asynchronous circuits. Whereas SLIP was designed to work with IP, PPP was designed to work with several network layer protocols, such as IP, IPX, and ARAP. PPP also has built-in security mechanisms, such as CHAP and PAP. PPP relies on two protocols: LCP and NCP.

RADIUS—Remote Authentication Dial-In User Service. RADIUS is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco routers and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

resource accounting—Provides “start” and “stop” records for calls that have passed user authentication, and provides “stop” records for calls that fail to authenticate.

RADIUS Timeout Set During Pre-Authentication

First Published: March 17, 2003
Last Updated: December 17, 2007

Some call sessions for Internet Service Provider (ISP) subscribers are billed through authentication, authorization, and accounting (AAA) messages in a prepaid time model. When these subscribers are preauthenticated, a RADIUS server checks for any remaining credit in the prepaid time model and sets a session timeout based on the credit available. The RADIUS Timeout Set During Pre-Authentication feature is useful in situations where the PPP authentication that follows the preauthentication phase of these call sessions does not return the Session-Timeout value (RADIUS attribute 27), and therefore allows the ISP to add call setup time to the subscriber’s bill.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for RADIUS Timeout Set During Pre-Authentication” section on page 5.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for the RADIUS Timeout Set During Pre-Authentication Feature

- This feature is specific to RADIUS. Basic AAA authentication and preauthentication must be configured.
- Preauthentication and normal PPP authentication are required for legacy functionality.

Information About the RADIUS Timeout Set During Pre-Authentication Feature

You need to understand the following concept about the RADIUS Timeout Set During Pre-Authentication feature:

- RADIUS Attribute 27 and the PPP Authentication Phase, page 2

RADIUS Attribute 27 and the PPP Authentication Phase

The RADIUS Timeout Set During Pre-Authentication feature was developed for ISPs that want to bill dial-in subscribers for call setup time and the entire duration of the call session. These subscribers are billed through AAA messages in a prepaid time model. When the subscribers are preauthenticated, a RADIUS server checks for any remaining credit in the prepaid time model and sets a session timeout (in minutes or seconds) based on the credit available. This time can range from a few seconds for ISDN users, to much longer for asynchronous dial-up subscribers.

Until the RADIUS Timeout Set During Pre-Authentication feature was developed, the value of RADIUS attribute 27, which is returned during the preauthentication phase of a call, was either ignored or overwritten during the PPP authentication phase. Even when the PPP authentication phase did not return a value for attribute 27, the old value obtained during the preauthentication phase was being ignored.

With the RADIUS Timeout Set During Pre-Authentication feature introduced for Cisco IOS Release 12.2(15)T, if the PPP authentication phase does not return a value for attribute 27, the old value that was returned during the preauthentication phase is saved and used to time out the session; attribute 27 is saved in a preauthentication database for future use. However, if the PPP authentication user profile has a session timeout configured and PPP authentication succeeds, the new value downloaded during PPP authentication overwrites the old attribute 27 value. By setting the session timeout value in the preauthentication phase itself, the service provider can bill the subscriber for the call setup time and the call duration.

How to Configure the RADIUS Timeout Set During Pre-Authentication Feature

No new configuration is required. The RADIUS Timeout Set During Pre-Authentication feature is included in all Cisco platforms that support preauthentication, and that have RADIUS attribute 27, Session-Timeout, specified in a preauthentication user profile.
Additional References

</tr>
<tr>
<td>Cisco IOS XE Release 2.1</td>
<td>This feature was introduced on Cisco ASR 1000 Series Routers.</td>
</tr>
</tbody>
</table>

This feature module describes the RADIUS Tunnel Attribute Extensions feature. It includes the following sections:

- Feature Overview, page 1
- Supported Platforms, page 3
- Supported Standards, MIBs, and RFCs, page 4
- Prerequisites, page 4
- Configuration Tasks, page 4
- Configuration Examples, page 5
- Command Reference, page 6
- Glossary, page 7

Feature Overview

The RADIUS Tunnel Attribute Extensions feature introduces RADIUS attribute 90 (Tunnel-Client-Auth-ID) and RADIUS attribute 91 (Tunnel-Server-Auth-ID). Both attributes help support the provision of compulsory tunneling in virtual private networks (VPNs) by allowing the user to specify authentication names for the network access server (NAS) and the RADIUS server.
How It Works

Once a NAS has set up communication with a RADIUS server, you can enable a tunneling protocol. Some applications of tunneling protocols are voluntary, but others involve compulsory tunneling; that is, a tunnel is created without any action from the user and without allowing the user any choice in the matter. In those cases, new RADIUS attributes are needed to carry the tunneling information from the NAS to the RADIUS server to establish authentication. These new RADIUS attributes are listed in Table 79.

Note

In compulsory tunneling, any security measures in place apply only to traffic between the tunnel endpoints. Encryption or integrity protection of tunneled traffic must not be considered as a replacement for end-to-end security.

Table 79 RADIUS Tunnel Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>IETF RADIUS Tunnel Attribute</th>
<th>Equivalent TACACS+ Attribute</th>
<th>Supported Protocols</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>90</td>
<td>Tunnel-Client-Auth-ID</td>
<td>tunnel-id</td>
<td>• Layer 2 Forwarding (L2F) • Layer 2 Tunneling Protocol (L2TP)</td>
<td>Specifies the name used by the tunnel initiator (also known as the NAS) when authenticating tunnel setup with the tunnel terminator.</td>
</tr>
<tr>
<td>91</td>
<td>Tunnel-Server-Auth-ID</td>
<td>gw-name</td>
<td>• Layer 2 Forwarding (L2F) • Layer 2 Tunneling Protocol (L2TP)</td>
<td>Specifies the name used by the tunnel terminator (also known as the Home Gateway) when authenticating tunnel setup with the tunnel initiator.</td>
</tr>
</tbody>
</table>

1. When L2TP is used, the NAS is referred to as an L2TP access concentrator (LAC).
2. When L2TP is used, the Home Gateway is referred to as an L2TP network server (LNS).

RADIUS attribute 90 and RADIUS attribute 91 are included in the following situations:

- If the RADIUS server accepts the request and the desired authentication name is different from the default, they must be included it.
- If an accounting request contains Acct-Status-Type attributes with values of either start or stop and pertains to a tunneled session, they should be included in.

Benefits

The RADIUS Tunnel Attribute Extensions feature allows you to specify a name (other than the default) of the tunnel initiator and the tunnel terminator. Thus, you can establish a higher level of security when setting up VPN tunneling.

Restrictions

Your RADIUS server must support tagged attributes to use RADIUS tunnel attributes 90 and 91.
Related Documents

The following documents provide information related to the RADIUS Tunnel Attribute Extensions feature:

- The chapters “Configuring Authentication” and “Configuring RADIUS” in the *Cisco IOS Security Configuration Guide*, Release 12.2
- The appendix “RADIUS Attributes” in the *Cisco IOS Security Configuration Guide*, Release 12.2
- The chapter “Configuring Virtual Private Networks” in the *Cisco IOS Dial Technologies Configuration Guide*, Release 12.2
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*

Supported Platforms

**Cisco IOS Release 12.1(5)T Only**
- AS5300
- AS5800

**Cisco IOS Releases 12.2(4)B3 and 12.2(13)T Only**
- Cisco 6400-NRP-1
- Cisco 6400-NRP-2
- Cisco 6400-NRP-2SV

**Determining Platform Support Through Cisco Feature Navigator**

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn
Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

**Supported Standards, MIBs, and RFCs**

**Standards**
None

**MIBs**
None

To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use Cisco MIB Locator found at the following URL:

http://tools.cisco.com/ITDIT/MIBS/servlet/index

If Cisco MIB Locator does not support the MIB information that you need, you can also obtain a list of supported MIBs and download MIBs from the Cisco MIBs page at the following URL:

To access Cisco MIB Locator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

**RFCs**
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*

**Prerequisites**

To use RADIUS attributes 90 and 91, you must complete the following tasks:
- Configure your NAS to support AAA.
- Configure your NAS to support RADIUS.
- Configure your NAS to support VPN.

**Configuration Tasks**
None
Verifying RADIUS Attribute 90 and RADIUS Attribute 91

To verify that RADIUS attribute 90 and RADIUS attribute 91 are being sent in access accepts and accounting requests, use the following command in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>router# debug radius</td>
<td>Displays information associated with RADIUS. The output of this command shows whether attribute 90 and attribute 91 are being sent in access accepts and accounting requests.</td>
</tr>
</tbody>
</table>

Configuration Examples

This section provides the following configuration examples:

- L2TP Network Server (LNS) Configuration Example
- RADIUS User Profile with RADIUS Tunneling Attributes 90 and 91 Example

L2TP Network Server (LNS) Configuration Example

The following example shows how to configure the LNS with a basic L2F and L2TP configuration using RADIUS tunneling attributes 90 and 91:

```bash
aaa new-model
aaa authentication login default none
aaa authentication login console none
aaa authentication ppp default local group radius
aaa authorization network default group radius if-authenticated
!

**RADIUS User Profile with RADIUS Tunneling Attributes 90 and 91 Example**

The following is an example of a RADIUS user profile that includes RADIUS tunneling attributes 90 and 91. This entry supports two tunnels, one for L2F and the other for L2TP. The tag entries with :1 support L2F tunnels, and the tag entries with :2 support L2TP tunnels.

cisco.com Password = 'cisco', Service-Type = Outbound
Service-Type = Outbound,
Tunnel-Type = :1:L2F,
Tunnel-Medium-Type = :1:IP,
Tunnel-Client-Endpoint = :1:10.0.0.2,
Tunnel-Server-Endpoint = :1:10.0.0.3,
Tunnel-Client-Auth-Id = :1:l2f-cli-auth-id,
Tunnel-Server-Auth-Id = :1:l2f-svr-auth-id,
Tunnel-Assignment-Id = :1:l2f-assignment-id,
Cisco-Avpair = "vpdn:nas-password=l2f-cli-pass",
Cisco-Avpair = "vpdn:gw-password=l2f-svr-pass",
Tunnel-Preference = :1:1,
Tunnel-Type = :2:L2TP,
Tunnel-Medium-Type = :2:IP,
Tunnel-Client-Endpoint = :2:10.0.0.2,
Tunnel-Server-Endpoint = :2:10.0.0.3,
Tunnel-Client-Auth-Id = :2:l2tp-cli-auth-id,
Tunnel-Server-Auth-Id = :2:l2tp-svr-auth-id,
Tunnel-Assignment-Id = :2:l2tp-assignment-id,
Cisco-Avpair = "vpdn:l2tp-tunnel-password=l2tp-tnl-pass",
Tunnel-Preference = :2:2

**Command Reference**

This feature uses no new or modified commands. To see the command pages for the commands used with this feature, see the Cisco IOS Security Command Reference at

For information about all Cisco IOS commands, see the Command Lookup Tool at
http://tools.cisco.com/Support/CLILookup or the Master Command List.
Layer 2 Forwarding (L2F)—A Layer 2 tunneling protocol that enables an ISP or other access service to create a virtual tunnel to link customer remote sites or remote users with corporate home networks. In particular, a network access server (NAS) at the ISP point of presence (POP) exchanges PPP messages with the remote users and communicates by L2F or L2TP requests and responses with the customer tunnel server to set up tunnels.

Layer 2 Tunnel Protocol (L2TP)—A Layer 2 tunneling protocol that enables an ISP or other access service to create a virtual tunnel to link customer remote sites or remote users with corporate home networks. In particular, a network access server (NAS) at the ISP point of presence (POP) exchanges PPP messages with the remote users and communicates by L2F or L2TP requests and responses with the customer tunnel server to set up tunnels.

L2TP access concentrator (LAC)—A network access server (NAS) to which the client directly connects and through which PPP frames are tunneled to the L2TP network server (LNS). The LAC need only implement the media over which L2TP is to operate to pass traffic to one or more LNSs. The LAC may tunnel any protocol carried within PPP. The LAC initiates incoming calls and receives outgoing calls. A LAC is analogous to an L2F network access server.

L2TP network server (LNS)—A termination point for L2TP tunnels, and an access point where PPP frames are processed and passed to higher-layer protocols. An LNS can operate on any platform that terminates PPP. The LNS handles the server side of the L2TP protocol. L2TP relies only on the single medium over which L2TP tunnels arrive. The LNS initiates outgoing calls and receives incoming calls. An LNS is analogous to a home gateway in L2F technology.

Network access server (NAS)—A Cisco platform, or collection of platforms, such as an AccessPath system, that interfaces between the packet world (such as the Internet) and the circuit-switched world (such as the PSTN).

tunnel—A virtual pipe between the L2TP access concentrator (LAC) and L2TP network server (LNS) that can carry multiple PPP sessions.

Virtual private network (VPN)—A system that permits dial-in networks to exist remotely to home networks, while giving the appearance of being directly connected. VPNs use L2TP and L2F to terminate the Layer 2 and higher parts of the network connection at the L2TP network server (LNS) instead of the L2TP access concentrator (LAC).
V.92 Reporting Using RADIUS Attribute v.92-info

The V.92 Reporting Using RADIUS Attribute v.92-info feature provides the ability to track V.92 call information, such as V.92 features that are supported, the Quick Connect feature set that was attempted, the duration for which the original call was put on hold, and how many times Modem On Hold was initiated. The vendor-specific attribute (VSA) v.92-info is included in accounting “start” and “stop” records when modems negotiate a V.92 connection.

Feature Specifications for the V.92 Reporting Using RADIUS Attribute v.92-info Feature

Feature History

Supported Platforms

Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, Cisco AS5850

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.

Prerequisites for V.92 Reporting Using RADIUS Attribute v.92-info

Before the network access server (NAS) can send attribute v.92-info information in accounting “start” and “stop” records, you must perform the following tasks:

- Configure your NAS for authentication, authorization, and accounting (AAA) and to accept incoming modem calls.
- Enable AAA accounting by using the `aaa accounting network default start-stop group radius` command in global configuration mode.
- Familiarize yourself with the V.92 Quick Connect feature. Refer to the following document:
  - *V.92 Quick Connect for Cisco AS5300 and Cisco AS5800 Universal Access Servers*
- Familiarize yourself with the V.92 Modem on Hold feature. Refer to the following document:
  - *V.92 Modem on Hold for Cisco AS5300 and Cisco AS5800 Universal Access Servers*

Restrictions for V.92 Reporting Using RADIUS Attribute v.92-info

- If V.92 is not negotiated on your server, V.92 information will not be included in the accounting record.
- Because the attribute v.92-info information is sent as a Cisco VSA, if you configure your RADIUS server as nonstandard (using a non-Cisco server), the V.92 call information will not be sent by default. However, you can still get the V.92 call information by first configuring the `radius-server vsa send` command with the `accounting` keyword (that is, `radius-server vsa send accounting`).

Information About V.92 Reporting Using RADIUS Attribute v.92-info

Before you use the V.92 Reporting Using RADIUS Attribute v.92-info feature, you must understand the following concepts:

- V.92 Standard Overview, page 2
- VSA v.92-info, page 3

V.92 Standard Overview

The International Telecommunication Union Telecommunication Standardization Sector (ITU-T) V.92 standard encompasses a number of specifications, including Quick Connect (QC), which dramatically improves how quickly users can connect with their Internet service provider (ISP), and Modem on Hold (MoH), which enables users to suspend and reactivate their dial-up connection to either receive or initiate a telephone call. V.92 also includes pulse code modulation (PCM) upstream, which boosts the upstream data rates from the user to the ISP to reduce transfer times for large files and e-mail attachments sent by the user.
VSA v.92-info

The VSA v.92-info information in RADIUS accounting “start” and “stop” records can help you track V.92 feature set information. The VSA is enabled by default for all sessions that reside over a modem call that is connected using V.92 model modulation.

The VSA information is displayed in the “start” and “stop” records as follows:

v92-info=<V.92 features supported>/<QC Exchange>/<Total MOH time>/<MOH count>

The VSA v92-info has the following four subfields:

- V.92 features supported—All features that are available for the V.92 modem user who is dialing in. These features include QC, MoH, and PCM Upstream.
- QC Exchange—If QC was initiated, this subfield states what feature set (within QC) was attempted.
- Total MOH time—If MoH was initiated, this subfield indicates the duration for which the original call was put on hold.
- MOH count—If MOH was initiated, this field indicates how many times the MOH was initiated.

The following is an example of VSA v92-info information displayed in an accounting record:

v92-info=V.92 QC MOH/QC Requested/60/1

How to Monitor and Verify V.92 Call Information

The following sections include tasks to help you monitor and verify V.92 call information:

- Monitoring V.92 Call Information, page 3
- Verifying V.92 Call Information, page 11

Monitoring V.92 Call Information

To monitor the V.92 information in the accounting “start” and “stop” records, you can perform the following task using some or all of the debug commands that are listed:

SUMMARY

1. enable
2. debug aaa accounting
3. debug aaa authentication
4. debug aaa authorization
5. debug isdn event
6. debug modem csm [slot|port | group group-number]
7. debug ppp {negotiation | authentication}
8. debug radius
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> debug aaa accounting</td>
<td>Displays information about accountable events as they occur.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# debug aaa accounting</td>
</tr>
<tr>
<td><strong>Step 3</strong> debug aaa authentication</td>
<td>Displays information about AAA authentication.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# debug aaa authentication</td>
</tr>
<tr>
<td><strong>Step 4</strong> debug aaa authorization</td>
<td>Displays information about AAA and TACACS+ authorization.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# debug aaa authorization</td>

## Verifying V.92 Call Information

To verify that the V.92 call was correctly established, use the following `show` commands:

### SUMMARY

- `show modem [slot/port | group number]`
- `show port modem log [reverse slot/port] [slot | slot/port]`
- `show users [all]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>`show modem [slot/port</td>
<td>group number]`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>`show port modem log [reverse slot/port] [slot</td>
<td>slot/port]`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>show users [all]</code></td>
<td>Displays information about the active lines on the router.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following V.92 reporting outputs are from the `show port modem log` and `show users` commands:

**Show Output 1**

```
Router# show port modem log 1/05
Port 1/05 Events Log
01:46:19: Service Type: DATA_FAX_MODEM

Troubleshooting Tips

If you see that V.92 call information is not being reported by AAA, ensure that the call is a V.92 call by using the `show modem` command or by looking at the modem logs by using the `show modem log` command.
Additional References

For additional information related to the V.92 Reporting Using RADIUS Attribute v.92-info feature, refer to the following references:

TACACS+ Attribute-Value Pairs

Terminal Access Controller Access Control System Plus (TACACS+) attribute-value (AV) pairs are used to define specific authentication, authorization, and accounting elements in a user profile that is stored on the TACACS+ daemon. This appendix lists the TACACS+ AV pairs currently supported.

How to Use This Appendix

This appendix is divided into two sections:

- TACACS+ Authentication and Authorization AV Pairs
- TACACS+ Accounting AV Pairs

The first section lists and describes the supported TACACS+ authentication and authorization AV pairs, and it specifies the Cisco IOS release in which they are implemented. The second section lists and describes the supported TACACS+ accounting AV pairs, and it specifies the Cisco IOS release in which they are implemented.

TACACS+ Authentication and Authorization AV Pairs

Table 80 lists and describes the supported TACACS+ authentication and authorization AV pairs and specifies the Cisco IOS release in which they are implemented.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>11.0</th>
<th>11.1</th>
<th>11.2</th>
<th>11.3</th>
<th>12.0</th>
<th>12.1</th>
<th>12.2</th>
</tr>
</thead>
</table>
| cmd=x     | A shell (EXEC) command. This indicates the command name for a shell command that is to be run. This attribute must be specified if service equals “shell.” A NULL value indicates that the shell itself is being referred to.  
**Note** This TACACS+ AV pair cannot be used with RADIUS attribute 26. | yes  | yes  | yes  | yes  | yes  | yes  | yes  |
<p>| data-service | Used with the service=outbound and protocol=ip. | no   | no   | no   | no   | no   | yes  | yes  |
| dial-number | Defines the number to dial. Used with the service=outbound and protocol=ip. | no   | no   | no   | no   | no   | yes  | yes  |
| dns-servers= | Identifies a DNS server (primary or secondary) that can be requested by Microsoft PPP clients from the network access server during IPCP negotiation. To be used with service=ppp and protocol=ip. The IP address identifying each DNS server is entered in dotted decimal format. | no   | no   | no   | yes  | yes  | yes  | yes  |
| force-56 | Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available. To turn on this attribute, use the “true” value (force-56=true). Any other value is treated as false. Used with the service=outbound and protocol=ip. | no   | no   | no   | no   | no   | yes  | yes  |
| gw-password | Specifies the password for the home gateway during the L2F tunnel authentication. Used with service=ppp and protocol=vpdn. | no   | no   | yes  | yes  | yes  | yes  | yes  |
| idletime=x | Sets a value, in minutes, after which an idle session is terminated. A value of zero indicates no timeout. | no   | yes  | yes  | yes  | yes  | yes  | yes  |
| inac1##&lt;n&gt; | ASCII access list identifier for an input access list to be installed and applied to an interface for the duration of the current connection. Used with service=ppp and protocol=ip, and service service=ppp and protocol =ipx. Per-user access lists do not currently work with ISDN interfaces. | no   | no   | no   | yes  | yes  | yes  | yes  |
| inac1=x | ASCII identifier for an interface input access list. Used with service=ppp and protocol=ip. Per-user access lists do not currently work with ISDN interfaces. | yes  | yes  | yes  | yes  | yes  | yes  | yes  |</p>
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>11.0</th>
<th>11.1</th>
<th>11.2</th>
<th>11.3</th>
<th>12.0</th>
<th>12.1</th>
<th>12.2</th>
</tr>
</thead>
</table>
| interface-config#<n>          | Specifies user-specific AAA interface configuration information with Virtual Profiles. The information that follows the equal sign (=) can be any Cisco IOS interface configuration command. Multiple instances of the attributes are allowed, but each instance must have a unique number. Used with service=ppp and protocol=lcp.  
Note  This attribute replaces the “interface-config=” attribute. | no   | no   | no   | yes  | yes  | yes  | yes  |
| ip-addresses                  | Space-separated list of possible IP addresses that can be used for the end-point of a tunnel. Used with service=ppp and protocol=vpdn. | no   | no   | yes  | yes  | yes  | yes  | yes  |
| l2tp-busy-disconnect          | If a vpdn-group on an LNS uses a virtual-template that is configured to be pre-cloned, this attribute will control the disposition of a new L2TP session that finds no pre-cloned interface to which to connect. If the attribute is true (the default), the session will be disconnected by the LNS. Otherwise, a new interface will be cloned from the virtual-template. Used with service=ppp and protocol=vpdn. | no   | no   | no   | no   | no   | yes  | yes  |
| l2tp-cm-local-window-size     | Specifies the maximum receive window size for L2TP control messages. This value is advertised to the peer during tunnel establishment. Used with service=ppp and protocol=vpdn. | no   | no   | no   | no   | no   | yes  | yes  |
| l2tp-drop-out-of-order        | Respects sequence numbers on data packets by dropping those that are received out of order. This does not ensure that sequence numbers will be sent on data packets, just how to handle them if they are received. Used with service=ppp and protocol=vpdn. | no   | no   | no   | no   | no   | yes  | yes  |
| l2tp-hello-interval           | Specifies the number of seconds for the hello keepalive interval. Hello packets are sent when no data has been sent on a tunnel for the number of seconds configured here. Used with service=ppp and protocol=vpdn. | no   | no   | no   | no   | no   | yes  | yes  |
| l2tp-hidden-avp               | When enabled, sensitive AVPs in L2TP control messages are scrambled or hidden. Used with service=ppp and protocol=vpdn. | no   | no   | no   | no   | no   | yes  | yes  |
| l2tp-nosession-timeout        | Specifies the number of seconds that a tunnel will stay active with no sessions before timing out and shutting down. Used with service=ppp and protocol=vpdn. | no   | no   | no   | no   | no   | yes  | yes  |

</tbody>
</table>
| port-type            | Indicates the type of physical port the network access server is using to authenticate the user. Physical ports are indicated by a numeric value as follows:  
• 0: Asynchronous  
• 1: Synchronous  
• 2: ISDN-Synchronous  
• 3: ISDN-Asynchronous (V.120)  
• 4: ISDN-Asynchronous (V.110)  
• 5: Virtual  
Used with service=any and protocol=aaa. | no   | no   | no   | no   | no   | yes  | yes  |
<p>| ppp-vj-slot-compression | Instructs the Cisco router not to use slot compression when sending VJ-compressed packets over a PPP link.                                                                                                       | no   | no   | no   | yes  | yes  | yes  | yes  |
| priv-lvl=x           | Privilege level to be assigned for the EXEC. Used with service=shell. Privilege levels range from 0 to 15, with 15 being the highest.                                                                             | yes  | yes  | yes  | yes  | yes  | yes  | yes  |
| protocol=x           | A protocol that is a subset of a service. An example would be any PPP NCP. Currently known values are <code>lcp</code>, <code>ip</code>, <code>ipx</code>, <code>atalk</code>, <code>vines</code>, <code>lat</code>, <code>xremote</code>, <code>tn3270</code>, <code>telnet</code>, <code>rlogin</code>, <code>pad</code>, <code>vpdn</code>, <code>osicp</code>, <code>deccp</code>, <code>cpp</code>, <code>cdp</code>, <code>bridging</code>, <code>xns</code>, <code>nbf</code>, <code>bap</code>, <code>multilink</code>, and <code>unknown</code>.                               | yes  | yes  | yes  | yes  | yes  | yes  | yes  |
| proxyacl#&lt;n&gt;         | Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces. Used with the service=shell and protocol=exec. | no   | no   | no   | no   | no   | yes  | yes  |</p>

<th>12.0</th>
<th>12.1</th>
<th>12.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>route</td>
<td>Specifies a route to be applied to an interface. Used with service=slip, protocol=ip. During network authorization, the route attribute can be used to specify a per-user static route, to be installed by TACACS+ as follows: <code>route=destination/mask [gateway]</code> This indicates a temporary static route that is to be applied. The destination, mask, and gateway are expected to be in the usual dotted-decimal notation, with the same meanings as in the familiar <code>ip route</code> configuration command on a network access server. If gateway is omitted, the peer’s address is the gateway. The route is expunged when the connection terminates.</td>
<td>no</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
