Static Routing Commands on Cisco IOS XR Software

This chapter describes the commands used to establish static routes.

For detailed information about static routing concepts, configuration tasks, and examples, see Implementing Static Routes on Cisco IOS XR Software module in Cisco IOS XR Routing Configuration Guide.
address-family (static)

To enter various address family configuration modes while configuring static routes, use the `address-family` command in the appropriate configuration mode. To disable support for an address family, use the `no` form of this command.

```
address-family {ipv4 | ipv6} {unicast | multicast}
no address-family {ipv4 | ipv6} {unicast | multicast}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>Specifies IP Version 4 address prefixes.</td>
</tr>
<tr>
<td>ipv6</td>
<td>Specifies IP Version 6 address prefixes. This option is available only in static router configuration mode.</td>
</tr>
<tr>
<td>unicast</td>
<td>Specifies unicast address prefixes.</td>
</tr>
<tr>
<td>multicast</td>
<td>Specifies multicast address prefixes. This option is available only in static router configuration mode.</td>
</tr>
</tbody>
</table>

### Defaults

When entering address family configuration mode without entering VRF configuration mode, all static routes belong to the default VRF.

### Command Modes

- Router static configuration
- VRF router static configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.3.0</td>
<td>This command was introduced on the Cisco CRS-1 and Cisco XR 12000 Series Router.</td>
</tr>
<tr>
<td>Release 3.4.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.5.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.6.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.7.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.8.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, your Cisco IOS XR software system administrator must assign you to a user group associated with a task group that includes the corresponding command task IDs. If you need assistance with your task group assignment, contact your system administrator. For detailed information about user groups and task IDs, see the Configuring AAA Services on Cisco IOS XR Software module of Cisco IOS XR System Security Configuration Guide.

Use the `address-family` command to enter various address family configuration modes while configuring static routing sessions. From address family configuration mode, you can configure static routes using the `route` command.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to enter IPv6 unicast address family mode:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)# address-family ipv6 unicast
RP/0/RP0/CPU0:router(config-static-afi)#
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route (static)</td>
<td>Establishes a static route.</td>
</tr>
</tbody>
</table>
address-family multicast topology (static)

To enable a multicast topology when configuring static routing, use the `address-family multicast topology` command in router configuration mode. To disable support for a multicast topology in static routing, use the `no` form of this command.

```
address-family {ipv4 | ipv6} multicast topology topo-name

no address-family {ipv4 | ipv6} multicast topology
```

**Syntax Description**

- `ipv4` Specifies IPv4 address prefixes.
- `ipv6` Specifies IPv6 address prefixes.
- `multicast` Specifies multicast address prefixes.
- `topology topo-name` Specifies the name of the topology.

**Defaults**

An address family for multicast topology is not specified. The default subaddress family (SAFI) is unicast.

**Command Modes**

Router static configuration

**Command History**

- **Release 3.7.0** This command was introduced.
- **Release 3.8.0** No modification.

**Usage Guidelines**

To use this command, your Cisco IOS XR software system administrator must assign you to a user group associated with a task group that includes the corresponding command task IDs. If you need assistance with your task group assignment, contact your system administrator. For detailed information about user groups and task IDs, see the Configuring AAA Services on Cisco IOS XR Software module of Cisco IOS XR System Security Configuration Guide.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure multitopology for static routing with an IPv6 multicast address prefix:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)# address-family ipv6 multicast topology green
RP/0/RP0/CPU0:router(config-static-vrf-afi-topo)#
```
maximum path (static)

To change the maximum number of allowable static routes, use the `maximum path` command in static router configuration mode. To remove the `maximum path` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
maximum path {ipv4 | ipv6} value

no maximum path {ipv4 | ipv6} value
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>Specifies IP Version 4 (IPv4) address prefixes.</td>
</tr>
<tr>
<td>ipv6</td>
<td>Specifies IP Version 6 (IPv6) address prefixes.</td>
</tr>
<tr>
<td>value</td>
<td>Maximum number of static routes for the given AFI. The range is 1 to 140000.</td>
</tr>
</tbody>
</table>

### Defaults

`value`: 4000

### Command Modes

Static router configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.3.0</td>
<td>This command was introduced on the Cisco CRS-1 and Cisco XR 12000 Series Router.</td>
</tr>
<tr>
<td>Release 3.4.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.5.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.6.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.7.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.8.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, your Cisco IOS XR software system administrator must assign you to a user group associated with a task group that includes the corresponding command task IDs. If you need assistance with your task group assignment, contact your system administrator. For detailed information about user groups and task IDs, see the Configuring AAA Services on Cisco IOS XR Software module of Cisco IOS XR System Security Configuration Guide.

If you use the `maximum path` command to reduce the configured maximum allowed number of static routes for a given table below the number of static routes currently configured, the change is rejected. In addition, if you commit a batch of routes that would, when grouped, push the number of static routes configured above the maximum allowed, the first `n` routes in the batch and the number previously configured are accepted, and the remainder rejected. The `n` argument is the difference between the maximum number allowed and the number previously configured.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to set the maximum number of static IPv4 routes to 100000:

```
RP/0/RP0/CPU0:router(config-static)# maximum path ipv4 100000
```

The following example shows how to remove the preceding configuration and set the maximum number of static IPv4 routes back to the default:

```
RP/0/RP0/CPU0:router(config-static)# no maximum path ipv4 100000
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>route (static)</strong></td>
<td>Enters static router configuration mode.</td>
</tr>
<tr>
<td><strong>show route static</strong></td>
<td>Displays the static routes in a routing table.</td>
</tr>
</tbody>
</table>
route (static)

To establish static routes, use the `route` command in router static address family configuration mode. To remove the `route` command from the configuration, use the `no` form of this command.

```
prefix mask [vrf vrf-name] {ip-address | type interface-path-id} [distance] [description text] [tag tag] [permanent]

no prefix mask [vrf vrf-name] {ip-address | type interface-path-id} [distance] [description text] [tag tag] [permanent]
```

### Syntax Description

**prefix**  
IP route prefix for the destination.

**mask**  
Prefix mask for the destination. The network mask can be specified in either of two ways:

- The network mask can be a four-part, dotted-decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit is a network address.
- The network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are 1s, and the corresponding bits of the address are the network address.

**vrf vrf-name**  
(Optional) Specifies a destination VRF. This option is available when IPv4 address families are specified. The following names cannot be used: all, default, and global.

```
router static
address-family ipv4 unicast
10.1.1.0/24 vrf vrf_a 192.168.1.1

router static
vrf vrf_a
address-family ipv4 unicast
10.1.1.0/24 192.168.1.1
```

**ip-address**  
(Optional) IP address of the next hop that can be used to reach that network.

- For IPv4 address—the IP address is required, not optional, if the interface type and `interface-path-id` arguments are not specified. You can specify an IP address and an interface type and interface path.
- For IPv6 link-local address—the interface type and `interface-path-id` arguments are required. The route is not valid, if the interface type and `interface-path-id` arguments are not specified.

**type**  
Interface type. For more information, use the question mark (?) online help function.

**interface-path-id**  
Physical interface or virtual interface.

**distance**  
(Optional) Administrative distance. Range is 1 to 254.

**description text**  
(Optional) Specifies a description of the static route.
route (static)

**tag tag**  
(Optional) Specifies a tag value that can be used as a “match” value for controlling redistribution using route policies. Range is 1 to 4294967295.

**permanent**  
(Optional) Specifies that the route is not removed from the routing table, even if the next-hop interface shuts down or next-hop IP address is not reachable.

---

**Defaults**

No static route is established.

**vrf vrf-name:** If no VRF is specified, the vrf where the configuration takes place is used.

---

**Command Modes**

Address family configuration

---

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 2.0</td>
<td>This command was introduced on the Cisco CRS-1.</td>
</tr>
<tr>
<td>Release 3.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 3.2</td>
<td>This command was supported on the Cisco XR 12000 Series Router. The `{unicast</td>
</tr>
</tbody>
</table>
| Release 3.3.0 | This command was moved from global configuration mode to router static configuration mode. The **vrf vrf-name** keyword and argument was added. The following keywords were removed:  
  - route  
  - ipv4  
  - ipv6  
  - unicast  
  - multicast |
| Release 3.4.0 | No modification. |
| Release 3.5.0 | The **description text** keyword and argument was added. |
| Release 3.6.0 | No modification. |
| Release 3.7.0 | No modification. |
| Release 3.8.0 | No modification. |

---

**Usage Guidelines**

To use this command, your Cisco IOS XR software system administrator must assign you to a user group associated with a task group that includes the corresponding command task IDs. If you need assistance with your task group assignment, contact your system administrator. For detailed information about user groups and task IDs, see the **Configuring AAA Services on Cisco IOS XR Software** module of <i>Cisco IOS XR System Security Configuration Guide</i>.

A static route is appropriate when the software cannot dynamically build a route to the destination. Static routes have a default administrative distance of 1, in which a low number indicates a preferred route. By default, static routes are preferred to routes learned by routing protocols. You can configure an administrative distance with a static route if you want the static route to be overridden by dynamic routes.
For example, you could have routes installed by the Open Shortest Path First (OSPF) protocol with an administrative distance of 120. To have a static route that would be overridden by an OSPF dynamic route, specify an administrative distance greater than 120.

The routing table considers the static routes that point to an interface as “directly connected.” Directly connected networks are advertised by IGP routing protocols if a corresponding `interface` command is contained under the router configuration stanza of that protocol.

A static route is always associated with a VPN routing and forwarding (VRF) instance. The VRF can be the default VRF or a specified VRF. Specifying a VRF allows you to enter VRF configuration mode where you can configure a static route. If you do not specify a VRF you can configure a default VRF static route.

Use the `router static` command to configure static routes. To configure a static route, you must enter router static configuration mode and then enter an address family configuration mode or VRF configuration mode. See the `vrf (static)` command for information on configuring a static route in VRF configuration mode. After you enter an address family mode, you can enter multiple static routes. The following example shows how to configure multiple static routes in IPv4 and IPv6 address family configuration modes:

```plaintext
router static
address-family ipv4 unicast
  0.0.0.0/0 2.6.0.1
!
address-family ipv6 unicast
  2b11::327a:7b00/120 POS0/2/0/7
  2b11::327a:7b00/120 GigabitEthernet0/6/0/0
  2b11::327a:7b00/120 2b11::2f01:4c
  2b11::327a:7b00/120 2b11::2f01:4d
  2b11::327a:7b00/120 2b11::2f01:4e
  2b11::327a:7b00/120 2b11::2f01:4f
```

**Note**

You cannot create a VRF named default, but you can reference the default VRF.

---

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure IPv6 unicast address family static routes:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)# address-family ipv6 unicast
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 POS0/2/0/7
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 GigabitEthernet0/6/0/0
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4c
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4d
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4e
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4f
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:50
```

</table>
To enter static router configuration mode, use the `router static` command in global configuration mode. To remove all static route configurations and terminate the static routing process, use the `no` form of this command.

```
router static
no router static
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
No static routing process is enabled.

### Command Modes
Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</table>
**vrf (static)**

To configure a VPN routing and forwarding (VRF) instance and enter VRF configuration mode, use the `vrf` command in router configuration mode. To remove the VRF instance from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
  vrf vrf-name

  no vrf vrf-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>vrf-name</th>
<th>Name of the VRF instance. The following names cannot be used: all, default, and global.</th>
</tr>
</thead>
</table>

**Defaults**

No default behavior or values

**Command Modes**

Static router configuration

**Command History**

<table>

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, your Cisco IOS XR software system administrator must assign you to a user group associated with a task group that includes the corresponding command task IDs. If you need assistance with your task group assignment, contact your system administrator. For detailed information about user groups and task IDs, see the *Configuring AAA Services on Cisco IOS XR Software* module of *Cisco IOS XR System Security Configuration Guide*.

Use the `vrf` command to configure a VRF instance. A VRF instance is a collection of VPN routing and forwarding tables maintained at the provider edge (PE) router.

If you are configuring a default VRF route, you do not need to enter VRF configuration mode. For example, routes 192.168.1.0/24 and 192.168.1.0/24 are configured as follows:

```
router static
  address ipv4 unicast
  192.168.1.0/24 loopback 5
  192.168.1.0/24 10.1.1.1
```

Routes 192.168.1.0/24 and 192.168.1.0/24 are default VRF routes.

Routes 172.168.40.0/24 and 172.168.40.0/24 are configured as follows:
router static
  vrf vrf_A
  address ipv4 unicast
  172.168.40.0/24 loopback 1
  172.168.40.0/24 vrf default 192.168.1.0/24

Routes 172.168.40.0/24 and 172.168.40.0/24 belong to vrf_A. Route 172.168.40.0/24 is not installed in vrf_A until route 192.168.1.0/24 (a default VRF route) is resolved.

**Note**
You cannot create a VRF named default, but you can reference the default VRF.

**Note**
You must remove IPv4/IPv6 addresses from an interface prior to assigning, removing, or changing a VRF on an IP interface. If this is not done in advance, any attempt to change the VRF on an IP interface is rejected.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>static</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure a VRF instance and enter VRF configuration mode:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)# vrf vrf-1
RP/0/RP0/CPU0:router(config-static-vrf)#
```
