

## Hosting Applications on IOS XR

This section explains the different kinds of application hosting, and demonstrates how a simple application, such as iPerf, can be hosted natively or in a third-party container on IOS XR.

- [Application Hosting in IOS XR Container, on page 1](#)
- [Container Application Hosting, on page 1](#)
- [Customize Docker Run Options Using Application Manager, on page 10](#)
- [Using Vagrant for Hosting Applications, on page 14](#)

## Application Hosting in IOS XR Container

You can create your own container on IOS XR, and host applications within the container. The applications can be developed using any Linux distribution. This is well suited for applications that use system libraries that are different from that provided by the IOS XR root file system.

### Selecting the Type of Application Hosting

You can select an application hosting type, depending on your requirement and the following criteria.

- **Resources:** If you need to manage the amount of resources consumed by the hosted applications, you must choose the container model, where constraints can be configured. In a native model, you can only deploy applications that use allotted resources, which are shared with internal IOS XR processes.
- **Choice of Environment:** Applications to be hosted natively must be built with the Wind River Linux 7 distribution that is offered by IOS XR. If you decide to choose the Linux distribution that is to be used for building your applications, then you must choose the container model. When you host an application using the container model, you can pre-package it prior to deployment.

## Container Application Hosting

This section introduces the concept of container application hosting and describes its workflow.

Container application hosting makes it possible for applications to be hosted in their own environment and process space (namespace) within a Linux container on Cisco IOS XR. The application developer has complete control over the application development environment, and can use a Linux distribution of choice. The applications are isolated from the IOS XR control plane processes; yet, they can connect to networks outside XR through the XR GigE interfaces. The applications can also easily access local file systems on IOS XR.

This figure illustrates the workflow for creating a Linux container for application hosting. For the complete configuration procedure, see [Running iPerf as a Container Application, on page 3](#).

**Figure 1: Container Application Hosting Workflow**

There are two components in container application hosting:

- **Linux server:** This is the server you use to develop your application, to bring up the Linux Container (LXC), and to prepare the container environment.
- **Router:** This is the router running the 64-bit IOS XR that is used to host your container with the application you want to run.

1. On the Linux server, bring up the LXC, and do the following:
  - a. Prepare the container environment and the required libraries.
  - b. Shut down the LXC.
2. Connect to the router running IOS XR, and copy the root file system.
3. Create the configuration file for the container in .xml format. This file specifies the attributes for the container, such as name of the container, default namespace, and so on.

**Note** If you specify a network namespace (third-party), then by default, the LXC is launched in that namespace.

4. Launch the LXC on the router.
  5. Log into the LXC on the router through IOS XR console access.
  6. Manually start the application, or configure the application to start automatically when the LXC is launched.
- You can use a container, like a Linux box, to install and host applications for users.

## Running iPerf as a Container Application

As an example of container application hosting, you can install an iPerf client within a LXC on IOS XR, and check its connectivity with an iPerf server installed within an LXC on another router, as described in this section.

### Topology

The following illustration describes the topology used in this example.

**Figure 2: iPerf as a Container Application**

iPerf server is installed on Router A, and iPerf client is installed on Router B. Both installations are done within containers on the 64-bit IOS XR. The iPerf client communicates with the iPerf server through the interfaces offered by IOS XR.

### Prerequisites

Ensure that you have configured the two routers as shown in the topology.

### Configuration Procedure

To run iPerf as a container application, follow these steps:

1. Log into Router A, and enter the XRNNS.

```
RP/0/RP0/CPU0:ios# run
[xr-vm_node0_RP0_CPU0:~]$
```

2. Launch the LXC.

```
[xr-vm_node0_RP0_CPU0:~]$virsh -c lxc+tcp://10.11.12.15:16509/ -e ^Q console demo1
```

3. Log into the LXC when prompted.

```
Connected to domain demo
Escape character is ^Q
Kernel 3.14.23-WR7.0.0.2_standard on an x86_64
```

```
host login: Password:
```

4. Install the iPerf server within the LXC on Router A.

```
[root@host ~]#apt-get install iperf
```

5. Perform Steps 1 to 4 to install the iPerf client on Router B.

6. Verify the iPerf server installation on Router A.

```
[root@host ~]#iperf -v
```

```
iperf version 2.0.5 (08 Jul 2010) pthreads
```

Similarly, verify the iPerf client installation on Router B.

7. Bind the Loopback0 interface on Router A to the iPerf server, and launch the iPerf server instance.

In this example, 1.1.1.1 is the assigned Loopback0 interface address of Router A, and 57730 is the port number used for communication.

```
[root@host ~]#iperf -s -B 1.1.1.1 -p 57730
Server listening on TCP port 57730
Binding to local address 1.1.1.1
TCP window size: 85.3 KByte (default)
```

8. Launch the iPerf client instance on Router B, by specifying the same port number used for the iPerf server, and the management IP address of Router A.

In this example, 192.168.122.213 is the management IP address of Router A, and 57730 is the port number used to access the iPerf server.

```
[root@host ~]#iperf -c 192.168.122.213 -p 57730
-----
Client connecting to 192.168.122.213, TCP port 57730
TCP window size: 85.0 KByte (default)
-----
[ 3] local 192.168.122.1 port 46974 connected with 192.168.122.213 port 57730
[ ID] Interval      Transfer    Bandwidth
[ 3]  0.0-10.0 sec   146 MBytes  122 Mbits/sec
```

To use UDP, instead of TCP, to communicate with the iPerf server, use the following command.

```
[root@host ~]#iperf -c 192.168.122.213 -p 57730 -u
-----
Client connecting to 192.168.122.213, UDP port 57730
Sending 1470 byte datagrams
UDP buffer size: 208 KByte (default)
-----
[ 3] local 192.168.122.1 port 41466 connected with 192.168.122.213 port 57730
[ ID] Interval      Transfer    Bandwidth
[ 3]  0.0-10.0 sec   1.25 MBytes  1.05 Mbits/sec
[ 3] Sent 893 datagrams
[ 3] Server Report:
[ 3]  0.0-10.0 sec   1.25 MBytes  1.05 Mbits/sec   0.233 ms    0/ 893 (0%)
[root@hostB ~]#
```

9. Ping the iPerf server from the iPerf client on Router B.

```
[root@host ~]#bin/ping 192.164.168.10
PING 192.164.168.10 (192.164.168.10) 56(84) bytes of data.
64 bytes from 192.164.168.10: icmp_seq=1 ttl=255 time=13.0 ms
64 bytes from 192.164.168.10: icmp_seq=2 ttl=255 time=2.14 ms
64 bytes from 192.164.168.10: icmp_seq=3 ttl=255 time=2.21 ms
```

The iPerf client hosted on Router B can access the iPerf server hosted on Router A.

## Using Docker for Hosting Applications on Cisco IOS XR

Like an LXC, docker is a container used for hosting applications on Cisco IOS XR. Docker provides isolation for application processes from the underlying host processes on XR by using Linux network namespaces.

### Need for Docker on Cisco IOS XR

Docker is becoming the industry-preferred packaging model for applications in the virtualization space. Docker provides the foundation for automating application life cycle management.

Docker follows a layered approach that consists of a base image at the bottom that supports layers of applications on top. The base images are available publicly in a repository, depending on the type of application you want to install on top. You can manipulate docker images by using the docker index and registry.

Docker provides a git-like workflow for developing container applications and supports the "thin update" mechanism, where only the difference in source code is updated, leading to faster upgrades. Docker also provides the "thin download" mechanism, where newer applications are downloaded faster because of the sharing of common base docker layers between multiple docker containers. The sharing of docker layers between multiple docker containers leads to lower footprint for docker containers on XR.

### Docker Architecture on Cisco IOS XR

The following figure illustrates the docker architecture on IOS XR.

**Figure 3: Docker on IOS XR**

The docker containers are created alongside the LXC on XR. To create and manage the containers, you can use the XR bash shell. This is where the docker client is installed. The application binaries for the applications to be hosted are installed inside the docker container.

### Hosting Applications in Docker Containers

The following figure illustrates the workflow for hosting applications in Docker containers on IOS XR.

Figure 4: Docker Workflow for Application Hosting

1. The docker file in the source repository is used to build the application binary file on your (docker engine build) host machine.
2. The application binary file is pushed into the docker image registry.
3. The application binary file is pulled from the docker image registry and copied to the docker container on XR (docker engine target host).
4. The application is built and hosted in the docker container on XR.

### Updating Applications in Docker Containers

The following figure illustrates the workflow for updating applications hosted in docker containers.

Figure 5: Docker Workflow for Updating Applications

1. The application update is generated as a base libs update file (delta update file) and pushed to the docker image registry.
2. The delta update file (containing only the difference in application code) is pulled from the docker image registry and copied to the docker containers on XR (docker engine target host).
3. The docker containers are restarted with the delta update file.

# Hosting and Seamless Activation of Third Party Applications Using Application Manager

**Table 1: Feature History Table**

Feature Name	Release Information	Feature Description
Hosting and Seamless Activation of Third Party Applications Using Application Manager	Release 7.5.1	<p>Application Manager manages third-party application hosting and their functioning through Cisco IOS XR CLIs. With this feature, all the activated third party applications are automatically restarted after a router reload or an RP switchover. This process ensures seamless functioning of the hosted applications.</p> <p>Prior to this release, the hosted applications were controlled by the Docker commands executed in the bash shell of the Kernel that hosts the Cisco IOS XR software.</p>
On-Demand Docker Daemon Service for Hosting Applications	Release 7.5.1	<p>From this release onwards, the Docker daemon service starts on a router only if you configure a third-party hosting application using the <b>appmgr</b> command. Such an on-demand service optimizes operating system resources such as CPU, memory, and power.</p> <p>In earlier releases, the Docker daemon service automatically started during the router boot up.</p>

In previous releases, the applications were hosted and controlled by the Docker commands. These Docker commands were executed in the bash shell of the Kernel that also hosted the Cisco IOS XR software. With the introduction of Application Manager, it is now possible to manage third-party application hosting and their functioning through Cisco IOS XR CLIs. With this feature, all the activated third party applications can restart automatically after a router reload or an RP switchover. This automatic restart of the applications ensure seamless functioning of the hosted applications.

## Supported Commands on Application Manager

For every application manager command or configuration executed, the Application Manager performs the requested action by interfacing with the Docker daemon through the Docker socket.

The following table lists the Docker container functionalities, the generic Docker commands that were used in the previous releases, and its equivalent application manager commands that can now be used:

Functionality	Generic Docker Commands	Application Manager Commands
Install the application RPM	NA	Router#appmgr package install rpm <i>image_name-0.1.0-XR_7.3.1.x86_64.rpm</i>
Configure and activate the application	<ul style="list-style-type: none"> <li>Load image - [xr-vm_node0_RP0_CPU0:~]\$docker load -i /tmp/<i>image_name.tar</i></li> <li>Verify the image on the router - xr-vm_node0_RP0_CPU0:~]\$docker images ls</li> <li>Create container over the image - [xr-vm_node0_RP0_CPU0:~]\$docker create <i>image_name</i></li> <li>Start container - [xr-vm_node0_RP0_CPU0:~]\$docker start <i>my_container_id</i></li> </ul>	Router#config Router (config) #appmgr  Router (config-appmgr) #application <i>app_name</i>  Router (config-application) #activate type docker source <i>image_name</i> docker-run-opts "--net=host" docker-run-cmd "iperf3 -s -d"  Router (config-application) #commit
View the list, statistics, logs, and details of the application container	<ul style="list-style-type: none"> <li>List images -[xr-vm_node0_RP0_CPU0:~]\$docker images ls</li> <li>List containers - [xr-vm_node0_RP0_CPU0:~]\$docker ps</li> <li>Statistics -[xr-vm_node0_RP0_CPU0:~]\$docker stats</li> <li>Logs -[xr-vm_node0_RP0_CPU0:~]\$docker logs</li> </ul>	Router#show appmgr source-table  Router#show appmgr application name <i>app_name</i> info summary Router#show appmgr application name <i>app_name</i> info detail  Router#show appmgr application name <i>app_name</i> stats  Router#show appmgr application-table  Router#show appmgr application name <i>app_name</i> logs
Run a new command inside a running container	<ul style="list-style-type: none"> <li>Execute - [xr-vm_node0_RP0_CPU0:~]\$docker exec -it <i>my_container_id</i></li> </ul>	Router#appmgr application exec name <i>app_name</i> docker-exec-cmd
Stop the application container	<ul style="list-style-type: none"> <li>Stop container - [xr-vm_node0_RP0_CPU0:~]\$docker stop <i>my_container_id</i></li> </ul>	Router#appmgr application stop name <i>app_name</i>
Kill the application container	<ul style="list-style-type: none"> <li>Kill container - [xr-vm_node0_RP0_CPU0:~]\$docker kill <i>my_container_id</i></li> </ul>	Router#appmgr application kill name <i>app_name</i>

Functionality	Generic Docker Commands	Application Manager Commands
Start the application container	<ul style="list-style-type: none"> <li>Start container -  <code>[xr-vm_node0_RP0_CPU0:~]\$docker start my_container_id</code> </li> </ul>	<pre>Router#appmgr application start name app_name</pre>
Deactivate the application	<ul style="list-style-type: none"> <li>Stop container -  <code>[xr-vm_node0_RP0_CPU0:~]\$docker stop my_container_id</code> </li> <li>Remove container -  <code>[xr-vm_node0_RP0_CPU0:~]\$docker rm my_container_id</code> </li> <li>Remove image -  <code>[xr-vm_node0_RP0_CPU0:~]\$docker rmi image_name</code> </li> </ul>	<pre>Router#configure Router(config)#no appmgr application app_name Router(config)#commit</pre>
Uninstall the application image/RPM	<ul style="list-style-type: none"> <li>Uninstall image -  <code>[xr-vm_node0_RP0_CPU0:~]\$docker app uninstall image_name</code> </li> </ul>	<pre>Router#appmgr package uninstall package image_name-0.1.0-XR_7.3.1.x86_64</pre>

**Note**

The usage of the application manager commands are explained in the "[Hosting iPerf in Docker Containers to Monitor Network Performance using Application Manager](#)" section.

# Customize Docker Run Options Using Application Manager

Table 2: Feature History Table

Feature Name	Release Information	Description
Customize Docker Run Options Using Application Manager	Release 24.1.1	<p>You can now leverage Application Manager to efficiently overwrite default docker runtime configurations, tailoring them to specific parameters like CPU usage, security settings, and health checks. You can thus optimize application performance, maintain fair resource allocation among multiple dockers, and establish non-default network security settings to meet specific security requirements. Additionally, you can accurately monitor and reflect the health of individual applications.</p> <p>This feature modifies the <b>docker-run-opts</b> option command.</p>

With this feature, runtime options for docker containerized applications on IOS-XR can be configured during launch using the **appmgr activate** command. AppMgr, which oversees docker containerized applications, ensures that these runtime options can effectively override default configurations, covering aspects like CPU, security, and health checks during the container launch.

This feature introduces multiple runtime options that allow users to customize different parameters of docker containers. The configuration of these runtime options is flexible, as users can use either command or Netconf for the configuration process. Regardless of the chosen method, runtime options must be added to **docker-run-opts** as needed.

The following are the docker run option commands introduced in IOS-XR software release 24.1.1.

Table 3: Docker Run Options

Docker Run Option	Description
--cpus	Number of CPUs
--cpuset-cpus	CPUs in which to allow execution (0-3, 0,1)
--cap-drop	Drop Linux capabilities
--user, -u	Sets the username or UID
--group-add	Add additional groups to run
--health-cmd	Run to check health

Docker Run Option	Description
--health-interval	Time between running the check
--health-retries	Consecutive failures needed to report unhealthy
--health-start-period	Start period for the container to initialize before starting health-retries countdown
--health-timeout	Maximum time to allow one check to run
--no-healthcheck	Disable any container-specified HEALTHCHECK
--add-host	Add a custom host-to-IP mapping (host:ip)
--dns	Set custom DNS servers
--dns-opt	Set DNS options
--dns-search	Set custom DNS search domains
--domainname	Container NIS domain name
--oom-score-adj	Tune host's OOM preferences (-1000 to 1000)
--shm-size	Option to set the size of /dev/shm
--init	Run an init inside the container that forwards signals and reaps processes
--label, -l	Set meta data on a container
--label-file	Read in a line delimited file of labels
--pids-limit	Tune container pids limit (set -1 for unlimited)
--work-dir	Working directory inside the container
--ulimit	Ulimit options
--read-only	Mount the container's root filesystem as read only
--volumes-from	Mount volumes from the specified container(s)
--stop-signal	Signal to stop the container
--stop-timeout	Timeout (in seconds) to stop a container

Prior to IOS-XR software release 24.1.1, only the below mentioned docker run option commands were supported.

**Table 4: Docker Run Options**

Docker Run Option	Description
--publish	Publish a container's port(s) to the host

Docker Run Option	Description
--entrypoint	Overwrite the default ENTRYPOINT of the image
--expose	Expose a port or a range of ports
--link	Add link to another container
--env	Set environment variables
--env-file	Read in a file of environment variables
--network	Connect a container to a network
--hostname	Container host name
--interactive	Keep STDIN open even if not attached
--tty	Allocate a pseudo-TTY
--publish-all	Publish all exposed ports to random ports
--volume	Bind mount a volume
--mount	Attach a filesystem mount to the container
--restart	Restart policy to apply when a container exits
--cap-add	Add Linux capabilities
--log-driver	Logging driver for the container
--log-opt	Log driver options
--detach	Run container in background and print container ID
--memory	Memory limit
--memory-reservation	Memory soft limit
--cpu-shares	CPU shares (relative weight)
--sysctl	Sysctl options

### Restrictions and Limitations

- For the options `--mount` and `--volume`, only the following values can be configured:
  - `"/var/run/netns"`
  - `"/var/lib/docker"`
  - `"/misc/disk1"`
  - `"/disk0"`
- The maximum allowed size for `shm-size` option is 64 Mb.

## Configuration

This section provides the information on how to configure the docker run time options.

In this example we configure the docker run time option **--pids-limit** to limit the number of process IDs using appmgr.

```
Router#appmgr application alpine_app activate type docker source alpine docker-run-opts
"-it -pids-limit 90" docker-run-cmd "sh"
Router#
```

In this example we configure the docker run time option **--pids-limit** to limit the number of process IDs using Netconf.

```
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <edit-config>
    <target>
      <candidate/>
    </target>
    <config>
      <appmgr xmlns=http://cisco.com/ns/yang/Cisco-IOS-XR-um-appmgr-cfg>

        <applications>
          <application>
            <application-name>alpine_app</application-name>
            <activate>
              <type>docker</type>

              <source-name>alpine</source-name>
              <docker-run-cmd>/bin/sh</docker-run-cmd>
              <docker-run-opts>-it

--pids-limit=90</docker-run-opts>
            </activate>
          </application>
        </applications>
      </appmgr>
    </config>
  </edit-config>
```

## Verification

This example shows how to verify the docker run time option configuration.

```
Router# show running-config appmgr
Thu Mar 23 08:22:47.014 UTC
appmgr
  application alpine_app
    activate type docker source alpine docker-run-opts "-it -pids-limit 90" docker-run-cmd
    "sh"
  !
!
```

You can also use **docker inspect** *container id* to verify the docker run time option configuration.

```
Router# docker inspect 25f3c30eb424
[
  {
    "PidsLimit": 90,
  }
]
```

# Using Vagrant for Hosting Applications

You can use vagrant on a host device of your choice, for hosting applications as described in the following sections.

**Note** IOS-XR software version 6.x.x and above is not supported on Vagrant.

## Pre-requisites for Using Vagrant

Before you can start using vagrant, ensure that you have fulfilled the following requirements on your host device.

- Latest version of [Vagrant](#) for your operating system. We recommend Version 1.8.6.
- Latest version of a [virtual box](#) for your operating system. We recommend Version 5.1+.
- Minimum of 5 GB of RAM with two cores.
- (Optional) If you are using the Windows Operating System, we recommend that you download the [Git bash](#) utility for running the commands.

## Setting up an Application Development Topology By Using Vagrant

For the sake of illustration, we will use a simple two-node topology, where an instance of Cisco IOS XR behaves as one node (`rt1`), and an instance of Ubuntu (hypervisor) behaves as the other (`devbox`). We will use the `devbox` to develop the app topology and deploy it on the `rt1`.

**Figure 6: Application Development Topology**

## Procedure

To create an application development topology on vagrant, follow these steps.

1. Generate an API key and a CCO ID by using the steps described on [Github](#).
2. Download the latest stable version of the IOS-XRv vagrant box.

```
$ curl <cco-id>:<API-KEY>
$ BOXURL --output ~/iosxrv-fullk9-x64.box
```

```
$ vagrant box add --name IOS-XRv ~/iosxrv-fullk9-x64.box
```

3. Verify if the vagrant box has been successfully installed.

```
annseque@ANNSEQUE-WS02 MINGW64 ~ $ vagrant box list
IOS-XRv (virtualbox, 0)
```

4. Create a working directory.

```
annseque@ANNSEQUE-WS02 MINGW64 ~ $ mkdir ~/iosxrv
annseque@ANNSEQUE-WS02 MINGW64 ~ $ cd ~/iosxrv
```

5. Initialize the vagrant file with the new vagrant box.

```
ANNSEQUE-WS02 MINGW64:iosxrv annseque$ vagrant init IOS-XRv
A `Vagrantfile` has been placed in this directory. You are now
ready to `vagrant up` your first virtual environment! Please read
the comments in the Vagrantfile as well as documentation on
`vagrantup.com` for more information on using Vagrant.
```

6. Clone the vagrant-xrdocs repository.

```
annseque@ANNSEQUE-WS02 MINGW64 ~
$ git clone https://github.com/ios-xr/vagrant-xrdocs.git
```

7. Navigate to the vagrant-xrdocs repository and locate the lxc-app-topo-bootstrap directory.

```
annseque@ANNSEQUE-WS02 MINGW64 ~
$ cd vagrant-xrdocs/

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs (master)
$ ls
ansible-tutorials/      native-app-topo-bootstrap/  simple-mixed-topo/
lxc-app-topo-bootstrap/  README.md                  single_node_bootstrap/

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs (master)
$ ls lxc-app-topo-bootstrap/
configs/  scripts/  Vagrantfile
```

8. (Optional) View the contents of the vagrant file in the lxc-app-topo-bootstrap directory.

The vagrant file (Vagrantfile) contains the two node topology for application development. You can modify this by using a vi editor, if required.

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs (master)
$ cd lxc-app-topo-bootstrap/

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ cat Vagrantfile
# -*- mode: ruby -*-
# vi: set ft=ruby :

# All Vagrant configuration is done below. The "2" in Vagrant.configure
# configures the configuration version (we support older styles for
# backwards compatibility). Please don't change it unless you know what
# you're doing.

Vagrant.configure(2) do |config|
```

```

config.vm.define "rtr" do |node|
  node.vm.box = "IOS-XRv"

  # gig0/0/0 connected to "link1"
  # auto_config is not supported for XR, set to false

  node.vm.network :private_network, virtualbox__intnet: "link1", auto_config
false

  #Source a config file and apply it to XR

  node.vm.provision "file", source: "configs/rtr_config", destination: "/home/vagrant/rtr_config"

  node.vm.provision "shell" do |s|
    s.path = "scripts/apply_config.sh"
    s.args = ["/home/vagrant/rtr_config"]
  end

end

config.vm.define "devbox" do |node|
  node.vm.box = "ubuntu/trusty64"

  # eth1 connected to link1
  # auto_config is supported for an ubuntu instance

  node.vm.network :private_network, virtualbox__intnet: "link1", ip: "11.1.1
.20"

  end

end

```

You have successfully created an application development topology on vagrant. See [Deploying an Application Development Topology by Using Vagrant, on page 16](#) for information on deploying the topology on vagrant.

## Deploying an Application Development Topology by Using Vagrant

This section describes how you can deploy an application development topology on vagrant for creating and hosting your applications.

### Procedure

To deploy an application development topology on vagrant, follow these steps.

**Note** Ensure you have created an application development topology as described in [Setting up an Application Development Topology By Using Vagrant, on page 14](#), before proceeding with the following steps.

1. Ensure you are in the `lxc-app-topo-bootstrap` directory, and launch the vagrant instance.

```

annseque@ANNSEQU-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant up

==> rtr: Machine 'rtr' has a post `vagrant up` message. This is a message
==> rtr: from the creator of the Vagrantfile, and not from Vagrant itself:
==> rtr:
==> rtr:
==> rtr: Welcome to the IOS XRv (64-bit) Virtualbox.
==> rtr: To connect to the XR Linux shell, use: 'vagrant ssh'.
==> rtr: To ssh to the XR Console, use: 'vagrant port' (vagrant version > 1.8)
==> rtr: to determine the port that maps to guestport 22,
==> rtr: then: 'ssh vagrant@localhost -p <forwarded port>'
==> rtr:
==> rtr: IMPORTANT: READ CAREFULLY
==> rtr: The Software is subject to and governed by the terms and conditions
==> rtr: of the End User License Agreement and the Supplemental End User
==> rtr: License Agreement accompanying the product, made available at the
==> rtr: time of your order, or posted on the Cisco website at
==> rtr: www.cisco.com/go/terms (collectively, the 'Agreement').
==> rtr: As set forth more fully in the Agreement, use of the Software is
==> rtr: strictly limited to internal use in a non-production environment
==> rtr: solely for demonstration and evaluation purposes. Downloading,
==> rtr: installing, or using the Software constitutes acceptance of the
==> rtr: Agreement, and you are binding yourself and the business entity
==> rtr: that you represent to the Agreement. If you do not agree to all
==> rtr: of the terms of the Agreement, then Cisco is unwilling to license
==> rtr: the Software to you and (a) you may not download, install or use the
==> rtr: Software, and (b) you may return the Software as more fully set forth
==> rtr: in the Agreement.
    
```

You have successfully deployed the two nodes, `rtr` and `devbox` on your host machine.

2. To access the XR router console, check the port number that maps to the guest port number 22.

```

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant port rtr
The forwarded ports for the machine are listed below. Please note that
these values may differ from values configured in the Vagrantfile if the
provider supports automatic port collision detection and resolution.

      22 (guest) => 2223 (host)
     57722 (guest) => 2222 (host)
    
```

You need to use port number 2223 to SSH to the `rtr` node (XR).

3. Access the XR router console (`rtr` console) through SSH.

The password for `vagrant@localhost` is **vagrant**.

```

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ ssh -p 2223 vagrant@localhost
vagrant@localhost's password:

RP/0/RP0/CPU0:ios#
    
```

You are at the XR router console, or the console of the `rtr` node in this example.

4. Check the GigE interface IP address of the `rtr`.

You will need the GigE interface IP address to access the `rtr` console from the `devbox` console at a later stage.

```
RP/0/RP0/CPU0:ios# show ipv4 interface gigabitEthernet 0/0/0/0 brief
Wed Aug 31 04:00:48.006 UTC
```

Interface	IP-Address	Status	Protocol
GigabitEthernet0/0/0/0	11.1.1.10	Up	Up

**Note** To access the XR Linux shell from the `rtr` console, use the `run` command.

```
RP/0/RP0/CPU0:ios# run
Wed Aug 31 04:01:45.119 UTC

[xr-vm_node0_RP0_CPU0:~]$
```

##### 5. Exit the `rtr` console, and access the `devbox` console through SSH.

```
RP/0/RP0/CPU0:ios# exit
Connection to localhost closed.

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant ssh devbox

Welcome to Ubuntu 14.04.4 LTS (GNU/Linux 3.13.0-87-generic x86_64)

 * Documentation:  https://help.ubuntu.com/

System information disabled due to load higher than 1.0

Get cloud support with Ubuntu Advantage Cloud Guest:
http://www.ubuntu.com/business/services/cloud

25 packages can be updated.
12 updates are security updates.

vagrant@vagrant-ubuntu-trusty-64:~$
```

##### 6. Verify if you can access the `rtr` console from the `devbox` console, by pinging the GigE interface of the `rtr`.

Use the GigE interface IP address you retrieved in Step 12.

```
vagrant@vagrant-ubuntu-trusty-64:~$ ping 11.1.1.10 -c 2
PING 11.1.1.10 (11.1.1.10) 56(84) bytes of data.
64 bytes from 11.1.1.10: icmp_seq=1 ttl=255 time=40.2 ms
64 bytes from 11.1.1.10: icmp_seq=2 ttl=255 time=6.67 ms

--- 11.1.1.10 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 1002ms
rtt min/avg/max/mdev = 6.670/23.457/40.245/16.788 ms
vagrant@vagrant-ubuntu-trusty-64:~$
```

**Note** To access the XR Linux console, exit the `devbox` console and run the **`vagrant ssh rtr`** command from the `lxc-app-topo-bootstrap` directory.

```
vagrant@vagrant-ubuntu-trusty-64:~$ exit
logout
Connection to 127.0.0.1 closed.

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant ssh rtr
Last login: Thu Jul 21 05:51:28 2016 from 10.0.2.2
xr-vm_node0_RP0_CPU0:~$
```

You have successfully deployed an application development topology on your host device.

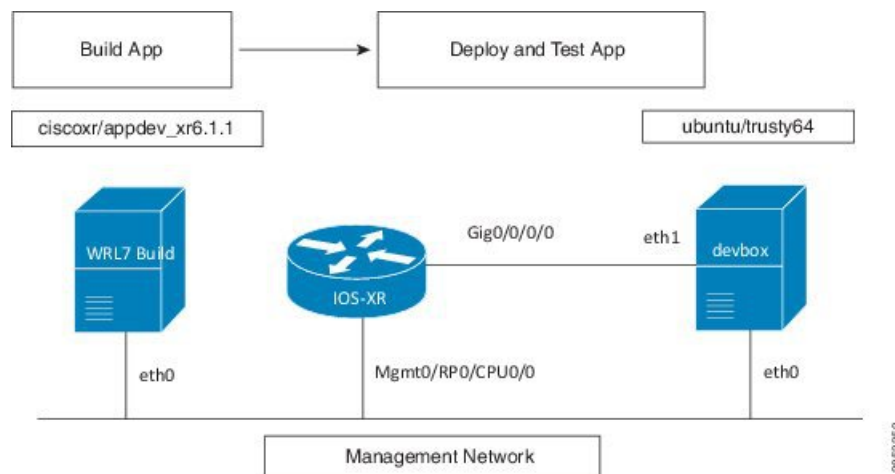

## Hosting a Wind River Linux (WRL7) Application Natively By Using Vagrant

This section describes how you can host a Wind river Linux (WRL7) application natively by using vagrant.

### Native Application Hosting Topology

For the sake of illustration, we will use the three vagrant instance topology as shown in the following figure.

**Figure 7: Native Application Hosting Topology on a Vagrant Box**

### Procedure

Use the following steps to host an application natively on IOS XR.

**Note** Ensure you have created an application development topology as described in [Setting up an Application Development Topology By Using Vagrant, on page 14](#), before proceeding with the following steps.

1. Verify if you have the `IOS-XRv` and the `ciscoxr/appdev-xr6.1.1` vagrant boxes installed on your machine.

```
annseque@ANNSEQUE-WS02 MINGW64 ~
$ vagrant box list
IOS-XRv                (virtualbox, 0)
ciscoxr/appdev-xr6.1.1 (virtualbox, 1.0)
ubuntu/trusty64        (virtualbox, 20160602.0.0)
```

## 2. Clone the vagrant-xrdocs repository.

```
annseque@ANNSEQUE-WS02 MINGW64 ~
$ git clone https://github.com/ios-xr/vagrant-xrdocs.git
```

## 3. Navigate to the vagrant-xrdocs/native-app-topo-bootstrap directory and launch the vagrant instance.

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs (master)
$ cd native-app-topo-bootstrap/

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/native-app-topo-bootstrap (master)
$ vagrant up

...
==> wr17_build: Welcome to the IOS XR Application Development (AppDev) VM that provides
a WRL7 based native environment to build appli
cations for IOS XR (Release
6.1.1) platforms.
    
```

#### 4. Verify if the WRL7 build instance has launched.

```

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/native-app-topo-bootstrap (master)
$ vagrant status
Current machine states:

rtr                               running (virtualbox)
devbox                           running (virtualbox)
wr17_build                       running (virtualbox)
...
    
```

#### 5. Access the WRL7 build instance through SSH, and retrieve the source code of the application you want to host natively.

In this example, we fetch the source code for the iPerf application.

```

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/native-app-topo-bootstrap (master)
$ vagrant ssh wr17_build

-----

localhost:~$ wget https://iperf.fr/download/source/iperf-2.0.9-source.tar.gz

```

9. Transfer the RPM file to XR.

- a. Note down the port number on XR for transferring the RPM file.

```
localhost:~$ exit
logout
Connection to 127.0.0.1 closed.
```

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/native-app-topo-bootstrap (master)
$ vagrant port rtr
The forwarded ports for the machine are listed below. Please note that
these values may differ from values configured in the Vagrantfile if the
```

```
provider supports automatic port collision detection and resolution.
```

```
22 (guest) => 2223 (host)
57722 (guest) => 2222 (host)
```

- b. Access the WRL7 build instance, and copy the RPM file by using the SCP command with the port number of XR.

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/native-app-topo-bootstrap (master)
$ vagrant ssh wr17_build
Last login: Tue Sep 13 01:49:37 2016 from 10.0.2.2

localhost:~$ scp -P 2222 /usr/src/rpm/RPMS/x86_64/iperf-2.0.9-XR_6.1.1.x86_64.rpm
vagrant@10.0.2.2:/home/vagrant/
vagrant@10.0.2.2's password:
iperf-2.0.9-XR_6.1.1.x86_64.rpm
```

10. Install the application (iPerf) on XR.

- a. Access XR through SSH.

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/native-app-topo-bootstrap (master)
$ vagrant ssh rtr
Last login: Fri Sep 9 19:20:56 2016 from 10.0.2.2
xr-vm_node0_RP0_CPU0:~$
```

- b. Verify the presence of the RPM file on XR.

```
xr-vm_node0_RP0_CPU0:~$ ls -l iperf-2.0.9-XR_6.1.1.x86_64.rpm
-rw-r--r-- 1 vagrant vagrant 48118 Sep 13 06:33 iperf-2.0.9-XR_6.1.1.x86_64.rpm
```

- c. Install iPerf by using yum.

```
xr-vm_node0_RP0_CPU0:~$ sudo yum install -y iperf-2.0.9-XR_6.1.1.x86_64.rpm
Loaded plugins: downloadonly, protect-packages, rpm-persistence
Setting up Install Process

```

You have successfully built an application RPM and hosted it natively by using vagrant.

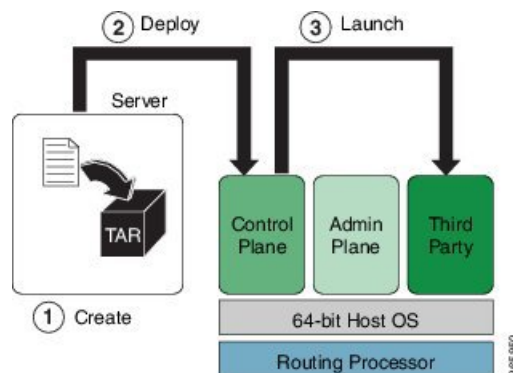

## Hosting an Application within a Linux Container (LXC) by Using Vagrant

This section describes how you can host an application within your own Linux container (LXC) by using vagrant.

### Workflow for Deploying Your LXC Container

The workflow for launching your container on IOS XR is described in this section and illustrated in the following topology.

Figure 8: LXC Container Deployment Workflow

1. Build the container `rootfs` tar ball on `devbox`.
2. Transfer the `rootfs` tar ball to IOS XR (`rtr`).
3. Launch the `rootfs` by running the `virsh` command.

### Procedure

To host your application within your own container, use the following steps.

**Note** Ensure you have created an application development topology as described in [Setting up an Application Development Topology By Using Vagrant, on page 14](#), before proceeding with the following steps.

1. Navigate to the `lxc-app-topo-bootstrap` directory and ensure the vagrant instance is running. If not, launch the vagrant instance.

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant status
Current machine states:
```

```
rtr                aborted (virtualbox)
devbox            aborted (virtualbox)
```

This environment represents multiple VMs. The VMs are all listed above with their current state. For more information about a specific VM, run ``vagrant status NAME``.

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant up

==> rtr: To ssh to the XR Console, use: 'vagrant port' (vagrant version > 1.8)
==> rtr: to determine the port that maps to guestport 22,
==> rtr: then: 'ssh vagrant@localhost -p <forwarded port>'
...
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant status
Current machine states:

```

```

rtr                running (virtualbox)
devbox            running (virtualbox)

```

This environment represents multiple VMs. The VMs are all listed above with their current state. For more information about a specific VM, run `vagrant status NAME`.

## 2. Access the devbox through SSH and install LXC tools.

To launch an LXC container, you need the following, which can be obtained by installing LXC tools:

- A container rootfs tar ball
- An XML file to launch the container using **virsh/libvirt**

```

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant ssh devbox
Welcome to Ubuntu 14.04.4 LTS (GNU/Linux 3.13.0-87-generic x86_64)

* Documentation:  https://help.ubuntu.com/

Universal Time is now:  Thu Sep  1 04:46:22 UTC 2016.

##
# The default user is 'ubuntu' with password 'ubuntu'!
# Use the 'sudo' command to run tasks as root in the container.
##

```

### 5. Verify if the LXC container has been successfully created.

```

vagrant@vagrant-ubuntu-trusty-64:~$ sudo lxc-ls --fancy
NAME          STATE      IPV4  IPV6  AUTOSTART

```

```
-----
xr-lxc-app STOPPED - - NO
```

## 6. Start the LXC container.

You will be prompted to log into the LXC container. The login credentials are `ubuntu/ubuntu`.

```
vagrant@vagrant-ubuntu-trusty-64:~$ sudo lxc-start --name xr-lxc-app
<4>init: plymouth-upstart-bridge main process (5) terminated with status 1
...
```

```
xr-lxc-app login: ubuntu
Password:
Welcome to Ubuntu 14.04.5 LTS (GNU/Linux 3.13.0-87-generic x86_64)
```

```
* Documentation: https://help.ubuntu.com/
```

```
The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.
```

```
Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by
applicable law.
```

```
ubuntu@xr-lxc-app:~$
```

## 7. Install your application within the LXC container.

For the sake of illustration, in this example we will install the iPerf application.

```
ubuntu@xr-lxc-app:~$ sudo apt-get -y install iperf
[sudo] password for ubuntu:
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following NEW packages will be installed:
  iperf
0 upgraded, 1 newly installed, 0 to remove and 0 not upgraded.
Need to get 56.3 kB of archives.
After this operation, 174 kB of additional disk space will be used.
Get:1 http://archive.ubuntu.com/ubuntu/ trusty/universe iperf amd64 2.0.5-3 [56.3 kB]
Fetched 56.3 kB in 16s (3,460 B/s)
Selecting previously unselected package iperf.
(Reading database ... 14648 files and directories currently installed.)
Preparing to unpack .../iperf_2.0.5-3_amd64.deb ...
Unpacking iperf (2.0.5-3) ...
Setting up iperf (2.0.5-3) ...
ubuntu@xr-lxc-app:~$
```

## 8. Change the SSH port inside the container and verify that it has been correctly assigned.

When you deploy your container to IOS XR, it shares the network namespace with XR. Since IOS XR already uses Ports 22 and 57722 for other purposes, you must pick some other port number for your container.

```
ubuntu@xr-lxc-app:~$ sudo sed -i s/Port\ 22/Port\ 58822/ /etc/ssh/sshd_config
[sudo] password for ubuntu:
```

```
ubuntu@xr-lxc-app:~$ cat /etc/ssh/sshd_config | grep Port
Port 58822
ubuntu@xr-lxc-app:~$
```

## 9. Shut the container down.

```
ubuntu@xr-lxc-app:~$ sudo shutdown -h now
ubuntu@xr-lxc-app:~$
Broadcast message from ubuntu@xr-lxc-app
      (/dev/lxc/console) at 5:17 ...

The system is going down for halt NOW!
<4>init: tty4 main process (369) killed by TERM signal
...
wait-for-state stop/waiting
* Asking all remaining processes to terminate...
  ...done.
* All processes ended within 1 seconds...
  ...done.
* Deactivating swap...
  ...done.
mount: cannot mount block device /dev/sda1 read-only
* Will now halt
```

## 10. Assume the root user role.

```
vagrant@vagrant-ubuntu-trusty-64:~$ sudo -s
root@vagrant-ubuntu-trusty-64:~# whoami
root
```

## 11. Navigate to the /var/lib/lxc/xr-lxc-app/ directory and package the rootfs into a tar ball.

```
root@vagrant-ubuntu-trusty-64:~# cd /var/lib/lxc/xr-lxc-app/
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app# ls
config  fstab  rootfs
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app# cd rootfs
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app/rootfs# tar -czvf
xr-lxc-app-rootfs.tar.gz *
tar: dev/log: socket ignored
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app/rootfs#
```

## 12. Transfer the rootfs tar ball to the home directory (~/. or /home/vagrant) and verify if the transfer is successful.

```
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app/rootfs# mv *.tar.gz /home/vagrant
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app/rootfs# ls -l /home/vagrant
total 120516
-rw-r--r-- 1 root root 123404860 Sep  1 05:22 xr-lxc-app-rootfs.tar.gz
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app/rootfs#
```

## 13. Create an LXC spec XML file for specifying attributes required to launch the LXC container with the application.

You must navigate to the /home/vagrant directory on devbox and use a vi editor to create the XML file. Save the file as xr-lxc-app.xml.

A sample LXC spec file to launch the application within the container is as shown.

```
root@vagrant-ubuntu-trusty-64:/var/lib/lxc/xr-lxc-app/rootfs# exit
exit
vagrant@vagrant-ubuntu-trusty-64:~$ pwd
/home/vagrant
vagrant@vagrant-ubuntu-trusty-64:~$ vi xr-lxc-app.xml
```

```
<domain type='lxc' xmlns:lxc='http://libvirt.org/schemas/domain/lxc/1.0' >
<name>xr-lxc-app</name>
<memory>327680</memory>
<os>
<type>exe</type>
<init>/sbin/init</init>
</os>
<lxc:namespace>
<sharenet type='netns' value='global-vrf'/>
</lxc:namespace>
<vcpu>1</vcpu>
<clock offset='utc'/>
<on_poweroff>destroy</on_poweroff>
<on_reboot>restart</on_reboot>
<on_crash>destroy</on_crash>
<devices>
<emulator>/usr/lib64/libvirt/libvirt_lxc</emulator>
<filesystem type='mount'>
<source dir='/misc/app_host/xr-lxc-app/'/>
<target dir='/'/>
</filesystem>
<console type='pty'/>
</devices>
</domain>
```

In IOS-XR the `global-vrf` network namespace contains all the XR GigE or management interfaces. The `sharenet` configuration in the XML file ensures that the container on being launched has native access to all XR interfaces.

`/misc/app_host/` on IOS XR is a special mount volume that is designed to provide nearly 3.9GB of disk space. This mount volume can be used to host custom container `rootfs` and other large files without occupying disk space on XR. In this example, we expect to untar the `rootfs` to the `/misc/app_host/xr-lxc-app/` directory.

14. Verify if the `rootfs` tar ball and the LXC XML spec file are present in the home directory.

```
root@vagrant-ubuntu-trusty-64:~# pwd
/home/vagrant
root@vagrant-ubuntu-trusty-64:~# ls -l
total 119988
-rw-r--r-- 1 root root 122863332 Jun 16 19:41 xr-lxc-app-rootfs.tar.gz
-rw-r--r-- 1 root root 590 Jun 16 23:29 xr-lxc-app.xml
root@vagrant-ubuntu-trusty-64:~#
```

15. Transfer the `rootfs` tar ball and XML spec file to XR.

There are two ways of transferring the files: Through the GigE interface (a little slower) or the management interface. You can use the method that works best for you.

- **Transfer Through the Management Interface of XR:**

- a. Check the port number that maps to the management port on XR.

Vagrant forwards the port number 57722 to a host port for XR over the management port. In a virtual box, the IP address of the host (your laptop) is always 10.0.2.2 for the port that was translated (NAT).

```
vagrant@vagrant-ubuntu-trusty-64:~$ exit
logout
Connection to 127.0.0.1 closed.
```

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
```

```
$ vagrant port rtr
```

The forwarded ports for the machine are listed below. Please note that these values may differ from values configured in the Vagrantfile if the provider supports automatic port collision detection and resolution.

```
22 (guest) => 2223 (host)
57722 (guest) => 2222 (host)
```

The output shows that port number 2222 maps to port number 57722.

- b. Access devbox and use the port number 2222 to transfer the `rootfs` tar ball and XML spec file to XR.

```
annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
```

```
$ vagrant ssh devbox
```

```

```

In this example, the IP address of the GigE interface is 11.1.1.10.

- b. Copy the `rootfs` tar ball to XR by using the GigE interface address.

```

vagrant@vagrant-ubuntu-trusty-64:~$ scp -P 57722
/home/vagrant/xr-lxc-app-rootfs.tar.gz
vagrant@11.1.1.10:/misc/app_host/scratch/
The authenticity of host '[11.1.1.10]:57722 ([11.1.1.10]:57722)' can't be
established.
ECDSA key fingerprint is db:25:e2:27:49:2a:7b:27:e1:76:a6:7a:e4:70:f5:f7.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '[11.1.1.10]:57722' (ECDSA) to the list of known
hosts.
vagrant@11.1.1.10's password:
xr-lxc-app-rootfs.tar.gz
    
```

- c. Copy the XML spec file to XR by using the GigE interface address.

```
vagrant@vagrant-ubuntu-trusty-64:~$ scp -P 57722 /home/vagrant/xr-lxc-app.xml
vagrant@11.1.1.10:/misc/app_host/scratch/
vagrant@11.1.1.10's password:
xr-lxc-app.xml
```

16. Create a directory (/misc/app\_host/xr-lxc-app/) on XR (rtr) to untar the rootfs tar ball.

```
vagrant@vagrant-ubuntu-trusty-64:~$ exit
logout
Connection to 127.0.0.1 closed.

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant ssh rtr
Last login: Fri Sep  2 05:49:01 2016 from 10.0.2.2

xr-vm_node0_RP0_CPU0:~$ sudo mkdir /misc/app_host/xr-lxc-app/
```

17. Navigate to the /misc/app\_host/xr-lxc-app/ directory and untar the tar ball.

```
xr-vm_node0_RP0_CPU0:~$ cd /misc/app_host/xr-lxc-app/
xr-vm_node0_RP0_CPU0:/misc/app_host/xr-lxc-app$ sudo tar -zxvf
../scratch/xr-lxc-app-rootfs.tar.gz
tar: dev/audio3: Cannot mknod: Operation not permitted
...
```

18. Use the XML spec file to launch the container and verify its existence on XR.

```
xr-vm_node0_RP0_CPU0:/misc/app_host/xr-lxc-app$ virsh create
/misc/app_host/scratch/xr-lxc-app.xml
Domain xr-lxc-app created from /misc/app_host/scratch/xr-lxc-app.xml

xr-vm_node0_RP0_CPU0:/misc/app_host/xr-lxc-app$ virsh list
  Id      Name                                     State
-----
  2095    xr-lxc-app                             running
  4932    sysadmin                               running
  12086   default-sdr--1                         running
```

19. Log into the container. The default login credentials are ubuntu/ubuntu.

There are two ways of logging into the container. You can use the method that works best for you:

• Logging into the container by using virsh command:

```
xr-vm_node0_RP0_CPU0:/misc/app_host/xr-lxc-app$ virsh console xr-lxc-app
Connected to domain xr-lxc-app
Escape character is ^]
init: Unable to create device: /dev/kmsg
* Stopping Send an event to indicate plymouth is up          [ OK ]
* Starting Mount filesystems on boot                          [ OK ]
* Starting Signal sysvinit that the rootfs is mounted         [ OK ]
* Starting Fix-up sensitive /proc filesystem entries          [ OK ]

xr-lxc-app login: * Starting OpenSSH server                  [ OK ]

Ubuntu 14.04.5 LTS xr-lxc-app tty1
xr-lxc-app login: ubuntu
Password:
Last login: Fri Sep  2 05:40:11 UTC 2016 on lxc/console
Welcome to Ubuntu 14.04.5 LTS (GNU/Linux 3.14.23-WR7.0.0.2_standard x86_64)

* Documentation:  https://help.ubuntu.com/
```

```
ubuntu@xr-lxc-app:~$
```

### • Logging into the container by using SSH:

Use the SSH port number you configured, 58822, and any of XR interface IP addresses to log in.

```
xr-vm_node0_RP0_CPU0:/misc/app_host/xr-lxc-app$ ssh -p 58822 ubuntu@11.1.1.10
Warning: Permanently added '[11.1.1.10]:58822' (ECDSA) to the list of known hosts.
ubuntu@11.1.1.10's password:
Welcome to Ubuntu 14.04.5 LTS (GNU/Linux 3.14.23-WR7.0.0.2_standard x86_64)

 * Documentation:  https://help.ubuntu.com/
Last login: Fri Sep  2 07:42:37 2016
ubuntu@xr-lxc-app:~$
```

### Note

- To exit the container, use the press **CTRL** and **J** keys simultaneously.
- To access the container directly from your host machine, ensure you forward the intended port (in this example, 58822) to your laptop (any port of your choice), in the Vagrant file:

```
node.vm.network "forwarded_port", guest: 58822, host: 58822
```

You can then SSH to the LXC container by using the following command:

```
ssh -p 58822 vagrant@localhost
```

## 20. Verify if the interfaces on XR are available inside the LXC container.

The LXC container operates as your own Linux server on XR. Because the network namespace is shared between the LXC and XR, all of XR interfaces (GigE, management, and so on) are available to bind to and run your applications.

```
ubuntu@xr-lxc-app:~$ ifconfig
Gi0_0_0_0 Link encap:Ethernet  HWaddr 08:00:27:5a:29:77
    inet addr:11.1.1.10  Mask:255.255.255.0

          RX packets:0 errors:0 dropped:0 overruns:0 frame:0
          TX packets:155549 errors:0 dropped:1 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:0 (0.0 B)  TX bytes:10765764 (10.7 MB)

lo        Link encap:Local Loopback
          inet addr:127.0.0.1  Mask:255.0.0.0
          inet6 addr: ::1/128 Scope:Host
          UP LOOPBACK RUNNING  MTU:65536  Metric:1
          RX packets:64 errors:0 dropped:0 overruns:0 frame:0
          TX packets:64 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:9400 (9.4 KB)  TX bytes:9400 (9.4 KB)
    
```

## 21. Configure the container to communicate outside XR with other nodes in the network.

By default, the IOS-XRv vagrant box is set up to talk to the internet using a default route through your management port. If you want the router to use the routing table to talk to other nodes in the network, then you must configure **tpa-address**. This becomes the **src-hint** for all Linux application traffic.

In this example, we use Loopback 0 for **tpa-address** to ensure that the IP address for any originating traffic for applications on the XR is a reachable IP address across your topology.

```

ubuntu@xr-lxc-app:~$ exit
logout
Connection to 11.1.1.10 closed.
xr-vm_node0_RP0_CPU0:/misc/app_host/xr-lxc-app$ exit
logout
Connection to 127.0.0.1 closed.

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ vagrant port rtr | grep 22
  22 (guest) => 2223 (host)
 57722 (guest) => 2222 (host)

annseque@ANNSEQUE-WS02 MINGW64 ~/vagrant-xrdocs/lxc-app-topo-bootstrap (master)
$ ssh -p 2223 vagrant@localhost
vagrant@localhost's password:

RP/0/RP0/CPU0:ios# configure
Fri Sep  2 08:03:05.094 UTC
RP/0/RP0/CPU0:ios(config)# interface loopback 0
RP/0/RP0/CPU0:ios(config-if)# ip address 1.1.1.1/32
RP/0/RP0/CPU0:ios(config-if)# exit
RP/0/RP0/CPU0:ios(config)# tpa address-family ipv4 update-source loopback 0
RP/0/RP0/CPU0:ios(config)# commit
Fri Sep  2 08:03:39.602 UTC
RP/0/RP0/CPU0:ios(config)# exit
RP/0/RP0/CPU0:ios# bash
Fri Sep  2 08:03:58.232 UTC

[xr-vm_node0_RP0_CPU0:~]$ ip route
default dev fwdfntf scope link src 1.1.1.1
10.0.2.0/24 dev Mg0_RP0_CPU0_0 proto kernel scope link src 10.0.2.15
    
```

You can see the configured Loopback 0 IP address (1.1.1.1).

## 22. Test your application within the launched container.

We installed iPerf in our container. We will run the iPerf server within the container, and the iPerf client on the devbox and see if they can communicate. Basically, the hosted application within a container on rtr should be able to talk to a client application on devbox.

- a. Check if the iPerf server is running within the LXC container on XR.

```
[xr-vm_node0_RP0_CPU0:~]$ssh -p 58822 ubuntu@11.1.1.10
Warning: Permanently added '[11.1.1.10]:58822' (ECDSA) to the list of known hosts.
ubuntu@11.1.1.10's password:

```

You have successfully hosted an application within a Linux container by using vagrant.

## Installing Docker on Cisco IOS XR By Using Vagrant

This section describes how you can install a Docker container on Cisco IOS XR by using Vagrant.

### Setup Options for Dockers on XR

You can choose any of the following setups for using Dockers on XR.

- **Public Docker-Hub registry:** You can configure a public Docker-Hub with the correct DNS resolution so that it is accessible to all users. This is the simplest form of Docker setup.
- **Private Docker-Hub unsecured registry:** You can configure a private Docker-Hub registry without security, if you are planning to run the registry inside a secured part of your network.

- **Private Docker-Hub self-signed registry:** You can configure a private Docker-Hub registry enabled with TLS. This is more secure than using a local unsecured registry.
- **Private Docker-Hub secured registry:** You can configure a private Docker-Hub secured registry, created using a certificate obtained from a Certificate Authority (CA) server. The steps used to set this up are identical to a private Docker-Hub self-signed registry except for the creation of the certificate.
- **Tarball image/container:** You can create and configure a Docker container on your laptop and package it as an image or a container tar ball. You can then transfer the tar ball to XR, and extract the Docker container for use.

For information on implementing these setup options, see the [XR toolbox, Part 6: Running Docker Containers on IOS-XR \(6.1.2+\)](#) section on Github.
