L2VPN Services over Segment Routing Traffic Engineering Tunnel

Segment Routing (SR) is a flexible and scalable way of performing source routing. The source device selects a path and encodes it in the packet header as an ordered list of segments. Segments are identifiers for any type of instruction.

Segment routing for traffic engineering (SR-TE) takes place through a tunnel between a source and destination pair. SR-TE uses the concept of source routing, where the source calculates the path and encodes it in the packet header as a segment. In SR-TE preferred path, each segment is an end-to-end path from the source to the destination, and instructs the routers in the provider core network to follow the specified path instead of the shortest path calculated by the IGP. The destination is unaware of the presence of the tunnel.

The user can achieve better resilience and convergence for the network traffic, by transporting MPLS L2VPN services using segment routing, instead of MPLS LDP. Segment routing can be directly applied to the MPLS architecture without changing the forwarding plane. In a segment-routing network that uses the MPLS data plane, LDP or other signaling protocol is not required; instead label distribution is performed by IGP. Removing protocols from the network simplifies its operation and makes it more robust and stable by eliminating the need for protocol interaction. Segment routing utilizes the network bandwidth more effectively than traditional MPLS networks and offers lower latency.

Preferred tunnel path functionality allows you to map pseudowires to specific traffic-engineering tunnel paths. Attachment circuits are cross-connected to specific SR traffic engineering tunnel interfaces instead of remote PE router IP addresses reachable using IGP or LDP. Using preferred tunnel path, the traffic engineering tunnel transports traffic from the source to destination PE routers. A path is selected for an SR Policy when the path is valid and its preference is the best (highest value) among all the candidate paths of the SR Policy.

- L2VPN Preferred path, on page 1
- VPWS over SR-TE Policy, on page 2
- VPWS PW over Preferred SR-TE using Statically Configured SR Policy, on page 3
- EVPN VPWS PW over Preferred SR-TE using On-Demand Nexthop SR Policy, on page 9
- Call Admission Control for L2VPN P2P Services over Circuit-Style SR-TE Policies, on page 16

L2VPN Preferred path

L2VPN preferred-path configuration allows you to steer pseudowire (PW) traffic over an SR-TE tunnel at the granularity of per PW level. It is recommended to use preferred-path configuration together with statically configured SR policy. EVPN ODN configuration allows you to steer PW traffic over an SR-TE tunnel at the

granularity of per EVPN instance (EVI) level. When both the preferred-path and EVPN ODN configurations are used on a PW, preferred-path configuration takes precedence.

VPWS over SR-TE Policy

Table 1: Feature History Table

Feature Name	Release Information	Feature Description
VPWS over SR-TE Policy	Release 7.7.1	Using the SR-TE policy, you can now set the preferred path between two endpoints for Virtual Private Wire Service (VPWS). This gives you the advantage of a reduced number of dedicated networks to provision IP and VPN services across SR-TE tunnels. The VPWS is a method to provide Ethernet-based point to point communication over MPLS or IP networks.

VPWS connects two locations via a pseudowire (PW). PW traffic is encapsulated within an MPLS label stack that is used to route the traffic.

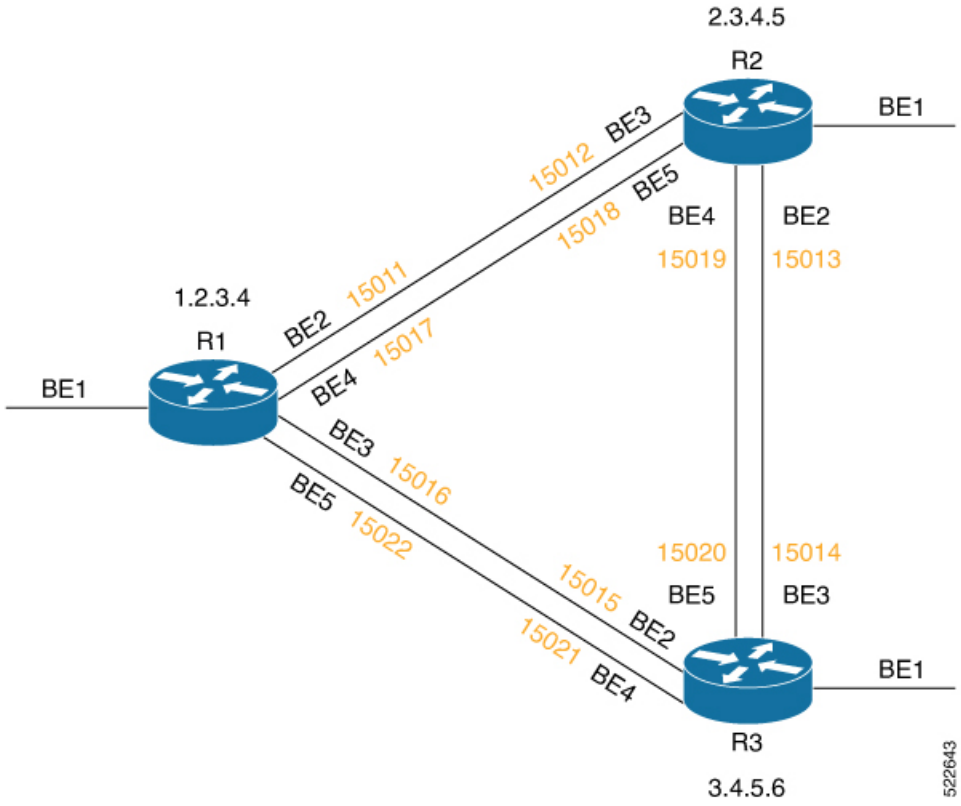
SR-TE uses SR policies to control the path the PW takes through the network, as opposed to using Label Distribution Protocol (LDP) to distribute labels.

Note For more information on SR-TE policy, see the *Configure SR-TE Policies* section in the *Segment Routing Configuration Guide for Cisco 8000 Series Routers, IOS XR*.

Cisco 8000 series routers provide the following methods of implementing VPWS:

- EVPN VPWS
- LDP VPWS
- EVPN VPWS On-Demand Nexthop

Figure 1: VPWS over SR-TE



The image shows a PW between the routers R1 and R3. By default, the PW takes the direct path from R1 to R3.

You can configure an SR-TE policy with preferred path to steer the traffic to pass through R2.

VPWS PW over Preferred SR-TE using Statically Configured SR Policy

This feature allows you to set the preferred path between the two endpoints for EVPN VPWS PW or LDP VPWS PW using statically configured policy. This feature is supported on bundle attachment circuit (AC) and physical AC.

Restrictions

- EVPN VPWS SR policy is not supported on EVPN VPWS dual homing.
- EVPN validates if the route is for a single home nexthop, otherwise it issues an error message about a dangling SR TE policy, and continues to set up EVPN-VPWS without it. EVPN relies on ESI value being zero to determine if this is a single home or not. If the AC is a Bundle-Ether interface running LACP then you must manually configure the ESI value to zero to overwrite the auto-sense ESI as EVPN VPWS multihoming is not supported.

  To disable EVPN dual homing, configure bundle-Ether AC with ESI value set to zero.

```
evpn
interface Bundle-Ether12
  ethernet-segment
   identifier type 0 00.00.00.00.00.00.00.00.00
/* Or globally */
evpn
 ethernet-segment type 1 auto-generation-disable
```

Configure VPWS PW over Preferred SR-TE using Statically Configured SR Policy

Perform these tasks to ensure the successful configuration of VPWS PW over Preferred SR-TE using statically configured SR policy for EVPN VPWS or LDP VPWS:

- Configure SR in IGP (IS-IS)
- Configure Segment Routing
- Configure Segment List
- Configure Static SR-TE Policy
- Configure EVPN VPWS over Statically Configured Policy
- Configure LDP VPWS over Statically Configured Policy

Configure SR in IGP (IS-IS)

The following examples show how to enable SR in IS-IS and configure Adjacency-SID on BE2, BE3, BE4, and BE5.

```
/* Enable SR in IS-IS */
Router(config)# router isis isp
Router(config-isis)# net 01.0000.0000.0001.00
Router(config-isis)# distribute link-state instance-id 32 level 2 throttle 5
Router(config-isis)# address-family ipv4 unicast
Router(config-isis-af)# metric-style wide
Router(config-isis-af)# mpls traffic-eng level-1
Router(config-isis-af)# mpls traffic-eng router-id 1.2.3.4
Router(config-isis-af)# segment-routing mpls sr-prefer
Router(config-isis-af)# segment-routing prefix-sid-map advertise-local
Router(config-isis-af)# exit

/* Configure Adjacency-SID on BE2 */
Router(config-isis)# interface Bundle-Ether2
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# adjacency-sid index 11
Router(config-isis-if-af)# adjacency-sid absolute 15011
Router(config-isis-if-af)# exit

/* Configure Adjacency-SID on BE3 */
Router(config-isis)# interface Bundle-Ether3
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# adjacency-sid index 16
Router(config-isis-if-af)# adjacency-sid absolute 15016
```

```
Router(config-isis-if-af)# exit

/* Configure Adjacency-SID on BE4 */
Router(config-isis)# interface Bundle-Ether4
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# adjacency-sid index 17
Router(config-isis-if-af)# adjacency-sid absolute 15017
Router(config-isis-if-af)# exit

/* Configure Adjacency-SID on BE5 */
Router(config-isis)# interface Bundle-Ether5
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# adjacency-sid index 22
Router(config-isis-if-af)# adjacency-sid absolute 15022
Router(config-isis-if-af)# exit

/* Configure Prefix-SID */
Router(config-isis)# interface Loopback0
Router(config-isis-if)# passive
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# prefix-sid index 1001
```

Configure Segment Routing

The following examples show how to configure segment routing on BE2, BE3, BE4, and BE5.

```
Router(config)# segment-routing
Router(config-sr)# adjacency-sid
Router(config-sr)# exit

Router(config)# interface Bundle-Ether2
Router(config-if)# address-family ipv4 unicast
Router(config-if-af)# l2-adjacency-sid absolute 15011 next-hop 0.0.0.0

Router(config)# interface Bundle-Ether3
Router(config-if)# address-family ipv4 unicast
Router(config-if-af)# l2-adjacency-sid absolute 15016 next-hop 0.0.0.0

Router(config)# interface Bundle-Ether4
Router(config-if)# address-family ipv4 unicast
Router(config-if-af)# l2-adjacency-sid absolute 15017 next-hop 0.0.0.0

Router(config)# interface Bundle-Ether5
Router(config-if)# address-family ipv4 unicast
Router(config-if-af)# l2-adjacency-sid absolute 15022 next-hop 0.0.0.0
```

Configure Segment List

This example shows how to configure segment list for Adjacency-SID.

```
Router(config)# segment-routing
Router(config-sr)# traffic-eng
Router(config-sr-te)# segment-list segment_list_r3_1
Router(config-sr-te-sl)# index 10 mpls label 15011
Router(config-sr-te-sl)# index 20 mpls label 15013
Router(config-sr-te-sl)# exit

Router(config-sr-te)# segment-list segment_list_r3_2
```

```
Router(config-sr-te-sl)# index 10 mpls label 15011
Router(config-sr-te-sl)# index 20 mpls label 15019
Router(config-sr-te-sl)# exit

Router(config-sr-te)# segment-list segment_list_r3_3
Router(config-sr-te-sl)# index 10 mpls label 15017
Router(config-sr-te-sl)# index 20 mpls label 15013
Router(config-sr-te-sl)# exit

Router(config-sr-te)# segment-list segment_list_r3_4
Router(config-sr-te-sl)# index 10 mpls label 15017
Router(config-sr-te-sl)# index 20 mpls label 15019
Router(config-sr-te-sl)# exit
```

Configure Static SR-TE Policy

This example shows how to configure static SR-TE policy.

```
Router(config)# segment-routing
Router(config-sr)# traffic-eng
Router(config-sr-te)# policy policy_r3_1
Router(config-sr-te-policy)# color 10 end-point ipv4 3.4.5.6
Router(config-sr-te-policy)# candidate-paths
Router(config-sr-te-policy-path)# preference 100
Router(config-sr-te-pp-info)# explicit segment-list segment_list_r3_1
Router(config-sr-te-pp-info)# weight 10

Router(config-sr-te-pp-info)# explicit segment-list segment_list_r3_2
Router(config-sr-te-pp-info)# weight 10

Router(config-sr-te-pp-info)# explicit segment-list segment_list_r3_3
Router(config-sr-te-pp-info)# weight 10

Router(config-sr-te-pp-info)# explicit segment-list segment_list_r3_4
Router(config-sr-te-pp-info)# weight 10
```

Configure EVPN VPWS over Statically Configured Policy

This example shows how to configure EVPN VPWS over statically configured policy.

Note Use the auto-generated SR-TE policy name to attach the policy to the L2VPN instance. The auto-generated policy name is based on the policy color and end-point. Use the **show segment-routing traffic-eng policy candidate-path name** *policy_name* command to get the auto-generated policy name.

```
Router# show segment-routing traffic-eng policy candidate-path name policy_r3_1

SR-TE policy database
---------------------
Color: 10, End-point: 3.4.5.6
 Name: sr-te policy srte_c_10_ep_3.4.5.6
```

Set the preferred path with the SR-TE policy name.

```
Router(config)# l2vpn
Router(config-l2vpn)# pw-class c1
Router(config-l2vpn-pwc)# encapsulation mpls
```

```
Router(config-l2vpn-pwc-mpls)# preferred-path sr-te policy srte_c_10_ep_3.4.5.6
!
Router(config)# l2vpn
Router(config-l2vpn)# xconnect group xg
Router(config-l2vpn-xc)# p2p xc200
Router(config-l2vpn-xc-p2p)# interface Bundle-Ether1.200
Router(config-l2vpn-xc-p2p)# neighbor evpn evi 2 target 3 source 4
Router(config-l2vpn-xc-p2p-pw)# pw-class c1
!
```

Configure LDP VPWS over Statically Configured Policy

This example shows how to configure LDP VPWS over statically configured policy.

Prerequisites

It is recommended to configure MPLS LDP (Label Distribution Protocol) as the baseline setup to ensure proper label distribution and network stability, particularly when handling scenarios involving unconfiguration and reconfiguration of loopback interfaces.

Configuration Example

```
/* Configure MPLS LDP */
Router(config)# mpls ldp
Router(config-ldp)# router-id 1.2.3.4
```

Attach the policy to the L2VPN instance.

Note Use the auto-generated SR-TE policy name to attach the policy to the L2VPN instance. The auto-generated policy name is based on the policy color and end-point. Use the **show segment-routing traffic-eng policy candidate-path name** *policy_name* command to get the auto-generated policy name.

```
Router# show segment-routing traffic-eng policy candidate-path name policy_r3_1

SR-TE policy database
---------------------
Color: 10, End-point: 3.4.5.6
 Name: sr-te policy srte_c_10_ep_3.4.5.6
```

Set the preferred path with the SR-TE policy name.

```
Router(config)# l2vpn
Router(config-l2vpn)# pw-class c
Router(config-l2vpn-pwc)# encapsulation mpls
Router(config-l2vpn-pwc-mpls)# preferred-path sr-te policy srte_c_10_ep_3.4.5.6
Router(config-l2vpn-pwc-mpls)# commit
Router(config-l2vpn-pwc-mpls)# exit

Router(config)# l2vpn
Router(config-l2vpn)# xconnect group xg
Router(config-l2vpn-xc)# p2p xc100
Router(config-l2vpn-xc-p2p)# interface Bundle-Ether1.100
Router(config-l2vpn-xc-p2p)# neighbor ipv4 3.4.5.6 pw-id 100
Router(config-l2vpn-xc-p2p-pw)# pw-class c
```

Verify VPWS PW over Preferred SR-TE using Statically Configured SR Policy

The following show commands display the output for LDP VPWS PW configuration over preferred SR-TE. You can use the same show commands to view the EVPN VPWS PW configuration over preferred SR-TE.

```
Router# show l2vpn xconnect interface Bundle-Ether 1.100 detail
Mon May 16 14:19:42.833 UTC

EVPN VPWS PW over Preferred SR-TE using On-Demand Nexthop SR Policy

This feature enables you to fetch the best path to send traffic from the source to destination in a point-to-point service using IOS XR Traffic Controller (XTC). On-Demand Nexthop (ODN) with SR-TE is supported on EVPN VPWS.

When redistributing routing information across domains, provisioning of multi-domain services (Layer2 VPN and Layer 3 VPN) poses complexity and scalability issues. ODN with SR-TE feature delegates computation of an end-to-end Label Switched Path (LSP) to a path computation element (PCE). This PCE includes constraints and policies without any redistribution. It then installs the reapplied multi-domain LSP for the duration of the service into the local forwarding information base(FIB).

ODN uses BGP dynamic SR-TE capabilities and adds the path to the PCE. The PCE has the ability to find and download the end-to-end path based on the requirements. ODN triggers an SR-TE auto-tunnel based on the defined BGP policy. The PCE learns real-time topologies through BGP and/or IGP.

IOS XR Traffic Controller (XTC)

The path computation element (PCE) describes a set of procedures by which a path computation client (PCC) reports and delegates control of head-end tunnels sourced from the PCC to a PCE peer. The PCE peer requests the PCC to update and modify parameters of LSPs it controls. It also enables a PCC to allow the PCE to initiate computations and to perform network-wide orchestration.

Restrictions

- Maximum number of auto-provisioned SR-TE policies is 1000.
- EVPN VPWS SR policy is not supported on EVPN VPWS dual homing.

EVPN validates if the route is for a single home nexthop, otherwise it issues an error message about a dangling SR-TE policy, and continue to setup EVPN-VPWS without it. EVPN relies on ESI value being zero to determine if this is a single home or not. If the AC is a Bundle-Ether interface running LACP then you need to manually configure the ESI value to zero to overwrite the auto-sense ESI as EVPN VPWS multihoming is not supported.

To disable EVPN dual homing, configure bundle-Ether AC with ESI value set to zero.

```
evpn
interface Bundle-Ether12
ethernet-segment
identifier type 0 00.00.00.00.00.00.00.00.00
/* Or globally */
evpn
ethernet-segment type 1 auto-generation-disable
```

Configure EVPN VPWS PW over Preferred SR-TE using On-Demand Nexthop SR Policy

Perform the following steps to configure EVPN VPWS PW over preferred SR-TE using On-Demand Nexthop SR policy.

- Configure SR in IS-IS
- Configure SR-TE Policy
- Configure PCE and PCC
- Configure BGP
- Configure SR Color
- Configure EVPN Route Policy
- Configure EVPN VPWS over SR-TE Policy

Configure SR in IS-IS

The following examples show how to enable SR in IS-IS and configure interfaces BE2, BE3, BE4, and BE5.

```
/* Enable SR in IS-IS */
Router(config)# router isis isp
Router(config-isis)# net 01.0000.0000.0001.00
Router(config-isis)# distribute instance-id 32 level 2 throttle 5
Router(config-isis)# address-family ipv4 unicast
Router(config-isis-af)# metric-style wide
Router(config-isis-af)# mpls traffic-eng level-1
Router(config-isis-af)# mpls traffic-eng router-id 1.2.3.4
Router(config-isis-af)# segment-routing mpls sr-prefer
Router(config-isis-af)# segment-routing prefix-sid-map advertise-local
Router(config-isis-af)# exit

/* Configure interface BE2 */
Router(config-isis)# interface Bundle-Ether2
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
```

```
Router(config-isis-if-af)# exit
Router(config-isis-if)# exit

/* Configure interface BE3 */
Router(config-isis)# interface Bundle-Ether3
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# exit
Router(config-isis-if)# exit

/* Configure interface BE4 */
Router(config-isis)# interface Bundle-Ether4
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# exit

/* Configure interface BE5 */
Router(config-isis)# interface Bundle-Ether5
Router(config-isis-if)# point-to-point
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# exit

/* Configure Loopback interface */
Router(config-isis)# interface Loopback0
Router(config-isis-if)# passive
Router(config-isis-if)# address-family ipv4 unicast
```

Configure SR-TE Policy

Configure SR-TE policy.

```
Router(config)# segment-routing
Router(config-sr)# traffic-eng
Router(config-sr-te)# on-demand color 1
Router(config-sr-te-color)# dynamic
Router(config-sr-te-color-dyn)# pcep
Router(config-sr-te-color-dyn-pce)# exit
Router(config-sr-te-color-dyn)# metric type igp
Router(config-sr-te-color-dyn)# exit
Router(config-sr-te-color)# exit

Router(config-sr-te)# on-demand color 2
Router(config-sr-te-color)# dynamic
Router(config-sr-te-color-dyn)# pcep
Router(config-sr-te-color-dyn-pce)# exit
Router(config-sr-te-color-dyn)# metric type igp
Router(config-sr-te-color-dyn)# exit
Router(config-sr-te-color)# exit
```

Configure PCE and PCC

Configure PCE and PCC on the routers.

```
/* Configure PCC on R1 */

Router(config)# segment-routing
Router(config-sr)# traffic-eng
Router(config-sr-te)# pcc
```

```
Router(config-sr-te-pcc)# source-address ipv4 1.2.3.4 >>>>> This is the node address
Router(config-sr-te-pcc)# pce address ipv4 3.4.5.6 >>>>> This is the PCE server address
Router(config-sr-te-pcc)# commit
```

```
/* Configure PCE on R3 */
```

```
Router(config)# segment-routing
Router(config-sr)# traffic-eng
Router(config-sr-te)# exit
Router(config)# pce
Router(config-pce)# address ipv4 3.4.5.6 >>>>> Configure the address only on a PCE server
Router(config-pce)# commit
```

Configure BGP

Configure BGP on the routers to establish neighborship with EVPN. When you enable an SR policy on R1, use the **nexthop validation color-extcomm sr-policy** command to instruct BGP that, instead of nexthop reachability validation of BGP routes, the validation is done for SR policy-installed color nexthop addresses. When the nexthop address of such a route is reachable, the route is added to the routing table.

```
Router(config)# router bgp 100
Router(config-bgp)# bgp router-id 1.2.3.4
Router(config-bgp)# nexthop validation color-extcomm sr-policy
Router(config-bgp)# address-family l2vpn evpn
Router(config-bgp-af)# exit
!
Router(config-bgp)# neighbor 2.3.4.5
Router(config-bgp-nbr)# remote-as 100
Router(config-bgp-nbr)# update-source Loopback0
Router(config-bgp-nbr)# address-family l2vpn evpn
Router(config-bgp-af)# exit
!
Router(config-bgp)# neighbor 3.4.5.6
Router(config-bgp-nbr)# remote-as 100
Router(config-bgp-nbr)# update-source Loopback0
Router(config-bgp-nbr)# address-family l2vpn evpn
Router(config-bgp-af)# exit
!
```

Configure SR Color

Configure SR colors on the routers.

```
Router(config)# extcommunity-set opaque color1
Router(config-ext)# 1
Router(config-ext)# end-set
!
Router(config)# extcommunity-set opaque color2
Router(config-ext)# 2
Router(config-ext)# end-set
!
```

Configure EVPN Route Policy

Configure EVPN route policy. This example shows how to define the route policy language and track the EVPN route.

```
Router(config)# route-policy route_policy_1
```

```
Router(config-rpl)# if evpn-route-type is 1 then
Router(config-rpl-if)# set extcommunity color color1
Router(config-rpl-if)# endif
Router(config-rpl)# pass
Router(config-rpl)# end-policy
!
Router(config)# route-policy route_policy_2
Router(config-rpl)# if evpn-route-type is 1 then
Router(config-rpl-if)# set extcommunity color color2
Router(config-rpl-if)# endif
Router(config-rpl)# pass
Router(config-rpl)# end-policy
!
```

Configure EVPN route policy for tail-end coloring by exporting EVPN policy to color EVPN type 1 route. At the head-end, ODN uses color advertised by tail-end to create SR-TE tunnel.

```
Router(config)# evpn
Router(config-evpn)# evi 1
Router(config-evpn-evi)# bgp
Router(config-evpn-evi-bgp)# route-policy export route_policy_1
```

Configure EVPN route policy for head-end coloring by importing EVPN policy to color EVPN type 1 route at the head-end. ODN uses color configured by head-end to create SR-TE tunnel.

```
Router(config)# evpn
Router(config-evpn)# evi 2
Router(config-evpn-evi)# bgp
Router(config-evpn-evi-bgp)# route-policy import route_policy_2
```

Configure EVPN VPWS over SR-TE Policy

This example shows how to configure EVPN VPWS over SR-TE policy.

```
Router(config)# l2vpn
Router(config-l2vpn)# xconnect group xg
Router(config-l2vpn-xc)# p2p xc100
Router(config-l2vpn-xc-p2p)# interface Bundle-Ether1.100
Router(config-l2vpn-xc-p2p)# neighbor evpn evi 1 target 1 source 2
Router(config-l2vpn-xc-p2p-pw)# exit
Router(config-l2vpn-xc-p2p)# exit

Call Admission Control for L2VPN P2P Services over Circuit-Style SR-TE Policies

Table 2: Feature History Table

Feature Name	Release Information	Feature Description
Call Admission Control for L2VPN P2P Services over Circuit-Style SR-TE Policies	Release 7.9.1	This feature allows you to configure guaranteed bandwidth for Layer 2 point-to-point (P2P) services steered over Circuit-Style SR-TE policies. This guaranteed bandwidth ensures that a Circuit-Style SR-TE policy has sufficient bandwidth to accommodate a Layer 2 P2P service. At the same time, it prevents a Layer 2 P2P service from being steered over a Circuit-Style SR-TE policy when there is insufficient available bandwidth.

In Layer 2 Virtual Private Network (L2VPN) point-to-point (P2P) services over Circuit-Style SR-TE policies, Call Admission Control (CAC) is used to ensure that the available bandwidth and other network resources are not overloaded by excessive traffic.

While Circuit-Style SR-TE policies are used to steer traffic along specific paths through the network, based on the specific needs of each L2VPN P2P service, CAC is used to ensure that the total bandwidth required by all active L2VPN P2P services on the network does not exceed the available capacity of the network links.

By combining CAC with Circuit-Style SR-TE policies, network administrators can optimize the routing of traffic through the network while ensuring that the network remains within its capacity limits.

Note For information about Circuit-Style SR-TE policies, refer to Circuit-Style SR-TE Policies in the *Segment Routing Configuration Guide for for Cisco 8000 Series Series Routers*.

Call Admission Control (CAC) prevents resource oversubscription in a network. The resources required to enable a service are allocated and reserved before enabling it.

CAC provides the following functionality:

- Ensures that a Circuit-Style SR-TE policy has sufficient bandwidth to accommodate a Layer 2 P2P service.
- Is aware of the total bandwidth associated with a Circuit-Style SR-TE policy, the available bandwidth of the Circuit-Style SR-TE policy considering all L2 P2P services steered over it, and the bandwidth of the L2 P2P service requesting to be admitted into the Circuit-Style SR-TE policy.
- Prevents a L2 P2P service from being steered over a Circuit-Style SR-TE policy when there is insufficient available bandwidth.

Usage Guideline and Limitations

- LDP-signaled L2 P2P services and EVPN VPWS L2 P2P services are supported.
- If a PW is configured with a bandwidth value but is not configured with a preferred path, then the PW stays down with the "admitted bandwidth" set to 0. See L2VPN Preferred path, on page 1.

Configure CAC for L2VPN P2P Services over Circuit-Style SR-TE Policies

To configure CAC for EVPN VPWS L2 P2P services, use the **admission-control bandwidth** *bandwidth* command. The range for *bandwidth* is from 1 to 4294967295 in kbps.

```
Router(config)# l2vpn
Router(config-l2vpn)# xconnect group evpn_vpws
Router(config-l2vpn-xc)# p2p evpn_vpws_1001
Router(config-l2vpn-xc-p2p)# interface TenGigE0/1/0/1.1001
Router(config-l2vpn-xc-p2p)# neighbor evpn evi 1001 target 10001 source 20001
Router(config-l2vpn-xc-p2p-pw)# admission-control bandwidth 24000
```

Running Configuration

```
l2vpn
 xconnect group evpn_vpws
  p2p evpn_vpws_1001
   interface TenGigE0/1/0/1.1001
   neighbor evpn evi 1001 target 10001 source 20001
    admission-control bandwidth 24000
   !
  !
 !
!
```

To configure CAC for LDP-signaled L2 P2P services, use the **bandwidth** *bandwidth* command. The range for *bandwidth* is from 1 to 4294967295 in kbps.

```
Router(config)# l2vpn
Router(config-l2vpn)# xconnect group xcon1
Router(config-l2vpn-xc)# p2p vplw1002
Router(config-l2vpn-xc-p2p)# interface TenGigE0/0/1/1.1002
Router(config-l2vpn-xc-p2p)# neighbor ipv4 3.3.3.3 pw-id 1002
Router(config-l2vpn-xc-p2p-pw)# bandwidth 24200
```

Running Configuration

```
l2vpn
 xconnect group xcon1
  p2p vplw1002
   interface TenGigE0/0/1/1.1002
```

```
   neighbor ipv4 3.3.3.3 pw-id 1002
    bandwidth 24200
   !
  !
 !
!
```

Verification

Use the **show l2vpn cac-db** command to display the total bandwidth of the policy, the available bandwidth, and the reserved bandwidth.

```
Router# show l2vpn cac-db

Policy Name: sr-srte_c_100_ep_3.3.3.3
  Total Bandwidth: 24000
  Available Bandwidth: 11000
  Reserved Bandwidth: 13000
  Service count: 1
  Pseudowire info:
  EVPN/AToM  VPN ID     AC ID      Reqd BW(kbps)   Alloc BW(kbps)  State
  ------------------------------------------------------------------------------
  EVPN     1          1          13000              13000             NOT CONF
```
