- [show filesystem](#), on page 17

cd

To change the current working directory, use **cd** command in XR EXEC mode.

cd *filesystem* :

Syntax Description	<i>filesystem</i> : (Optional) Location of the new working directory. Include the file system alias for the <i>filesystem</i> argument, followed by a colon and optionally, the name of a directory.
---------------------------	--

Command Default	The default file directory is disk0:/usr .
------------------------	---

Command Modes	XR EXEC mode.
----------------------	---------------

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines	<p>The current working directory is the directory used when EXEC commands that have an optional argument are entered without that argument. Use cd command to define the working directory. For example, when the dir command is entered without specifying the <i>filesystem</i> argument, the files in the current working directory are displayed.</p>
-------------------------	---

Use **cd** command without an argument to set the working directory back to the default directory, **disk0:/usr**.

The following example shows how to change the current working directory to the root directory on the hard disk. In this example, the **pwd** command confirms that the working directory has changed to the root directory on the hard disk.

```
RP/0/RP0/CPU0:router# cd harddisk:
RP/0/RP0/CPU0:router# pwd

harddisk:
```

The following example shows how to change the current working directory to the default file directory by specifying the **cd** command without a location. In this example, the **pwd** command confirms that the working directory has changed to the default file directory.

```
RP/0/RP0/CPU0:router# cd
RP/0/RP0/CPU0:router# pwd

disk0:/usr
```

cfs check

To perform a check on the Configuration File System (CFS), use **cfs check** command in EXEC or administration EXEC mode.

cfs check

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values.

Command Modes EXEC mode
Admin EXEC mode

Command History	Release	Modification
	Release 7.0.1	This command was introduced.

Usage Guidelines Use this command to check the sanity of the configuration file system and attempt to recover from internal inconsistencies; one or more rollback points may be lost depending on the severity of the state of the file system.

Note While this command runs, redundancy of the is disabled.

The following example shows how to perform a CFS check:

```
RP/0/RP0/CPU0:router# cfs check

Creating any missing directories in Configuration File system...OK
Initializing Configuration Version Manager...OK
Syncing commit database with running configuration...OK
Re-initializing cache files...OK
Updating Commit Database. Please wait...[OK]
```

copy

To copy a file from a source (such as a network server) to a destination (such as a flash disk), use **copy** command in XR EXEC mode.

```
copy source { location node-id destination location { node-id | all } | running-config [atomic] }
```

Syntax Description

<i>source</i>	<p>Filename including the directory path or network location of the file. The possible sources are:</p> <p><i>directory-path</i> —Directory path of the file from which the file is copied.</p> <p>access-list { ipv4 ipv6 }—Copies an access list (EXEC mode only).</p> <p>config: —Copies from disk0: file system.</p> <p>disk0: —Copies from disk0: file system.</p> <p>ftp: —Copies from an FTP network server. The syntax is ftp:[[[//<i>username</i>[:<i>password</i>]@] <i>location</i>]/<i>directory</i>]/<i>filename</i>.</p> <p>harddisk: —Copies from the hard disk drive file system (if present).</p> <p>http: —Copies from one webserver to another over a network. The syntax is http://username:password@ip-address:port/directory-path</p> <p>https: —Copies from the https: file system. The syntax is https://username:password@ip-address:port/directory-path</p> <p>sftp: —Copies from an SFTP network server. The syntax is sftp:[[[//<i>username</i>[:<i>password</i>]@] <i>location</i>]/<i>directory</i>]/<i>filename</i>.</p> <p>scp: —Copies from an SCP network server. The syntax is scp:[[[//<i>username</i>[:<i>password</i>]@] <i>location</i>]/<i>directory</i>]/<i>filename</i>.</p> <p>prefix-list { ipv4 ipv6 }—Copies from a prefix list (EXEC mode only).</p> <p>rootfs: —Copies from the rootfs: file system.</p> <p>running-config —Copies from the current system configuration.</p> <p>tftp: —Copies from a TFTP network server. The syntax is tftp:[[//<i>location</i>]/<i>directory</i>]/<i>filename</i></p> <p>xml-schema —Copies the XML schema files as a tar ball file (.tar.gz) [EXEC mode only].</p>
<i>destination</i>	Filename including the directory path or network location of the file.
location <i>node-id</i>	Specifies a node. The <i>node-id</i> argument is expressed in the <i>rack/slot</i> notation.
location all	Copies to all nodes.
running-config	Applies the source configuration file to the running configuration of the system.
atomic	(Optional) Applies the changes to the running configuration only if there are no errors

Command Default None

Command Modes XR EXEC mode

Command History	Release	Modification
	Release 7.10.1	This command was modified to support public key authentication.
	Release 7.9.1	This command was modified to support SFTP and SCP options.
	Release 7.0.12	This command was introduced.

Usage Guidelines Source and destination can each be a configuration file, a text file, or a file system. Enter source and destination URL information, usernames, and passwords and issue the **copy** command. The networking device prompts for any missing information.

The exact format of the *source* and *destination* arguments vary according to the file or directory location. Enter the device or network location for the file system type.

Filenames can include the following characters:

! # \$ % + 0 1 2 3 4 5 6 7 8 9 @ A B C D E F G H I J K L M N O P Q R S T U V W X Y Z [] ^ _ a b c d e f g h i j k l m n o p q r s t u v w x y z { } ~

The following characters can be used with the stated limitations:

- ` needs backslash before this character
- – cannot be the first character
- . cannot be the last character
- = cannot be the filename without other characters

The following characters cannot be used in filenames:

" () * , / : < > ? \ | ' & ;

The maximum length allowed for a filename is 254 characters including the path. If a filename longer than 254 characters is specified, the filename is truncated to 254 characters.

To copy a file from a source on the router to a destination on the router, specify a source **location** *node-id* and a destination **location** *node-id*. To copy the file to all nodes, use the **location all** keywords.

In the alias syntax for the **ftp:**, **rcp:**, **tftp:**, **sftp:**, and **scp:** keywords, the location is either an IP address or a hostname. The filename is specified relative to the directory used for file transfers.

When no alias is specified, the networking device looks for a file in the current directory. To view the current directory, enter the **pwd** command.

Note During processing of the **copy** command, you might see the “C” character. For all files being copied, “C” indicates that the copy process is taking place. The entire copying process might take several minutes and differs from protocol to protocol and from network to network.

Table 1: Network Protocols Supported by Cisco IOS XR Software

Prefix	Name	Description
tftp:	Trivial File Transfer Protocol	<i>TFTP</i> is a simplified version of FTP that allows files to be transferred from one computer to another over a network, usually without the use of client authentication (for example, username and password).
ftp:	File Transfer Protocol	<i>FTP</i> is an application protocol, part of the TCP/IP protocol stack, and is used for transferring files between network nodes. FTP requires a username and password.
rcp:	Remote Copy Protocol	The rcp protocol allows users to copy files to and from a file system residing on a remote host or server on the network. The rcp protocol uses TCP to ensure the reliable delivery of data. The rcp protocol downloads require a username.
http:	Hypertext Transfer Protocol	<i>HTTP</i> protocol allows users to transfer files from one webserver to another over a network. The user authentication depends on the webserver configuration.
sftp:	Secure File Transfer Protocol	<i>SFTP</i> is an application protocol is used for secure transferring files between the router and and an archive server. SFTP requires a username and password.
scp:	Secure Copy Protocol	<i>SCP</i> is an application protocol is used for secure transferring files between the router and and an archive server. SFTP requires a username and password.

Additional usage guidelines are in the following sections.

Invalid Combinations of Source and Destination

Some combinations of source and destination are invalid. Specifically, you cannot copy the following:

- From a running configuration to a running configuration
- From a network device to a network device (for example, **copy ftp: rcp:**)

Using TFTP

TFTP is a simplified version of FTP that allows files to be transferred from one computer to another over a network, usually without the use of client authentication (for example, username and password).

The syntax is as follows:

copy tftp://hostname /ipaddress/directory-path pie name target-device [location {node-id | all}]

Example:

```
Router# copy tftp://1.1.1.1/images/software.pie disk1:
```

Note Some Cisco IOS XR images may be larger than 32 MB, and the TFTP services provided by some vendors may not support a file this large. If you do not have access to a TFTP server that supports files larger than 32 MB, download the software image using FTP or rcp as described in the following sections.

Using FTP

FTP servers require a username and password for each client request. Cisco IOS XR software sends the first valid username in the following list:

1. The username and password specified in the **copy** command, if a username is specified.

The syntax is as follows:

```
copy ftp://username : password @ hostname or ipaddress/directory-path/pie-name target-device [location {node-id | all}]
```

Example:

```
Router# copy ftp://john:secret@10.1.1.1/images/software.pie disk1:
```

2. An “anonymous” username and password. The anonymous password is “root@ip address,” where “ip address” is the IP address of the local networking device.
3. A password “username@iosname.domain” formed by the networking device. The variable “username” is the username associated with the current session, “iosname” is the configured hostname, and “domain” is the domain of the networking device.

The username and password must be associated with an account on the FTP server. If you are writing to the network server, the FTP server must be properly configured to accept the FTP write request from the user on the networking device.

If the network server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the network server. For example, if the system image resides in the home directory of a user on the network server, specify the name of that user as the remote username.

Refer to the documentation for your FTP server for more details.

Using rcp

The rcp protocol requires a username upon each request. When you copy a configuration file or image between the networking device and an rcp server, the Cisco IOS XR software sends the first valid username in the following list:

1. The remote username specified in the **copy** command, if one is specified.
2. The username set by the **rcp client username** command, if the command is configured.
3. The networking device hostname.

For the rcp copy request to process successfully, an account must be defined on the network server for the remote username. If the network administrator of the destination server did not establish an account for the remote username, this command does not run successfully. If the network server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on

the network server. For example, if the system image resides in the home directory of a user on the network server, specify the name of that user as the remote username.

If you are writing to the network server, the rcp server must be properly configured to accept the rcp write request from the user on the networking device. For UNIX systems, add an entry to the .rhosts file for the remote user on the rcp server. Suppose the networking device contains the following configuration lines:

```
hostname Rtrl
ip rcp remote-username User0
```

If the IP address of the networking device translates to company.com, then the .rhosts file for User0 on the rcp server should contain the following line:

```
company.com Rtrl
```

See the documentation for your rcp server for more details.

If you are using a personal computer as a file server, the computer must support remote shell (rsh) protocol.

Using xml-schema

Use the **xml-schema** keyword to obtain the most up-to-date XML schemas (.xsd files) from the router. Using this keyword is useful to prevent the use of outdated schemas in the event that router software updates include schema updates. The tar ball file includes all active schema files. It does not include schemas that are activated by specific package installation envelopes (PIEs) if those PIEs are not installed and activated on the router.

Using HTTP(s)

HTTP(s) allows files to be transferred from one webserver to another over a network. The user authentication depends on the webserver configuration. The following copy operations are supported:

- Copy a file from webserver to device via HTTP
- Copy a file from webserver to device via HTTPS
- Copy a file from device to webserver via HTTP

Note Copying a file from device to webserver via HTTP is not supported.

Copying a file from sys-admin via HTTP(s) is not supported.

The syntax is as follows:

```
copyhttps://username : password@ip-address : port target-device [location {node-id | all}]
```

Example:

The following example shows how to copy a file from http server, where user credentials are not required, and server listens to the default port.

```
Router# copy http://1.1.1.1/images/software.pie disk1:
```

The following example shows how to copy a file from http server, where user credentials are required, and server listens to the default port.

```
Router# copy http://user:cisco@1.1.1.1/images/software.pie disk1:

UserID: user
Password: cisco
```

The following example shows how to copy a file from http server, where user credentials are required, and server listens to a specific port.

```
Router# copy http://user:cisco@1.1.1.1:45/images/software.pie disk1:

UserID: user
Password: cisco
Specific listen port: 45
```

Copying to the Running Configuration

When you use the **copy** command to copy a configuration file to the **running-config** destination, the configuration in the file is applied to the running configuration of the system. This is a configuration operation. By default, the copy is carried out in a best-effort manner. This means that if some configuration lines from the file cannot be applied, the remaining configuration is still integrated into the system. In this case, a partial configuration is committed. When the **atomic** keyword is used, partial configurations are not committed. This means that even if one error occurs in the parsing or committing phase, no changes are made to the system. To view any errors when applying the configuration, use the **show configuration failed** command.

Task ID

Task ID Operations

```
filesystem execute
```

The following example shows how to copy a file from a FTP server to disk1:

```
Router#copy ftp://john:secret@10.1.1.1/images/comp-cisco8k-full.pie disk1:
```

The following example shows how to copy a file from an rcp server to disk1:

```
Router#copy rcp://john@10.1.1.1/images/comp-cisco8k-full.pie disk1:
```

The following example shows how to copy a configuration file to running-config destination:

```
Router#copy running-config disk0:/running-config.txt
Thu Apr 20 15:53:49.116 UTC
Destination file name (control-c to cancel): [/disk0:/running-config.txt]?
Building configuration.
188 lines built in 1 second
[OK]
```

The following example shows how to copy a file from a SCP and SFTP server using public key authentication:

```
Router#copy running-config scp://root@192.0.4.2//var/opt/run_conf_scp.txt
Router#copy running-config sftp://root@192.0.4.2//var/opt/run_conf_sftp.txt
```

delete

To delete files, use **delete** command in the appropriate mode.

delete [**/noprompt**] [**/ena**] *filesystem* : *filename* **location** {*node-id* | **all**}

Syntax Description	
/noprompt	(Optional) Causes no prompt for confirmation before deleting the specified files.
/ena	(Optional) Deletes all files from and below the current working directory.
<i>filesystem</i> :	(Optional) Location of the file to be deleted. Include the file system alias for the <i>filesystem</i> argument, followed by a colon, and, optionally, the name of a directory.
<i>filename</i>	Filename of the file to be deleted.
harddisk	Deletes the harddisk
location { <i>node-id</i> all }	Deletes a file from a designated node. The <i>node-id</i> argument is entered in the <i>rack/slot</i> notation. The all keyword specifies to delete the file from all nodes.

Command Default A filename must be specified. If a filename is entered without a file system or directory path, the present working directory is used.

Command Modes XR EXEC mode.

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines When a file is deleted, it is removed from the system and cannot be restored (undeleted).

Use the **dir** command to display the list of files on a storage device.

The following example shows how to delete a file:

```
RP/0/RP0/CPU0:router# delete rbtest
Delete disk1:/rbtest[confirm]y
```

dir

To display a list of files on a file system or in a specific directory, use the **dir** command in XR EXEC mode.

dir [{/all | /ena | /recurse}] [*filesystem*:] [*filename*] **location** {*node-id* | **all**}

Syntax Description

/all	(Optional) Lists deleted files, undeleted files, and files with errors.
/ena	(Optional) Recognizes subdirectories.
/recurse	(Optional) Recursively lists subdirectories.
<i>filesystem</i> :	(Optional) Name of the directory containing the files to be displayed. Include the file system alias for the <i>filesystem</i> argument, followed by a colon, and, optionally, the name of a directory.
<i>filename</i>	(Optional) Name of the files to display. The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings following a wildcard are ignored.
location { <i>node-id</i> all }	(Optional) Specifies the node from which to display a list of files. The <i>node-id</i> argument is entered in the <i>rack/slot</i> notation. The all keyword specifies to display files on all nodes.

Command Default

When **dir** command is entered without keywords or arguments, the contents of the present working directory are displayed.

Command Modes

XR EXEC mode.

Command History

Release	Modification
Release 7.0.12	This command was introduced.

Usage Guidelines

If you enter the **dir** command without specifying a directory, the contents of the present working directory are displayed. The **all** keyword displays all files, including deleted files. The size associated with the directory name is the total size for all files in that directory.

The following example shows how to display the contents of a directory:

```
RP/0/RP0/CPU0:router# dir harddisk:/log

Directory of harddisk:/log

5527      drwx  4096      Thu Aug 28 11:21:48 2008  boot_28_Aug_2008_11_21_49
5533      drwx  4096      Thu Aug 28 11:38:54 2008  boot_28_Aug_2008_11_38_54
5538      drwx  4096      Fri Sep  5 13:28:54 2008  boot_05_Sep_2008_13_28_54
5543      drwx  4096      Mon Sep  8 08:55:52 2008  boot_08_Sep_2008_06_59_08
```

--More--

mkdir

To create a new directory on a file system, use the **mkdir** command in the appropriate mode.

mkdir *filesystem*:**[location** {*node-id* | **all**}]

Syntax Description

filesystem: File system on which to create a new directory.

location{*node-id* | **all**} (Optional) Specifies the node where the file system is located. The *node-id* argument is expressed in the *rack/slot* notation. Use the **all** keyword to indicate all nodes.

Command Default

No default behavior or values

Command Modes

System Admin EXEC

Command History

Release	Modification
Release 7.0.12	This command was introduced.

Usage Guidelines

After you issue the **mkdir** command, Cisco IOS XR software prompts you to specify the name of the directory to be created. When specifying the name of the new directory, include the directory path where you want the new directory to reside. If you do not specify a directory path, the new directory is created in the /usr directory of the file system specified for the *filesystem*: argument.

The following example shows how to create a directory named newdir. The **dir** command is used to verify that the directory has been added.

```
RP/0/RP0/CPU0:router# mkdir harddisk:

Create directory filename []?newdir
Created dir harddisk:/newdir
RP/0/RP0/CPU0:router# dir harddisk:

Directory of harddisk:

11193      drwx  4096      Fri Feb 13 06:45:05 2009  newdir
37146      drwx  4096      Sun Dec 14 15:30:48 2008  malloc_dump
43030      drwx  4096      Wed Dec 24 11:20:52 2008  tracebacks
43035      drwx  4096      Thu Jan  8 18:59:18 2009  sau
51026      drwx  4096      Sat Dec 27 02:52:46 2008  tempA
51027      drwx  4096      Sat Dec 27 02:04:10 2008  dir.not.del
-430307552 -rwx   342      Fri Jan 16 10:47:38 2009  running-config
-430305504 -rwx  39790     Mon Jan 26 23:45:56 2009  cf.dat

39929724928 bytes total (39883231232 bytes free)
```

pwd

To display the present working directory, use the **pwd** command in

EXEC mode

System Admin EXEC

pwd

Syntax Description

This command has no keywords or arguments.

Command Default

No default behavior or values.

Command Modes

EXEC

System Admin EXEC

Command History

Release	Modification
Release 7.0.12	This command was introduced.

Usage Guidelines

Use the **pwd** command to show what directory or file system is specified as the default by the **cd** command.

The following example shows how to display the present working directory:

```
RP/0/RP0/CPU0:router# pwd
```

```
disk0:/usr
```

rmdir

To remove an existing directory, use the **rmdir** command in the appropriate mode.

rmdir *filesystem:* **location** {*node-id* | **all**}

Syntax Description	<i>filesystem</i>	Name of the file system from which to delete a directory, followed by a colon.
	location { <i>node-id</i> all }	Specifies the node where the file system is located. The <i>node-id</i> argument is expressed in the <i>rack/slot</i> notation. Use the all keyword to indicate all nodes.
Command Default	No default behavior or values	
Command Modes	System Admin EXEC	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines Use the **rmdir** command to remove directories (for example, to free up disk space) from a file system. After you issue the **rmdir** command, the Cisco IOS XR software prompts you to specify the name of the directory to be deleted.

When a directory contains files, you must remove the files before deleting the directory. Use the **delete** command to remove files.

The following example shows how to delete a subdirectory from the hard disk. The **dir** command is used to verify that the directory has been deleted.

```
RP/0/RP0/CPU0:router# rmdir harddisk:

Remove directory filename []?newdir
Delete harddisk:/newdir[confirm]y
RP/0/RP0/CPU0:router# dir harddisk:

Directory of harddisk:

 37146      drwx  4096      Sun Dec 14 15:30:48 2008  malloc_dump
 43030      drwx  4096      Wed Dec 24 11:20:52 2008  tracebacks
 43035      drwx  4096      Thu Jan  8 18:59:18 2009  sau
 51026      drwx  4096      Sat Dec 27 02:52:46 2008  tempA
 51027      drwx  4096      Sat Dec 27 02:04:10 2008  dir.not.del
-430307552  -rwx   342      Fri Jan 16 10:47:38 2009  running-config
-430305504  -rwx  39790     Mon Jan 26 23:45:56 2009  cf.dat

39929724928 bytes total (39883235328 bytes free)
```

show filesystem

To display the layout and contents of file systems, use the **show filesystem** command in XR EXEC mode

System Admin EXEC

show filesystem *filesystem:* [**location** {*node-id* | **all**}]

Syntax Description	<p><i>filesystem:</i> Name of the file system for which to display information, followed by a colon. Possible values are: disk0:, disk1:, harddisk:.</p> <p>location {<i>node-id</i> all} (Optional) Specifies the node where the file system is located. The <i>node-id</i> argument is expressed in the <i>rack/slot</i> notation. Use the all keyword to indicate all nodes.</p>																																																							
Command Default	The file system for the active RP is displayed.

Release	Modification																																																							
Release 7.0.12	This command was introduced.																																																							
Usage Guidelines	<p>Use the show filesystem command to learn the alias names (prefixes) of the file systems supported by your networking device.</p> <p>The following example shows sample output from the show filesystem command:</p> <pre>RP/0/RP0/CPU0:router# show filesystem</pre> <p>File Systems:</p> <table border="1"> <thead> <tr> <th>Size (b)</th> <th>Free (b)</th> <th>Type</th> <th>Flags</th> <th>Prefixes</th> </tr> </thead> <tbody> <tr> <td>-</td> <td>-</td> <td>network</td> <td>rw</td> <td>qsm/dev/fs/tftp: tftp:</td> </tr> <tr> <td>-</td> <td>-</td> <td>network</td> <td>rw</td> <td>qsm/dev/fs/rcp: rcp:</td> </tr> <tr> <td>-</td> <td>-</td> <td>network</td> <td>rw</td> <td>qsm/dev/fs/ftp: ftp:</td> </tr> <tr> <td>39929724928</td> <td>39852978176</td> <td>harddisk</td> <td>rw</td> <td>harddisk:</td> </tr> <tr> <td>1024606208</td> <td>863584256</td> <td>flash-disk</td> <td>rw</td> <td>disk0:</td> </tr> <tr> <td>2092032</td> <td>2059264</td> <td>nvrn</td> <td>rw</td> <td>nvrn:</td> </tr> <tr> <td>62390272</td> <td>62381260</td> <td>flash</td> <td>rw</td> <td>bootflash:</td> </tr> </tbody> </table> <p>The following example shows sample output from the show filesystem command using the optional location <i>node-id</i> keyword and argument:</p> <pre>RP/0/RP0/CPU0:router# show filesystem location 0/rp0/cpu0</pre> <p>File Systems:</p> <table border="1"> <thead> <tr> <th>Size (b)</th> <th>Free (b)</th> <th>Type</th> <th>Flags</th> <th>Prefixes</th> </tr> </thead> <tbody> <tr> <td>-</td> <td>-</td> <td>network</td> <td>rw</td> <td>qsm/dev/fs/tftp: tftp:</td> </tr> <tr> <td>-</td> <td>-</td> <td>network</td> <td>rw</td> <td>qsm/dev/fs/rcp: rcp:</td> </tr> </tbody> </table>	Size (b)	Free (b)	Type	Flags	Prefixes	-	-	network	rw	qsm/dev/fs/tftp: tftp:	-	-	network	rw	qsm/dev/fs/rcp: rcp:	-	-	network	rw	qsm/dev/fs/ftp: ftp:	39929724928	39852978176	harddisk	rw	harddisk:	1024606208	863584256	flash-disk	rw	disk0:	2092032	2059264	nvrn	rw	nvrn:	62390272	62381260	flash	rw	bootflash:	Size (b)	Free (b)	Type	Flags	Prefixes	-	-	network	rw	qsm/dev/fs/tftp: tftp:	-	-	network	rw	qsm/dev/fs/rcp: rcp:
Size (b)	Free (b)	Type	Flags	Prefixes																																																				
-	-	network	rw	qsm/dev/fs/tftp: tftp:																																																				
-	-	network	rw	qsm/dev/fs/rcp: rcp:																																																				
-	-	network	rw	qsm/dev/fs/ftp: ftp:																																																				
39929724928	39852978176	harddisk	rw	harddisk:																																																				
1024606208	863584256	flash-disk	rw	disk0:																																																				
2092032	2059264	nvrn	rw	nvrn:																																																				
62390272	62381260	flash	rw	bootflash:																																																				
Size (b)	Free (b)	Type	Flags	Prefixes																																																				
-	-	network	rw	qsm/dev/fs/tftp: tftp:																																																				
-	-	network	rw	qsm/dev/fs/rcp: rcp:																																																				

```

- - network rw qsm/dev/fs/ftp: ftp:
39929724928 39883235328 harddisk rw harddisk:
2092032 2019328 nvram rw nvram:
1024606208 847888384 flash-disk rw disk0:
62390272 62153616 flash rw bootflash:

```

Table 2: show filesystem Field Descriptions

Field	Description
Size(b)	Amount of memory in the file system, in bytes.
Free(b)	Amount of free memory in the file system, in bytes.
Type	Type of file system.
Flags	Permissions for file system.
Prefixes	Alias for the file system.
