ntp clear	34
ntp reset drift	35
peer (NTP)	37
server (NTP)	39
show calendar	41
show ntp associations	42
show ntp status	46
source (NTP)	48
trusted-key	50
update-calendar	51

CHAPTER 4**PTP Commands 53**

synchronous-ethernet prefer-interface ptp-receiver	54
performance-monitoring	55
show ptp dataset performance	56
show ptp platform performance-counters	59

Preface

- [Preface, on page v](#)
- [Changes to This Document, on page v](#)

Preface

This guide consists of information about the system management commands in Cisco IOS XR Software.

The *Timing and Synchronization Command Reference for Cisco 8000 Series Routers* preface contains these sections:

Changes to This Document

This table lists the changes made to this document since it was first printed.

Date	Change Summary
November 2025	Initial release of this document

Clock Commands

- [clock set](#), on page 2
- [clock timezone](#), on page 4
- [locale country](#), on page 8
- [locale language](#), on page 9
- [show clock](#), on page 10

clock set

To change the software clock settings, use the **clock set** command in XR EXEC mode.

clock set *hh:mm:ss* {*day month* | *month day*} *year*

Syntax Description	<i>hh:mm:ss</i>	Current time in hours (24-hour format), minutes, and seconds. Colons are required between values.
	<i>day</i>	Current day (by date) in the month.
	<i>month</i>	Current month (by name).
	<i>year</i>	Current year (no abbreviation). Enter a valid four-digit year.
Command Default	Clock is not set.	
Command Modes	XR EXEC mode	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Generally, if the system is synchronized by a valid outside timing mechanism, such as a Network Time Protocol (NTP) clock source, or if you have a networking device with calendar capability, you need not set the software clock. Use the clock set command if no other time sources are available. The time specified in this command is relative to the configured time zone.	

Setting the Software Clock

This example shows how to set the software clock using the **clock set** command with the *day month* arguments first.

```
RP/0/RP0/CPU0:router# clock set 14:12:00 10 feb 2005
14:12:00.114 JST Fri Feb 10 2009
```

This example shows how to set the software clock using the **clock set** command with the *month day* arguments first.

```
RP/0/RP0/CPU0:router# clock set 14:38:00 feb 10 2005
14:38:00.069 PST Tue Feb 10 2009
```

Displaying the Clock Settings

This example shows how to display the settings of the software clock:

```
RP/0/RP0/CPU0:router# show clock
```

```
14:38:11.292 PST Tue Feb 10 2009
```

clock timezone

To set the time zone for display, use the **clock timezone** command in System Admin Config mode or XR Config mode. To remove the time zone setting, use the **no** form of this command.

clock timezone *zone region*

Syntax Description	<i>zone</i>	Name of the time zone to be displayed when standard time is in effect.
	<i>region</i>	Sets the offset according to the region specified.

Command Default UTC

Command Modes System Admin Config mode
XR Config mode

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines This table lists common time zone acronyms used for the *zone* argument.

Table 1: Common Time Zone Acronyms

Acronym	Time Zone Name and UTC Offset
Europe	
GMT	Greenwich Mean Time, as UTC.
BST	British Summer Time, as UTC plus 1 hour.
IST	Irish Summer Time, as UTC plus 1 hour.
WET	Western Europe Time, as UTC.
WEST	Western Europe Summer Time, as UTC plus 1 hour.
CET	Central Europe Time, as UTC plus 1 hour.
CEST	Central Europe Summer Time, as UTC plus 2 hours.
EET	Eastern Europe Time, as UTC plus 2 hours.
EEST	Eastern Europe Summer Time, as UTC plus 3 hours.
MSK	Moscow Time, as UTC plus 3 hours.

Acronym	Time Zone Name and UTC Offset
MSD	Moscow Summer Time, as UTC plus 4 hours.
United States and Canada	
AST	Atlantic Standard Time, as UTC minus 4 hours.
ADT	Atlantic Daylight Time, as UTC minus 3 hours.
ET	Eastern Time, either as EST or EDT, depending on place and time of year.
EST	Eastern Standard Time, as UTC minus 5 hours.
EDT	Eastern Daylight Saving Time, as UTC minus 4 hours.
CT	Central Time, either as CST or CDT, depending on place and time of year.
CST	Central Standard Time, as UTC minus 6 hours.
CDT	Central Daylight Saving Time, as UTC minus 5 hours.
MT	Mountain Time, either as MST or MDT, depending on place and time of year.
MST	Mountain Standard Time, as UTC minus 7 hours.
MDT	Mountain Daylight Saving Time, as UTC minus 6 hours.
PT	Pacific Time, either as PST or PDT, depending on place and time of year.
PST	Pacific Standard Time, as UTC minus 8 hours.
PDT	Pacific Daylight Saving Time, as UTC minus 7 hours.
AKST	Alaska Standard Time, as UTC minus 9 hours.
AKDT	Alaska Standard Daylight Saving Time, as UTC minus 8 hours.
HST	Hawaiian Standard Time, as UTC minus 10 hours.
Australia	
WST	Western Standard Time, as UTC plus 8 hours.
CST	Central Standard Time, as UTC plus 9.5 hours.
EST	Eastern Standard/Summer Time, as UTC plus 10 hours (plus 11 hours during summer time).

This table lists an alternative method for referring to time zones, in which single letters are used to refer to the time zone difference from UTC. Using this method, the letter Z is used to indicate the zero meridian,

equivalent to UTC, and the letter J (Juliet) is used to refer to the local time zone. Using this method, the International Date Line is between time zones M and Y.

Table 2: Single-Letter Time Zone Designators

Letter Designator	Word Designator	Difference from UTC
Y	Yankee	UTC minus 12 hours.
X	Xray	UTC minus 11 hours.
W	Whiskey	UTC minus 10 hours.
V	Victor	UTC minus 9 hours.
U	Uniform	UTC minus 8 hours.
T	Tango	UTC minus 7 hours.
S	Sierra	UTC minus 6 hours.
R	Romeo	UTC minus 5 hours.
Q	Quebec	UTC minus 4 hours.
P	Papa	UTC minus 3 hours.
O	Oscar	UTC minus 2 hours.
N	November	UTC minus 1 hour.
Z	Zulu	Same as UTC.
A	Alpha	UTC plus 1 hour.
B	Bravo	UTC plus 2 hours.
C	Charlie	UTC plus 3 hours.
D	Delta	UTC plus 4 hours.
E	Echo	UTC plus 5 hours.
F	Foxtrot	UTC plus 6 hours.
G	Golf	UTC plus 7 hours.
H	Hotel	UTC plus 8 hours.
I	India	UTC plus 9 hours.
K	Kilo	UTC plus 10 hours.
L	Lima	UTC plus 11 hours.
M	Mike	UTC plus 12 hours.

This example shows how to set the time zone to IST Asia/Calcutta:

```
Router# config  
Router(config)# clock timezone IST Asia/Calcutta
```

locale country

To set the default country of use, use the **locale country** command in `mode`. To remove the country setting, use the **no** form of this command.

locale country *country*

Syntax Description	<i>country</i> Country, where <i>country</i> is a two-character country code. Case is not important.	
Command Default	No default behavior or values	
Command Modes		
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	To display a complete listing of the available country codes, use the online help (?) function:	

```
RP/0/RP0/CPU0:router(config)# locale country ?
```

```

AD      Andorra
AE      United Arab Emirates
AF      Afghanistan
AG      Antigua and Barbuda
AI      Anguilla
AL      Albania
AM      Armenia
AN      Netherlands Antilles
AO      Angola
AQ      Antarctica
AR      Argentina
AS      American Samoa
AT      Austria
AU      Australia
AW      Aruba
AZ      Azerbaijan
BA      Bosnia and Herzegovina
BB      Barbados
BD      Bangladesh
BE      Belgium
--More--
```

The following example shows how to set the country of use to Australia:

```
RP/0/RP0/CPU0:router(config)# locale country au
```

locale language

To set the default language of use, use the **locale language** command in `mode`. To remove the language setting, use the **no** form of this command.

locale language *language*

Syntax Description

language Two-character code that specifies the language. Case is not important.

Command Default

No default behavior or values

Command Modes

Command History

Release	Modification
Release 7.0.12	This command was introduced.

Usage Guidelines

To display a complete listing of the available language codes, use the online help (?) function:

```
RP/0/RP0/CPU0:router(config)# locale language ?

aa      Afar
ab      Abkhazian
af      Afrikaans
am      Amharic
ar      Arabic
as      Assamese
ay      Aymara
--More--
```

The following example shows how to set the language of use to English:

```
RP/0/RP0/CPU0:router(config)# locale language en
```

show clock

To display the system clock, use the **show clock** command in XR EXEC mode.

show clock [detail]

Syntax Description	detail (Optional) Indicates the time zone, time source, and current summer time setting (if any).				
Command Default	No default behavior or values.				
Command Modes	XR EXEC mode				
Command History	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 7.0.12</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 7.0.12	This command was introduced.
Release	Modification				
Release 7.0.12	This command was introduced.				

Usage Guidelines

The system clock keeps an “authoritative” flag that indicates whether the time is authoritative (believed to be accurate). If the system clock has been set by a timing source, such as system calendar or Network Time Protocol (NTP), the flag is set. If the time is not authoritative, it is used only for display. Until the clock is authoritative and the “authoritative” flag is set, the flag prevents peers from synchronizing to the clock when the peers have invalid times.

The leading symbols that precede the **show clock** command display are shown in this table

Table 3: show clock Display Leading Symbol Descriptions

Symbol	Description
*	Time is not authoritative.
(blank)	Time is authoritative.
.	Time is authoritative, but NTP is not synchronized.

The following sample output shows the current clock settings:

```
RP/0/RP0/CPU0:router# show clock
16:18:28.927 PST Tue Feb 10 2009
```

The following sample output shows the current clock detail, including the time zone and time source:

```
RP/0/RP0/CPU0:router# show clock detail
16:18:07.164 PST Tue Feb 10 2009
Timezone: PST8PST Timesource: User configured
```

Frequency Synchronization Commands

- [clock-id mac-address mac-address-id](#), on page 12
- [synchronous-ethernet prefer-interface ptp-receiver](#), on page 13

clock-id mac-address mac-address-id

To configure the MAC address of the device clock that can transmit the enhanced QL TLV in the network, use the **clock-id mac-address mac-address-id** command. To disable the device clock as the one that can transmit the enhanced QL TLV in the network, use the **no** form of this command.

clock-identity mac-address mac-address-identity region

Command Default	When the clock-id mac-address mac-address-id command is not configured, the router MAC address is used to send clock-id in enhanced QL-TLV of ESMC packet.				
Command Modes	XR Config mode				
Command History	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 7.3.1</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 7.3.1	This command was introduced.
Release	Modification				
Release 7.3.1	This command was introduced.				

Task ID

Task ID	Operations
ethernet-services	read, write

This example shows how to configure the MAC address of the device clock that can transmit the enhanced QL TLV in the network:

```
Router# config
Router(config)# frequency synchronization
Router(config-freqsync)# clock-id mac-address 0000.0001.0003
Router(config-freqsync)# commit
```

synchronous-ethernet prefer-interface ptp-receiver

To choose PTP receiver interface as the SyncE source among equally qualified sources, use the **synchronous-ethernet prefer-interface ptp-receiver** command in XR Config mode mode.

synchronous-ethernet prefer-interface ptp-receiver

Syntax Description	This command has no keywords or arguments.	
Command Default	None	
Command Modes	XR Config mode	
Command History	Release	Modification
	Release 24.4.1	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operations
	ethernet-services	execute

Examples

This example shows how to select the PTP receiver interface as the SyncE source among equally qualified sources using the **synchronous-ethernet prefer-interface ptp-receiver** command:

```
Router#configure terminal
Router(config)#frequency synchronization
Router(config-freqsync)#synchronous-ethernet prefer-interface ptp-receiver
Router(config-freqsync)#commit
```

`synchronous-ethernet prefer-interface ptp-receiver`

Network Time Protocol Commands

- [access-group \(NTP\)](#), on page 16
- [authenticate \(NTP\)](#), on page 18
- [authentication-key \(NTP\)](#), on page 19
- [broadcast](#), on page 20
- [broadcast client](#), on page 21
- [broadcastdelay](#), on page 22
- [interface \(NTP\)](#), on page 23
- [master](#), on page 25
- [master primary-reference-clock](#), on page 27
- [max-associations](#), on page 29
- [multicast client](#), on page 30
- [multicast destination](#), on page 31
- [ntp](#), on page 32
- [ntp clear](#), on page 34
- [ntp reset drift](#), on page 35
- [peer \(NTP\)](#), on page 37
- [server \(NTP\)](#), on page 39
- [show calendar](#), on page 41
- [show ntp associations](#), on page 42
- [show ntp status](#), on page 46
- [source \(NTP\)](#), on page 48
- [trusted-key](#), on page 50
- [update-calendar](#), on page 51

access-group (NTP)

To control access to Network Time Protocol (NTP) services for an IPv4 or IPv6 access list, use the **access-group** command in one of the NTP configuration modes. To remove the **access-group** command from the configuration file and restore the system to its default condition with respect to this command, use the **no** form of this command.

access-group [vrf vrf-name] [ipv4 | ipv6] {peer | query-only | serve | serve-only} access-list-name
no access-group [vrf vrf-name] [ipv4 | ipv6] {peer | query-only | serve | serve-only}

Syntax Description

vrf vrf-name	(Optional) Applies the access control configuration to a specified nondefault VRF. If not specified, the configuration is applied to the default VRF.
ipv4	(Optional) Specifies an IPv4 access list (default).
ipv6	(Optional) Specifies an IPv6 access list.
peer	Allows time requests and NTP control queries and allows a networking device to synchronize to the remote system.
query-only	Allows only NTP control queries. Cisco IOS XR software uses NTP Version 4, but the RFC for Version 3 (RFC 1305: <i>Network Time Protocol (Version 3)—Specification, Implementation and Analysis</i>) still applies.
serve	Allows time requests and NTP control queries, but does not allow the networking device to synchronize to the remote system.
serve-only	Allows only time requests.
access-list-name	Name of an IPv4 or IPv6 access list.

Command Default

No NTP access control is configured.

Command Modes

NTP configuration
 VRF-specific NTP configuration

Command History

Release	Modification
Release 7.0.12	This command was introduced.

Usage Guidelines

The access group options are scanned in the following order from least restrictive to most restrictive:

1. **peer**—Allows time requests and NTP control queries and allows the router to synchronize itself to a system whose address passes the access list criteria.
2. **serve**—Allows time requests and NTP control queries, but does not allow the router to synchronize itself to a system whose address passes the access list criteria.
3. **serve-only**—Allows only time requests from a system whose address passes the access list criteria.
4. **query-only**—Allows only NTP control queries from a system whose address passes the access list criteria.

Access is granted for the first match that is found. If no access groups are specified, all access is granted to all sources. If any access groups are specified, only the specified access is granted. This facility provides minimal security for the time services of the system. However, it can be circumvented by a determined programmer. If tighter security is desired, use the NTP authentication facility.

If you use the **access-group** command in a VRF-specific NTP configuration mode, the command is applied to the specific VRF. If you are not in a VRF-specific NTP configuration mode, the command is applied to the default VRF unless you use the **vrf** *vrf-name* keyword and argument to specify a VRF.

Task ID**Task ID Operations**

ip-services read,
 write

The following example shows how to configure the router to allow itself to be synchronized by a peer from an IPv4 access list named access1 and to restrict access to allow only time requests from an IPv4 access list named access2:

```
RP/0/RP0/CPU0:router(config-ntp)# access-group peer access1
RP/0/RP0/CPU0:router(config-ntp)# access-group serve-only access2
```

The following example shows how to configure the router to allow itself to be synchronized by peers from the IPv6 access list named access20 that route through the vrf10 VRF:

```
RP/0/RP0/CPU0:router(config-ntp)# access-group vrf vrf10 ipv6 peer access20
```

Related Commands

Command	Description
ipv4 access-list	Defines an IPv4 access list by name.
ipv6 access-list	Defines an IPv6 access list by name.
vrf	Configures a VRF instance for a routing protocol.

authenticate (NTP)

To enable Network Time Protocol (NTP) authentication, use the **authenticate** command in NTP configuration mode. To restore the system to its default condition, use the **no** form of this command.

authenticate

Syntax Description	This command has no keywords or arguments.
---------------------------	--

Command Default	NTP authentication is enabled by default.
------------------------	---

Command Modes	NTP configuration
----------------------	-------------------

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines	This feature is enabled by default to prevent an exploitable condition when passive , broadcast client or multicast client is configured.
-------------------------	--

If the system has been configured with the **broadcast client** or **multicast client** command in NTP configuration mode, and when the system receives an incoming symmetric active NTP packet, or if the system receives a broadcast or multicast mode NTP packet, it can set up an ephemeral peer association in order to synchronize with the sender. The system will then synchronize to the peer when a symmetric active, broadcast, or multicast NTP packet is received and the packet carries one of the authentication keys specified in the **trusted-key** command.

Even though NTP authentication is enabled by default, it does not force the authentication of peer associations that are created using the **server** and **peer** commands in NTP configuration mode. It only enforces authentication when remote systems attempt to create new ephemeral associations.

Use the **no authenticate** command to allow synchronizing with unauthenticated and unconfigured network peers.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure the system to synchronize only to a system that provides an authentication key 42 in its NTP packets:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# authenticate
RP/0/RP0/CPU0:router(config-ntp)# authentication-key 42 md5 clear key1
RP/0/RP0/CPU0:router(config-ntp)# trusted-key 42
```

authentication-key (NTP)

To define an authentication key for a trusted Network Time Protocol (NTP) time source, use the **authentication-key** command in NTP configuration mode. To restore the system to its default condition, use the **no** form of this command.

authentication-key *key-number* **md5** [**clear** | **encrypted**] *key-name*
no authentication-key *key-number*

Syntax Description	<i>key-number</i>	Authentication key. A number in the range from 1 to 65535.
	md5	Provides message authentication support using the Message Digest 5 (MD5) algorithm.
	clear	(Optional) Specifies that the key value entered after this keyword is unencrypted.
	encrypted	(Optional) Specifies that the key value entered after this keyword is encrypted.
	<i>key-name</i>	Key value. The maximum length is 32 characters.
Command Default	No authentication key is defined for NTP.	
Command Modes	NTP configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Use the authentication-key command to define authentication keys for use with trusted NTP time sources.	

Note When this command is written to NVRAM, the key is encrypted so that it is not displayed when the configuration is displayed.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure the system to synchronize only to systems providing authentication key 42 in their NTP packets:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# authenticate
RP/0/RP0/CPU0:router(config-ntp)# authentication-key 42 md5 clear key1
RP/0/RP0/CPU0:router(config-ntp)# trusted-key 42
```

broadcast

To create a Network Time Protocol (NTP) broadcast server on a specified NTP interface, use the **broadcast** command in NTP interface configuration mode. To remove the command from the configuration file and restore the system to its default condition, use the **no** form of this command.

broadcast [**destination** *ip-address*] [**key** *key-id*] [**version** *number*]
no broadcast [**destination** *ip-address*] [**key** *key-id*] [**version** *number*]

Syntax Description	destination <i>ip-address</i>	(Optional) Specifies the host IPv4 address.
	key <i>key-id</i>	(Optional) Defines the authentication key, where <i>key-id</i> is the authentication key to use when sending packets to this peer. The key identified by the <i>key-id</i> value is also used for packets received from the peer.
	version <i>number</i>	(Optional) Specifies a number from 1 to 4, indicating the NTP version.
Command Default	No NTP broadcast servers are configured.	
Command Modes	NTP interface configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Use the broadcast command to create an NTP broadcast server on an NTP interface to send NTP broadcast packets.	
	Use the broadcast client command to set a specific interface to receive NTP broadcast packets.	
Task ID	Task ID	Operations
	ip-services	read, write
The following example shows how to configure interface 0/0/0/1 to send NTP packets to destination host IP address 10.0.0.0: <pre>RP/0/RP0/CPU0:router(config)# ntp RP/0/RP0/CPU0:router(config-ntp)# interface tengige 0/0/0/1 RP/0/RP0/CPU0:router(config-ntp-int)# broadcast destination 10.0.0.0</pre>		

broadcast client

To allow a networking device to receive Network Time Protocol (NTP) broadcast packets on an interface, use the **broadcast client** command in NTP interface configuration mode. To remove the configuration and restore the system to its default condition, use the **no** form of this command.

broadcast client

no broadcast client

Syntax Description	This command has no keywords or arguments.
---------------------------	--

Command Default	No NTP broadcast clients are configured.
------------------------	--

Command Modes	NTP interface configuration
----------------------	-----------------------------

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines	Use the broadcast client command to configure and create an NTP broadcast client and to associate the client with an interface to receive and handle NTP broadcast packets. If no NTP client has been created for an interface, the received NTP broadcast packets are dropped. Use this command to allow the system to listen to broadcast packets on an interface-by-interface basis.
-------------------------	--

To prevent synchronization with unauthorized systems, whenever this command is specified, authentication must be enabled using the **authenticate (NTP)** command or access must be restricted to authorized systems using the **access-group (NTP)** command. See the documentation of the respective commands for more information.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure interface 0/0/0/1 to send NTP packets:

```
RP/0/RP0/CPU0:router(config)# ntp interface tengige 0/0/0/1
RP/0/RP0/CPU0:router(config-ntp-int)# broadcast client
```

broadcastdelay

To set the estimated round-trip delay between a Network Time Protocol (NTP) client and an NTP broadcast server, use the **broadcastdelay** command in NTP configuration mode. To restore the system to its default condition, use the **no** form of this command.

```
broadcastdelay microseconds
no broadcastdelay microseconds
```

Syntax Description	microseconds Estimated round-trip time for NTP broadcasts, in microseconds. The range is from 1 to 999999. The default is 3000.	
Command Default	microseconds: 3000	
Command Modes	NTP configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Use the broadcastdelay command to change the default round-trip delay time on a networking device that is configured as a broadcast client.	
Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to set the estimated round-trip delay between a networking device and the broadcast client to 5000 microseconds:

```
RP/0/RP0/CPU0:router(config-ntp)# broadcastdelay 5000
```

interface (NTP)

To enter a Network Time Protocol (NTP) interface mode and run NTP interface configuration commands, use the **interface** command in one of the NTP configuration modes. To remove an NTP interface configuration, use the **no** form of this command.

interface *type interface-path-id* [**vrf** *vrf-name*] [**disable**]
no interface *type interface-path-id* [**disable**]

Syntax Description	<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
	<i>interface-path-id</i>	Physical interface or virtual interface.
	Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.	
	vrf <i>vrf-name</i>	(Optional) Applies the interface configuration to a specific nondefault VRF.
	disable	(Optional) Disables NTP on the specified interface.
Command Default	No NTP interfaces are configured.	
Command Modes	NTP configuration mode	
	VRF-specific NTP configuration mode	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Use the interface command to place the router in NTP interface configuration mode, from which NTP broadcast and multicast servers and clients can be configured. By default, after the NTP process is started, NTP features become available for all interfaces. To exit NTP interface configuration mode, use the exit command.	
	If you use the interface command in a VRF-specific NTP configuration mode, the command is applied to the specific VRF. If you are not in a VRF-specific NTP configuration mode, the command is applied to the default VRF unless you use the vrf <i>vrf-name</i> keyword and argument to specify a VRF.	
	By default, NTP is enabled on every interface. To disable NTP on a specific interface, use the interface command with the disable keyword. To reenab NTP on an interface, use the no form of the interface command with the disable keyword.	
Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to enter NTP configuration mode, specify an NTP interface to be configured, and enter NTP interface configuration mode:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# interface POS 0/1/0/0
RP/0/RP0/CPU0:router(config-ntp-int)#
```

The following example shows how to enter a VRF-specific NTP interface configuration mode:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# interface TenGigE 0/1/1/0 vrf vrf_10
RP/0/RP0/CPU0:router(config-ntp-int)#
```

The following example shows a different way to enter a VRF-specific NTP interface configuration mode:

```
RP/0/RP0/CPU0:router(config)# ntp vrf vrf_10
RP/0/RP0/CPU0:router(config-ntp-vrf)# interface TenGigE 0/1/1/0
RP/0/RP0/CPU0:router(config-ntp-int)#
```

master

To configure the router to use its own Network Time Protocol (NTP) master clock to synchronize with peers when an external NTP source becomes unavailable, use the **master** command in NTP configuration mode. To restore the system to its default condition, use the **no** form of this command.

master [*stratum*]
no master [*stratum*]

Syntax Description	<i>stratum</i> (Optional) NTP stratum number that the system claims. Range is from 1 to 15. The default is 8.	
Command Default	By default, the master clock function is disabled. When the function is enabled, the default stratum is 8.	
Command Modes	NTP configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	NTP uses the concept of a “stratum” to describe how many NTP “hops” away a machine is from an authoritative time source. A stratum 1 time server has a radio or atomic clock attached directly. A stratum 2 time server receives its time through NTP from a stratum 1 time server, a stratum 3 from a stratum 2, and so on.	

Caution Use the **master** command with extreme caution. It is easy to override other valid time sources using this command, especially if a low-stratum number is configured. Configuring multiple machines in the same network with the **master** command can lead to instability in time-keeping if the machines do not agree on the time.

The networking device is normally synchronized, directly or indirectly, with an external system that has a clock. Cisco IOS XR software does not support directly attached radio or atomic clocks. The **master** command should be used only when there is a temporary disruption in a reliable time service. It should not be employed as an alternative source by itself in the absence of a real-time service.

If the system has the **master** command configured and it cannot reach any clock that has a lower stratum number, the system claims to be synchronized at the configured stratum number. Other systems synchronize with it through NTP.

Note The system clock must have been manually set from some source before the **master** command has an effect. This precaution protects against the distribution of erroneous time after the system is restarted.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure a networking device as an NTP master clock to which peers may synchronize:

```
RP/0/RP0/CPU0:router(config)# ntp  
RP/0/RP0/CPU0:router(config-ntp)# master 9
```

master primary-reference-clock

To configure the router to use PTP and external timing sources, such as PTP grandmaster, Data over Cable Service Interface Specification (DOCSIS) Timing Interface [DTI] or global positioning system (GPS) clock, as the time-of-day source for NTP and operating system time, use the **master primary-reference-clock** command in NTP configuration mode. To remove the PTP configuration, use the **no** form of this command.

master primary-reference-clock
no master primary-reference-clock

Syntax Description	This command has no keywords or arguments.				
Command Default	PTP is not used as the time-of-day source for NTP.				
Command Modes	NTP configuration				
Command History	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 7.0.12</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 7.0.12	This command was introduced.
Release	Modification				
Release 7.0.12	This command was introduced.				
Usage Guidelines	PTP must be enabled on the router before this command can be used. If PTP is not enabled, you receive an error message similar to the following when you try to commit the configuration: <pre>RP/0/RP0/CPU0:router(config)# ntp master primary-reference-clock RP/0/RP0/CPU0:router(config)# commit % Failed to commit one or more configuration items. Please issue 'show configuration failed' from this session to view the errors RP/0/RP0/CPU0:router(config)# show configuration failed [:::] ntp master primary-reference-clock !!% 'ip-ntp' detected the 'fatal' condition 'PTP is not supported on this platform' ! end</pre> To verify that PTP is used as the reference clock, use the show ntp association command. <pre>RP/0/RP0/CPU0:router# show ntp association address ref clock st when poll reach delay offset disp *~127.127.45.1 .PTP. 0 54 64 377 0.00 6.533 1.905 * sys_peer, # selected, + candidate, - outlayer, x falseticker, ~ configured</pre>				

Task ID	Task ID	Operation
	ip-services	read, write

This example shows how to configure PTP as the reference clock for NTP:

```
RP/0/RP0/CPU0:router(config)# ntp  
RP/0/RP0/CPU0:router(config-ntp)# master primary-reference-clock
```

max-associations

To set the maximum number of Network Time Protocol (NTP) associations, use the **max-associations** command in NTP configuration mode. To restore the default setting, use the **no** form of this command.

max-associations *number*
no max-associations *number*

Syntax Description	<i>number</i> Maximum number of NTP associations. Range is from 0 to 4294967295. The default is 100.	
Command Default	The default setting for the maximum number of NTP associations is 100.	
Command Modes	NTP configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Use the max-associations command to specify the maximum number of associations for an NTP server.	
Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to set the maximum number of associations to 200:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# max-associations 200
```

multicast client

To configure an NTP interface as an NTP multicast client, use the **multicast client** command in NTP interface configuration mode. To remove the NTP multicast client configuration from an interface, use the **no** form of this command.

multicast client [*ip-address*]
no multicast client [*ip-address*]

Syntax Description	<i>ip-address</i> IPv4 or IPv6 IP address of the multicast group to join. The default is the IPv4 address 224.0.1.1.	
Command Default	The interface is not configured as an NTP multicast client.	
Command Modes	NTP interface configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Use the multicast client command to configure an NTP interface to receive multicast packets that are sent to an IPv4 or IPv6 multicast group IP address. If you do not specify an IP address, the interface is configured to receive multicast packets sent to the IPv4 multicast group address 224.0.1.1. You can configure multiple multicast groups on the same interface. To prevent synchronization with unauthorized systems, whenever this command is specified, authentication must be enabled using the authenticate (NTP) command or access must be restricted to authorized systems using the access-group (NTP) command. See the documentation of the respective commands for more information.	
Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure the router to receive NTP multicast packets to the multicast group address of 224.0.1.1:

```
RP/0/RP0/CPU0:router(config)# ntp interface TenGigE 0/1/1/0
RP/0/RP0/CPU0:router(config-ntp-int)# multicast client
```

multicast destination

To configure an NTP interface as an NTP multicast server, use the **multicast destination** command in NTP interface configuration mode. To remove the NTP multicast server configuration from an interface, use the **no** form of this command.

multicast destination *ip-address* [**key** *key-id*] [**ttl** *ttl*] [**version** *number*]
no multicast destination *ip-address* [**key** *key-id*] [**ttl** *ttl*] [**version** *number*]

Syntax Description	<i>ip-address</i>	The IPv4 or IPv6 multicast group IP address to which to send NTP multicast packets.
	key <i>key-id</i>	(Optional) Specifies an authentication key, where the value of the <i>key-id</i> argument is the authentication key to use when sending multicast packets to the specified multicast group.
	ttl <i>ttl</i>	(Optional) Specifies the time to live (TTL) of a multicast packet.
	version <i>number</i>	(Optional) Specifies the NTP version number.
Command Default	The interface is not configured as an NTP multicast server.	
Command Modes	NTP interface configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure the router to send NTP multicast packets to the multicast group address of 224.0.1.1:

```
RP/0/RP0/CPU0:router(config)# ntp interface TenGigE 0/1/1/0
RP/0/RP0/CPU0:router(config-ntp-int)# multicast destination 224.0.1.1
```

ntp

To enter Network Time Protocol (NTP) configuration mode and run NTP configuration commands, use the **ntp** command in

global

configuration mode.

ntp [**vrf** *vrf-name*]

Syntax Description	vrf <i>vrf-name</i> (Optional) Enters a VRF-specific NTP configuration mode.				
Command Default	No defaults behavior or values				
Command Modes	Global configuration				
Command History	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 7.0.12</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 7.0.12	This command was introduced.
Release	Modification				
Release 7.0.12	This command was introduced.				
Usage Guidelines	NTP configuration commands can also be run from global configuration mode by preceding the command string with the ntp keyword. From NTP configuration mode, the following NTP configuration commands are available:				

```
RP/0/RP0/CPU0:router(config-ntp)# ?
```

access-group	Control NTP access
authenticate	Authenticate time sources
authentication-key	Authentication key for trusted time sources
broadcastdelay	Estimated round-trip delay
commit	Commit the configuration changes to running
default	Set a command to its defaults
describe	Describe a command without taking real actions
do	Run an exec command
exit	Exit from this submode
interface	Configure NTP on an interface
master	Act as NTP master clock
max-associations	Set maximum number of associations
no	Negate a command or set its defaults
peer	Configure NTP peer
port	Enable NTP port
server	Configure NTP server
show	Show contents of configuration
source	Configure interface for source address
trusted-key	Key numbers for trusted time sources
update-calendar	Periodically update calendar with NTP time

Use the **ntp** command with the **vrf** *vrf-name* keyword and argument to enter an NTP configuration mode specific to the specified VRF.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to enter NTP configuration mode:

```
RP/0/RP0/CPU0:router(config)# ntp  
RP/0/RP0/CPU0:router(config-ntp)#
```

The following example shows how to enter an NTP configuration mode for a VRF called VRF1:

```
RP/0/RP0/CPU0:router(config)# ntp vrf vrf1  
RP/0/RP0/CPU0:router(config-ntp-vrf)#
```

ntp clear

To clear all Network Time Protocol (NTP) peers or a specific NTP peer, use the **ntp clear** command in EXEC mode.

ntp clear {*peer* | **all** | **vrf** *vrf-name* *ip-address*}

Syntax Description	<i>peer</i>	IPv4 address or hostname of the NTP peer to be cleared.
	all	Clears all NTP peers.
	vrf <i>vrf-name</i>	Clears a peer on the specified nondefault VRF.
	<i>ip-address</i>	IPv4 or IPv6 IP address of the peer.

Command Default No defaults behavior or values

Command Modes EXEC

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to clear all NTP peers:

```
RP/0/RP0/CPU0:router# ntp clear all
```

ntp reset drift

To reset the NTP drift and loopfilter state, use the **ntp reset drift** command in

EXEC

mode.

ntp reset drift

Syntax Description This command has no keywords or arguments.

Command Default No defaults behavior or values

Command Modes EXEC

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines Use the **ntp reset drift** command to set the loopfilter state to NSET (never set) and reset the drift. Resetting the loopfilter state and drift enables the router to relearn the frequency of the NTP server clock. This is necessary if there is a synchronization error caused by a large frequency error. This can arise, for example, if the router switches from synchronizing with one NTP server to synchronizing with another NTP server with a different frequency.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to reset the NTP drift and loopfilter state:

```
RP/0/RP0/CPU0:router# ntp reset drift
```

```
Thu Nov 13 11:21:04.381 JST
```

The following example shows NTP status before and after resetting NTP drift and loopfilter state:

```
RP/0/RP0/CPU0:router# show ntp status
```

```
Thu Nov 13 11:20:53.122 JST
```

```
Clock is synchronized, stratum 3, reference is 192.168.128.5
nominal freq is 1000.0000 Hz, actual freq is 1000.2787 Hz, precision is 2**24
reference time is CCC60CBE.9F836478 (11:17:34.623 JST Thu Nov 13 2008)
clock offset is -3.172 msec, root delay is 189.289 msec
root dispersion is 70.03 msec, peer dispersion is 0.11 msec
loopfilter state is 'CTRL' (Normal Controlled Loop), drift is -0.0002785891 s/s
system poll interval is 128, last update was 199 sec ago
```

```
RP/0/RP0/CPU0:router# ntp reset drift
Thu Nov 13 11:21:04.381 JST
```

```
RP/0/RP0/CPU0:router# show ntp status
Thu Nov 13 11:21:10.595 JST
```

```
Clock is unsynchronized, stratum 16, no reference clock
nominal freq is 1000.0000 Hz, actual freq is 1000.0000 Hz, precision is 2**24
reference time is CCC60CBE.9F836478 (11:17:34.623 JST Thu Nov 13 2008)
clock offset is -3.172 msec, root delay is 0.000 msec
root dispersion is 0.09 msec, peer dispersion is 0.00 msec
loopfilter state is 'NSET' (Never set), drift is 0.0000000000 s/s
system poll interval is 64, last update was 216 sec ago
```

peer (NTP)

To configure the system clock to synchronize a peer or to be synchronized by a peer, use the **peer** command in one of the NTP configuration modes. To remove the **peer** command from the configuration file and restore the system to its default condition with respect to the command, use the **no** form of this command.

```
peer [vrf vrf-name] [ipv4 | ipv6] ip-address [version number] [key key-id] [minpoll interval]
[maxpoll interval] [source type interface-path-id] [prefer] [burst] [iburst]
no peer [vrf vrf-name] [ipv4 | ipv6] ip-address
```

Syntax Description

vrf <i>vrf-name</i>	(Optional) Applies the peer configuration to the specified nondefault VRF.
ipv4	(Optional) Specifies an IPv4 IP address.
ipv6	(Optional) Specifies an IPv6 IP address.
<i>ip-address</i>	IPv4 or IPv6 address of the peer providing or being provided with the clock synchronization.
version <i>number</i>	(Optional) Defines the Network Time Protocol (NTP) version number, where the <i>number</i> argument is a value from 1 to 4. The default is 4.
key <i>key-id</i>	(Optional) Defines the authentication key, where the <i>key-id</i> argument is the authentication key to use when packets are sent to this peer. The authentication key is also used for packets received from the peer. By default, no authentication key is used.
minpoll <i>interval</i>	(Optional) Defines the shortest polling interval, where the <i>interval</i> argument is specified in powers of two seconds. Range is from 4 to 17. The default value is 6.
maxpoll <i>interval</i>	(Optional) Defines the longest polling interval, where the <i>interval</i> argument is specified in powers of two seconds. Range is from 4 to 17. The default value is 10.
source	(Optional) IP source address. The default is the outgoing interface.
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	(Optional) Physical interface or virtual interface.
Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.	
prefer	(Optional) Makes this peer the preferred peer that provides synchronization.
burst	(Optional) Sends a series of packets instead of a single packet within each synchronization interval to achieve faster synchronization.
iburst	(Optional) Sends a series of packets instead of a single packet within the initial synchronization interval to achieve faster initial synchronization.

Command Default No peers are configured by default.

Command Modes NTP configuration
VRF-specific NTP configuration

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines Use the **peer** command to allow this machine to synchronize with the peer, or conversely.

Caution Although using the **prefer** keyword can help reduce the switching among peers, you should avoid using the keyword because it interferes with the source selection mechanism of NTP and can result in a degradation in performance.

The value for the **minpoll** keyword must be less than or equal to the value for the **maxpoll** keyword. If this is not the case, the system issues an error message.

To provide peer-level service (as opposed to client/server-level service), it may be necessary to explicitly specify the NTP version for the peer if it is not version 4.

If you use the **peer** command in a VRF-specific NTP configuration mode, the command is applied to the specific VRF. If you are not in a VRF-specific NTP configuration mode, the command is applied to the default VRF unless you use the **vrf vrf-name** keyword and argument to specify a VRF.

Note To change the configuration of a specific IP address from peer to server or from server to peer, use the **no** form of the **peer** or **server** command to remove the current configuration before you perform the new configuration. If you do not remove the old configuration before performing the new configuration, the new configuration does not overwrite the old configuration.

Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure a networking device to allow its system clock to be synchronized with the clock of the peer (or conversely) at IP address 10.0.0.0 using NTP. The source IP address is the address of interface 0/0/0/1.

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# peer 10.0.0.0 minpoll 8 maxpoll 12 source tengige 0/0/0/1
```

server (NTP)

To allow the system clock to be synchronized by a time server, use the **server** command in one of the NTP configuration modes. To remove the **server** command from the configuration file and restore the system to its default condition with respect to this command, use the **no** form of this command.

```
server [vrf vrf-name][ipv4 | ipv6] ip-address [version number] [key key-id] [minpoll interval]
[maxpoll interval] [source type interface-path-id][prefer] [burst] [iburst]
no server [vrf vrf-name] [ipv4 | ipv6] ip-address
```

Syntax Description

vrf <i>vrf-name</i>	(Optional) Applies the server configuration to the specified nondefault VRF.
ipv4	(Optional) Specifies an IPv4 IP address.
ipv6	(Optional) Specifies an IPv6 IP address.
<i>ip-address</i>	IPv4 or IPv6 address of the time server providing the clock synchronization.
version <i>number</i>	(Optional) Defines the Network Time Protocol (NTP) version number, where the <i>number</i> argument is a value from 1 to 4. The default is 4.
key <i>key-id</i>	(Optional) Defines the authentication key, where the <i>key-id</i> argument is the authentication key to use when packets are sent to this peer. By default, no authentication key is used.
minpoll <i>interval</i>	(Optional) Defines the shortest polling interval, where the <i>interval</i> argument is specified in powers of two seconds. Range is from 4 to 17. The default value is 6.
maxpoll <i>interval</i>	(Optional) Defines the longest polling interval, where the <i>interval</i> argument is specified in powers of two seconds. Range is from 4 to 17. The default value is 10.
source	(Optional) Specifies the IP source address. The default is the outgoing interface.
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	(Optional) Physical interface or virtual interface.
Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.	
prefer	(Optional) Makes this peer the preferred server that provides synchronization.
burst	(Optional) Sends a series of packets instead of a single packet within each synchronization interval to achieve faster synchronization.
iburst	(Optional) Sends a series of packets instead of a single packet within the initial synchronization interval to achieve faster initial synchronization.

Command Default No servers are configured by default.

Command Modes NTP configuration
VRF-specific NTP configuration

Command History

Release	Modification
Release 7.0.12	This command was introduced.

Usage Guidelines

The value for the **minpoll** keyword must be less than or equal to the value for the **maxpoll** keyword. If this is not the case, the system issues an error message.

Using the **prefer** keyword reduces switching back and forth among servers.

If you use the **server** command in a VRF-specific NTP configuration mode, the command is applied to the specific VRF. If you are not in a VRF-specific NTP configuration mode, the command is applied to the default VRF unless you use the **vrf vrf-name** keyword and argument to specify a VRF.

Note To change the configuration of a specific IP address from peer to server or from server to peer, use the **no** form of the **peer** or **server** command to remove the current configuration before you perform the new configuration. If you do not remove the old configuration before performing the new configuration, the new configuration does not overwrite the old configuration.

Task ID

Task ID	Operations
ip-services	read, write

The following example shows how to configure a router to allow its system clock to be synchronized with the clock of the peer at IP address 209.165.201.1 using NTP:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# server 209.165.201.1 minpoll 8 maxpoll 12
```

show calendar

To display the system time and date, use the **show calendar** command in the EXEC mode.

show calendar

Syntax Description	This command has no keywords or arguments.	
Command Default	None	
Command Modes	EXEC	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	The time format of the show calendar output depends on the time format set using the clock timezone command.	
Task ID	Task ID	Operations
	basic-services	read

The following example shows sample output from the **show calendar** command:

```
RP/0/RP0/CPU0:router# show calendar  
  
01:29:28 UTC Thu Apr 01 2004
```

show ntp associations

To display the status of Network Time Protocol (NTP) associations, use the **show ntp associations** command in privileged EXEC mode.

```
show ntp associations [detail] [location node-id]
```

Syntax Description	detail (Optional) Displays detailed information about each NTP association. location node-id (Optional) Displays the status of NTP associations from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot</i> notation.				
Command Default	None				
Command Modes	EXEC				
Command History	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 7.0.12</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 7.0.12	This command was introduced.
Release	Modification				
Release 7.0.12	This command was introduced.				
Usage Guidelines	Output for the show ntp associations command is displayed only if NTP is configured on the router.				
Task ID	<table> <tr> <th>Task ID</th><th>Operations</th></tr> <tr> <td>ip-services</td><td>read</td></tr> </table>	Task ID	Operations	ip-services	read
Task ID	Operations				
ip-services	read				

This example shows sample output from the **show ntp associations** command:

```
RP/0/RP0/CPU0:router# show ntp associations

Wed Jul 30 04:03:13.471 PST DST

      address      ref clock      st  when  poll reach  delay  offset  disp
~172.19.69.1      172.24.114.33    3   25    64    3    2.89  57550122 39377
~2001:db8::feed  .INIT.           16   -     64    0    0.00   0.000  15937
~2001:db8::beef  vrf vrf_1        16   -     64    0    0.00   0.000  16000
                  .INIT.
* sys_peer, # selected, + candidate, - outlayer, x falseticker, ~ configured
```

Table 4: show ntp associations Field Descriptions

Field	Description
*	Peer has been declared the system peer and lends its variables to the system variables.
#	Peer is a survivor, but not among the first six peers sorted by synchronization distance. If the association is ephemeral, it may be demobilized to conserve resources.
+	Peer is a survivor and a candidate for the combining algorithm.

Field	Description
-	Peer is discarded by the clustering algorithm as an outlier.
x	Peer is discarded by the intersection algorithm as a falseticker.
~	Indicates peer is statically configured.
address	IPv4 or IPv6 address of the peer. If a nondefault VRF is configured for the peer, the VRF follows the address.
ref clock	Reference clock type or address for the peer.
st	Stratum setting for the peer.
when	Time since last NTP packet was received from peer, in milliseconds.
poll	Polling interval, in seconds.
reach	Peer reachability (bit string, in octal).
delay	Round-trip delay to peer, in milliseconds.
offset	Relative time difference between a peer clock and a local clock, in milliseconds.
disp	Dispersion.

This example shows sample output from the **show ntp associations** command with the **detail** keyword:

```
RP/0/RP0/CPU0:router# show ntp associations detail
```

```

Table 5: show ntp associations detail Field Descriptions

Field	Descriptions
vrf	Nondefault VRF, if specified for this peer.
configured	Statically configured peer.
dynamic	Dynamically discovered peer.
our_master	Synchronization of the local machine to this peer.
sane	Passing of basic sanity checks by this peer.
ref ID	Address of machine to which the peer is synchronized.
time	Last time stamp that the peer received from its master.
our mode	Mode relative to peer (active/passive/client/server/bdcast/bdcast client).
peer mode	Mode of peer relative.
our poll intvl	Poll interval to peer.
peer poll intvl	Poll interval of interval.
root delay	Delay along path to root (ultimate stratum 1 time source).
root disp	Dispersion of path to root.
reach	Peer reachability (bit string in octal).
sync dist	Peer synchronization distance.
delay	Round-trip delay to peer.
offset	Offset of peer clock relative to this clock.
dispersion	Dispersion of peer clock.
precision	Precision of peer clock in (Hertz) Hz.
version	NTP version number that peer is using.

Field	Descriptions
org time	Originate time stamp.
rcv time	Receive time stamp.
xmt time	Transmit time stamp.
filtdelay	Round-trip delay of each sample, in milliseconds.
filtoffset	Clock offset of each sample, in milliseconds.
filterror	Approximate error of each sample.

show ntp status

To display the status of Network Time Protocol (NTP), use the **show ntp status** command in XR EXEC mode.

```
show ntp status [ location node-id ]
```

Syntax Description	location node-id (Optional) Displays the status of NTP from the designated node. The node-id argument is entered in the rack/slot notation.				
Command Default	None				
Command Modes	XR EXEC mode				
Command History	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 7.0.12</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 7.0.12	This command was introduced.
Release	Modification				
Release 7.0.12	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table> <tr> <th>Task ID</th><th>Operations</th></tr> <tr> <td>ip-services</td><td>read</td></tr> </table>	Task ID	Operations	ip-services	read
Task ID	Operations				
ip-services	read				

This example shows sample output from the **show ntp status** command:

```
Router# show ntp status

Clock is synchronized, stratum 3, reference is 192.168.128.5
nominal freq is 1000.0000 Hz, actual freq is 1000.0021 Hz, precision is 2**24
reference time is CC38EC6A.8FCCA1C4 (10:10:02.561 JST Tue Jul 29 2008)
clock offset is -124.051 msec, root delay is 174.060 msec
root dispersion is 172.37 msec, peer dispersion is 0.10 msec
loopfilter state is 'CTRL' (Normal Controlled Loop), drift is -0.0000021106 s/s
system poll interval is 32, last update was 19 sec ago
```

Table 6: show ntp status Field Descriptions

Field	Description
synchronized	Synchronized system to an NTP peer.
stratum	NTP stratum of this system.
reference	IPv4 address or first 32 bits of the MD5 hash of the IPv6 address of the peer to which clock is synchronized.
nominal freq	Nominal frequency in Hertz (Hz) of the system hardware clock.

Field	Description
actual freq	Measured frequency in Hz of the system hardware clock.
precision	Precision of the clock of this system in Hz.
reference time	Reference time stamp.
clock offset	Offset of clock to synchronized peer, in milliseconds.
root delay	Total delay along path to root clock, in milliseconds.
root dispersion	Dispersion of root path.
peer dispersion	Dispersion of synchronized peer.
loopfilter state	The state of the clock state machine transition function.
drift	Drift of the hardware clock.
system poll interval	Poll interval of the peer.
last update	Time the router last updated its NTP information.

source (NTP)

To use a particular source address in Network Time Protocol (NTP) packets, use the **source** command in one of the NTP configuration modes. To remove the **source** command from the configuration file and restore the system to its default condition, use the **no source** form of this command.

source [**vrf** *vrf-name*] **type** *interface-path-id*
no source

Syntax Description	vrf <i>vrf-name</i>	(Optional) Applies the source address configuration to the specified nondefault VRF.
	type	(Optional) Interface type. For more information, use the question mark (?) online help function.
	interface-path-id	(Optional) Physical interface or virtual interface.
	Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.	
Command Default	The source address is determined by the outgoing interface.	
Command Modes	NTP configuration	
	VRF-specific NTP configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	Use the source command to use a particular source IP address for all NTP packets. The address is taken from the named interface. This command is useful if the address on an interface cannot be used as the destination for reply packets. If the source keyword has been configured with the server (NTP) or peer (NTP) command, that value overrides the global value.	
	Use the source command in a VRF-specific NTP configuration mode or use the vrf vrf-name keyword and argument to configure the source address for a specific nondefault VRF. Otherwise, the configuration is applied to the default VRF.	
Task ID	Task ID	Operations
	ip-services	read, write
This example shows how to configure the router to use the IP address of interface 0/0/0/1 as the source address of all outgoing NTP packets:		

```
RP/0/RP0/CPU0:router(config)# ntp  
RP/0/RP0/CPU0:router(config-ntp)# source tengige 0/0/0/1
```

trusted-key

To designate a Network Time Protocol (NTP) trusted key, use the **trusted-key** command in NTP configuration mode. To remove the **trusted-key** command from the configuration file and restore the system to its default condition with respect to this command, use the **no** form of this command.

trusted-key *key-number*

no trusted-key *key-number*

Syntax Description	<i>key-number</i> Authentication key number to be trusted. Range is from 1 to 65535.	
Command Default	No NTP trusted key is designated.	
Command Modes	NTP configuration	
Command History	Release	Modification
	Release 7.0.12	This command was introduced.
Usage Guidelines	If authentication is enabled, use the trusted-key command to define one or more key numbers (corresponding to the keys defined with the authentication-key [NTP] command) that a NTP system must provide in its NTP packets for this system to synchronize to it. Because the other system must know the correct authentication key, this precaution provides protection against accidentally synchronizing the system to a system that is not trusted.	
Task ID	Task ID	Operations
	ip-services	read, write

The following example shows how to configure the system to synchronize only to systems providing authentication key 42 in its NTP packets:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# authenticate
RP/0/RP0/CPU0:router(config-ntp)# authentication-key 42 md5 clear key1
RP/0/RP0/CPU0:router(config-ntp)# trusted-key 42
```

update-calendar

To update the calendar periodically from Network Time Protocol (NTP), use the **update-calendar** command in NTP configuration mode. To remove the **update-calendar** command from the configuration file and restore the system to its default condition with respect to the command, use the **no** form of this command.

update-calendar
no update-calendar

Syntax Description	This command has no keywords or arguments.
---------------------------	--

Command Default	This command is disabled.
------------------------	---------------------------

Command Modes	NTP configuration
----------------------	-------------------

Command History	Release	Modification
	Release 7.0.12	This command was introduced.

Usage Guidelines	Your router has a calendar that is separate from the software clock. This calendar runs continuously, even if the router is powered off or rebooted.
-------------------------	--

If a router is synchronized to an outside time source through NTP, it is a good idea to update the router's calendar with the time learned from NTP. Otherwise, the calendar may gradually lose or gain time.

After you configure the **update-calendar** command, NTP updates the calendar with the software clock every hour.

Task ID	Task ID	Operations
	ip-services	read, write

This example shows how to configure the router to update the calendar periodically from the software clock:

```
RP/0/RP0/CPU0:router(config)# ntp
RP/0/RP0/CPU0:router(config-ntp)# update-calendar
```

PTP Commands

- [synchronous-ethernet prefer-interface ptp-receiver](#), on page 54
- [performance-monitoring](#), on page 55
- [show ptp dataset performance](#), on page 56
- [show ptp platform performance-counters](#), on page 59

synchronous-ethernet prefer-interface ptp-receiver

To prefer selection of the SyncE source on the same interface where the PTP receiver is selected by the router, use the **synchronous-ethernet prefer-interface ptp-receiver** command in the global frequency synchronization mode.

The desired SyncE source on PTP receiver interface gets selected if it has the highest or equal QL and user configured priority among the other available SyncE sources.

If the selected PTP source goes down or if the PTP source's quality degrades, the system may switch to another PTP source. In such case, use this command so that the SyncE source selection would also switch to the new PTP receiver interface. Here, the preferred switching of SyncE source to the new PTP receiver interface shall happen only if the new interface uses the same SyncE QL and the user configured priority as the previously selected interface.

synchronous-ethernet prefer-interface ptp-receiver

Syntax Description	prefer-interface	Selects the frequency source among equal sources.
	ptp-receiver	Selects the PTP receiver interface.
Command Default	None	
Command Modes	EXEC	
Command History	Release	Modification
	Release 24.4.1	This command was introduced.
Usage Guidelines		
Task ID	Task ID	Operation
	ethernet-services	read, write

Example

This example shows how to configure the **synchronous-ethernet prefer-interface ptp-receiver** command.

```
RP/0/RP0/CPU0:router(config)# frequency synchronization synchronous-ethernet prefer-interface
ptp-receiver
RP/0/RP0/CPU0:router(config)# commit
```

This example verifies the **synchronous-ethernet prefer-interface ptp-receiver** configuration.

```
RP/0/RP0/CPU0:router(config)# show running-config frequency synchronization
Thu Aug 8 04:50:13.638 UTC
frequency-synchronization
 synchronous-ethernet prefer-interface ptp-receiver
!
```

performance-monitoring

To enable the collection of performance-monitoring statistics, use the **performance-monitoring** command in PTP configuration mode.

performance-monitoring

Syntax Description	This command has no keywords or arguments.	
Command Default	By default performance-monitoring is not enabled.	
Command Modes	Global PTP configuration	
Command History	Release	Modification
	Release 25.3.1	This command was introduced.
Usage Guidelines	None.	
Task ID	Task ID	Operation
	performance-monitoring	read, write

The following example shows how to enable the collection of performance-monitoring statistics.

```
Router(config)# ptp
Router(config-ptp)# performance-monitoring
Router(config-ptp)# commit
```

show ptp dataset performance

To display the performance monitoring dataset for the local clock and any PTP port for the current 15-minute window, use the **show ptp dataset performance { clock | port { all | interface name } }** command in EXEC mode.

show ptp dataset performance { clock | port { all | interface name } }

Syntax Description	clock Displays the performance monitoring dataset of the local clock for the current 15-minute window.	
	port Displays the performance monitoring dataset of the port for the current 15-minute window for <i>all</i> or specified interface <i>name</i> .	
Syntax Description	This command has no keywords or arguments.	
Command Default	None	
Command Modes	EXEC	
Command History	Release	Modification
	Release 25.3.1	This command was introduced.
Usage Guidelines	None.	
Task ID	Task ID	Operation
	performance	read

Example

The following show command displays the performance monitoring dataset of the local clock for the current 15-minute window.

```
Router#show ptp dataset performance clock
```

```
performanceMonitoringDS for the current 15-minute window:
Clock ID cccfffecccc00, steps removed 1, receiving port 2:
  Start of time window: Thursday, 14:18:59
  Measurement is valid
  Period is complete
  Measurement has been taken with reference to system clock
  Master slave delay:
    Average: 50ns
    Min: 50ns
    Max: 70ns
    Std: 1ns
  Slave master delay:
    Average: 51ns
    Min: 51ns
    Max: 71ns
```

```

        Std: 2ns
Mean path delay:
    Average: 52ns
    Min: 52ns
    Max: 72ns
    Std: 3ns
Offset from master:
    Average: 53ns
    Min: 53ns
    Max: 73ns
    Std: 4ns

Clock ID aaaabbbbecccc00, steps removed 1, receiving port 2:
Start of time window: Thursday, 14:18:59
Measurement is not valid
Period is not complete
Measurement has been taken with reference to system clock
Master slave delay:
    Average: 50ns
    Min: 50ns
    Max: 70ns
    Std: 1ns
Slave master delay:
    Average: 51ns
    Min: 51ns
    Max: 71ns
    Std: 2ns
Mean path delay:
    Average: 52ns
    Min: 52ns
    Max: 72ns
    Std: 3ns
Offset from master:
    Average: 53ns
    Min: 53ns
    Max: 73ns
    Std: 4ns

```

Example

The following show command displays the performance monitoring dataset of the port for the current 15-minute window.

```

Router#show ptp dataset performance port GigabitEthernet 0/0/0/1
performanceMonitoringPortDS for the current 15-minute window:
Interface GigabitEthernet 0/0/0/1
Start of time window: Thursday, 14:18:59
Measurement is valid
Period is not complete
Measurement has been taken with reference to system clock
Packets                Sent      Received    Dropped

show ptp platform performance-counters

To display counters details for platform performance sent by Precision Time Protocol (PTP), use the **show ptp platform performance-counters** in command in EXEC mode.

show ptp platform performance-counters { detail | brief }

Syntax Description	detail Displays all 123 counter record details for platform performance sent by PTP.
	brief Displays only the current counter record in 15 minutes, 24 hours, 3minutes, and 1hour windows.
Command Default	None
Command Modes	EXEC
Command History	Release Modification
	Release 25.3.1 This command was introduced.
Usage Guidelines	None.
Task ID	Task ID Operation
	platform performance-counters read

Example

In this example, the **detail** mode of the command displays all 123 records.

```
Router#sh ptp platform performance-counters detail
```

```
PTP Current record index 15 min: 96
PTP Current record index 3 min: 119
```

```
PTP performance monitoring statistics:
```
