

## Script Infrastructure and Sample Templates

**Table 1: Feature History Table**

Feature Name	Release Information	Description
Contextual Script Infrastructure	Release 7.3.2	<p>When you create and run Python scripts on the router, this feature enables a contextual interaction between the scripts, the IOS XR software, and the external servers. This context, programmed in the script, uses Cisco IOS XR Python packages, modules, and libraries to:</p> <ul style="list-style-type: none"><li>• obtain operational data from the router</li><li>• set configurations and conditions</li><li>• detect events in the network and trigger an appropriate action</li></ul>

You can create Python scripts and execute the scripts on routers running Cisco IOS XR software. The software supports the Python packages, libraries and dictionaries in the software image. For more information about the script types and to run the scripts using CLI commands To run the same actions using NETCONF RPCs,

Cisco IOS XR, Release 7.3.2 supports creating scripts using Python version 3.5.

Cisco IOS XR, Release 7.5.1 supports creating scripts using Python version 3.9.

# Cisco IOS XR Python Packages

*Table 2: Feature History Table*

Feature Name	Release Information	Description
Upgraded IOS XR Python from Version 3.5 to Version 3.9	Release 7.5.1	This upgrade adds new modules and capabilities to create Python scripts and execute the scripts on routers running Cisco IOS XR software. Some of the modules added as part of the upgraded IOS XR Python 3.9 are: hashlib, idna, packaging, pyparsing, six, yaml.

With on-box Python scripting, automation scripts that was run from an external controller is now run on the router. To achieve this functionality, Cisco IOS XR software provides contextual support using SDK libraries and standard protocols.

The following Python third party application packages are supported by the scripting infrastructure and can be used to create automation scripts.

Package	Description	Support Introduced in Release
appdirs	Chooses the appropriate platform-specific directories for user data.	Release 7.3.2
array	Defines an object type that can compactly represent an array of basic values: characters, integers, floating point numbers.	Release 7.3.2
asn1crypto	Parses and serializes Abstract Syntax Notation One (ASN.1) data structures.	Release 7.3.2
chardet	Universal character encoding auto-detector.	Release 7.3.2
concurrent.futures	Provides a high-level interface for asynchronously executing callables.	Release 7.3.2
ecdsa	Implements Elliptic Curve Digital Signature Algorithm (ECDSA) cryptography library to create keypairs (signing key and verifying key), sign messages, and verify the signatures.	Release 7.3.2

Package	Description	Support Introduced in Release
enum	Enumerates symbolic names (members) bound to unique, constant values.	Release 7.3.2
email	Manages email messages.	Release 7.3.2
google.protobuf	Supports language-neutral, platform-neutral, extensible mechanism for serializing structured data.	Release 7.3.2
hashlib	Implements a common interface to many different secure hash and message digest algorithms.	Release 7.5.1
idna	Supports the Internationalized Domain Names in Applications (IDNA) protocol as specified in RFC 5891.	Release 7.5.1
ipaddress	Provides capability to create, manipulate and operate on IPv4 and IPv6 addresses and networks.	Release 7.3.2
jinja2	Supports adding functionality useful for templating environments.	Release 7.3.2
json	Provides a lightweight data interchange format.	Release 7.3.2
markupsafe	Implements a text object that escapes characters so it is safe to use in HTML and XML.	Release 7.3.2
netaddr	Enables system-independent network address manipulation and processing of Layer 3 network addresses.	Release 7.3.2
packaging	Add the necessary files and structure to create the package.	Release 7.5.1
pdb	Defines an interactive source code debugger for Python programs.	Release 7.3.2
pkg_resources	Provides runtime facilities for finding, introspecting, activating and using installed distributions.	Release 7.3.2

Package	Description	Support Introduced in Release
psutil	Provides library to retrieve information on running processes and system utilization such as CPU, memory, disks, sensors and processes.	Release 7.3.2
pyasn1	Provides a collection of ASN.1 modules expressed in form of pyasn1 classes. Includes protocols PDUs definition (SNMP, LDAP etc.) and various data structures (X.509, PKCS).	Release 7.3.2
pyparsing	Provides a library of classes to construct the grammar directly in Python code.	Release 7.5.1
requests	Allows sending HTTP/1.1 requests using Python.	Release 7.3.2
shellescape	Defines the function that returns a shell-escaped version of a Python string.	Release 7.3.2
six	Provides simple utilities for wrapping over differences between Python 2 and Python 3.	Release 7.5.1
subprocess	Spawns new processes, connects to input/output/error pipes, and obtain return codes.	Release 7.3.2
urllib3	HTTP client for Python.	Release 7.3.2
xmltodict	Makes working with XML feel like you are working with JSON.	Release 7.3.2
yaml	Provides a human-friendly format for structured data, that is both easy to write for humans and still parsable by computers.	Release 7.5.1

## Cisco IOS XR Python Libraries

Cisco IOS XR software provides support for the following SDK libraries and standard protocols.

Library	Syntax
xrlog	<pre># To generate syslogs # from cisco.script_mgmt import xrlog  syslog = xrlog.getSysLogger('template_exec')</pre> <p>For more information, see <a href="#">Xrlog Python Module, on page 16</a>.</p>
netconf	<pre>#To connect to netconf client # from iosxr.netconf.netconf_lib import NetconfClient  nc = NetconfClient(debug=True)</pre>
xrclihelper	<pre># To run native xr cli and config commands from iosxr.xrcli.xrcli_helper import *</pre> <pre>helper = XrcliHelper(debug = True)</pre> <p>For more information, see <a href="#">Xrcli_helper Python Module, on page 12</a>.</p>
config_validation	<pre># To validate configuration # import cisco.config_validation as xr</pre> <p>For more information, see <i>Config Scripts</i> Chapter.</p>
eem	<pre># For EEM operations # from iosxr import eem</pre> <p>For more information, see <i>EEM Scripts</i> Chapter.</p>
precommit	<pre># For Precommit script operations # from cisco.script_mgmt import precommit</pre> <p>For more information, see <i>Precommit Scripts</i> Chapter.</p>

## Sample Script Templates

**Table 3: Feature History Table**

Feature Name	Release Information	Description
Github Repository for Automation Scripts	Release 7.5.1	You now have access to sample scripts and templates published on the <a href="#">Github</a> repository. You can leverage these samples to use the python packages and libraries developed by Cisco to build your custom automation scripts for your network

Use these sample script templates based on script type to build your custom script.

To get familiar with IOS XR Python scripts, see the samples and templates on the [Cisco Devnet](#) developer program and [Github](#) repository.

Follow these instructions to download the sample scripts from the Github repository to your router, and run the scripts:

1. Clone the Github repository.

```
$git clone https://github.com/CiscoDevNet/iosxr-ops.git
```

2. Copy the Python files to the router's harddisk or a remote repository.

### Config Script

The following example shows a code snippet for config script. Use this snippet in your script to import the libraries required to validate configuration and also generate syslogs.

```
#Needed for config validation
import cisco.config_validation as xr

#Used for generating syslogs
from cisco.script_mgmt import xrlog
syslog = xrlog.getSysLogger('Add script name here')

def check_config(root):
    #Add config validations
    pass

xr.register_validate_callback([<Add config path here>],check_config)
```

### Exec Script

Use this sample code snippet in your exec script to import Python libraries to connect to NETCONF client and also to generate syslogs.

```
#To connect to netconf client
from iosxr.netconf.netconf_lib import NetconfClient

#To generate syslogs
syslog = xrlog.getSysLogger('template_exec')

def test_exec():
    """
    Testcase for exec script
    """
    nc = NetconfClient(debug=True)
    nc.connect()
    #Netconf or processing operations
    nc.close()

if __name__ == '__main__':
    test_exec()
```

### Process Script

Use the following sample code snippet to trigger a process script and perform various actions on the script. You can leverage this snippet to create your own custom process script. Any exec script can be used as a process script.

To trigger script  
Step 1: Add and configure script as shown in README.MD

Step 2: Register the application with Appmgr

Configuraton:

```
appmgr process-script my-process-app
executable test_process.py
run args --threshold <threshold-value>
```

Step 3: Activate the registered application

```
appmgr process-script activate name my-process-app
```

Step 4: Check script status

```
show appmgr process-script-table
```

```
Router#show appmgr process-script-table
```

Name	Executable	Activated	Status	Restart Policy	Config Pending
my-process-app	test_process.py	Yes	Running	On Failure	No

Step 5: More operations

```
Router#appmgr process-script ?
  activate  Activate process script
  deactivate Deactivate process script
  kill      Kill process script
  restart   Restart process script
  start     Start process script
  stop      Stop process script
"""
```

#To connect to netconf client

```
from iosxr.netconf.netconf_lib import NetconfClient
```

#To generate syslogs

```
syslog = xrlog.getSysLogger('template_exec')
```

```
def test_process():
```

```
    """
```

```
    Testcase for process script
```

```
    """
```

```
    nc = NetconfClient(debug=True)
```

```
    nc.connect()
```

```
    #Netconf or any other operations
```

```
    nc.close()
```

```
if __name__ == '__main__':
```

```
    test_process()
```

## EEM Script

You can leverage the following sample code to import Python libraries to create your custom eem script and also generate syslogs.

Required configuration:

User and AAA configuration

```
event manager event-trigger <trigger-name>
type syslog pattern "PROC_RESTART_NAME"
```

```
event manager action <action-name>
username <user>
```

```
type script script-name <script-name> checksum sha256 <checksum>
```

```
event manager policy-map policy1
```

```

trigger event <trigger-name>
action <action-name>

To verify:
Check for syslog EVENT SCRIPT EXECUTED: User restarted <process-name>

"""
#Needed for eem operations
from iosxr import eem

#Used to generate syslogs
from cisco.script_mgmt import xrlog
syslog = xrlog.getSysLogger(<add your script name here>)

# event_dict consists of details of the event
rc, event_dict = eem.event_reqinfo()

#You can process the information as needed and take action for example: generate a syslog.
#Syslog type can be emergency, alert, critical, error, exception, warning, notification,
info, debug

syslog.info(<Add you syslog here>)

```

## Use Automation Scripts to Interact with the Router via gNMI RPCs

**Table 4: Feature History Table**

Feature Name	Release Information	Description
Automation Scripts for gNMI RPCs	Release 7.5.2	You can create automation scripts to connect to the gRPC Network Management Interface (gNMI) server and interact with the router using gNMI services. Based on gNMI-defined RPCs, you can use the automation script to connect to the gNMI server, manage the configuration of network devices, and query the operational data.

gRPC Network Management Interface (gNMI) is developed by Google. gNMI provides the mechanism to install, manipulate, and delete the configuration of network devices, and also to view operational data. The content provided through gNMI can be modeled using YANG. The supported operations are based on the gNMI defined RPCs:

```

from iosxr.gnmi.gnmi_lib import GNMIClient
gnmi = GNMIClient()

#Connect
gnmi.connect()

#Capabilities
cap = gnmi.capabilities()

#Get
get = gnmi.get(get_request)

```

```
#Set
set = gnmi.set(set_request)

#Disconnect
gnmi.disconnect()
```

- **gNMI Capabilities RPC:** This RPC allows the client to retrieve the gNMI capabilities that is supported by the target (router). This allows the target to validate the service version that is implemented and retrieve the set of models that the target supports. The models can then be specified in subsequent RPCs to restrict the set of data that is utilized. The `CapabilityRequest` RPC returns a response `CapabilityResponse` RPC.
- **gNMI GET RPC:** This RPC specifies how to retrieve one or more of the configuration attributes, state attributes or all attributes associated with a supported mode from a data tree. A `GetRequest` RPC is sent from a client to the target to retrieve values from the data tree. A `GetResponse` RPC is sent in response to the request.
- **gNMI SET RPC:** This RPC specifies how to set one or more configurable attributes associated with a supported model. A `SetRequest` RPC is sent from a client to a target to update the values in the data tree. The actions contained in a `SetRequest` RPC is treated as a single transaction. If any element of the transaction fails, the entire transaction fails and is rolled back. A `SetResponse` RPC is sent in response to the request.
- **gNMI Connect RPC:** This RPC specifies how to initialize a connection to the client.
- **gNMI Disconnect RPC:** This RPC specifies how to end the connection with the client.

### Restrictions for the gNMI Protocol

The following restrictions apply to the gNMI protocol:

- Subscribe RPC services are not supported.
- Only JSON\_IETF encoding for GET and SET requests is supported
- CLI over GNMI is not supported

Follow the procedure to use automation scripts to interact with the router via gNMI services:

## Procedure

**Step 1** Create script using the `GNMIClient` python module.

### Example:

In this example, you create a script to connect with the router using gNMI capabilities.

```
from iosxr.gnmi.gnmi_lib import GNMIClient

gnmi = GNMIClient()
gnmi.connect()
print("Getting capabilities")
cap = gnmi.capabilities()
print("Get")
get_req = """
path: {
  elem: {
    name: "network-instances"
```

```

    }
    elem: {
      name: "network-instance"
      key: {
        key: "name"
        value: "vrf_1"
      }
    }
    origin: "openconfig-network-instance"
  }
  type: CONFIG
  encoding: JSON_IETF
  """
  get = gnmi.get(get_req)
  print("Set")
  set_req = """
  prefix: <
    origin:"openconfig-interfaces"
  >
  update: <
  path: <
    elem: <
      name: "interfaces"
    >
    elem: <
      name: "interface"
      key: <
        key: "name"
        value: "MgmtEth0/RP0/CPU0/0"
      >
    >
    elem: <
      name: "config"
    >
  >
  val: <
    json_ietf_val: '{"description":"Testing failover case: testrole200"}'
  >
  >
  """
  set = gnmi.set(set_req)
  import pdb;pdb.set_trace()

```

**Step 2** Configure gRPC.**Example:**

```

Router#config
Router(config)#grpc
Router(config-grpc)#local connection
Router(config-grpc)#no-tls
Router(config-grpc)#commit

```

**Step 3** Copy the script to the router.**Step 4** Verify that the script is available on the router.**Example:**

```

Router#show script status detail
Tue Apr 12 23:10:50.453 UTC

```

```

=====
Name                               | Type      | Status           | Last Action | Action Time
-----
gnmi-sample-script.py              | exec      | Config Checksum  | NEW         | Tue Apr 12 10:18:23 2021
=====

```

```

Script Name      : gnmi-sample-scripy.py
Checksum        : 94336f3997521d6e1aec0ee6faab0233562d53d4de7b0092e80b53caed58414b
Script Description : View gNMI capabilities
History:
-----
1.   Action      : NEW
     Time        : Tue Apr 12 05:03:41 2021
     Description  : User action IN_CLOSE_WRITE
=====
Router(config)#exit

```

**Step 5** Add the script to the script management repository.

**Example:**

```
Router#script add <type> <location> <name>
```

In this example, you add an Exec script `gnmi-sample-script.py` to the router.

```

Router#script add exec /harddisk\.: gnmi-sample-scripy.py
Tue Apr 18 16:16:46.427 UTC
Copying script from /harddisk:/gnmi-sample-scripy.py
gnmi-sample-scripy.py has been added to the script repository

```

**Step 6** Configure the checksum.

**Example:**

```
Router(config)#script <type> <name> checksum SHA 256 <checksum>
```

In this example, you configure the checksum for the Exec script `gnmi-sample-script.py` to the router.

**Example:**

```

Router(config)#script exec gnmi-sample-script.py checksum SHA 256
94336f3997521d6e1aec0ee6faab0233562d53d4de7b0092e80b53caed58414b
Router(config)#commit
Router(config)#end

```

**Step 7** Run the script.

**Example:**

```

Router#script run gnmi-sample-script.py
Tue Apr 18 16:17:46.427 UTC
Script run scheduled: gnmi-sample-script.py. Request ID: 1634055439
Getting capabilities
.....

```

The following example shows the output of the gNMI `get` operation:

```

notification: <
  timestamp: 1649917466577514766
  update: <
    path: <
      origin: "openconfig-interfaces"
      elem: <
        name: "interfaces"
      >
      elem: <
        name: "interface"
        key: <
          key: "name"
          value: "TenGigE0/0/0/0"
        >
      >
    >
  >

```

```

val: <
  json_ietf_val: "{\n \"config\": {\n  \"name\": \"TenGigE0/0/0/0\", \n  \"type\":
\"iana-if-type:ethernetCsmacd\", \n  \"enabled\": false\n }, \n \"openconfig-if-ethernet:
ethernet\": {\n  \"config\": {\n    \"auto-negotiate\": false\n  } \n } \n } \n"
>
>
update: <
  path: <
    origin: "openconfig-interfaces"
    elem: <
      name: "interfaces"
    >
    elem: <
      name: "interface"
      key: <
        key: "name"
        value: "TenGigE0/0/0/1"
      >
    >
  >
val: <
  json_ietf_val: "{\n \"config\": {\n  \"name\": \"TenGigE0/0/0/1\", \n  \"type\":

>
----- Output truncated for brevity -----

```

## Xrcli\_helper Python Module

### Overview of xrcli\_helper Python Module

The `XrcliHelper` is a utility class designed to facilitate the execution of IOS-XR CLI commands and configuration changes programmatically. It provides methods to:

- Execute native IOS-XR commands.
- Apply configurations from files or strings.

### Prerequisites of xrcli\_helper Python Module

- Python 2.7 or higher.
- Ensure that you are on Cisco IOS XR Release 7.4.x or higher.
- Access to Cisco IOS XR device with AAA Authorization enabled. Use the **aaa authorization exec default group tacacs+ local** command to enable AAA Authorization.
- Ensure that the `iosxr.xrcli.xrcli_helper` module is available in your Python environment.

### Import Library Information

To use the XrcliHelper class in your Python script, you need to import it from the appropriate module. The import statement provided allows you to bring the XrcliHelper class into your script so you can create instances of it and use its methods.

```
from iosxr.xrcli.xrcli_helper import XrcliHelper
```

### Library/API Initialization

By initializing the XrcliHelper class, you establish the environment needed to execute IOS-XR commands and apply configurations programmatically. This serves as the initial step in automating network management tasks, enabling you to utilize the class's methods to efficiently interact with your IOS-XR devices.

```
<object name> = XrcliHelper([debug=True/False(default)])
```

This example shows how to initialize Xrclihelper class.

```
helper = XrcliHelper()
```

## Xrcli\_helper Script APIs

### xrcli\_exec

The xrcli\_exec API executes IOS-XR exec commands to obtain the output.

#### Parameter

**cmd:** A String representing the IOS- XR exec command to be executed.

#### Result

The result of the xrcli\_exec API is a dictionary containing:

- **status:** Indicates whether the command execution was error or success.
- **output:** The output of the executed command.

### Example

The following example shows the sample output of xrcli\_exec API:

```
>>> result = helper.xrcli_exec("show filesystem ")
>>> print(result)
{'output': '\n'
'----- show filesystem '
'-----\n'
'File Systems:\n'
'\n'
'      Size(b)      Free(b)      Type  Flags  Prefixes\n'
'  4275265536  4274974720  flash-disk    rw  disk0:\n'
'  67301322752  67266158592   harddisk    rw  harddisk:\n'
'              0           0     network    rw   ftp:\n'
'  60264796160  51056054272     flash    rw  /misc/config\n'
'              0           0     network    rw  tftp:\n',
'status': 'success'}
```

### xr\_apply\_config\_file

The `xr_apply_config_file` API applies configuration to IOS-XR using a file.

#### Parameter

- `filename`: Path to a configuration file containing XR config commands with the following structure:

```
!
XR config command
!
end
```

- `comment`: A comment for the configuration commit, which will be visible in the output of **show configuration commit list detail**.

#### Result

The result of `xr_apply_config_file` is a dictionary specifying the effect of the configuration change:

- `status`: Indicates whether the configuration application was `error` or `success`.
- `output`:
  - If `status` is `error`: use the **show configuration failed** command.
  - If `status` is `success`: use the **show configuration commit changes last 1** command.

#### Example

The following example shows sample output of `xr_apply_config_file` API.

```
[node0_RP0_CPU0:~]$more /harddisk:/noshut_int.cfg
!
interface hundredGigE 0/0/0/24
no shutdown
interface hundredGigE 0/0/0/25
no shutdown
!
end

>>> result = helper.xr_apply_config_file("/harddisk:/noshut_int.cfg")
>>> print(result)
{'output': '\n'
  '----- show configuration commit changes last 1 '
  '-----\n'
  '!! Building configuration...\n'
  '!! IOS XR Configuration x.y.z \n'
  'interface HundredGigE0/0/0/24\n'
  ' no shutdown\n'
  '!\n'
  'interface HundredGigE0/0/0/25\n'
  ' no shutdown\n'
  '!\n'
  'end\n'
  '\n',
 'status': 'success'}
>>>
```

### xr\_apply\_config\_string

The `xr_apply_config_string` applies configuration to XR using a single line string.

### Parameter

**cmd:** Single line string representing an XR config command.

**comment:** Reason for the config commit, visible in **show configuration commit list detail**.

### Result

The result of `xr_apply_config_string` is a dictionary specifying the effect of the configuration change:

- **status:** Indicates whether the configuration application was `error` or `success`.
- **output:**
  - If `status` is `error`: use the **show configuration failed** command.
  - If `status` is `success`: use the **show configuration commit changes last 1** command.

### Example

The following example shows sample output of `xr_apply_config_file` API.

```
>>> cmd = """
... interface HundredGigE0/0/0/25
... description "shut down by scriptx"
... shut
... """
>>> result = helper.xr_apply_config_string(cmd)
>>> print(result)
{'output': '\n'
  '----- show configuration commit changes last 1 '
  '-----\n'
  '!! Building configuration...\n'
  '!! IOS XR Configuration x.y.z\n'
  'interface HundredGigE0/0/0/25\n'
  ' description "shut down by scriptx"\n'
  ' shutdown\n'
  '!\n'
  'end\n'
  '\n',
'status': 'success'
>>>
```

### user

The user is an `XrcliHelper` Object Attribute (not API) which contains the username to authorize the XR commands.

### Example

The following example shows sample output of `user`.

Example:

```
>>> helper.user
'cisco'
```

### toggle\_debug

The `toggle_debug` enables or disables debug logging.

### Example

The following example shows sample output of `toggle_debug`.

```
>>> helper.toggle_debug(True)
>>>
```

# Xrlog Python Module

## Overview of Xrlog Python Module

The `xrlog` Python module is a utility designed for generating syslog messages and script logs within Cisco IOS XR environments. It provides methods to do the following:

- Module to generate XR syslog messages from scripts.
- Provides a logger for generating script logs.

## Prerequisites of Xrlog Python Module

- Python 2.7 or higher.
- Ensure that you are on Cisco IOS XR Release 7.4.x or higher.
- Ensure that the `cisco.script_mgmt.xrlog` is available in your Python environment.

## Import Library Information

To use the `xrlog` module in your Python script, you need to import it from the appropriate module. The import statement provided allows you to bring the `xrlog` functionalities into your script so you can create instances of syslog and script loggers.

```
from cisco.script_mgmt import xrlog
```

## Library/API Initialization

By initializing the `xrlog` module, you establish the environment needed to generate syslog messages and script logs programmatically. This serves as the initial step in automating logging tasks, enabling you to utilize the module's methods to efficiently log events and messages.

```
<object_name> = xrlog.getSysLogger([logger_name [default: root]])
<object_name> = xrlog.getScriptLogger([logger_name [default: root]])
```

### Example:

This is the example of generating syslog and script logs.

```
syslog = xrlog.getSysLogger('myscript')
log = xrlog.getScriptLogger('myscript')
```

## getSysLogger Script APIs

The `getSysLogger` API returns a `syslogger` object with APIs to print to XR syslog.

### Parameter

**name:** A string representing the module name of the `syslogger`. This parameter is optional, and the default value is "root".

## Result

The result of the `getSysLogger` API is a `syslogger` object.

## Result

The result of the `alert` API is the message being logged to the XR syslog with severity level 1.

## Syslogger APIs

The following are the list of Syslogger APIs:

- `emergency`
- `alert`
- `critical`
- `error`
- `warning`
- `notification`
- `info`
- `debug`
- `log`
- `setlevel`

### emergency

The `emergency` API prints a message string to the XR syslog with severity level 0, indicating that the system is unusable.

### Parameters

- **self**: The `syslogger` object.
- **msg\_string**: A string representing the syslog message to be printed.

## Result

The result of the `emergency` API is the message being logged to the XR syslog with severity level 0.

## Example

The following example shows how to use the `emergency` API to log a message indicating a system emergency and the system logging message that you can see on the router.

```
>>> syslog.emergency("script generated syslog message")
RP/0/RP0/CPU0: scripting_python3[67965]: %OS-SCRIPT_LOG-0-EMERGENCY : Script-myscript:
script generated syslog message
```

## alert

The `alert` API prints a message string to the XR syslog with severity level 1, indicating that immediate action is needed.

After getting the object, the following are the list of APIs that belong to that object.

### Parameters

- **self**: The syslogger object.
- **msg\_string**: A string representing the syslog message to be printed.

### Example

The following example shows how to use the `alert` API to log a message indicating that immediate action is needed and the system logging message that you can see on the router:

```
>>> syslog.alert("script generated syslog message")
RP/0/RP0/CPU0: scripting_python3[67965]: %OS-SCRIPT_LOG-1-ALERT : Script-myscript: script
generated syslog message
```

### critical

The `critical` API prints a message string to the XR syslog with severity level 2, indicating critical conditions.

### Parameters

- **self**: The syslogger object.
- **msg\_string**: A string representing the syslog message to be printed.

### Result

The result of the `critical` API is the message being logged to the XR syslog with severity level 2.

### Example

The following example shows how to use the `critical` API to log a message indicating critical conditions and the system logging message that you can see on the router:

```
>>> syslog.critical("script generated syslog message")
RP/0/RP0/CPU0: scripting_python3[67965]: %OS-SCRIPT_LOG-2-CRITICAL : Script
```

### error

The `error` API prints a message string to the XR syslog with severity level 3, indicating error conditions.

### Parameters

- **self**: The syslogger object.
- **msg\_string**: A string representing the syslog message to be printed.

### Result

The result of the `error` API is the message being logged to the XR syslog with severity level 3.

### Example

The following example shows how to use the `error` API to log a message indicating error conditions and the system logging message that you can see on the router:

```
>>> syslog.error("script generated syslog message")
RP/0/RP0/CPU0: scripting_python3[67965]: %OS-SCRIPT_LOG-3-ERROR : Script-myscript: script
generated syslog message
```

### warning

The `warning` API prints a message string to the XR syslog with severity level 4, indicating a warning condition.

#### Parameters

- **self**: The syslogger object.
- **msg\_string**: A string representing the syslog message to be printed.

#### Result

The result of the `warning` API is the message being logged to the XR syslog with severity level 4.

#### Example

The following example shows how to use the `warning` API to log a message indicating a warning condition and the system logging message that you can see on the router:

```
>>> syslog.warning("script generated syslog message")
RP/0/RP0/CPU0: scripting_python3[67965]: %OS-SCRIPT_LOG-4-WARNING : Script-myscript: script
generated syslog message
```

### notification

The `notification` API prints a message string to the XR syslog with severity level 5, indicating a normal but significant condition.

#### Parameters

- **self**: The syslogger object.
- **msg\_string**: A string representing the syslog message to be printed.

#### Result

The result of the `notification` API is the message being logged to the XR syslog with severity level 5.

#### Example

The following example shows how to use the `notification` API to log a message indicating a normal but significant condition and the system logging message that you can see on the router:

```
>>> syslog.notification("script generated syslog message")
RP/0/RP0/CPU0:scripting_python3[67965]: %OS-SCRIPT_LOG-5-NOTIFICATION : Script-myscript:
script generated syslog message
```

### info

The `info` API prints a message string to the XR syslog with severity level 6, indicating an informational message only.

#### Parameters

- **self**: The syslogger object.
- **msg\_string**: A string representing the syslog message to be printed.

#### Result

The result of the `info` API is the message being logged to the XR syslog with severity level 6.

#### Example

The following example shows how to use the `info` API to log an informational message and the system logging message that you can see on the router:

```
>>> syslog.info("script generated syslog message")
RP/0/RP0/CPU0:scripting_python3[67965]: %OS-SCRIPT_LOG-6-INFO : Script-myscript: script
generated syslog message
```

### debug

The `debug` API prints a message string to the XR syslog with severity level 7, indicating a debugging message only.

#### Parameters

- **self**: The syslogger object.
- **msg\_string**: A string representing the syslog message to be printed.

#### Result

The result of the `debug` API is the message being logged to the XR syslog with severity level 7.

#### Example

The following example shows how to use the `debug` API to log a debugging message and the system logging message that you can see on the router:

```
>>> syslog.debug("script generated syslog message")
RP/0/RP0/CPU0:scripting_python3[67965]: %OS-SCRIPT_LOG-7-DEBUG : Script-myscript: script
generated syslog message
```

### log

The `log` API prints a message string to the XR syslog at the provided severity level.

#### Parameters

- **self**: The syslogger object.
- **level**: An integer representing the syslog logging level.
- **msg\_string**: A string representing the syslog message to be printed.

#### Result

The result of the `log` API is the message being logged to the XR syslog at the specified severity level.

#### Example

The following example shows how to use the `log` API to log a message at a specified severity level and the system logging message that is generated on the router:

```
syslog.log(xrlog.WARNING, "script generated syslog message")
RP/0/RP0/CPU0: scripting_python3[67965]: %OS-SCRIPT_LOG-4-WARNING : Script-myscript: script
generated syslog message
>>> syslog.log(30, "script generated syslog message")
RP/0/RP0/CPU0:scripting_python3[67965]: %OS-SCRIPT_LOG-4-WARNING : Script-myscript: script
generated syslog message
```

**setLevel**

The `setLevel` API sets the level of messages that should be written to syslogs. Messages with a lower level than the specified level will be discarded.

**Parameters**

**level:** An integer representing the syslog logging level.

**Result**

The result of the `setLevel` API is that only messages with a severity level equal to or higher than the specified level will be logged to the XR syslog.

**Example**

The following example shows how to use the `setLevel` API to set the logging level:

```
syslog = xrlog.getSysLogger('myscript')
syslog.setLevel(4)
```

## Script Logger API

**getScriptLogger**

The `getScriptLogger` API returns a Python Logger object.

**Parameters**

**name:** A string representing the module name of the logger. This parameter is optional.

**Result**

The result of the `getScriptLogger` API is a Python Logger object.

For more information on Python Logger, refer to the [Python logger documentation](#).

**Example**

The following example shows how to initialize a script logger using the `getScriptLogger` API:

```
log = xrlog.getScriptLogger('myscript')
```
