Routing Policy Language Commands

This module describes the Cisco IOS XR software routing policy language (RPL) commands used to create, modify, monitor, and maintain routing policies.

For detailed information about RPL concepts, configuration tasks, and examples, see the Implementing Routing Policy on Cisco NCS 5000 Series Routers module in the Routing Configuration Guide for Cisco NCS 5000 Series Routers.

Note
Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

• vpn-distinguisher is, on page 239
**abort (RPL)**

To discard a route policy or set definition and return to XR Config mode, use the `abort` command in the appropriate configuration mode.

```
abort
```

### Syntax Description

This command has no keywords or arguments.

This command has no arguments or keywords.

### Command Default

No default behavior or values.

### Command Modes

- Route-policy configuration
- Prefix set configuration
- Route distinguisher set configuration
- AS path set configuration
- Community set configuration
- Extended community set configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

No specific guidelines impact the use of this command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to discard a route policy definition that was started and return to XR Config mode:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# if as-path is-local then
RP/0/RP0/CPU0:router(config-rpl-if)# abort
RP/0/RP0/CPU0:router(config)#
```

The following example shows how to discard a prefix set definition that was started and return to XR Config mode:

```
RP/0/RP0/CPU0:router(config)# prefix-set legal-ipv4-prefix-examples
RP/0/RP0/CPU0:router(config-pfx)# 10.0.1.1,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.2.0/24,
```
RP/0/RP0/CPU0:router(config-pfx)# abort
RP/0/RP0/CPU0:router(config)#
add

To add a value to an Routing Information Protocol (RIP) existing metric, use the **add** command in route-policy configuration mode.

```
add {rip-metric} {numberparameter}
```

**Syntax Description**
- **rip-metric**  Specifies an RIP metric attribute.
- **number**  Value assigned to a four-bit unsigned integer. Range is from 0 to 16.
- **parameter**  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If the add value is greater than the maximum allowed value, the metric is added. If the resulting metric exceeds the maximum for the routing protocol, then the route is dropped (by the client routing protocol).

**Task ID**
- **Task ID**  Operations
- route-policy  read, write

**Examples**
The following example shows how to offset the RIP metric value:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# add rip-metric 4
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**apply**

To execute a parameterized or unparameterized policy from within another policy, use the `apply` command in route-policy configuration mode.

```
apply policy_name [{argument1, argument2, ... , argumentN}]
```

**Syntax Description**

- `policy_name` Name of a route policy.
- `argument` (Optional) Parameter name. The argument can be a value (for example, '100') or a parameter (for example, 'Sparameter')

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `apply` command to execute a policy (either parameterized or unparameterized) from within another policy, which allows for the reuse of common blocks of policy.

Wildcards can be used in apply policy names. This supports the nested wildcard apply scenario. A wildcard is specified by inserting an asterisk (*) in place of one of the portions of the apply policy name; the wildcard indicates that any value for that portion of the apply policy name matches. The nested wildcard apply policy allows wildcard (*) based apply nesting. The wildcard operation permits declaration of a generic apply statement that calls all policies that contain a specific defined set of alphanumeric characters, defined on the router.

**Examples**

In the following example, the policy CustomerIn applies the route-policy SetLocalPref to conditionally set the local preference on a route. The parameters 20, 30, 40, and 50 are passed to the parameterized policy SetLocalPref, where the local preference is set to:

- 20, if the community 217:20 is present in the route
- 30, if the community 217:30 is present in the route
- 40, if the community 217:40 is present in the route
- 50, if the community 217:50 is present in the route

```
RP/0/RP0/CPU0:router(config)# route-policy SetLocalPref ($lp0, $lp1, $lp2, $lp3, $lp4)
RP/0/RP0/CPU0:router(config-rpl)# if community matches-any ($lp0:$lp1) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference $lp1
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif community matches-any ($lp0:$lp2) then
```
set local-preference $lp2
elseif community matches-any ($lp0:$lp3) then
set local-preference $lp3
elseif community matches-any ($lp0:$lp4) then
set local-preference $lp4
endif
end-policy

route-policy CustomerIn($cust)
apply SetLocalPref ($cust, 20, 30, 40, 50)
end-policy

route-policy Cust_217
apply CustomerIn(217)
end-policy
as-path in

To match the AS path of a route to an AS path set, use the as-path in command in route-policy configuration mode.

```
as-path in {as-path-name|inline-as-path-set|parameter}
```

**Syntax Description**
- as-path-name: Name of an AS path set.
- inline-as-path-set: Inline AS path set. The inline AS path set must be enclosed in parentheses.
- parameter: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the as-path in command as a conditional expression within an if statement to match the AS path of a route to an AS path set. The AS path is a sequence of autonomous system numbers traversed by a route.

For a list of all conditional expressions available within an if statement, see the if command.

The as-path in command evaluates to true if at least one of the regular expressions defined in the associated AS path set matches the AS path attribute of the route.

In the case where the AS path set is defined but contains no elements in it, the as-path in conditional expression command returns false.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

For example, assume we have an AS path set named my-as-set defined as follows:

```
RP/0/RP0/CPU0:router(config)# as-path-set my-as-set
RP/0/RP0/CPU0:router(config-as)# ios-regex '._12$'
RP/0/RP0/CPU0:router(config-as)# ios-regex '._13$'
RP/0/RP0/CPU0:router(config-as)# end-set
```

and the following policy excerpt using an as-path-name argument:
The AS path in condition evaluates to true if one or more of the regular expression matches in the set my-as-set match the AS path associated with the route. In the case of a defined but empty AS path set, this operator returns false.

The preceding policy excerpt is equivalent to the following version, which uses an inline-as-path set variable:

```bash
RP/0/RP0/CPU0:router(config-rpl)# if as-path in (ios-regex '_12$',ios-regex '_13$') then
  RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
  RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
as-path is-local

To determine if this router or another router within this autonomous system or confederation originated a Border Gateway Protocol (BGP) route, use the **as-path is-local** command in route-policy configuration mode.

```plaintext
as-path is-local
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **as-path is-local** command as a conditional expression within an **if** statement to determine if this router (or another router within this autonomous system or confederation) originated the route.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

- Routes that are locally originated within the autonomous system or confederation carry an empty AS path. For the Border Gateway Protocol (BGP) specification, when a route is advertised across the autonomous system boundary or a confederation boundary, the local autonomous system number or confederation ID is appended to the autonomous system path. The AS path of a locally originated aggregate is also empty unless it has been modified by policy.

- The **is-local** operator evaluates to true for autonomous system paths that are empty. An empty AS path is how an AS path that is local to our autonomous system is represented in BGP.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, if the AS path is local, then the local preference is set to 100:

```plaintext
RP/0/RP0/CPU0:router(config-rpl)# if as-path is-local then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
as-path length

To compare the number of ASN in the AS path of a Border Gateway Protocol (BGP) route, use the `as-path length` command in route-policy configuration mode.

```
as-path length {eq|is|ge|le} {number parameter}
```

Syntax Description

<table>
<thead>
<tr>
<th>eq</th>
<th>is</th>
<th>ge</th>
<th>le</th>
<th>Equal to; greater than or equal to; less than or equal to.</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Value assigned to an 11-bit unsigned integer. Range is from 0 to 2047.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Command Default

No default behavior or values

Command Modes

Route-policy configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the `as-path length` command as a conditional expression within an `if` statement to perform a conditional check based on the length of the AS path.

For a list of all conditional expressions available within an `if` statement, see the `if` command.

This command takes either a specific integer value or a range of integer values specified with the `ge` and `le` operators. Any or all these integers can be parameterized. The operator counts one for each autonomous system in the path. In the case where the route may be aggregated and contain one or more AS sets, the length operator adds one for each set present, the occurrence of an AS set typically indicates that this route is an aggregated route, and the aggregated route had a component route that contained one of the autonomous systems in the set. Likewise, in the case of confederations, a count of one is added for each confederation in the path or each confederation set in the path. A null AS path has a length of zero.

Task ID

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

Examples

In the following example, if the AS path length equals 10, then the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path length eq 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
as-path neighbor-is

To test autonomous system numbers at the head of the AS path against a sequence of one or more values or parameters, use the **as-path neighbor-is** command in route-policy configuration mode.

**as-path neighbor-is as-number-list [exact]**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>as-number-list</th>
<th>Numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Range for 4-byte Autonomous system numbers (ASNs) as asdot format is 1.0 to 65535.65535.</td>
</tr>
<tr>
<td>exact</td>
<td>(Optional)</td>
<td>Specifies that with the <strong>exact</strong> keyword, the <strong>as-number-list</strong> value must identically match the AS path for the route; without the <strong>exact</strong> keyword, any element in the <strong>as-number-list</strong> argument matches one or more occurrences of that element in the AS path for the route.</td>
</tr>
</tbody>
</table>

| Command Default     | No default behavior or values |
| Command Modes       | Route-policy configuration   |

| Command History     | Release 6.0  This command was introduced. |

| Usage Guidelines    | Use the **as-path neighbor-is** command as a conditional expression within an **if** statement to test the autonomous system number or numbers at the head of the AS path against a sequence of one or more integral values or parameters. In other words, to test to learn if the sequence of autonomous system numbers matches the path beginning with the neighboring autonomous system from which this route was heard. |

| Note               | For a list of all conditional expressions available within an **if** statement, see the **if** command. |
|                   | This command has an equivalent regular expression (ios-regex). For example, AS path neighbor-is ‘1’ would be ‘^1’. |

| Task ID            | Task ID  Operations |
|                   | route-policy  read, |
|                   | write          |

| Examples           | The following are incomplete configuration examples: |
These statements evaluate to true when the first autonomous system numbers on the AS path match, in the same order, the supplied parameters or integer values in the `neighbor-is` statement. If the neighboring autonomous system location happens to be an AS-set, the operator evaluates to true if the corresponding argument to the `neighbor-is` operator is an element of the AS-set.

Without the `exact` keyword, repeated autonomous system numbers in the AS path are ignored. For example,

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path neighbor-is '10 20' then
```

matches an AS path beginning

```
 10 10 10 20 ...
```

and an AS path beginning:

```
 10 20 ....
```

With the `exact` keyword, repetitions are not ignored, therefore

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path neighbor-is '10 20' exact then
```

matches the second of these AS paths but not the first.
As-path originates-from

To compare an AS path against the AS sequence beginning with the AS number that originated a route, use the *as-path originates-from* command in route-policy configuration mode.

```
as-path originates-from as-number-list [exact]
```

**Syntax Description**

- **as-number-list**: Numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers.
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.

- **exact**: (Optional) Specifies that with the *exact* keyword, the *as-number-list* value must identically match the AS path for the route; without the *exact* keyword, any element in the *as-number-list* argument matches one or more occurrences of that element in the AS path for the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0: This command was introduced.

**Usage Guidelines**

Use the *as-path originates-from* command as a conditional expression within an *if* statement to compare an AS path to the autonomous system sequence.

```
Note
```

For a list of all conditional expressions available within an *if* statement, see the *if* command.

The *originates-from* operator is similar to the *neighbor-is* operator, except that it looks at the autonomous system number at the opposite end of the AS path. In other words, it is comparing to the autonomous system that originated the route. It can take numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers. When more than one number is specified in the list, the sequence of autonomous system numbers listed must appear as a subsequence in the AS path, with the last number corresponding to the autonomous system that originated the route.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>
The following are incomplete configuration examples:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path originates-from '10 11' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path originates-from '$asnum 11' then
```

The first line of the preceding example evaluates to true if autonomous system 11 originated the route and then advertised it to autonomous system 10, from which the route was eventually propagated to us. In the case where the route has been aggregated, and the location of the originating autonomous system contains an AS-set, the `originates-from` operator evaluates to true if the argument to the `originates-from` operator is contained in the AS-set.

Without the `exact` keyword, repeated autonomous system numbers in the AS path are ignored. For example,

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path originates-from '10 11' then
```

matches an autonomous system path ending

```
...10 10 10 11
```

and an autonomous system path ending

```
...10 11
```

With the `exact` keyword, repetitions are not ignored, therefore

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path originates-from '10 11' exact then
```

matches the second of these autonomous system paths but not the first.
as-path passes-through

To verify if the supplied integer or parameter appears anywhere in the AS path or if the supplied sequence of integers and parameters appears, in the same order, anywhere in the AS path, use the as-path passes-through command in route-policy configuration mode.

```
as-path passes-through as-number-list [exact]
```

Syntax Description

- **as-number-list**: Numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers.
  
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.

- **exact**: (Optional) Specifies that with the exact keyword, the as-number-list value must identically match the AS path for the route; without the exact keyword, any element in the as-number-list argument matches one or more occurrences of that element in the AS path for the route.

</table>

Usage Guidelines

Use the as-path passes-through command as a conditional expression within an if statement to verify if the specified integer or parameter appears anywhere in the AS path or if the sequence of integers and parameters appears.

Note

For a list of all conditional expressions available within an if statement, see the if command.

The passes-through operator takes a sequence of integers or parameters, enclosed in single quotation marks, as an argument. It can also take a single integer or parameter as an argument. It evaluates to true if the supplied integer or parameter appears anywhere in the AS path, or if the supplied sequence of integers and parameters appears, in the same order, anywhere in the AS path. This includes the originates-from or neighbor-is location in the AS path.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following are incomplete configuration examples:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '10' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path passes-through '$asnum' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path passes-through '10 11' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path passes-through '10 $asnum 12' then
```

Without the `exact` keyword, repeated autonomous system numbers in the AS path are ignored. For example:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '9 10 11' then
```

matches an AS path containing

```
...9 10 10 10 10 11 ....
```

and an AS path containing:

```
...9 10 11...
```

With the `exact` keyword, repetitions are not ignored. Therefore:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '9 10 11' exact then
```

matches the second of these AS paths but not the first.
as-path-set

To create a named AS path set, use the `as-path-set` command in XR Config mode. To remove the named AS path set, use the `no` form of this command.

```
as-path-set name
no as-path-set name
```

**Syntax Description**
- `name` Name of the AS path set.

**Command Default**
No default behavior or values

**Command Modes**
XR Config mode

**Command History**
- **Release 6.0** This command was introduced.

**Usage Guidelines**
Use the `as-path-set` command to create a named AS path set.

An AS path set comprises operations for matching an AS path attribute.

This command enters AS path set configuration mode, in which you can use any of the below option to specify an operation.

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dfa-regex</td>
<td>Indicates the DFA (deterministic finite automata) style regular expression. It performs better for complex regular expressions. Single quotation marks are required around the regular expression.</td>
</tr>
<tr>
<td>ios-regex</td>
<td>Indicates the traditional IOS style regular expression. It performs better with simpler regular expressions. Single quotation marks are required around the regular expression.</td>
</tr>
<tr>
<td>length</td>
<td>Indicates the number of ASN (Autonomous System Number) in the AS path of a Border Gateway Protocol (BGP) route.</td>
</tr>
<tr>
<td>neighbor-is</td>
<td>Indicates the neighbor's AS-path number that can be matched with.</td>
</tr>
<tr>
<td>originates-from</td>
<td>Indicates the BGP AS from which the route originated.</td>
</tr>
<tr>
<td>passes-through</td>
<td>Indicates if the supplied integer or parameter appears anywhere in the AS path, or if the supplied sequence of integers and parameters appear, in the same order, anywhere in the AS path.</td>
</tr>
</tbody>
</table>
The above options can also be used as an inline set in a parenthesized list of comma-separated expressions.

The following is a sample definition of an AS path set named aset1. This AS path set is composed of two elements. When used in a matching operation, this AS path set matches any route whose AS path ends with either the autonomous system number 42 or 127.

```
RP/0/RP0/CPU0:router(config)# as-path-set aset1
RP/0/RP0/CPU0:router(config-as)# ios-regex '_42$'
RP/0/RP0/CPU0:router(config-as)# ios-regex '_127$'
RP/0/RP0/CPU0:router(config-as)# end-set
```

The following is a sample of the as-path options used as an inline set.

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path in (ios-regex '_42$', ios-regex$ '_127$')
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
```

### Table: as-path-set

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unique-length</td>
<td>Indicates the length of BGP AS-path, ignoring duplicates.</td>
</tr>
</tbody>
</table>
**as-path unique-length**

To perform specific checks based on the length of the AS path (match against the number of unique ASNs in the AS path), use the `as-path unique-length` command in route-policy configuration mode.

```
as-path unique-length {eq|is|ge|le} {numberparameter}
```

**Syntax Description**

- **eq**, **is**, **ge**, **le**: Equal to; greater than or equal to; less than or equal to.
- **number**: Value assigned to an 11-bit unsigned integer. Range is from 0 to 2047.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `as-path unique-length` command as a conditional expression within an `if` statement to perform a match based on the length of the AS path.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

The `unique-length` operator is similar to the length operator, except that when an AS path has been padded with the same autonomous system number multiple times, the operator counts only one when the route is padded. Therefore, given an AS path of 333 333 111 222 123 444 444 444, the `unique-length` operator would return a value of 5, whereas the length operator would return a value of 8.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to perform checks based on the AS path length. If the AS path matches the specified values, the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path unique-length eq 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length ge 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length le 10 then

RP/0/RP0/CPU0:router(config-rpl)# if as-path unique-length eq $integerparam then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length ge $geparam then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length le $leparam then
```
RP/0/RP0/CPU0:router(config-rpl)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl)# endif
**community is-empty**

To check if a route has no community attributes associated with it, use the `community is-empty` command in route-policy configuration mode.

```plaintext
community is-empty
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

```
Release 6.0  This command was introduced.
```

**Usage Guidelines**

Use the `community is-empty` command as a conditional expression within an `if` statement to check if a route has community attributes associated with it.

```plaintext
Note
```

For a list of all conditional expressions available within an `if` statement, see the `if` command.

This command takes no arguments and evaluates to true only if the route has no community attributes associated with it.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

In the following example, if the route has no community attributes associated with it, then the local preference is set to 100:

```plaintext
RP/0/RP0/CPU0:router(config-rpl)# if community is-empty then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
```
community matches-any

To match any elements of a community set, use the **community matches-any** command in route-policy configuration mode.

**Syntax Description**

- **community-set-name** Name of a community set.
- **inline-community-set** Inline community set. The inline community set must be enclosed in parentheses.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release** Modification
- Release 6.0 This command was introduced.

**Usage Guidelines**

Use the **community matches-any** command as a conditional expression within an **if** statement to match any element of a community set.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

A simple condition using the **matches-any** operator evaluates as true if at least one community element of the community attribute for the route matches an element in the community set operand. If no community in the route matches any of the specifications in the named or inline set, then the condition evaluates to false. Likewise, when there is no community at all in the route, the condition evaluates to false.

Matching of a community in the route to a specification in a named or an inline set is intuitive. If the community specification in a set is the familiar colon-separated decimal 16-bit numbers specification, or one of the well-known communities, the community matches the specification if the specification denotes the same 32-bit number as that in the route. If the community specification uses a wildcard, then the community in the route matches if it is one of the many communities denoted by the wildcard specification. In inline sets, community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

Communities may also be matched using range and regular expression operators. Range specifications are entered as follows: [ low-value .. high-value ]. Either or both colon-separated halves of a community value may contain a range. The following are valid range specifications:

- 10:[100..1000]
- [10..100]:80
- [10..100]:[100..2000]
In addition, the `private-as` keyword may be used to specify the range from 64512 to 65534. Regular expressions are specified as the `ios-regex` keyword followed by a valid regular expression string.

Community values from the route are matched one at a time to the match specifications. Therefore, regex match specifications are expected to represent one individual community value and not a sequence of community values.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, a named community set called `my-community-set` and a route policy called `community-matches-any-example` are created. The policy sets the local-preference to 100 for any route that has one or more of the communities in the `my-community-set` community set. If the route does not have any of these communities, the policy checks whether it has any communities whose first half is in the range from 10 to 25 and whose second half is the value 35, in which case it sets the local-preference to 200. Otherwise, it checks for a community value in the range of 30:100 to 30:500, in which case it sets the local-preference to 300.

```
RP/0/RP0/CPU0:router(config)# community-set my-community-set
RP/0/RP0/CPU0:router(config-comm)# 10:20,
RP/0/RP0/CPU0:router(config-comm)# 10:30,
RP/0/RP0/CPU0:router(config-comm)# 10:40
RP/0/RP0/CPU0:router(config-comm)# end-set

RP/0/RP0/CPU0:router(config)# route-policy community-matches-any-example
RP/0/RP0/CPU0:router(config-rpl)# if community matches-any my-community-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# elseif community matches-any ([10..25]:35) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif community matches-any (30:[100..500]) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
To match every element of a community set, use the **community matches-every** command in route-policy configuration mode.

```
community matches-every {community-set-nameinline-community-setparameter}
```

**Syntax Description**

- **community-set-name**: Name of a community set.
- **inline-community-set**: Inline community set. The inline community set must be enclosed in parentheses.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Release 6.0</td>
</tr>
</tbody>
</table>

| This command was introduced. |

**Usage Guidelines**

Use the **community matches-every** command as a conditional expression within an **if** statement to match every element of a community set.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

A simple condition using the **matches-every** operator evaluates as true if every specification in the named set or inline set specified matches at least one community value in the route. If any community specification in the named or inline set is not matched, then the operation evaluates to false.

Matching of a community in the route to a specification in a named or an inline set is intuitive. If the community-specification in a set is the familiar colon-separated decimal 16-bit numbers specification, or one of the well-known communities, the community matches the specification if the specification denotes the same 32-bit number as that in the route. If the community specification uses a wildcard, then the community in the route matches if it is one of the many communities denoted by the wildcard specification. In inline sets, community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

Communities may also be matched using range and regular expression operators. Range specifications are entered as follows: ![low-value .. high-value]. Either or both colon-separated halves of a community value may contain a range. The following are valid range specifications:

- `10:[100..1000]`
- `[10..100]:80`
- `[10..100]:[100..2000]`
Therefore, a **matches-every** operation with two community range specifications means that a community must be present in the route that corresponds to each range. For example, in the following statement:

\[
\text{if community matches-every \{10:[100..200],20:[100..200]\} then}
\]

the statement evaluates as true if one or more communities in the route lie in the range 10:[100..200] and one or more communities in the route lie in the range 20:[100..200].

In addition, the **private-as** keyword may be used to specify the range from 64512 to 65534.

Regular expressions are specified as the **ios-regex** keyword followed by a valid single-quoted regular expression string. Community values from the route are matched one at a time against the match specifications. Therefore, regex match specifications are expected to represent one individual community value and not a sequence of community values.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rout-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, the route policy named community-matches-every-example sets the local-preference value to 100 for all routes that have all three communities in the my-community-set community set. Routes that do not have all three communities but have a community that matches the first regular expression match have the local-preference value set to 200. Finally, any remaining routes that match the last regular expression have the local-preference values set to 300.

```bash
RP/0/RP0/CPU0:router(config)# community-set my-community-set
RP/0/RP0/CPU0:router(config-comm)# 10:20,
RP/0/RP0/CPU0:router(config-comm)# 10:30,
RP/0/RP0/CPU0:router(config-comm)# 10:40
RP/0/RP0/CPU0:router(config-comm)# end-set

RP/0/RP0/CPU0:router(config)# route-policy community-matches-every-example
RP/0/RP0/CPU0:router(config-rpl)# if community matches-every my-community-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rp-elseif)# elseif community matches-every (ios-regex '_10:[0-9]0_' ) then
RP/0/RP0/CPU0:router(config-rp-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rp-elseif)# elseif community matches-every (ios-regex' _20:[0-9]0_ ' ) then
RP/0/RP0/CPU0:router(config-rp-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rp-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
community-set

To define a community set, use the `community-set` command in XR Config mode. To remove the community set, use the `no` form of this command.

```
community-set name
no community-set name
```

**Syntax Description**

- `name`: Name of the community set.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Regular expressions and ranges can be specified to match the communities. An attempt to use a community set that contains a range or regular expression to set a community value is rejected when an attempt to attach such a policy is made.

A community set holds community values for matching against the Border Gateway Protocol (BGP) community attribute. A community is a 32-bit quantity. For notational convenience, each community value must be split in half and expressed as two unsigned decimal integers in the range from 0 to 65535, separated by a colon.

The inline form of a community set also supports parameterization. Each 16-bit portion of the community may be parameterized.

The routing policy language (RPL) provides symbolic names for the standard well-known community values:

- `accept-own` is `0xFFFF0001`, `internet` is `0:0`, `no-export` is `65535:65281`, `no-advertise` is `65535:65282`, and `local-as` is `65535:65283`.

RPL also provides a facility for using wildcards in community specifications. A wildcard is specified by inserting an asterisk (*) in place of one of the 16-bit portions of the community specification, which indicates that any value for that portion of the community matches.

Every community set must contain at least one community value. An empty community set is invalid and the policy configuration system rejects it.

Community sets can be entered in these formats:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#-remark</td>
<td>Remark beginning with '#'</td>
</tr>
<tr>
<td>*</td>
<td>Wildcard (any community or part thereof)</td>
</tr>
<tr>
<td>0-65535</td>
<td>16-bit half-community number</td>
</tr>
<tr>
<td>[</td>
<td>Left bracket to begin range</td>
</tr>
<tr>
<td>accept-own</td>
<td>Accept-Own (BGP well-known community)</td>
</tr>
</tbody>
</table>
The dfa-regex and ios-regex syntax for community set is "'[^[':&<>\s]*:'[^':&<>\s]*']". This means that regex starts with a single-quote (') followed by a string of any character (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by a colon, and a string of any characters (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by single-quote.

### Examples

In the following example, a community set named cset_accept_own is created:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#community-set cset_accept_own
RP/0/RP0/CPU0:router(config-comm)#accept-own
RP/0/RP0/CPU0:router(config-comm)#end-set
```

In the following example, a community set named cset1 is created:

```
RP/0/RP0/CPU0:router(config)# community-set cset1
RP/0/RP0/CPU0:router(config-comm)# 12:34,
RP/0/RP0/CPU0:router(config-comm)# 12:56,
RP/0/RP0/CPU0:router(config-comm)# 12:78,
RP/0/RP0/CPU0:router(config-comm)# internet
RP/0/RP0/CPU0:router(config-comm)# end-set
```

In the following example, a community set named cset2 is created:

```
RP/0/RP0/CPU0:router(config)# community-set cset2
RP/0/RP0/CPU0:router(config-comm)# 123:456,
RP/0/RP0/CPU0:router(config-comm)# no-advertise,
```
In the following example, a community set named cset3 is created. This policy uses wildcards and matches all communities where the autonomous system part of the community is 123.

```
RP/0/RP0/CPU0:router(config)＃ community-set cset3
RP/0/RP0/CPU0:router(config-comm)＃ 123:*
RP/0/RP0/CPU0:router(config-comm)＃ end-set
```
delete community

To delete community attributes associated with a Border Gateway Protocol (BGP) route, use the `delete community` command in route-policy configuration mode.

```
delete community {all|in {community-set-nameinline-community-setparameter}|not in {community-set-nameinline-community-setparameter}}
```

<table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `delete community` command to delete community attributes associated with a BGP route.

**Note**
The `delete community` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

Communities are 32-bit values carried in Border Gateway Protocol (BGP) routes. Each route may have zero or more communities in an unordered list.

You can remove a well-known community (internet, no-export, no-advertise, or local-as) from a route, but this removal must be done explicitly. This command should be used with a degree of caution. In general, few circumstances exist in which you would need to remove a well-known community.
The following example shows how to delete any communities associated with the routes that are listed in either the named community set or inline community set, respectively.

```
RP/0/RP0/CPU0:router(config-rpl)# delete community in my_community_set
RP/0/RP0/CPU0:router(config-rpl)# delete community in (10:[0..50],20:[60..80])
```

The following example shows how to remove all communities including well-known communities.

```
RP/0/RP0/CPU0:router(config-rpl)# delete community in (internet, no-export, no-advertise, local-as, *:*)
```

The following example shows how to remove all communities except for the well-known communities.

```
RP/0/RP0/CPU0:router(config-rpl)# delete community all
```

The following example shows how to delete the well-known community value internet from a route:

```
RP/0/RP0/CPU0:router(config-rpl)# delete community in (internet)
```
delete extcommunity rt

To delete route target (RT) extended community attributes associated with a Border Gateway Protocol (route), use the `delete extcommunity rt` command in route-policy configuration mode.

```
delete extcommunity rt {all|in {extcommunity-set-name|inline-extcommunity-set|parameter} |not in {extcommunity-set-name|inline-extcommunity-set|parameter}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>all</code></td>
<td>Removes all extended communities.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Removes any extended communities associated with the routes that are listed in either the named extended community set or the inline extended community set.</td>
</tr>
<tr>

<tr>
<td><code>not in</code></td>
<td>Removes all extended communities that are not listed in either the named extended community set or the inline extended community set, and are not well-known extended communities.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `delete extcommunity rt` command to delete extended community values from a BGP route target extended community list in a route.

**Note**

The `delete extcommunity rt` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

Extended communities are similar to regular Border Gateway Protocol (BGP) communities but contain more data and have a richer structure for encoding information in them.

Wildcards (*) and regular expressions are allowed for extended community set elements.

The forms of this command that take a named extended community set or an inline extended community set value as arguments are equivalent. They delete any extended communities that are listed in either the named set or the inline set, respectively.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, all extended communities are deleted:

```
RP/0/RP0/CPU0:router(config-rpl)# delete extcommunity rt all
```

In this example, any extended communities that are listed in my-extcommunity-set are deleted:

```
RP/0/RP0/CPU0:router(config-rpl)# delete extcommunity rt in my-extcommunity-set
```

In this example, extended communities associated with the route listed in the named inline extended community sets are deleted:

```
RP/0/RP0/CPU0:router(config-rpl)# delete extcommunity rt in (67:29, 67:55)
```
destination in

To match a destination entry in a named prefix set or inline prefix set, use the `destination in` command in route-policy configuration mode.

```
destination in {prefix-set-name|inline-prefix-set|parameter}
```

**Syntax Description**
- `prefix-set-name` Name of a prefix set.
- `inline-prefix-set` Inline prefix set. The inline prefix set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**
- Release 6.0  This command was introduced.

**Usage Guidelines**
Use the `destination in` command as a conditional expression within an `if` statement to match a destination entry in a named prefix set or inline prefix set.

**Note**
For a list of all conditional expressions available within an `if` statement, see the `if` command.

This command takes either a named prefix set or an inline prefix set value as an argument. The condition returns true if the destination entry matches any entry in the prefix set or inline prefix set. An attempt to match a destination using a prefix set that is defined but contains no elements returns false.

The routing policy language (RPL) provides the ability to test destinations for a match to a list of prefix match specifications using the `in` operator. The `destination in` command is protocol-independent.

In Border Gateway Protocol (BGP), the destination of a route is also known as its network-layer reachability information (NLRI). It comprises a prefix value and a mask length.

RPL supports both 32-bit IPv4 prefixes, specified in dotted-decimal format, and 128-bit IPv6 prefixes, specified in colon-separated hexadecimal format.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
In the following example, a prefix set named `my-prefix-set` is defined and a route policy named `use-destination-in` is created. Within the `use-destination-in` route policy, the `destination in` command
is used within an if statement to learn if the destination is in the prefix-set named my-prefix-set. If it is, then local preference is set to 100. If it is not in my-prefix-set but does match the next prefix specifications, then local preference is set to 200.

```
RP/0/RP0/CPU0:router(config)# prefix-set my-prefix-set
RP/0/RP0/CPU0:router(config-pfx)# 10.0.0.1/32,
RP/0/RP0/CPU0:router(config-pfx)# fe80::203:0:0:0/64,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.0.2/24 le 32
RP/0/RP0/CPU0:router(config-pfx)# end-set
RP/0/RP0/CPU0:router(config)# route-policy use-destination-in
RP/0/RP0/CPU0:router(config-rpl)# if destination in my-prefix-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# elseif destination in (10.0.0.1/32, 10.0.0.2/24 le 32) then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

In the following example, a prefix set named ipv6-prefix-set is defined and a route policy named ipv6-destination-in is created. Within the ipv6-destination-in route policy, the destination in command is used within an if statement to learn if the destination is in the prefix-set named ipv6-prefix-set. If it is, then the next-hop is set to 2001:abcd:fedc::1. If it is not in ipv6-prefix-set but does match the next prefix specifications, then the next-hop is set to 1111:2222:3333:4444:5555:6666:7777:8888.

```
RP/0/RP0/CPU0:router(config)# prefix-set ipv6-prefix-set
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:1::/64,
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:2::/64,
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:3::/64,
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:4::/64
RP/0/RP0/CPU0:router(config-pfx)# end-set
RP/0/RP0/CPU0:router(config)# route-policy ipv6-destination-in
RP/0/RP0/CPU0:router(config-rpl)# if destination in ipv6-prefix-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set next-hop 2001:abcd:fedc::1
RP/0/RP0/CPU0:router(config-rpl-if)# elseif destination in (2001::1, 2002:1:2:3::/64) then
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**done**

To stop executing a policy and accept the route, use the `done` command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `done` command to stop executing the policy and accept the route.

```
**Note**
The `done` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.
```

When encountering a `done` statement the route is passed and no further policy statements are executed. All modifications made to the route prior to the `done` statement are still valid.

```
**Note**
The default action of a route policy is to drop or discard any routes that have not been either explicitly passed or for which no attempt has been made to modify with an action. The routing policy language (RPL) does not have specific "match clauses," which means the default drop behavior is controlled by whether a route has been explicitly passed or an attempt has been to modify the route using an action statement.
```

**Examples**

In the following example, if the destination match succeeds for 29.0.0.0/8 le 32, the execution continues past set community 102:12 and onto the next statement. If the destination match succeeds for 39.0.0.0/8 le 32 execution, then the policy execution stops when in encounters the `done` statement.

```
RP/0/RP0/CPU0:router(config)# route-policy done_st_example
RP/0/RP0/CPU0:router(config-rpl)# if destination in (29.0.0.0/8 le 32) then
  RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:12
  RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# if destination in (39.0.0.0/8 le 32) then
  RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:39
  RP/0/RP0/CPU0:router(config-rpl-if)# done
```
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# if destination in (49.0.0.0/8 le 32) then
RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:49
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# if destination in (59.0.0.0/8 le 32) then
RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:59
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
drop

To discard a route, use the drop command in route-policy configuration mode.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the drop command within a route policy to drop a route.

**Note**
The drop command can be used as an action statement within an if statement. For a list of all action statements available within an if statement, see the if command.

This command causes the route to be dropped. After a route is dropped, no further execution of policy occurs. Therefore, if after executing the first two statements of a policy the drop statement is encountered, the route is discarded and execution stops immediately even when the policy contains further statements.

**Note**
The default action of a route policy is to drop or discard any routes that have not been either explicitly passed or attempted to be modified with an action. The routing policy language (RPL) does not have specific “match clauses,” which means the default drop behavior is controlled by whether a route has been explicitly passed or an attempt has been to modify the route using an action statement.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, any route with a destination address contained within the prefix set pset1 is dropped:

```
RP/0/RP0/CPU0:router(config-rpl)# if destination in pset1 then
RP/0/RP0/CPU0:router(config-rpl-if)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
**edit**

To edit the contents of a route policy, a prefix set, an AS path set, a community set, or an extended community set, use the `edit` command in XR EXEC mode.

```
edit {route-policy|prefix-set|as-path-set|community-set|extcommunity-set} {rt|soo}|policy-global|rd-set}
name [{nano|emacs|vim|inline} {add|prepend|remove} set-element]
```

**Syntax Description**

- **route-policy**: Edits the contents of a route policy.
- **prefix-set**: Edits the contents of a prefix set.
- **as-path-set**: Edits the contents of an AS path set.
- **community-set**: Edits the contents of a community set.
- **extcommunity-set**: Edits the contents of an extended community set of the specified type.
- **rt**: Edits the BGP route target (RT) extended community.
- **soo**: Edits the BGP site of origin (SoS) extended community.
- **policy-global**: Edits the contents of policy-global definitions.
- **rd-set**: Edits the contents of a route-distinguisher set.
- **name**: Name of a route policy, a prefix set, an AS path set, a community set, or an extended community set, RD set, or global parameters.
- **nano**: (Optional) Uses GNU Nano text editor.
- **emacs**: (Optional) Uses Micro Emacs editor.
- **vim**: (Optional) Uses VI Improved editor.
- **inline**: (Optional) Uses the command line.
- **add**: Appends the element to the set.
- **prepend**: Prepends the element to the set.
- **remove**: Removes the element from the set.
- **set-element**: Value of the set element.

**Note**
To inline edit multiple set elements separated with comma, use quotes to club the entries as a single argument. Example:
```
edit extcommunity-set rt rt_set inline add "4:4,5:4"
```

**Command Default**
Default editor is GNU nano text editor

**Command Modes**
XR EXEC mode
Command History

Release 6.0    This command was introduced.

Usage Guidelines

Use the edit command to edit the contents of a route policy, a prefix set, an AS path set, a community set, an extended community set, a global policy, or a route destination set.

After editing with Nano, save the edit buffer and exit the editor using the Ctrl-X keystroke.

After editing with Emacs, save the editor buffer by using the Ctrl-X and Ctrl-S keystrokes. To save and exit the editor, use the Ctrl-X and Ctrl-C keystrokes.

After editing with VIM, to write to a current file and exit use the :wq or :x or ZZ keystrokes. To quit and confirm, use the :q keystrokes. To quit and discard changes, use the :q! keystrokes.

Task ID  Operations

route-policy  read,
             write

Examples

In the following example, the policy_A policy is opened in the editor:

```
RP/0/RP0/CPU0:router# edit route-policy policy_A
```

```
== MicroEMACS 3.8b () == rpl_edit.139281 ==
if destination in (2001::/8) then
  drop
endif
end-policy!
```

```
Parsing.
83 bytes parsed in 1 sec (82)bytes/sec
Committing.
1 items committed in 1 sec (0)items/sec
Updating.
Updated Commit database in 1 sec
```

If there are parse errors, you are asked whether editing should continue:

```
RP/0/RP0/CPU0:router#edit route-policy policy_B
```

```
== MicroEMACS 3.8b () == rpl_edit.141738
route-policy policy_B
  set metric-type type_1
  if destination in (2001::/8) then
    drop
  endif
end-policy!
```

```
Parsing.
105 bytes parsed in 1 sec (103)bytes/sec
% Syntax/Authorization errors in one or more commands.!! CONFIGURATION
```
FAILED DUE TO SYNTAX/AUTHORIZATION ERRORS
set metric-type type_1
if destination in (2001::/8) then
    drop
endif
end-policy
!

Continue editing? [no]:

If you answer **yes**, the editor continues on the text buffer from where you left off. If you answer **no**, the running configuration is not changed and the editing session is ended.

After the policy is opened, it may be manipulated using normal editor commands, then saved and committed to the running configuration.
To end the definition of global parameters and exit global parameter configuration mode, use the `end-global` command in global parameter configuration mode.

**end-global**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Global parameter configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `end-global` command to end the definition of global parameters and exit global parameter configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the `end-global` command ends the definition of global parameters:

```
RP/0/RP0/CPU0:router(config)#policy-global
RP/0/RP0/CPU0:router(config-rp-gl)# glbpatichtype 'ebgp'
RP/0/RP0/CPU0:router(config-rp-gl)# glbtag '100'
RP/0/RP0/CPU0:router(config-rp-gl)# end-global
```
end-policy

To end the definition of a route policy and exit route-policy configuration mode, use the `end-policy` command in route-policy configuration mode.

end-policy

Syntax Description
This command has no arguments or keywords.

Command Default
No default behavior or values

Command Modes
Route-policy configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use the `end-policy` command to end the definition of a route policy and exit route-policy configuration mode.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

In the following example, the `end-policy` command ends the definition of a route policy:

```
RP/0/RP0/CPU0:router(config)#route-policy med-to-local-pref
RP/0/RP0/CPU0:router(config-rpl)#if med eq 150 then
RP/0/RP0/CPU0:router(config-elseif)# set local-preference 10
RP/0/RP0/CPU0:router(config-elseif)# elseif med eq 200 then
RP/0/RP0/CPU0:router(config-elseif)# set local-preference 60
RP/0/RP0/CPU0:router(config-elseif)# elseif med eq 250 then
RP/0/RP0/CPU0:router(config-elseif)# set local-preference 0
RP/0/RP0/CPU0:router(config-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
end-set

To end the definition of an AS path set, a prefix set, a community set, an extended community set, or an RD set and return to XR Config mode, use the `end-set` command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

AS path set configuration
Prefix set configuration
Community set configuration
Extended community set configuration
Route distinguisher set configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `end-set` command to end the definition of an AS path set, a prefix set, a community set, or an extended community set.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the `end-set` command ends the definition of an AS path set named `aset1`:

```
RP/0/RP0/CPU0:router(config)# as-path-set aset1
RP/0/RP0/CPU0:router(config-as)# ios-regex '__42$'
RP/0/RP0/CPU0:router(config-as)# ios-regex '__127$'
RP/0/RP0/CPU0:router(config-as)# end-set
```

The following example shows how to create an RD set called `my_rd_set` and use the `end-set` command to end the definition:

```
RP/0/RP0/CPU0:router(config)# rd-set my_rd_set
RP/0/RP0/CPU0:router(config-rd)# 172.16.0.0/16:*,
RP/0/RP0/CPU0:router(config-rd)# 172.17.0.0/16:100,
RP/0/RP0/CPU0:router(config-rd)# 192:*,
RP/0/RP0/CPU0:router(config-rd)# 192:100
```
RP/0/RP0/CPU0:router(config-rd)# end-set
extcommunity rt is-empty

To check if a Border Gateway Protocol (BGP) route has route target (RT) extended community attributes associated with it, use the `extcommunity rt is-empty` command in route-policy configuration mode.

### Syntax Description
This command has no arguments or keywords.

### Command Default
No default behavior or value

### Command Modes
Route-policy configuration

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
Use the `extcommunity rt is-empty` command as a conditional expression within an `if` statement to check if a BGP route has extended community attributes associated with it.

#### Note
For a list of all conditional expressions available within an `if` statement, see the `if` command.

The `is-empty` operator takes no arguments and evaluates to true if the route has no extended community attributes associated with it.

### Task ID
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples
In the following example, if the extended community is empty, then the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config)# route-policy extcommunity-is-empty-example
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity rt is-empty then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100

RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity rt matches-any

To match any element of a Border Gateway Protocol (BGP) route target (RT) extended community set, use the `extcommunity rt matches-any` command in route-policy configuration mode.

```
extcommunity rt matches-any {extcommunity-set-name inline-extcommunity-set parameter}
```

**Syntax Description**

- `extcommunity-set-name` Name of an RT extended community set.
- `inline-extcommunity-set` Inline RT extended community set. The inline extended community set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `extcommunity rt matches-any` command as a conditional expression within an `if` statement to match elements of an extended community set.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the `matches-any` operator evaluates as true if at least one extended community in the route matches an extended community specification in the named or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, an extended community set named `my-extcommunity-set` and a parameterized route-policy named `my-extcommunity-set-example($tag,$ip)` are defined. The `extcommunity rt matches-any` command is used in an `if` statement such that if at least one extended community in the route matches an extended community specification in the named set, then the local preference is set to 100. If there is no extended community in the route that matches any of the
specifications in the named set, then the condition evaluates as false and the extended community is compared to the inline extended sets.

```
RP/0/RP0/CPU0:router(config)# extcommunity-set rt my-extcommunity-set
RP/0/RP0/CPU0:router(config-ext)# 10:615,
RP/0/RP0/CPU0:router(config-ext)# 10:6150,
RP/0/RP0/CPU0:router(config-ext)# 15.15.15.15
RP/0/RP0/CPU0:router(config-ext)# end-set

RP/0/RP0/CPU0:router(config)# route-policy my-extcommunity-set-example($tag,$ip)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity rt matches-any my-extcommunity-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# elseif extcommunity rt matches-any (10:20, 10:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif extcommunity rt matches-any ($ip:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif extcommunity rt matches-any (2.3.4.5:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 400
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity rt matches-every

To match every element of a Border Gateway Protocol (BGP) route target (RT) extended community set, use the `extcommunity rt matches-every` command in route-policy configuration mode.

```
extcommunity rt matches-every {extcommunity-set-name|inline-extcommunity-set|parameter}
```

**Syntax Description**

- `extcommunity-set-name`: Name of an RT extended community set.
- `inline-extcommunity-set`: Inline RT extended community set. The inline extended community set must be enclosed in parentheses.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 6.0     | This command was introduced.

**Usage Guidelines**

Use the `extcommunity rt matches-every` command as a conditional expression within an `if` statement to match every element of an RT extended community set.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the `matches-every` operator evaluates as true if every extended community value in the extended community attribute for the route matches at least one element of the extended community set or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Examples**

In the following example, an extended community set named `my-extcommunity-set` and a parameterized route policy named `extcommunity-matches-every-example ($as, $tag)` are defined. The condition `extcommunity rt matches-every` is used in an `if` statement in this policy. If it evaluates to true, the local-preference value is set to 100. If it evaluates to false, the extended community is
evaluated using an inline set. If that condition evaluates to true, the local-preference value is set to 200. If it evaluates to false, the local-preference value is set to 300.

RP/0/RP0/CPU0:router(config)# extcommunity-set rt my-extcommunity-set
RP/0/RP0/CPU0:router(config-ext)# 10:20,
RP/0/RP0/CPU0:router(config-ext)# 10:30,
RP/0/RP0/CPU0:router(config-ext)# 10:40
RP/0/RP0/CPU0:router(config-ext)# end-set
RP/0/RP0/CPU0:router(config)# route-policy extcommunity-matches-every-example($as,$tag)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity rt matches-every my-extcommunity-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# elseif extcommunity rt matches-every (10:20, 10:$tag, $as:30) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
extcommunity rt matches-within

To match at least one element of an extended community set of a Border Gateway Protocol (BGP) route target (RT), use the `extcommunity rt matches-within` command in route-policy configuration mode.

```
extcommunity rt matches-within \{rt-type-extcommunity-set-name\}inline-extcommunity-set\|parameter
```

**Syntax Description**

- `rt-type-extcommunity-set-name` Name of an RT extended community set.
- `inline-extcommunity-set` Inline RT extended community set, enclosed in parentheses.
- `parameter` Parameter name preceded with a “$” symbol.

**Command Default**
None

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `extcommunity rt matches-within` command as a conditional expression within an if statement to match elements of an extended community set.

**Note**

For a list of all conditional expressions available within an if statement, see the `if` command.

A simple condition using the `matches-within` operator evaluates as true if all the elements in extended community from the route match any element in the extended community set. For example, let ‘c’ be the RTs from the route and ‘m’ be the RT set from the policy. With the `extcommunity rt matches-within` configuration, each value in ‘c’ must match any (or at least one) value in ‘m’.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In the following example, an extended community set named `my-extcommunity-set` and a parameterized route-policy named `my-extcommunity-set-example($tag,$ip)` are defined. The `extcommunity rt matches-within` command is used in an if statement such that if all extended community values in the route match any element of the extended community specification in the named set, then the local preference is set to 100.

```
RP/0/RP0/CPU0:router(config)#extcommunity-set rt my-extcommunity-set
```
RP/0/RP0/CPU0:router(config-ext)#10:615,
RP/0/RP0/CPU0:router(config-ext)#10:6150,
RP/0/RP0/CPU0:router(config-ext)#15.15.15.15
RP/0/RP0/CPU0:router(config-ext)#end-set
RP/0/RP0/CPU0:router(config)#route-policy my-extcommunity-set-example($tag,$ip)
RP/0/RP0/CPU0:router(config-rpl)#if extcommunity rt matches-within my-extcommunity-set then
RP/0/RP0/CPU0:router(config-rpl-if)#set local-preference 100
extcommunity-set cost

To define a cost extended community set, use the **extcommunity-set cost** command in XR Config mode. To remove the cost extended community set, use the **no** form of this command.

```
extcommunity-set cost name
no extcommunity-set cost name
```

**Syntax Description**

`name` Name of a cost extended community set. The `name` argument is case sensitive, can contain any alphanumeric characters, and can be up to 63 characters in length.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **extcommunity-set cost** command to define a cost extended community set.

An extended community set is analogous to a community set except that it contains extended community values instead of regular community values. Extended community values are 64-bit structured values. An extended community set also supports named forms and inline forms.

Cost extended communities can be entered in these formats:

- `#-remark` --- Remark beginning with '#'
- `0-255` --- Decimal number
- `abort` --- Discard RPL definition and return to top level config
- `end-set` --- End of set definition
- `exit` --- Exit from the submode
- `igp:` --- Cost Community with IGP as point of insertion
- `pre-bestpath:` --- Cost Community with Pre-Bestpath as point of insertion
- `show` --- Show partial RPL configuration

Multiple cost community set clauses can be configured in each route policy block or sequence. Each cost community set clause must have a different ID (0-255). The cost community set clause with the lowest cost-value is preferred by the best path selection process when all other attributes are equal.

As with community sets, the inline form supports parameterization within parameterized policies. Either portion of the extended community value can be parameterized.

Every extended community set must contain at least one extended community value. Empty extended community sets are invalid and the policy configuration system rejects them.

Wildcards (*) and regular expressions are allowed for extended community set elements.
In the following example, a cost extended community set named extcomm-cost is defined:

RP/0/RP0/CPU0:router(config)# extcommunity-set cost extcomm-cost
RP/0/RP0/CPU0:router(config-ext)# IGP:90:914,
RP/0/RP0/CPU0:router(config-ext)# Pre-Bestpath:91:915
RP/0/RP0/CPU0:router(config-ext)# end-set
extcommunity-set rt

To define a Border Gateway Protocol (BGP) route target (RT) extended community set, use the `extcommunity-set rt` command in XR Config mode. To remove the RT community set, use the `no` form of this command.

```
extcommunity-set rt  name
no extcommunity-set rt  name
```

**Syntax Description**

- `name` Name of an RT extended community set.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `extcommunity-set rt` command to define an RT extended community set for BGP. Regular expressions and ranges can be specified to match the extended communities. Regular expressions and ranges can be specified in an extended community set to support the matching of communities. An attempt to use an extended community set that contains a range or regular expression to set an extended community set value is rejected when an attempt to attach such a policy is made.

An extcommunity set RT holds RT extended community values to match against the Border Gateway Protocol (BGP) RT extended community attribute. RT extended communities can be entered in these formats:

- `#-remark` --- Remark beginning with '#'
- `*` --- Wildcard (any community or part thereof)
- `1-4294967295` --- 32-bit decimal number
- `1-65535` --- 16-bit decimal number
- `A.B.C.D/M:N` --- Extended community - IPv4 prefix format
- `A.B.C.D:N` --- Extended community - IPv4 format
- `ASN:N` --- Extended community - ASPLAIN format
- `X.Y:N` --- Extended community - ASDOT format
- `dfa-regex` --- DFA (deterministic finite automata) style regular expression
- `ios-regex` --- Traditional IOS style regular expression
The dfreg and ios-regex syntax for community set is "[''][^':&<>\s]*:[^':&<>\s]*[']'". This means that regex starts with a single-quote (”) followed by a string of any character (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by a colon, and a string of any characters (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by single-quote.

\(N\) is a number within the range of 1 to 65535.

**Examples**

In the following example, an RT extended community set named extcomm-rt is defined:

```
RP/0/RP0/CPU0:router(config)# extcommunity-set rt extcomm-rt
RP/0/RP0/CPU0:router(config-ext)# 10002:666
RP/0/RP0/CPU0:router(config-ext)# 10.0.0.2:666
RP/0/RP0/CPU0:router(config-ext)# end-set
```
extcommunity-set soo

To define a Border Gateway Protocol (BGP) Site-of-Origin (SoO) extended community set, use the `extcommunity-set soo` command in XR Config mode mode. To remove the SoO extended community set, use the `no` form of this command.

```
extcommunity-set soo name
no extcommunity-set soo name
```

**Syntax Description**

- `name` Name of an SoO extended community set.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `extcommunity-set soo` command to define an SoO extended community set.

An extcommunity set soo holds SoO extended community values to match against the Border Gateway Protocol (BGP) SoO extended community attribute. SoO extended communities can be entered in these formats:

- `#-remark` --- Remark beginning with '#'
- `*` --- Wildcard (any community or part thereof)
- `1-4294967295` --- 32-bit decimal number
- `1-65535` --- 16-bit decimal number
- `A.B.C.D/M:N` --- Extended community - IPv4 prefix format
- `A.B.C.D:N` --- Extended community - IPv4 format
- `ASN:N` --- Extended community - ASPLAIN format
- `X.Y:N` --- Extended community - ASDOT format
- `abort` --- Discard RPL definition and return to top level config
- `dfa-regex` --- DFA style regular expression
- `end-set` --- End of set definition
- `exit` --- Exit from the submode
- `ios-regex` --- Traditional IOS style regular expression
- `show` --- Show partial RPL configuration

`N` is a site-specific number.
In the following example, a SoO extended community set named extcomm-soo is defined:

```
RP/0/RP0/CPU0:router(config)# extcommunity-set soo extcomm-soo
RP/0/RP0/CPU0:router(config-ext)# 66:60001,
RP/0/RP0/CPU0:router(config-ext)# 77:70001,
RP/0/RP0/CPU0:router(config-ext)# 88:80001,
RP/0/RP0/CPU0:router(config-ext)# 99:90001,
RP/0/RP0/CPU0:router(config-ext)# 100.100.100.1:153
RP/0/RP0/CPU0:router(config-ext)# end-set
```
extcommunity soo is-empty

To determine if a Border Gateway Protocol (BGP) route has any Site-of-Origin (SoO) extended communities associated with it, use the **extcommunity soo is-empty** command in route-policy configuration mode.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the **extcommunity soo is-empty** command as a conditional expression within an *if* statement to check if a BGP SoO route has extended community attributes associated with it.

**Note**
For a list of all conditional expressions available within an *if* statement, see the *if* command.

The *is-empty* operator takes no arguments and evaluates to true if the route has no SoO extended community attributes associated with it.

**Task ID**
Task ID | Operations
--- | ---
route-policy | read, write

**Examples**
In the following example, if a route has no SoO extended communities associated with it, the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config)# route-policy extcommunity-is-empty-example
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity soo is-empty then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
To match any element of a Border Gateway Protocol (BGP) Site-of-Origin (SoO) extended community set, use the `extcommunity soo matches-any` command in route-policy configuration mode.

```
extcommunity soo matches-any {extcommunity-set-name inline-extcommunity-set parameter}
```

**Syntax Description**

- `extcommunity-set-name` Name of a SoO extended community set.
- `inline-extcommunity-set` Inline SoO extended community set. The inline extended community set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

Use the `extcommunity soo matches-any` command as a conditional expression within an `if` statement to match elements of an extended community set.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the `matches-any` operator evaluates as true if at least one extended community in the route matches an extended community specification in the named or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Examples**

In the following example, an SoO extended community set named extcomm-soo and a parameterized route policy named my-extcommunity-set-example($Tag,$Ip) are defined.

The condition route policy named extcommunity soo matches-any is used in an `if` statement in this policy. If it evaluates to true, the local preference value is set to 100.
If it evaluates to false, the SoO extended community is evaluated using an inline set. If it evaluates to true, the local preference value is set to 200.

If it evaluates to false, the SoO extended community is evaluated using a different inline set. If it evaluates to true, the local preference value is set to 300.

If it evaluates to false, the SoO extended community is evaluated using a different inline set. If it evaluates to true, the local preference value is set to 400.

```
RP/0/RP0/CPU0:router(config)# extcommunity-set soo extcomm-soo
RP/0/RP0/CPU0:router(config-ext)# 66:60001,
RP/0/RP0/CPU0:router(config-ext)# 77:70001,
RP/0/RP0/CPU0:router(config-ext)# 88:80001,
RP/0/RP0/CPU0:router(config-ext)# 99:90001,
RP/0/RP0/CPU0:router(config-ext)# 100.100.100.1:153
RP/0/RP0/CPU0:router(config-ext)# end-set

RP/0/RP0/CPU0:router(config)# route-policy my-extcommunity-set-example($tag,$ip)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity soo matches-any extcomm-soo then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif extcommunity soo matches-any (10:20, 10:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif extcommunity soo matches-any ($ip:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif extcommunity soo matches-any (2.3.4.5:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 400
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity soo matches-every

To match every element of a Border Gateway Protocol (BGP) Site-of-Origin (SoO) extended community set, use the `extcommunity soo matches-every` command in route-policy configuration mode.

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extcommunity-set-name</code></td>
<td>Name of a SoO extended community set.</td>
</tr>
<tr>
<td><code>inline-extcommunity-set</code></td>
<td>Inline SoO extended community set. The inline extended community set must be enclosed in parentheses.</td>
</tr>
<tr>
<td><code>parameter</code></td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `extcommunity soo matches-every` command as a conditional expression within an `if` statement to match every element of a SoO extended community set.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the `matches-every` operator evaluates as true if every extended community value in the extended community attribute for the route matches at least one element of the extended community set or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Examples**

In the following example, an extended community set named `my-extcomm-rt-set` and a parameterized route policy named `extcommunity-matches-every-example($as, $tag)` are defined. The condition `extcommunity soo matches-every` is used in an `if` statement in this policy and if it evaluates to true, the local-preference value is set to 100. If it evaluates to false, the extended community is evaluated using an inline set. If that condition evaluates to true, the local-preference value is set to 200. If it evaluates to false, the local-preference value is set to 300.

```
RP/0/RP0/CPU0:router(config) extcommunity-set soo my-extcomm-rt-set
RP/0/RP0/CPU0:router(config-ext) 10:20,
RP/0/RP0/CPU0:router(config-ext) 10:30,
```
RP/0/RP0/CPU0:router(config-ext)# 10:40
RP/0/RP0/CPU0:router(config-ext)# end-set

RP/0/RP0/CPU0:router(config)# route-policy extcommunity-matches-every-example($as, $tag)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity soo matches-every my-extcomm-rt-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# elseif extcommunity soo matches-every (10:20, 10:$tag, $as:30) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)# else
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
To decide which actions or dispositions should be taken for a given route, use the `if` command in route-policy configuration mode.

```plaintext
if conditional-expression then action-statement [action-statement] [elseif conditional-expression then action-statement [action-statement]] [else action-statement [action-statement]] endif
```

### Syntax Description

- **conditional-expression**: Expression to decide which actions or dispositions should be taken for the given route.
- **then**: Executes an action statement if the `if` condition is true.
- **elseif**: Strings together a sequence of tests.
- **else**: Executes an action statement if the `if` condition is false.
- **endif**: Ends the `if` statement.
- **action-statement**: Sequence of operations that modify a route.

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

**Release**  
**Modification**  
Release 6.0  This command was introduced.

### Usage Guidelines

The `if` command uses a conditional expression to decide which actions or dispositions should be taken for a given route. Table 1: Conditional Expressions, on page 67 lists the conditional expressions.

An action statement is a sequence of operations that modify a route, most of which are distinguished by the `set` keyword. In a route policy, these operations can be grouped. Table 2: Action Statements, on page 68 lists the action statements.

Apply Condition policies allow usage of a route-policy in an "if" statement of another route-policy.

```plaintext
Route-policy policy_name
If apply policyA and apply policyB then
Set med 100
Else if not apply policyD then
Set med 200
Else
Set med 300
Endif
End-policy
```

</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, any route whose AS path is in the set as-path-set-1 is dropped:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path in as-path-set-1 then
RP/0/RP0/CPU0:router(config-rpl-if)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
```

The contents of the `then` clause may be an arbitrary sequence of action statements.

The following example shows an `if` statement with two action statements:

```
RP/0/RP0/CPU0:router(config-rpl)# if origin is igp then
RP/0/RP0/CPU0:router(config-rpl-if)# set med 42
RP/0/RP0/CPU0:router(config-rpl-if)# prepend as-path 73 5
RP/0/RP0/CPU0:router(config-rpl-if)# endif
```

The `if` command also permits an `else` clause to be executed if the expression is false, as follows:

```
RP/0/RP0/CPU0:router(config-rpl)# if med eq 200 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 10
RP/0/RP0/CPU0:router(config-rpl-if)# else
RP/0/RP0/CPU0:router(config-rpl-else)# set community (12:34) additive
RP/0/RP0/CPU0:router(config-rpl-else)# endif
```

The routing policy language (RPL) also provides syntax using the `elseif` command to string together a sequence of tests, as shown in the following example:

```
RP/0/RP0/CPU0:router(config-rpl)# if med eq 150 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 10
RP/0/RP0/CPU0:router(config-rpl-if)# elseif med eq 200 then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 60
```
The statements within an `if` statement may themselves be `if` statements, as shown in this example:

```plaintext
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif med eq 250 then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 110
RP/0/RP0/CPU0:router(config-rpl-elseif)# else
RP/0/RP0/CPU0:router(config-rpl-else)# set local-preference 0
RP/0/RP0/CPU0:router(config-rpl-else)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```

The policy configuration shown sets the value of the local preference attribute to 100 on any route that has a community value of 12:34 or 56:78 associated with it. However, if any of these routes has a Multi Exit Descriminator (MED) value of 150, then each route with both the community value of 12:34 or 56:78 and a MED of 150 is dropped.

```plaintext
RP/0/RP0/CPU0:router(config-rpl)# if community matches-any (12:34, 56:78) then
RP/0/RP0/CPU0:router(config-rpl-if)# if med eq 150 then
RP/0/RP0/CPU0:router(config-rpl-if)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
if route-aggregated

To match the aggregated routes from the other routes, use the **if route-aggregated** command in route policy configuration mode.

```plaintext
if route-aggregated
```

### Syntax Description

<table>

Wed Jul 8 16:08:23.436 IST
```
**local-preference**

To compare the local-preference attribute of a BGP route to an integer value or a parameterized value, use the local-preference command in route-policy configuration mode.

```
local-preference {eq|is|ge|le} {number|parameter}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eq</td>
<td>Equal to; exact match</td>
</tr>
<tr>
<td>is</td>
<td>Greater than or equal to; less than or equal to</td>
</tr>
<tr>
<td>ge</td>
<td>Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.</td>
</tr>
<tr>
<td>le</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

Use the `local-preference` command as a conditional expression within an `if` statement to compare the local-preference attribute to an integer value or a parameterized value.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

The MED is a 32-bit unsigned integer. The `eq` operation compares the local-preference to either a static value or a parameterized value passed to a parameterized policy for equality with that value. A greater than or equal to comparison can also be done with the `ge` operator, and a less than or equal to comparison can be performed using the `le` operator.

**Examples**

The following example shows that if the `local-preference` is 10, local-preference is set to 100:

```
RP/0/RSP0RP0/CP00:router(config-rpl)# if local-preference eq 10 then
RP/0/RSP0RP0/CP00:router(config-rpl-if)# set weight 100
RP/0/RSP0RP0/CP00:router(config-rpl-if)# endif
RP/0/RSP0RP0/CP00:router(config-rpl)#
```
To compare the Multi Exit Discriminator (MED) to an integer value or a parameterized value or compare the MED attribute of a BGP route to an integer value, use the `med` command in route-policy configuration mode.

```
med {eq|is|ge|le} {number|parameter}
```

### Syntax Description

- **eq**: Equal to; exact match; greater than or equal to; less than or equal to.
- **is**: Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.
- **ge**: Parameter name. The parameter name must be preceded with a “$.”

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

**Release** | **Modification**
--- | ---
Release 6.0 | This command was introduced.

### Usage Guidelines

Use the `med` command as a conditional expression within an `if` statement to compare the MED to an integer value or a parameterized value.

For a list of all conditional expressions available within an `if` statement, see the `if` command.

The MED is a 32-bit unsigned integer. The `eq` operation compares the MED to either a static value or a parameterized value passed to a parameterized policy for equality with that value. A greater than or equal to comparison can also be done with the `ge` operator, and a less than or equal to comparison can be performed using the `le` operator.

### Examples

The following example shows that if the `med` commands match, the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config-rpl)# if med eq 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
next-hop in

To compare the next-hop associated with the route to data contained in either an inline or a named prefix set, use the next-hop in command in route-policy configuration mode.

```
next-hop in {prefix-set-name|inline-prefix-set|parameter}
```

**Syntax Description**

- `prefix-set-name` Name of a prefix set.
- `inline-prefix-set` Inline prefix set. The inline prefix set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Release 6.0 This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the next-hop in command as a conditional expression within an if statement to compare the next-hop associated with the route to data contained in either an inline or a named prefix set. The result is true if any value in the prefix set matches the next-hop of the route. A comparison that refers to a named prefix set that has no elements in it returns false.

**Note**

For a list of all conditional expressions available within an if statement, see the if command.

The next-hop is an IPv4 address entered as a dotted-decimal or an IPv6 address entered as a colon-separated hexadecimal.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows that if the next-hop in commands match, the local preference is set to 100

```
RP/0/RP0/CPU0:router(config-rpl)# if next-hop in some-prefix-set then
RP/0/RP0/CPU0:router(config-rpl-if)# if next-hop in (10.0.0.5, fe80::230/64) then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 0
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
of prefix in

To configure an outbound route filter (ORF), use the `orf prefix in` command in route-policy configuration mode.

**orf prefix in {prefix-set-name|inline-prefix-set}**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix-set-name</td>
<td>Name of a prefix set.</td>
</tr>
<tr>
<td>inline-prefix-set</td>
<td>Inline prefix set. The inline prefix set must be enclosed in parentheses.</td>
</tr>
</tbody>
</table>

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `orf prefix in` command to match a prefix in a prefix set or an inline prefix set.

This command takes either a named prefix set or an inline prefix set value as an argument. It returns true if the destination NLRI matches any entry in the prefix set. An attempt to match destination using a prefix set that is defined but contains no elements returns false.

This command is used in the context of the orf route-policy attach point in BGP. The destination of a route is also known in Border Gateway Protocol (BGP) as its network-layer reachability information (NLRI). It comprises a prefix value and a mask length. The routing policy language (RPL) provides one operation on prefixes, testing them for matching against a list of prefix-match specifications using the `in` operator.

**Examples**

In the following example, the prefix set orfpreset1 and the route policy named orfpolicy are defined. Next, the orfpolicy is applied to the neighbor orf attach point.

If the prefix of the route matches any of the prefixes specified in orfpreset1 (211.105.1.0/24, 211.105.5.0/24, 211.105.11.0/24), then the prefix is dropped. If the prefix matches in (211.105.3.0/24, 211.105.7.0/24, 211.105.13.0/24), then the prefix is accepted. In addition to this inbound filtering, BGP sends these prefix entries to the upstream neighbor indicating a permit or deny so that the neighbor can make the same filter updates.

```
RP/0/RP0/CPU0# prefix-set orfpreset1
RP/0/RP0/CPU0(config-pfx)# 211.105.1.0/24,
RP/0/RP0/CPU0(config-pfx)# 211.105.5.0/24,
RP/0/RP0/CPU0(config-pfx)# 211.105.11.0/24
RP/0/RP0/CPU0(config-pfx)# end-set
!
RP/0/RP0/CPU0# route-policy orfpolicy
RP/0/RP0/CPU0(config-rpl)# if orf prefix in orfpreset1 then
RP/0/RP0/CPU0(config-rpl-if)# drop
RP/0/RP0/CPU0(config-rpl-if)# endif
RP/0/RP0/CPU0(config-rpl)# if orf prefix in (211.105.3.0/24, 211.105.7.0/24,
```
211.105.13.0/24) then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
!
RP/0/RP0/CPU0:router(config)# router bgp 2
RP/0/RP0/CPU0:router(config-bgp)# neighbor 1.1.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 3
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# orf route-policy orfpolicy
# origin is

To match a specific origin type, use the `origin is` command in route-policy configuration mode.

```
origin is {igp|egp|incomplete|parameter}
```

## Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>igp</td>
<td>Specifies Interior Gateway Protocol.</td>
</tr>
<tr>
<td>egp</td>
<td>Specifies Exterior Gateway Protocol.</td>
</tr>
<tr>
<td>incomplete</td>
<td>Specifies that Border Gateway Protocol (BGP) first learned the route by means other than BGP or Interior Gateway Protocol (IGP); for example, the route is learned through configuration.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

## Command Default

No default behavior or values

## Command Modes

Route-policy configuration

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

Use the `origin is` command as a conditional expression within an `if` statement to test the value of the origin attribute.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

The origin of a BGP route is an enumeration; it is `igp`, `egp`, or `incomplete`.

This command can be parameterized.

## Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

## Examples

In the following example, the origin is tested within an `if` statement to learn if it is either `igp` or `egp`:

```
RP/0/RP0/CPU0:router(config-rpl)# if origin is igp or origin is egp then
```

In the following example, a parameter is used to match a specific origin type:

```
RP/0/RP0/CPU0:router(config)# route-policy bar($origin)
RP/0/RP0/CPU0:router(config-rpl)# if origin is $origin then
```
RP/0/RP0/CPU0:router(config-rpl-if)# set med 20
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#

origin is
ospf-area

To match a specific ospf area, use the ospf-area command in route-policy configuration mode.

ospf-area [all-paths] {in|is}

**Syntax Description**

- **is** Specify the explicit area-id.
- **in** Specify a list of area-id or area-set. Multiple areas can be specified separated by a comma (,).
- **all-paths** Used for routes with multiple paths. A match is made if area for every path of the route is configured in the route-policy.

**Command Default**

None

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The route policy define by using ospf-area is useful in redistributing routes from a specific area of a routing domain into OSPF. After the route policy is created, use the redistribute ospf route-policy command for route redistribution.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

In the following example, an explicit area is specified as the matching criteria.

```
RP/0/RP0/CPU0:router(config-rpl)# if ospf-area is 10 then pass else drop endif
```

In the following example, a collection of areas is specified as the matching criteria.

```
RP/0/RP0/CPU0:router(config-rpl)# if ospf-area in (5,6,255.255.10.2) then pass else drop endif
```

In the following example, an area set is specified as the matching criteria. As a pre-requisite, the area set must be defined.

```
RP/0/RP0/CPU0:router(config)# ospf-area-set S1
RP/0/RP0/CPU0:router(config-ospf-area)# 1 , 2.2.2.2 end-set
RP/0/RP0/CPU0:router(config)# route-policy P1
```
if ospf-area in S1 then pass else drop endif
pass

To pass a route for further processing, use the pass command in route-policy configuration mode.

Syntax Description
This command has no arguments or keywords.

Command Default
No default behavior or values

Command Modes
Route-policy configuration

Command History
Release 6.0 This command was introduced.

Usage Guidelines
Use the pass command to signify that even though this route has not been modified, the user wants to continue executing in this policy block.

Note
The pass command can be used as an action statement within an if statement. For a list of all action statements available within an if statement, see the if command.

When a policy block has finished executing, any route that has been modified in this policy block or has received a pass disposition in this policy block passes the policy and execution finishes for that policy. If this policy block is applied from within another policy block and the route is either passed or modified, then execution continues in the policy block that applied this policy block.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples
The following example shows how to accept the route unconditionally without modifying it:

```
RP/0/RP0/CPU0:router(config-rpl) # pass
```

This example accepts the route unconditionally, without modifying it, if the destination is in prefix-set permitted:

```
RP/0/RP0/CPU0:router(config-rpl) # if destination in permitted then
RP/0/RP0/CPU0:router(config-rpl-if) # pass
RP/0/RP0/CPU0:router(config-rpl-if) # endif
RP/0/RP0/CPU0:router(config-rpl) #
```
**path-type is**

To match path types, use the **path-type is** command in route-policy configuration mode.

```
path-type is {ibgp|ebgp}parameter
```

**Syntax Description**
- **ibgp** Specifies an internal BGP path.
- **ebgp** Specifies an external BGP path.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**
- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**
Use the **path-type is** command as a conditional expression within an **if** statement to match path types.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

**Examples**
In the following example, if the path is an external BGP path the route is accepted:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_A
RP/0/RP0/CPU0:router(config-rpl)# if path-type is ebgp then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# else
RP/0/RP0/CPU0:router(config-rpl-else)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**policy-global**

To define global parameters and enter global parameter configuration mode, use the `policy-global` command in XR Config mode. To remove global parameters, use the `no` form of this command.

```
policy-global
no policy-global
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `policy-global` command to define global parameters and enter global parameter configuration mode.

RPL supports the definition of systemwide global parameters that can be used inside a policy definition. The global parameter values can be used directly inside a policy definition similar to the local parameters of parameterized policy. When a parameterized policy has a parameter name “collision” with a global parameter name, parameters local to policy definition take precedence, effectively ‘masking off’ global parameters. In addition, a validation mechanism is in place to prevent the deletion of a particular global parameter if it is referred by any policy. For more information on global parameters and parameterization, see the Implementing Routing Policy module of the Routing Configuration Guide for Cisco NCS 5000 Series Routers

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure global parameters:

```
RP/0/RP0/CPU0:router(config)# policy-global
RP/0/RP0/CPU0:router(config-rp-gl)# glbpathtype 'ebgp'
RP/0/RP0/CPU0:router(config-rp-gl)# glbtag '100'
RP/0/RP0/CPU0:router(config-rp-gl)# end-global
```

In the following example, the `globalparam` argument makes use of the global parameters `gbpathtype` and `glbtag` defined above and is defined for a nonparameterized policy:

```
RP/0/RP0/CPU0:router(config)# route-policy globalparam
RP/0/RP0/CPU0:router(config-rpl)# if path-type is $gbpathtype then
RP/0/RP0/CPU0:router(config-rpl)# set tag $glbtag
RP/0/RP0/CPU0:router(config-rpl)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
prefix-set

To enter prefix set configuration mode and define a prefix set for contiguous and non-contiguous set of bits, use the `prefix-set` command in XR Config mode. To remove a named prefix set, use the `no` form of this command.

```
 prefix-set name
 no prefix-set name
```

**Syntax Description**
- `name`  
  Name of a prefix set.

**Command Default**
None

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `prefix-set` command to enter prefix set configuration mode and define a prefix set.

A prefix set is a comma-separated list of prefix match specifications. It holds IPv4 or IPv6 prefix match specifications, each of which has four parts: an address, a mask length, a minimum matching length, and a maximum matching length. The address is required, but the other three parts are optional. The address is a standard four-part, dotted-decimal numeric IPv4 address or a colon-separated hexadecimal IPv6 address. The mask length, if present, is a nonnegative decimal integer in the range from 0 to 32 for IPv4 prefixes or 0 to 128 for IPv6 prefixes following the address and separated from it by a slash. The optional minimum matching length follows the address and optional mask length and is expressed as the keyword `ge` (mnemonic for greater than or equal to), followed by a nonnegative decimal integer in the range from 0 to 32 for IPv4 or 0 to 128 for IPv6. The optional maximum matching length follows the rest and is expressed by the keyword `le` (mnemonic for less than or equal to), followed by yet another nonnegative decimal integer in the range from 0 to 32 for IPv4 or 0 to 128 for IPv6. A syntactic shortcut for specifying an exact length for prefixes to match is the `eq` keyword, mnemonic for equal to.

If a prefix match specification has no mask length, then the default mask length is 32 for IPv4 or 128 for IPv6. The default minimum matching length is the mask length. If a minimum matching length is specified, then the default maximum matching length must be less than 32 for IPv4 prefixes or 128 for IPv6 prefixes. Otherwise, if neither a minimum nor maximum length is specified, the default maximum length is the mask length.

A prefix set is a list of prefix match specifications. It holds IPv4 or IPv6 prefix match specifications, each of which has two parts: an address and a mask. The address and mask is a standard dotted-decimal IPv4 or colon-separated hexadecimal IPv6 address. The prefix set allows the specifying of contiguous and non-contiguous set of bits that must be matched in any route. The set of bits to be matched are provided in the form of a mask in which a binary 0 means a mandatory match and a binary 1 means a 'do not match' condition.
Examples

The following example shows a prefix set named legal-ipv4-prefix-examples:

```
RP/0/RP0/CPU0:router (config)# prefix-set legal-ipv4-prefix-examples
RP/0/RP0/CPU0:router (config-pfx)# 10.0.1.1,  
RP/0/RP0/CPU0:router (config-pfx)# 10.0.2.0/24,  
RP/0/RP0/CPU0:router (config-pfx)# 10.0.3.0/24 ge 28,  
RP/0/RP0/CPU0:router (config-pfx)# 10.0.4.0/24 le 28,  
RP/0/RP0/CPU0:router (config-pfx)# 10.0.5.0/24 ge 26 le 30,  
RP/0/RP0/CPU0:router (config-pfx)# 10.0.6.0/24 eq 28  
RP/0/RP0/CPU0:router (config-pfx)# end-set
```

The first element of the prefix set matches only one possible value, 10.0.1.1/32 or the host address 10.0.1.1. The second element matches only one possible value, 10.0.2.0/24. The third element matches a range of prefix values, from 10.0.3.0/28 to 10.0.3.255/32. The fourth element matches a range of values, from 10.0.4.0/24 to 10.0.4.240/28. The fifth element matches prefixes in the range from 10.0.5.0/26 to 10.0.5.252/30. The sixth element matches any prefix of length 28 in the range from 10.0.6.0/28 through 10.0.6.240/28.

The following prefix set consists entirely of invalid prefix match specifications:

```
RP/0/RP0/CPU0:router (config)# prefix-set INVALID-PREFIX-EXAMPLES
RP/0/RP0/CPU0:router (config-pfx)# 10.1.1.1 ge 16,  
RP/0/RP0/CPU0:router (config-pfx)# 10.1.2.1 le 16,  
RP/0/RP0/CPU0:router (config-pfx)# 10.1.3.0/24 le 23,  
RP/0/RP0/CPU0:router (config-pfx)# 10.1.4.0/24 ge 33,  
RP/0/RP0/CPU0:router (config-pfx)# 10.1.5.0/25 ge 29 le 28  
RP/0/RP0/CPU0:router (config-pfx)# end-set
```

Neither the minimum length nor the maximum length is legal without a mask length. The maximum length must be at least the mask length. The minimum length must be less than 32, the maximum length of an IPv4 prefix. The maximum length must be equal to or greater than the minimum length.

The following example shows a valid IPv6 prefix set named legal-ipv6-prefix-examples:

```
RP/0/RP0/CPU0:router (config)# prefix-set legal-ipv6-prefix-examples
RP/0/RP0/CPU0:router (config-pfx)# 2001:0:0:1::/64,  
RP/0/RP0/CPU0:router (config-pfx)# 2001:0:0:2::/64,  
RP/0/RP0/CPU0:router (config-pfx)# 2001:0:0:3::/64,  
RP/0/RP0/CPU0:router (config-pfx)# 2001:0:0:4::/64  
RP/0/RP0/CPU0:router (config-pfx)# end-set
```

This example shows a prefix set named legal-ipv4-prefix:

```
RP/0/RP0/CPU0:router (config)# prefix-set legal-ipv4-prefix
RP/0/RP0/CPU0:router (config-pfx)# 10.1.1.1 0.255.0.255  
RP/0/RP0/CPU0:router (config-pfx)# 10.2.2.2 0.0.0.0  
RP/0/RP0/CPU0:router (config-pfx)# 10.3.3.3 255.255.255.254  
RP/0/RP0/CPU0:router (config-pfx)# 10.4.4.4 255.255.255.255  
```

In the above example, the command defines the prefix-set named acl-prefix-set. The first element specifies to match all routes having 10 in first octet and 1 in third octet. The second element matches all routes having prefix as 10.2.2.2 (that is, matches all conditions). The third element matches all routes having odd numbers in the last octets and the fourth element matches all routes with any prefix.
prepend as-path

To prepend the AS path with additional autonomous system numbers, use the `prepend as-path` command in route-policy configuration mode.

```
prepend as-path \{as-numberparameter|most-recent\} \{numberparameter\}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-number</td>
<td>Autonomous system number to prepend to the path.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
<tr>
<td>most-recent</td>
<td>Specifies that the most recent autonomous system number should be prepended.</td>
</tr>
<tr>
<td>number</td>
<td>(Optional) Number of times the autonomous system number should be prepended.</td>
</tr>
</tbody>
</table>

- Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
- Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
- Range for 4-byte Autonomous system numbers (ASNs) as asdot format is 1.0 to 65535.65535.

**Command Default**

The default `number` is 1.

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0**  This command was introduced.

**Usage Guidelines**

Use the `prepend as-path` command to prepend the AS path with additional autonomous system numbers.

**Note**

The `prepend as-path` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command can take one or two arguments. The first argument (either a number or parameter) is the autonomous system number to prepend to the path. The optional second argument (either a number or parameter) is the number of times the autonomous system number should be prepended.

**Examples**

The following example shows how to prepend the autonomous system number 666.1 to the AS path three times:
The following example shows how to prepend the autonomous system number 666.0 to the AS path one time:

```
RP/0/RP0/CPU0:router(config-rpl)# prepend as-path 666.0 1
```
To check the protocol that installs the route, use the `protocol` command in route-policy configuration mode.

```
protocol {in(protocol-set)|is(protocol-name)}
```

**Syntax Description**

- `in (protocol-set)` Specifies a member of a set. The `protocol-set` argument accepts the following keywords within parentheses:
  - `bgp` — Border Gateway Protocol (BGP)
  - `connected` — Connected routes
  - `isis` — ISO Intermediate System-to-Intermediate System (IS-IS)
  - `ospf` — Open Shortest Path First (OSPF)
  - `ospfv3` — Open Shortest Path First version 3 (OSPFv3)
  - `rip` — Routing Information Protocol (RIP)
  - `static` — Static routes

  Keywords must be separated by a comma.

- `is protocol-name` Specifies a single protocol name, and accepted keywords are similar to the `protocol-set` argument.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `protocol` command as a conditional expression within an `if` statement to specify a protocol to install a route.

Use the `in` keyword to determine if a protocol listed in the `protocol-set` is the originator of the route being filtered.

Use the `is` keyword to determine if `protocol-name` is an exact match.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to use the `protocol` command as a conditional expression within if statements:

```text
RP/0/RP0/CPU0:router(config)# route-policy ripl
RP/0/RP0/CPU0:router(config-rpl)# if protocol in (connected, static) then
RP/0/RP0/CPU0:router(config-rpl-if)# add rip-metric 2
RP/0/RP0/CPU0:router(config-rpl-if)# elseif protocol is bgp 1 then
RP/0/RP0/CPU0:router(config-rpl-elseif)# add rip-metric 3
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif protocol is ospf 2 then
RP/0/RP0/CPU0:router(config-rpl-elseif)# add rip-metric 4
RP/0/RP0/CPU0:router(config-rpl-elseif)# else
RP/0/RP0/CPU0:router(config-rpl-else)# add rip-metric 5
RP/0/RP0/CPU0:router(config-rpl-else)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy

RP/0/RP0/CPU0:router(config)# router rip
RP/0/RP0/CPU0:router(config-rip)# interface tenGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-rip-if)# route-policy ripl out
```
rd in

To compare the route distinguisher (RD) associated with the route to RDs contained in either a named or an inline RD set, use the **rd in** command in route-policy configuration mode.

```
rd in \{rd-set-nameinline-rd-setparameter\}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>rd-set-name</td>
<td>Name of an RD set.</td>
</tr>
<tr>
<td>inline-rd-set</td>
<td>Inline RD set. The inline RD set must be enclosed in parentheses.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>No default behavior or values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Modes</td>
<td>Route-policy configuration</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **rd in** command as a conditional expression within an **if** statement to match a destination entry in a named prefix set or inline prefix set.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

This command takes either a named RD set or an inline RD set value as an argument. The condition returns true if the destination entry matches any entry in the RD set or inline RD set. An attempt to match an RD using an RD set that is defined but contains no elements returns false.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows the **rd in** command with an inline RD set value as an argument:

```
RP/0/RP0/CPU0:router(config)# route-policy
RP/0/RP0/CPU0:router(config-rpl)# if rd in (128.1.0.0/16:100) then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**rd-set**

To define a route distinguisher (RD) set and enter RD configuration mode, use the `rd-set` command in XR Config mode.

```
rds-set name
no rd-set name
```

**Syntax Description**
- **name**: Name of an RD community set.

**Command Default**
No default behavior or values

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `rd-set` command to create a set with RD elements and enter RD configuration mode. An RD set is a 64-bit value prepended to an IPv4 address to create a globally unique Border Gateway Protocol (BGP) VPN IPv4 address.

For `m`, the mask length is supported.

**Note**
You can define RD values with the following commands:

- `a.b.c.d/m:*`—BGP VPN RD in IPv4 format with a wildcard character. For example, `10.0.0.2/24.0:*`.
- `a.b.c.d/m:n`—BGP VPN RD in IPv4 format with a mask. For example, `10.0.0.2/24:666`.
- `a.b.c.d:*`—BGP VPN RD in IPv4 format with a wildcard character. For example, `10.0.0.2:*`.
- `a.b.c.d:n`—BGP VPN RD in IPv4 format. For example, `10.0.0.2:666`.
- `asn:*`—BGP VPN RD in ASN format with a wildcard character. For example, `10002:*`.
- `asn:n`—BGP VPN RD in ASN format. For example, `10002:666`.
- `x.y:*`—BGP VPN RD in 4-byte ASN format with a wildcard character. For example, `10002.101:*`.
- `x.y:n`—BGP VPN RD in 4-byte ASN format. For example, `10002.101:666`.

**Task ID**
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to create an RD set called `my_rd_set`:

```bash
RP/0/RP0/CPU0:router(config)# rd-set my_rd_set
RP/0/RP0/CPU0:router(config-rd)# 172.16.0.0/16:*,
RP/0/RP0/CPU0:router(config-rd)# 172.17.0.0/16:100,
```
RP/0/RP0/CPU0:router(config-rd)# 192:*,
RP/0/RP0/CPU0:router(config-rd)# 192:100
RP/0/RP0/CPU0:router(config-rd)# end-set
replace as-path

To replace a sequence of AS numbers or private AS numbers in the AS path with the configured local AS number, use the replace as-path command in route-policy configuration mode.

**replace as-path**  
{ [[as-number-list parameter]]|private-as }

**Syntax Description**

- **as-number-list** (Optional) Sequence of AS numbers to replace. The sequence must be enclosed in single quotes (‘ ’). You can use 2-byte or 4-byte AS numbers.
  - The 2-byte value is entered as a 16-bit unsigned decimal value. The range is 0 to 65535.
  - The 4-byte value is entered as two 16-bit unsigned decimal values separated by a period. The range is 1.0 to 65535.65535.

- **parameter** (Optional) Parameter name. The parameter name must be preceded with a “$.”

- **private-as** Matches within the BGP private AS range. Range is from 64512 to 65534.

**Command Default**

None.

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the replace as-path command to replace a sequence of AS numbers or private AS numbers in the AS path with the local AS numbers. For example, if the AS path is ‘67 65534 100 65533 5 78 89 90’ and the local AS number is 900, then:

```
replace as-path '5 78'
```

replaces ‘5 78’ in the AS path with 900 (from the local AS), and the new path would be ‘67 65534 100 65533 900 89 90’.

Consider following statement:

```
replace as-path private-as
```

Because 65534 and 65533 are within the private AS range, they are replaced with 900. The path is ‘67 900 100 900 5 78 89 90’. The length of the path remains the same.

The replace as-path command can be used as an action statement within an if statement. For a list of all action statements available within an if statement, see the if command.

**Caution**

The replace as-path command changes the AS path content which can lead to routing loops.
The following example shows how to use the `replace as-path` command to replace AS numbers in the AS path:

```
RP/0/RP0/CPU0:router(config)# route-policy drop-as-1234
RP/0/RP0/CPU0:router(config-rpl)# replace as-path '90 78 45 $asnum'
RP/0/RP0/CPU0:router(config-rpl)# replace as-path private-as
RP/0/RP0/CPU0:router(config-rpl)# replace as-path '9.9 7.89 14.15 $asnum'
RP/0/RP0/CPU0:router(config-rpl)# replace as-path '9 89 14.15 $asnum'
```
remove as-path private-as

To remove BGP private AS numbers from as-path structure used by BGP, use the `remove as-path private-as` command under route policy configuration mode.

```
remove as-path private-as [ entire-aspath]
```

**Syntax Description**
- `entire-aspath` (Optional) Removes the entire private autonomous system numbers from an autonomous system path only if all the autonomous systems in the path are private.

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**
- `Task ID` | `Operations`
  - route-policy | read, write

**Examples**
This example shows how to remove BGP private AS numbers from as-path structure:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# route-policy rm_private_as
RP/0/RP0/CPU0:router(config-rpl)# remove as-path private-as entire-aspath
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**rib-has-route**

To check if a route listed in the prefix set exists in the Routing Information Base (RIB), use the **rib-has-route** command in route-policy configuration mode.

```
rib-has-route in \{prefix-set-name\inline-prefix-set\parameter\}
```

**Syntax Description**

- **prefix-set-name**: Name of a prefix set.
- **inline-prefix-set**: Inline prefix set. The inline prefix set must be enclosed in parentheses.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If routes are active, then they are advertised. Routes are considered active if they are already installed in the Routing Information Base (RIB).

The prefix sets used in the **rib-has-route** command contain two match specifications. The first is where an exact route match is requested (for example, 10.10.0.0/16 will match exactly one route) and the second is where a route match or any more-specific route match is allowed (for example, 10.10.0.0/16 ge 32 will match the 10.10.0.0/16 route and any longer prefix).

Use the **rib-has-route** command as a conditional expression within an **if** statement to check if there is an active route with a specific prefix contained in the RIB. If the statement reveals an active route that meets that criteria, additional actions are executed.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, an **if** statement is used to learn if a route contained in a prefix set 10.10.0.0/16 is in the RIB:

```
RP/0/RP0/CPU0:router(config-rpl)# if rib-has-route in (10.10.0.0/16 ge 16) then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
route-has-label

To check if there is a Multiprotocol Label Switching (MPLS) label in a route during redistribution, use the `route-has-label` command in route-policy configuration mode.

Syntax Description
This command has no arguments or keywords.

Command Default
No default behavior or values

Command Modes
Route-policy configuration

Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use the `route-has-label` command as a conditional expression within an `if` statement to check if there is an MPLS label in a route during redistribution.

For a list of all conditional expressions available within an `if` statement, see the `if` command.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

Examples

In the following example, an `if` statement learns if an MPLS label is present in a route:

```
RP/0/RP0/CPU0:router(config-rpl)# if route-has-label then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
route-policy (RPL)

To define a route policy and enter route-policy configuration mode, use the `route-policy` command in XR Config mode. To remove a policy definition, use the `no` form of this command.

```
route-policy name [{(parameter1, parameter2, . . . , parameterN)}]
no route-policy name (parameter1, parameter2, . . . , parameterN)
```

**Syntax Description**
- `name` Name of a route policy.
- `parameter` (Optional) Parameter name. The parameter name must be preceded with a “$.” The `parameters` must be enclosed in parenthesis “(“).

**Command Default**
No default behavior or values

**Command Modes**
XR Config mode

**Command History**
- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**
Use the `route-policy` command to define a route policy and enter route-policy configuration mode.

Policy definitions create named bundles of policy statements. A policy definition consists of the `route-policy` command followed by a name, a group of policy statements, and the `end-policy` command.

The policy name serves as a handle for binding the policy to protocols.

**Examples**
The following example shows a simple policy named drop-everything that drops any route it encounters:

```
RP/0/RP0/CPU0:router(config)# route-policy drop-everything
RP/0/RP0/CPU0:router(config-rpl)# drop
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

Policies may also refer to other policies such that common blocks of policy can be reused. This reference to other policies is accomplished by using the `apply` command. The following is a simple example:

```
RP/0/RP0/CPU0:router(config)# route-policy drop-as-1234
RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '1234' then
RP/0/RP0/CPU0:router(config-rpl-if)# apply check-communities
```
The **apply** command indicates that the policy check-communities should be executed if the route under consideration passed through autonomous system 1234 before it was received. If so, the communities of the route are checked, and based on the findings the route may be accepted unmodified, accepted with changes, or dropped.
route-type is

To match route types when redistribution is being performed into Border Gateway Protocol (BGP), Open Shortest Path First (OSPF), or Integrated Intermediate System-to-Intermediate System (IS-IS), use the route-type is command in route-policy configuration mode.

route-type is {local|interarea|internal|type-1|type-2|level-1|level-2|parameter}

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local</td>
<td>Uses a local value to match locally generated BGP routes.</td>
</tr>
<tr>
<td>interarea</td>
<td>Uses an interarea value to match IS-IS interarea routes.</td>
</tr>
<tr>
<td>internal</td>
<td>Uses an internal value to match OSPF intra- and interarea routes.</td>
</tr>
<tr>
<td>type-1</td>
<td>Uses a Type 1 value to match Type 1 OSPF routes.</td>
</tr>
<tr>
<td>type-2</td>
<td>Uses a Type 2 value to match Type 2 OSPF routes.</td>
</tr>
<tr>
<td>level-1</td>
<td>Uses a Level 1 value to match Level 1 IS-IS routes.</td>
</tr>
<tr>
<td>level-2</td>
<td>Uses a Level 2 value to match Level 2 IS-IS routes.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

Command Default
No default behavior or values

Command Modes
Route-policy configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use the route-type is command as a conditional expression within an if statement to compare route types when redistribution is being performed into BGP, OSPF, or IS-IS.

Note
For a list of all conditional expressions available within an if statement, see the if command.

The valid keywords are local, internal, interarea, type-1, type-2, level-1, and level-2. A parameterized value that fills in one of these values may also be used. The local value is used to match locally generated BGP routes. The internal value is used to match OSPF intra- and interarea routes. The type-1 and type-2 values are used to match Type 1 and Type 2 OSPF external routes. The level-1, level-2, and interarea values are used to match IS-IS routes of those respective types.

Because the route type is a matching operator, it appears in conditional clauses of if and then statements.
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, non-local routes are dropped:

```plaintext
RP/0/RP0/CPU0:router(config)# route-policy policy_A
RP/0/RP0/CPU0:router(config-rpl)# if route-type is local then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# else
RP/0/RP0/CPU0:router(config-rpl-else)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
To set the default routing policy language (RPL) editor, use the `rpl editor` command in XR Config mode.

```
rpl editor {nano|emacs|vim}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>nano</code></td>
<td>Sets the default RPL editor to GNU nano.</td>
</tr>
<tr>
<td><code>emacs</code></td>
<td>Sets the default RPL editor to EMACS.</td>
</tr>
<tr>
<td><code>vim</code></td>
<td>Sets the default RPL editor to VIM.</td>
</tr>
</tbody>
</table>

**Command Default**
The Nano editor is the default.

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the default RPL editor is set to Nano:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl editor nano
```

In the following example, the default RPL editor is set to EMACS:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl editor emacs
```

In the following example, the default RPL editor is set to VIM:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl editor vim
```
rpl maximum

To configure system limits on the routing policy subsystem, use the rpl maximum command in XR Config mode.

```
rpl maximum {lines|policies} number
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lines number</td>
<td>Configures the number of lines of configuration limit. Range is from 1 to 131072.</td>
</tr>
<tr>
<td>policies number</td>
<td>Configures the number of policies limit. Range is from 1 to 5000.</td>
</tr>
</tbody>
</table>

**Command Default**

- **lines number**: 65536
- **policies numbers**: 3500

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the rpl maximum command to configure system limits on the routing policy subsystem. As such, rpl maximum configuration lines do not appear as statements within a routing policy. This command places resource limits on the routing policy subsystem. Use the rpl maximum command to configure the maximum number of lines of configuration and number of policies.

The number of lines of configuration includes the beginning and ending statements, for example, route-policy and end-policy. Each line of configuration for sets is also counted.

A line of configuration is counted only once; it is not counted each time it is used. Similarly, any multiple use of policy in an apply statement counts only as one policy.

A user can change the default values for lines and policies but cannot exceed the maximum value, nor can the value for lines and policies be configured lower than the number of lines or policies that are currently configured.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the maximum number of RPL system limits are modified:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl maximum lines 50
RP/0/RP0/CPU0:router(config)# rpl maximum policies 6
```
rpl set-exit-as-abort

To change the default exit behavior under RPL configuration mode to abort from the RPL configuration mode without saving the configuration, use the `rpl set-exit-as-abort` command in XR Config mode.

**Syntax Description**

This command has no keywords or arguments.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The default `exit` command acts as end-policy, end-set, or end-if. If the `exit` command is executed under route policy configuration mode, the changes are applied and configuration is updated. This destructs the existing policy. The `rpl set-exit-as-abort` command allows to overwrite the default behavior of the `exit` command under the route policy configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how change the default exit behavior:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl set-exit-as-abort
```
**set administrative-distance**

To set a route with lower administrative distance such that it is preferred to a route with higher administrative distance, use the `set administrative-distance` command in route policy configuration mode.

```
set administrative-distance  [{number | parameter}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

<td>Release 6.0 This command was introduced.</td>
<td>No specific guidelines impact the use of this command.</td>
<td>read, write</td>
<td>This example shows how to set a route with an administrative value such that it is preferred to a route with higher administrative distance.</td>
</tr>
</tbody>
</table>
| parameter          |                 |               |                 |                  |        | RP/0/RPO/CPU0:router# configure
RP/0/RPO/CPU0:router(config)# route-policy sample
RP/0/RPO/CPU0:router(config-rpl)# set administrative-distance 34
RP/0/RPO/CPU0:router(config-rpl)# end-policy
RP/0/RPO/CPU0:router(config-rpl)# exit
RP/0/RPO/CPU0:router(config)# route bgp 100
RP/0/RPO/CPU0:router(config-bgp)# address family ipv4 unicast
RP/0/RPO/CPU0:router(config-bgp-af)# table-policy sample
RP/0/RPO/CPU0:router(config-bgp-af)# exit
RP/0/RPO/CPU0:router(config-bgp)# exit
RP/0/RPO/CPU0:router(config)# end |
set aigp-metric

To set originating prefixes with accumulated interior gateway protocol (AiGP) attribute information, use the `set aigp-metric` command in route-policy configuration mode.

```
set aigp-metric {igp-cost value}
```

**Syntax Description**

- `igp-cost` Specifies the internal routing protocol cost.
- `value` Specifies the aigp-metric value. 32-bit decimal number. Range is 0-4294967295.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

- `read`
- `write`

**Examples**

The following example shows how to set the aigp metric as the igp cost for route-policy `aigp_policy`:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# route-policy aigp_policy
RP/0/RP0/CPU0:router(config-rpl)# set aigp-metric igp-cost
```
set community

To set the Border Gateway Protocol (BGP) community attributes in a route, use the `set community` command in route-policy configuration mode.

```
set community {community-set-name inline-community-set parameter} [additive]
```

**Syntax Description**

- `community-set-name`: Community set name.
- `inline-community-set`: Inline community set. The inline community set must be enclosed in parentheses.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”
- `additive`: (Optional) Adds communities to communities in the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0**: This command was introduced.

**Usage Guidelines**

Use the `set community` command to set the BGP community attribute.

The `set community` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

- Communities are 32-bit values carried in BGP routes. Each route may have zero or more communities in an unordered list.
- Use this command to replace the communities in a route or add to them using the optional `additive` keyword.
- As with the other community forms that support inline sets, either or both 16-bit portions of the community can be parameterized. Likewise, the names of the well-known communities `internet (0:0)`, `no-advertise` (65535:65281), `no-export` (65535:65282), and `local-AS` (65535:65283) can also be used. In an inline community set, each 16-bit portion can also be specified as the `peeras` to express the AS number of the neighbor from which the route was received. If the neighbor AS employs a 4-byte ASN, the IANA-assigned 16-bit value 23456 (AS_TRANS) is used as `peeras` instead.
- Without the `additive` keyword, any existing communities (other than the well-known communities) are removed and replaced with the given communities. The `additive` keyword specifies that all communities already present in the route be maintained and the list of communities be added to them.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
<td></td>
</tr>
</tbody>
</table>
The following are incomplete configuration examples using the `set community` command:

```
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24)
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, $as:24, $as:$tag)
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, internet) additive
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, $as:24) additive
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, peeras:24) additive
```
set core-tree

To set a Multicast Distribution Tree (MDT) type, use the `set core-tree` command in route-policy configuration mode.

```
set core-tree
{gre-rosen|mldp-inband|mldp-partitioned-mp2mp|mldp-partitioned-p2mp|mldp-rosen|rsvp-te-partitioned-p2mp}pxarameter}
```

**Syntax Description**
- `gre-rosen`: Specifies the IP GRE Rosen core MDT type
- `mldp-inband`: Specifies the MLDP InBand core MDT type
- `mldp-partitioned-mp2mp`: Specifies the MLDP Partitioned MP2MP core MDT type
- `mldp-partitioned-p2mp`: Specifies the MLDP Partitioned P2MP core MDT type
- `mldp-rosen`: Specifies the MLDP Rosen core MDT type
- `rsvp-te-partitioned-p2mp`: Specifies the RSVP TE core core MDT type
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
None

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In this example, the Multicast Distribution Tree type is set to IP GRE Rosen core:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#route-policy policy_mdt_type
RP/0/RP0/CPU0:router(config-rpl)#set core-tree gre-rosen
```
To configure Border Gateway Protocol (BGP) route dampening, use the `set dampening` command in route-policy configuration mode.

```
set dampening {halflife {minutes parameter} | max-suppress {minutes parameter} | reuse {seconds parameter} | suppress {penalty-units parameter} | others default}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>halflife minutes</code></td>
<td>Specifies the time (in minutes) after which a penalty is decreased. After the route has been assigned a penalty, the penalty is decreased by half after the half-life period. The process of reducing the penalty happens every 5 seconds. Range is 1 to 45 minutes.</td>
</tr>
<tr>
<td><code>max-suppress minutes</code></td>
<td>Specifies the maximum time (in minutes) a route can be suppressed. Range is 1 to 20000. If the half-life value is allowed to default, the maximum suppress time defaults to 60 minutes.</td>
</tr>
<tr>
<td><code>reuse seconds</code></td>
<td>Unsuppresses a route if the penalty for flapping the route decreases enough to fall below the configured value (in seconds). The process of unsuppressing routes occurs at 10-second increments. Range is 1 to 20000.</td>
</tr>
<tr>
<td><code>suppress penalty-units</code></td>
<td>Specifies a penalty of 1000 each time a route flaps. When a route penalty exceeds the configured limit, it is suppressed. Range is 1 to 20000.</td>
</tr>
<tr>
<td><code>others default</code></td>
<td>If all four keyword values are not specified in the command, then the command must end with <code>others default</code>. This designation indicates that any keyword not defined is set to its default.</td>
</tr>
</tbody>
</table>

### Command Default

- **half-life**: 15 minutes
- **max-suppress**: 60 minutes (four times the half-life)
- **reuse**: 750 seconds
- **suppress**: 2000 penalty units

### Command Modes

- Route-policy configuration

### Command History

- **Release 6.0** This command was introduced.

### Usage Guidelines

The BGP protocol supports route dampening using an exponential backoff algorithm. The algorithm is controlled by setting the four supported BGP values: half-life, max-suppress, reuse, and suppress. Use the `set dampening` command to configure BGP route dampening.
The *set dampening* command can be used as an action statement within an *if* statement. For a list of all action statements available within an *if* statement, see the *if* command.

A value for at least one of the four keywords must be set. If the *set dampening* command defines values for three or fewer of the supported keywords, then the configuration must end with the *others default*, which indicates that any keyword value not defined in the command is set to its default value.

The keywords may appear in the command in any order.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following examples, the half-life is set to 20 minutes and the maximum suppress time is set to 90 minutes. Each command must end with *others default* because three or fewer keywords are defined.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening halflife 20 others default
RP/0/RP0/CPU0:router(config-rpl)# set dampening max-suppress 90 others default
```

In this example, all four keywords are defined, which means the command does not use *others default*.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening halflife 15 max-suppress 60 reuse 750 suppress 2000
```

The following command is invalid because it is missing *others default*.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening reuse 700
```

In the following example, the parameters are used.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening halflife $p1 suppress $p4 reuse $p3 max-suppress $p2
```
set extcommunity cost

To set the Border Gateway Protocol (BGP) cost extended community attributes, use the `set extcommunity cost` command in route-policy configuration mode.

```
set extcommunity cost {cost-extcommunity-set-name cost-inline-extcommunity-set parameter} [additive]
```

**Syntax Description**

- `cost-extcommunity-set-name` Cost extended community set name.
- `cost-inline-extcommunity-set` Inline cost extended community set. The inline cost extended community set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”
- `additive` (Optional) Adds extended communities for cost to extended communities in the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set extcommunity cost` command to either replace the extended communities on the route or add to them using the optional `additive` keyword. Cost community is an extended community used to tie break the best path selection process in BGP so as to have a localized custom decision for packet forwarding. The extended community format defines generic points of insertion (POI) that influence the decision at different points of the bestpath algorithm.

**Note**

The `set extcommunity cost` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

As with the other extended community forms that support inline sets, either or both portions of the community can be parameterized. Similarly to regular communities, the `additive` keyword can be used to signify adding these extended communities to those that are already present, as opposed to replacing them. Without the `additive` keyword, any existing extended communities for cost (other than the well-known communities) are removed and replaced with the given communities. The `additive` keyword specifies that all extended communities for cost already present in the route be maintained and the set of extended communities be added to them. Well-known communities include internet, local-AS, no-advertise, and no-export.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
Examples

The following are incomplete configuration examples using the `set extcommunity cost` command:

```
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity cost (IGP:10:20)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity cost (Pre-Bestpath:33:44)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity cost (IGP:11:21)
```
To set the Border Gateway Protocol (BGP) route target (RT) extended community attributes, use the `set extcommunity rt` command in route-policy configuration mode.

### Syntax

```
set extcommunity rt {rt-extcommunity-set-name rt-inline-extcommunity-set parameter} additive
```

### Syntax Description

- **rt-extcommunity-set-name**: Route target extended community set name.
- **rt-inline-extcommunity-set**: Inline route target extended community set. The inline route target extended community set must be enclosed in parentheses.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”
- **additive**: (Optional) Adds extended communities for an RT to extended communities in the route.

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

- **Release**
- **Modification**

  Release 6.0  This command was introduced.

### Usage Guidelines

Use the `set extcommunity rt` command to either replace the extended communities on the route or add to them using the optional `additive` keyword.

#### Note

The `set extcommunity rt` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

As with the other extended community forms that support inline sets, either or both portions of the community can be parameterized. Similarly to regular communities, the `additive` keyword can be used to signify adding these extended communities to those that are already present, as opposed to replacing them.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following are incomplete configuration examples using the `set extcommunity rt` command:

```
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity rt (10:24)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity rt (10:24, $as:24, $as:$tag)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity rt (10:24, internet) additive
```
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity rt (10:24, $as:24) additive

Without the additive keyword, any existing extended communities for cost (other than the well-known communities) are removed and replaced with the given communities. The additive keyword specifies that all extended communities for cost already present in the route be maintained and the list of extended communities be added to them.
set ip-precedence

To set the IP precedence, use the `set ip-precedence` command in route-policy configuration mode.

```
set ip-precedence {number parameter}
```

**Syntax Description**

- `number` Value of the precedence. The precedence value can be a number from 0 to 7:
  - 7 — network (set packets with network control precedence)
  - 6 — internet (set packets with internetwork control precedence)
  - 5 — critical (set packets with critical precedence)
  - 4 — flash-override (set packets with flash override precedence)
  - 3 — flash (set packets with flash precedence)
  - 2 — immediate (set packets with immediate precedence)
  - 1 — priority (set packets with priority precedence)
  - 0 — routine (set packets with routine precedence)

- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set ip-precedence` command to set the IP precedence to classify packets. This command is supported at the BGP table-policy attachpoint. Prefixes are marked for subsequent processing in the forwarding plane. After QoS Policy Propagation through Border Gateway Protocol (BGP) (QPPB) is enabled on an interface, corresponding traffic shaping and policing is completed using packet classification based on the IP precedence or QoS group ID. See *Modular QoS Configuration Guide for Cisco NCS 5000 Series Routers* for information on QPPB.

**Task ID**

- Task ID: route-policy
- Operations: read, write

**Examples**

This example shows how use `set ip-precedence` command:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set ip-precedence 3
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set isis-metric

To set the Intermediate System-to-Intermediate System (IS-IS) metric attribute value, use the `set isis metric` command in route-policy configuration mode.

```
set isis-metric {number|parameter}
```

**Syntax Description**

- `number` 24-bit integer number. Range is from 0 to 16777215.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set isis-metric` command to set the IS-IS metric attribute value for routes that are redistributed into IS-IS.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the IS-IS metric attribute value is set to 1000:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set isis-metric 1000
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set label

To set the Border Gateway Protocol (BGP) label attribute value, use the **set label** command in route-policy configuration mode.

```
set label {explicit-null|implicit-null|parameter}
```

**Syntax Description**

- **explicit-null**  
  Sets the label to the well-known explicit value of 0.
- **implicit-null**  
  Sets the label to the well-known implicit value of 3.
- **parameter**  
  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0**  
  This command was introduced.

**Usage Guidelines**

Use the **set label** command in a route policy at the allocate label attachpoint to set the label to explicit-null or implicit-null based on deployment preference. During inter-AS operation, the ASBR sends some of its own loopbacks to other its peers and labels them either implicit null or explicit null.

**Examples**

The following example shows how to set the labels:

```
RP/0/RP0/CPU0:router(config)#  route-policy labelpolicy
RP/0/RP0/CPU0:router(config-rpl)#  if destination in (206.141.0.0/24) then
RP/0/RP0/CPU0:router(config-rpl)#    set label explicit-null
RP/0/RP0/CPU0:router(config-rpl)#  elseif destination in (206.141.3.0/24) then
RP/0/RP0/CPU0:router(config-rpl)#    drop
RP/0/RP0/CPU0:router(config-rpl)#    elseif destination in (206.141.4.0/24) then
RP/0/RP0/CPU0:router(config-rpl)#    set label explicit-null
RP/0/RP0/CPU0:router(config-rpl)#  endif
RP/0/RP0/CPU0:router(config-rpl)#  end-policy
```
set label-mode

To set the type of Border Gateway Protocol (BGP) label mode, use the set label-mode command in route-policy configuration mode. This command does not have a no form.

```
set label-mode {per-ce | per-vrf | per-prefix}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>per-ce</td>
<td>Specifies that the same label is used for all routes advertised from a unique customer edge (CE) peer or router.</td>
</tr>
<tr>
<td>per-vrf</td>
<td>Specifies that the same label is used for all routes advertised from a unique VRF.</td>
</tr>
<tr>
<td>per-prefix</td>
<td>Specifies that the same label is used for all routes advertised from a unique prefix.</td>
</tr>
</tbody>
</table>

**Command Default**

Per-prefix label mode.

If a policy attached at label-mode attachpoint evaluates to pass and a label mode is not explicitly set, per-prefix is used as a default label mode.

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the set label-mode command in a route policy at the label-mode attachpoint to set the type of label mode to per-ce or per-vrf or per-prefix, based on deployment preference.

Per-vrf label mode is not supported for Carrier Supporting Carrier (CSC) network with internal and external BGP multipath setup.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the type of label-mode to per-ce:

```
RP/0/RP0/CPU0:router(config)# route-policy set_label_mode
RP/0/RP0/CPU0:router(config-rpl)# set label-mode per-ce
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

This example shows how to set the type of label-mode to per-vrf:

```
RP/0/RP0/CPU0:router(config)# route-policy set_label_mode
RP/0/RP0/CPU0:router(config-rpl)# set label-mode per-vrf
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

This example shows how to set the type of label-mode to per-prefix:
RP/0/RP0/CPU0:router(config)# route-policy set_label_mode
RP/0/RP0/CPU0:router(config-rpl)# set label-mode per-prefix
RP/0/RP0/CPU0:router(config-rpl)# end-policy
**set level**

To configure the Intermediate System-to-Intermediate System (IS-IS) link-state packet (LSP) level advertised to redistributed routes, use the `set level` command in route-policy configuration mode.

```
set level {level-1|level-2|level-1-2} parameter
```

**Syntax Description**

- **level-1** Specifies that redistributed routes are advertised in the Level 1 LSP of the router.
- **level-2** Specifies that redistributed routes are advertised in the Level 2 LSP of the router.
- **level-1-2** Specifies that redistributed routes are advertised in Level 1 and Level 2 LSPs of the router.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release** Modification
  - Release 6.0  This command was introduced.

**Usage Guidelines**

Use the IS-IS `set level` command to configure the LSP level advertised to redistributed routes.

**Note**

The `set level` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command supports parameterization of the `level` keyword.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>read, write</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the level is set to Level 2:

```
RP/0/RP0/CPU0:router(config)# route-policy bgp_isis_redist
RP/0/RP0/CPU0:router(config-rpl)# if destination in (172.2.0.0/16 ge 16) then
RP/0/RP0/CPU0:router(config-rpl)# set level level-2
RP/0/RP0/CPU0:router(config-rpl)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set local-preference

To set the Border Gateway Protocol (BGP) local preference attribute in a route, use the `set local-preference` command in route-policy configuration mode.

```
set local-preference \{numberparameter\}
```

**Syntax Description**
- `number` Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
Default value is 100.

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `set local-preference` command to specify a preference value for the autonomous system path. Local preference is a nontransitive (does not cross autonomous system boundaries) attribute and is the second metric considered in the BGP best path calculation (the highest local preference is chosen). Weight is the first metric evaluated for best path, but it is local to the router and propagates only to iBGP peers. See the Implementing BGP module of the Routing Configuration Guide for Cisco NCS 5000 Series Routers for information on the BGP best path calculation.

**Note**
The `set local-preference` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

The local preference is a 32-bit unsigned integer.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the local preference value is set to 10:

```
RP/0/RP0/CPU0:router(config-rpl)# set local-preference 10
```
set med

To set the Border Gateway Protocol (BGP) Multi Exit Discriminator (MED) attribute, use the `set med` command in route-policy configuration mode.

```
set med {number|parameter|igp-cost|{+|{-number|parameter}}|max-reachable}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.</td>
</tr>
<tr>
<td><code>parameter</code></td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
<tr>
<td><code>igp-cost</code></td>
<td>Sets the MED value to the cost for the Interior Gateway Protocol (IGP) route to resolve the next-hop of the BGP route.</td>
</tr>
<tr>
<td><code>+</code></td>
<td>Sets the MED to the MED plus or minus a static offset. An integer or parameter must follow the plus or minus.</td>
</tr>
<tr>
<td><code>-</code></td>
<td>Sets the MED to the maximum possible value of 4294967295.</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

**Release** **Modification**

- Release 6.0  This command was introduced.

### Usage Guidelines

Use the `set med` command to set the MED value, which is a 32-bit unsigned integer.

**Note**

The `set med` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command can take the following as argument values: an integer, a parameter, the `igp-cost` keyword, or a mathematical operator (either plus or minus) followed by an integer or a parameter. Setting the MED to the IGP cost is supported on outbound BGP policies only. The MED cannot be set to the IGP cost in policies applied to other BGP attach points.

The `max-reachable` keyword sets the MED to the maximum value while leaving the route reachable.

The plus or minus variants allow the user to set the MED to the MED plus or minus a static offset. The variants that allow a user to add or subtract offsets to the MED value are also range checked for underflow or overflow. If the value underflows as a result of subtraction, then the MED value is set to zero. If the value overflows, the value is set to 4294967295, which is the maximum value for MED. When MED is set to 4294967295, the route is unreachable.
Routing Policy Language Commands

Examples

The following two examples show how to set the MED to a value that is either specified directly (using the integer 156) or passed to the policy as a parameter:

```
RP/0/RP0/CPU0:router(config-rpl)# set med 156
RP/0/RP0/CPU0:router(config-rpl)# set med $med_param
```

The following example shows how to instruct BGP to automatically set the MED value to the cost of the IGP route that resolves the next-hop of the BGP route:

```
RP/0/RP0/CPU0:router(config-rpl)# set med igp-cost
```
set metric-type (IS-IS)

To configure the integrated Intermediate System-to-Intermediate System (IS-IS) metric type, use the `set metric-type` command in route-policy configuration mode.

```
set metric-type {internal|external|rib-metric-as-internal| rib-metric-as-external}{parameter}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>internal</code></td>
<td>Sets metric type to internal.</td>
</tr>
<tr>
<td><code>external</code></td>
<td>Sets the metric type to external.</td>
</tr>
<tr>
<td><code>rib-metric-as-internal</code></td>
<td>Uses RIB metric and sets IS-IS internal metric type.</td>
</tr>
<tr>
<td><code>rib-metric-as-external</code></td>
<td>Uses RIB metric and sets IS-IS external metric type.</td>
</tr>
<tr>
<td><code>parameter</code></td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the IS-IS `set metric-type` command to control whether IS-IS treats the metric as an internal or external metric.

Use the `rib-metric-as-external` and `rib-metric-as-internal` keywords to preserve RIB metrics when redistributing routes from another ISIS router instance or another protocol.

**Note**
The `set metric-type` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command does not support parameterization.
Examples

In the following example, the IS-IS metric type is set to internal:

```
RP/0/RP0/CPU0:router(config-rpl)# set metric-type internal
```
set metric-type (OSPF)

To control how Open Shortest Path First (OSPF) computes the cost for a route, use the **set metric-type** command in route-policy configuration mode.

```
set metric-type {type-1|type-2}parameter
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>type-1</th>
<th>Uses the cost set on the route plus the topology-related costs in the calculation for Type 1 metrics.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>type-2</td>
<td>Uses only the cost set on the route in the calculation for Type 2 metrics.</td>
</tr>
<tr>
<td></td>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Release 6.0 This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the OSPF **set metric-type** command to control whether OSPF treats the cost as a Type 1 or Type 2 metric.

**Note**

The **set metric-type** command can be used as an action statement within an **if** statement. For a list of all action statements available within an **if** statement, see the **if** command.

The value of Type 1 or Type 2 controls how OSPF computes the cost for this route. For Type 2 metrics, only the cost set on the route is used. For Type 1 metrics, the cost set on the route plus the topology-related costs are used in the calculation.

This command does not support parameterization.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the OSPF metric type is set to Type 1:

```
RP/0/RP0/CPU0:router(config-rpl)# set metric-type type-1
```
**set next-hop**

To replace the next-hop associated with a given route, use the `set next-hop` command in route-policy configuration mode.

```
set next-hop {ipv4-address [destination-vrf] ipv6-address [destination-vrf] | discard parameter | peer-address | self}
```

**Syntax Description**

- **ipv4-address**: Valid IPv4 address.
- **ipv6-address**: Valid IPv6 address.
- **discard**: Sets next-hop as Null0 interface.
- **destination-vrf**: (Optional) Specifies that the next-hop of the route should be resolved in destination VRF context. This keyword is available when an IPv4 or IPv6 address or parameter is used.
- **peer-address**: Sets the next-hop to the IP address of the remote Border Gateway Protocol (BGP) peer.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”
- **self**: Sets itself as the next-hop.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set next-hop` command to replace the next-hop associated with a specific address.

**Note**

The `set next-hop` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

Use the `set next-hop peer-address` command to set the next-hop to the address of the BGP neighbor, where this policy is attached.

The next-hop is a valid IPv4 address entered as a dotted decimal or an IPv6 address entered as a colon-separated hexadecimal.

It is not possible to use this command to set the BGP IPv6 link-local next-hop.

The `destination-vrf` keyword is used mainly in Layer 3 VPN networks when importing routes.

The below address families support the selective setting of 'next-hop-self' via the RPL statement 'set next-hop self' starting in 4.2.1. Previous to this the setting of next-hop-self via an RPL was for all prefixes in the address family or none of the prefixes.
• IPv4 unicast
• IPv4 labeled-unicast
• IPv4 multicast
• IPv6 unicast
• IPv6 multicast

The **set next-hop discard** configuration is used in the neighbor inbound policy. When this config is applied to a path, the primary next-hop is still be associated with the actual path but the RIB is updated with next-hop set to Null0. Even if the primary received nexthop is unreachable, the Remotely Triggered Blackhole (RTBH) path will be considered reachable and will be a candidate in the bestpath selection process. The RTBH path is readvertised to other peers with either the received next-hop or nexthop-self based on normal BGP advertisement rules.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the next-hop is set to a valid IPv4 address:

```
RP/0/RP0/CPU0:router(config-rpl)# set next-hop 10.0.0.5
```

In this example, the next-hop is set to a parameter value $nexthop:

```
RP/0/RP0/CPU0:router(config-rpl)# set next-hop $nexthop
```

In this example, the next-hop is set to a valid IPv4 address with a destination VRF context:

```
RP/0/RP0/CPU0:router(config-rpl)# set next-hop 10.0.0.5 destination-vrf
```
set origin

To change the Border Gateway Protocol (BGP) origin attribute, use the `set origin` command in route-policy configuration mode.

```
set origin {igp|incomplete|egp} parameter
```

**Syntax Description**

- `igp` Sets the origin type to Interior Gateway Protocol (IGP).
- `incomplete` Sets the origin type to incomplete.
- `egp` Sets the origin type to Exterior Gateway Protocol (EGP).
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set origin` command to change the origin attribute.

**Note**

The `set origin` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

The origin of a Border Gateway Protocol (BGP) route is `igp`, `egp`, or `incomplete`.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the origin attribute is set to EGP:

```
RP/0/RP0/CPU0:router(config-rpl)# set origin egp
```
set ospf-metric

To set an Open Shortest Path First (OSPF) protocol metric attribute value, use the `set ospf-metric` command in route-policy configuration mode.

```
set ospf-metric {number|parameter}
```

**Syntax Description**

- **number**: Value assigned to a 24-bit unsigned integer. Range is 0 to 4294967295.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set ospf-metric` command to set the metric for routes that are redistributed into OSPF. The OSPF metric operator accepts either an integer value or a parameter.

**Examples**

In the following example, the OSPF metric attribute value is set to 1000:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set ospf-metric 1000
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set path-selection

To set path selection criteria and install or advertise the path for the Border Gateway Protocol, use the `set path-selection` command in route-policy configuration mode.

```plaintext
set path-selection {backup number|group-best|all|best-path} [install] [multipath-protect] [advertise]
```

### Syntax Description

- `backup` Specifies the BGP backup path.
- `number` Specifies the BGP backup path number. 3 bit decimal number. Range is 0-7.
- `group-best` Specifies the BGP group best path.
- `all` Specifies all BGP paths.
- `best-path` Specifies the BGP best path.
- `install` Installs the path.
- `multipath-protect` Installs and advertises the multipath protect.
- `advertise` Advertises the path.

### Command Default

None

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

No specific guidelines impact the use of this command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to set the path selection as `advertise backup path 3` for route-policy `path_selection_plcy`:

```plaintext
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# route-policy path_selection_plcy
RP/0/RP0/CPU0:router(config-rpl)# set path-selection backup 3 advertise
```
**set qos-group (RPL)**

To set the quality of service (QoS) group, use the `set qos-group` command in route-policy configuration mode:

```
set qos-group {number parameter}
```

**Syntax Description**

- `number`  QoS group ID. Range is from 0 to 31.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set qos-group` command to set the QoS group to classify packets.

This command is supported at the BGP table-policy attachpoint. Prefixes are marked for subsequent processing in the forwarding plane. After QoS Policy Propagation through Border Gateway Protocol (BGP) (QPPB) is enabled on an interface, corresponding traffic shaping and policing is completed using packet classification based on the IP precedence or QoS group ID. See the *Modular QoS Configuration Guide for Cisco NCS 5000 Series Routers* for information on QPPB.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to use `set qos-group` command:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set qos-group 12
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set rib-metric

To set the Routing Information Base (RIB) metric attribute value for a table policy, use the `set rib-metric` command in route-policy configuration mode:

```
set rib-metric {number parameter}
```

**Syntax Description**
- `number`: Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `set rib-metric` command set the RIB metric attribute value for BGP routes.

Every route in the RIB has a metric associated with it, signifying the cost to reach a specific destination based on link characteristics. The `set rib-metric` command modifies the RIB metric while installing BGP routes into RIB, enabling the upgrading or downgrading of the BGP route installed in RIB.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the RIB metric attribute is set to 1000:

```
RP/0/RP0/CPU0:router(config)＃ route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)＃ set rib-metric 1000
RP/0/RP0/CPU0:router(config-rpl)＃ end-policy
```
set rip-metric

To set Routing Information Protocol (RIP) metric attributes, use the `set rip-metric` command in route-policy configuration mode.

```
set rip-metric {number parameter}
```

**Syntax Description**

- `number`: Value assigned to a 4-bit unsigned integer. Range is from 0 to 16.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

- **Release** 6.0  This command was introduced.

**Usage Guidelines**

Use the `set rip-metric` command to set the cost attribute for routes that are redistributed into RIP. You can use the `add` command to increment the RIP metric value.

**Examples**

In the following example, the RIP metric number is adjusted for route policy policy_1:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set rip-metric 10
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set rip-tag

To set a route tag attribute for Routing Information Protocol (RIP) routes, use the `set rip-tag` command in route-policy configuration mode.

```
set rip-tag {number parameter}
```

**Syntax Description**

- `number` Value assigned to a 16-bit unsigned integer. Range is from 0 to 65535.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set rip-tag` command to set the RIP tag attribute for routes that are redistributed into RIP. The RIP tag operator accepts either an integer value or a parameter.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

In the following example, the RIP tag is adjusted for route policy `policy_1`:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set rip-tag 1000
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set rpf-topology

To set reverse-path forwarding (RPF) to any default or nondefault tables for particular sources and groups, use the `set rpf-topology` command in routing policy configuration mode.

```
set rpf-topology [vrf vrf-name] {ipv4|ipv6} {unicast|multicast}parameter topology table-name
```

**Syntax Description**

- **vrf vrf-name**: [Optional] Specifies a VPN routing and forwarding (VRF) instance. Required when configuring extranet topologies.
- **ipv4**: [Optional] Specifies IPv4 address prefixes.
- **ipv6**: [Optional] Specifies IPv6 address prefixes.
- **unicast**: Specifies unicast address prefixes.
- **multicast**: Specifies multicast address prefixes.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”
- **topology**: Specifies the default or non-default topology table for the source or group.
- **table-name**: Alphanumeric name string.

**Command Default**

Default or current topology setting.

**Command Modes**

Routing policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When using this command for MVPN extranet routing configuration, only the `vrf vrf-name` keyword and argument are required.

When using this command in the context of multitopology routing, all keywords and arguments with the exception of `vrf vrf-name` keyword and argument are required.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to execute the `set rpf-topology` command:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# route-policy green
RP/0/RP0/CPU0:router(config-rpl)# set rpf-topology ipv6 multicast topology t12
```
The following example shows the use of `set rpf-topology` command in the context of creating an RPF for a topology table in multiple topologies:

```
route-policy mt4-p1
  if destination in (225.0.0.1, 225.0.0.11) then
    set rpf-topology ipv4 multicast topology t201
  elseif destination in (225.0.0.2, 225.0.0.12) then
    set rpf-topology ipv4 multicast topology t202
  elseif destination in (225.0.0.3, 225.0.0.13) then
    pass
  endif
end-policy
!

route-policy mt4-p3
  if destination in (225.0.0.8) then
    set rpf-topology ipv4 multicast topology t208
  elseif destination in (225.0.0.9) then
    set rpf-topology ipv4 multicast topology t209
  elseif destination in (225.0.0.10) then
    set rpf-topology ipv4 multicast topology t210
  else
    drop
  endif
end-policy
!```
set spf-priority

To set OSPF Shortest Path First (SPF) priority, use the set spf-priority command in route-policy configuration mode.

```plaintext
set spf-priority {critical|high|medium}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>critical</td>
<td>Sets critical priority for SPF</td>
</tr>
<tr>
<td>high</td>
<td>Sets high priority for SPF</td>
</tr>
<tr>
<td>medium</td>
<td>Sets medium priority for SPF</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example sets SPF priority as critical:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#route-policy policy_spf_priority
RP/0/RP0/CPU0:router(config-rpl)#set spf-priority critical
```
set tag

To set the tag attribute, use the `set tag` command in route-policy configuration mode.

```
set tag {numberparameter}
```

**Syntax Description**

- `number` Value assigned to a 32-bit unsigned integer. Range is from 0 to 4294967295.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set tag` command to set the tag attribute.

**Note**

The `set tag` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

Tags are routing-protocol independent 32-bit integers that can be associated with a given route in the Routing Information Base (RIB).

For the Border Gateway Protocol (BGP), the tag attribute can be set only at the table-policy attach point.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the tag attribute is set to 10:

```
RP/0/RP0/CPU0:router(config-rpl)# set tag 10
```

In this example, the tag attribute is set to a parameter value `$tag_param`:

```
RP/0/RP0/CPU0:router(config-rpl)# set tag $tag_param
```
set traffic-index

To set the traffic index attribute, use the `set traffic-index` command in route-policy configuration mode.

```plaintext
set traffic-index {number|parameter|ignore}
```

### Syntax Description

- **number**: Integer value assigned to the traffic index attribute. Range is 1 to 63.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”
- **ignore**: Specifies that Border Gateway Protocol (BGP) policy accounting is not done.

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `set traffic-index` command to set the traffic index attribute.

The `set traffic-index` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

Traffic index is a special attribute for BGP. It is used as an index to a set of counters that are maintained by forwarding hardware. It is also used to track packet and byte counters that are forwarded using routes with specific attributes. These counters can be enabled and disabled on an individual interface basis.

The traffic index attribute can be set only at the table-policy attach point, and can take a value from 1 to 63, or a value of `ignore`. If the traffic index is set to `ignore`, then BGP policy accounting is not done. Parameterization of this value is also supported.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, a policy is created in which the traffic index is set to 10 for all routes that originated in autonomous system 1234:

```plaintext
RP/0/RSPORP0/CPU0:router(config)# route-policy count-as-1234
RP/0/RSPORP0/CPU0:router(config-rpl)# if as-path originates-from '1234' then
RP/0/RSPORP0/CPU0:router(config-rpl-if)# set traffic-index 10
RP/0/RSPORP0/CPU0:router(config-rpl-if)# else
RP/0/RSPORP0/CPU0:router(config-rpl-if)# pass
RP/0/RSPORP0/CPU0:router(config-rpl-if)# endif
```
RP/0/RSP0RP0/CPU0:router(config-rpl)# end-policy

This policy could then be attached using the BGP **table-policy** command. The counters could then be enabled on various interfaces with the appropriate commands.
set vpn-distinguisher

To change the Border Gateway Protocol (BGP) VPN distinguisher attribute, use the set vpn-distinguisher command in route-policy configuration mode.

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Value assigned to a 32-bit unsigned integer. Range is from 1 to 4294967295.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the set vpn-distinguisher command to change the VPN distinguisher attribute.

**Note**

The set origin command can be used as an action statement within an if statement. For a list of all action statements available within an if statement, see the if command.

A VPN distinguisher is used in Layer 3 VPN networks for enhanced individual VPN control and to avoid route target mapping at AS boundaries in inter-AS VPN networks. Route target extended communities are removed at neighbor outbound, and the VPN distinguisher value is applied on the BGP route as an extended community. When the route is received on a neighboring router in another AS, the VPN distinguisher is removed and mapped to a route target extended community.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, the VPN distinguisher attribute is set to 456:

```
RP/0/RP0/CPU0:router(config-rpl)# set vpn-distinguisher 456
```
set weight

To set the weight value for Border Gateway Protocol (BGP) routes, use the `set weight` command in route-policy configuration mode.

```
set weight {number|parameter}
```

**Syntax Description**
- `number` Number assigned to the weight value for BGP routes. Weight is 16 bits. Range is 0 to 65535.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `set weight` command to set the weight value for BGP routes.

*Note*
The `set weight` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

A weight is a value that can be applied to a route to override the BGP local preference. This is not a BGP attribute announced to BGP peer routers. RPL can be used to set the weight value.

Given two BGP routes with the same network layer reachability information (NLRI), a route with a higher weight is selected, no matter what the values of other BGP attributes may be. However, weight only has significance on the local router. It is not sent from one BGP speaker to another, even within the same autonomous system.

On Cisco routers, if a BGP route is sourced by the local router, its weight is automatically set to 32768; if the BGP route is learned from another router, its weight is automatically set to 0. Thus, by default, locally sourced routes are preferred over BGP learned routes.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
In the following example, the weight of the route is set to 10 and then to a parameter value `$weight_param`:

```
RP/0/RP0/CPU0:router(config-rpl)# set weight 10
RP/0/RP0/CPU0:router(config-rpl)# set weight $weight_param
```
show rpl

To display system-wide RPL configuration, use the show rpl command in XR EXEC mode.

show [running-config] rpl [{maximum {lines configuration-limit|policies policies-limit}|editor {emacs|nano|vim}}]

Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>running-config</td>
<td>(Optional) Displays configuration-limit argument.</td>
</tr>
<tr>
<td>maximum</td>
<td>(Optional) Displays the maximum number of lines of configuration and number of policies.</td>
</tr>
<tr>
<td>lines configuration-limit</td>
<td>(Optional) Displays the number of lines to which configuration is limited. Range is 1 to 131072. The configuration-limit argument is available if the running-config keyword is specified.</td>
</tr>
<tr>
<td>policies policies-limit</td>
<td>(Optional) Displays the limit on the number of policies. Range is 1 to 5000. The configuration-limit argument is available if the running-config keyword is specified.</td>
</tr>
<tr>
<td>editor</td>
<td>(Optional) Specifies the default RPL editor. This keyword is available if the running-config keyword is specified.</td>
</tr>
<tr>
<td>emacs</td>
<td>(Optional) Displays the default RPL editor to Micro Emacs.</td>
</tr>
<tr>
<td>nano</td>
<td>(Optional) Displays the default RPL editor to nano.</td>
</tr>
<tr>
<td>vim</td>
<td>(Optional) Displays the default RPL editor to Vim.</td>
</tr>
</tbody>
</table>

Command Default

No default behavior or values

<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following shows the output of the show running-config rpl command:
show running-config rpl

extcommunity-set rt ext_comm_set_rt_ex1
  1.2.3.4:34
end-set

prefix-set prefix_set_ex1
  10.0.0.0/16 ge 16 le 32,
  0.0.0.0/0 ge 25 le 32,
  0.0.0.0/0
end-set

route-policy policy_2
  if destination in prefix_set_ex1 then
    if (community matches-any com_set_ex1) then
      set community (10:666) additive
    endif
    if (extcommunity rt matches-any ext_comm_set_rt_ex1) then
      set community (10:999) additive
    endif
  endif
end-policy
show rpl active as-path-set

To display the AS path sets that are referenced by at least one policy that is being used at an attach point, use the `show rpl active as-path-set` command in XR EXEC mode.

```
show rpl active as-path-set [detail]
```

**Syntax Description**

- `detail` (Optional) Displays the content of the object and all referenced objects for active AS path sets.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release** Modification
  - Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `show rpl active as-path-set` command to display all AS path sets that are in use in the system and referenced either directly or indirectly at a policy attach point.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>

Routing Policy Language Commands

show rpl active community-set

Given this sample configuration, the `show rpl active community-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl active community-set
ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following community-sets are ACTIVE
---------------------------------------
comm_set_ex1
```

Routing Policy Language Commands
show rpl active extcommunity-set

To display the extended community sets for cost, route target (RT), and Site-of-Origin (SoO) that are referenced by at least one route policy used at an attach point, use the `show rpl active extcommunity-set` command in XR EXEC mode.

```
show rpl active extcommunity-set [{cost|rt|soo}] [detail]
```

**Syntax Description**

- `cost` (Optional) Displays all extended community cost sets.
- `rt` (Optional) Displays all extended community RT sets.
- `soo` (Optional) Displays all extended community SoO sets.
- `detail` (Optional) Displays the content of the object and all referenced objects for active extended community sets.

**Command Default**

All extended community sets are displayed.

**Command Modes**

XR EXEC mode

**Command History**

- **Release**
  - Modification
  - Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `show rpl active extcommunity-set` command to display all extended community sets that are in use in the system and referenced either directly or indirectly at a policy attach point.

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast

neighbor 10.0.101.2
  remote-as 100
  address-family ipv4 unicast
  route-policy policy_1 in

neighbor 10.0.101.3
  remote-as 12
  address-family ipv4 unicast
  route-policy policy_2 in

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_2 detail

prefix-set prefix_set_ex1
  10.0.0.0/16 ge 16 le 32,
  0.0.0.0/0 ge 25 le 32,
  0.0.0.0/0
end-set
!
community-set comm_set_ex1
  65500:1,
  65500:2,
  65500:3
end-set
!
extcommunity-set rt ext_comm_set_rt_ex1
  1.2.3.4:34
end-set
!
route-policy policy_2
  if destination in prefix_set_ex1 then
    if (community matches-any comm_set_ex1) then
      set community (10:666) additive
    endif
    if (extcommunity rt matches-any ext_comm_set_rt_ex1) then
      set community (10:999) additive
    endif
  endif
end-policy
!

RP/0/RP0/CPU0:router# show rpl route-policy policy_1 detail

prefix-set prefix_set_ex1
  10.0.0.0/16 ge 16 le 32,
  0.0.0.0/0 ge 25 le 32,
  0.0.0.0/0
end-set
!
as-path-set as_path_set_ex1
  ios-regex '^_655--$,'
  ios-regex '^_65501_$'
end-set
!

  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
end-policy
!

Given this sample configuration, the `show rpl active extcommunity-set` command displays the following information:

RP/0/RP0/CPU0:router# show rpl active extcommunity-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
The following extcommunity-sets are ACTIVE

------------------------------------------
ext_comm_set_rt_ex1

UNUSED -- Not attached (directly or indirectly) and not referenced

show rpl active extcommunity-set
show rpl active prefix-set

To display the prefix sets that are referenced by at least one policy that is being used at an attach point, use the `show rpl active prefix-set` command in XR EXEC mode.

`show rpl active prefix-set [detail]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>

</table>

**Examples**

This example shows the following sample configuration:

```plaintext
router bgp 2
  address-family ipv4 unicast
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
    route-policy policy_1 in
      !
    neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
    route-policy policy_2 in
      !
  !
RP/0/RP0/CPU0:router# show rpl route-policy policy_2 detail
prefix-set prefix_set_ex1
  10.0.0.0/16 ge 16 le 32,
  0.0.0.0/0 ge 25 le 32,
  0.0.0.0/0
end-set
```

Routing Policy Language Commands
The following example displays active prefix sets:

RP/0/RP0/CPU0:router# show rpl active prefix-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following prefix-sets are ACTIVE
-------------------------------------
prefix_set_1
show rpl active rd-set

To display the route distinguisher (RD) sets that are referenced by at least one policy that is being used at an attach point, use the `show rpl active rd-set` command in XR EXEC mode.

```
show rpl active rd-set [detail]
```

**Syntax Description**
```
detail (Optional) Displays the content of the object and all referenced objects for active route policies.
```

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**
```
Release    Modification
-------------
Release 6.0  This command was introduced.
```

**Usage Guidelines**
Use the `show rpl active rd-set` command to display all RD sets that are in use in the system and that are referenced either directly or indirectly at a policy attach point.

**Task ID**
```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>read-policy</td>
<td>read</td>
</tr>
</tbody>
</table>
```

**Examples**
This example shows the following sample configuration:

```
rd-set rdset1
  10:151,
  100.100.100.1:153,
  100.100.100.62/31:63
end-set
!
rd-set rdset2
  10:152,
  100.100.100.1:154,
  100.100.100.62/31:89
end-set
!
route-policy rdsetmatch
  if rd in rdset1 then
    set community (10:112)
  elseif rd in rdset2 then
    set community (10:223)
  endif
end-policy
!
routing bgp 10
  bgp router-id 10.0.0.1
  address-family vpnv4 unicast
  neighbor 10.10.10.1
  remote-as 10
  address-family ipv4 unicast
```
route-policy rdsetmatch in
!
!

Given this sample configuration, the `show rpl active rd-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl active rd-set
ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following rd-sets are ACTIVE
------------------------------------------
    rdset1
    rdset2
```
**show rpl active route-policy**

To display the route policies that are referenced by at least one policy that is being used at an attach point, use the `show rpl active route-policy` command in XR EXEC mode.

```
show rpl active route-policy [detail]
```

**Syntax Description**

- **detail** (Optional) Displays the content of the object and all referenced objects for active route policies.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl active route-policy` command to display all policies that are in use in the system and that are referenced either directly or indirectly at a policy attach point.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
        
        neighbor 10.0.101.3
          remote-as 12
          address-family ipv4 unicast
            route-policy policy_2 in
              
              !

RP/0/RP0/CPU0:router# show rpl route-policy policy_1
```

```
route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
```
end-policy
!
RP/0/RP0/CPU0:router# show rpl route-policy policy_2

route-policy policy_2
  if destination in prefix_set_ex1 then
    if (community matches-any comm_set_ex1) then
      set community (10:666) additive
    endif
    if (extcommunity rt matches-any ext_comm_set_rt_ex1) then
      set community (10:999) additive
    endif
  endif
end-policy
!

Given this sample configuration, the `show rpl active route-policy` command displays the following information:

RP/0/RP0/CPU0:router# show rpl active route-policy

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following policies are (ACTIVE)
-----------------------------
policy_1
policy_2
# show rpl as-path-set

To display the contents of AS path sets, use the `show rpl as-path-set` command in XR EXEC mode.

```bash
show rpl as-path-set [{name|states|brief}]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>(Optional) Name of the AS path set.</td>
</tr>
<tr>
<td><code>states</code></td>
<td>(Optional) Displays all unused, inactive, and active states.</td>
</tr>
<tr>
<td><code>brief</code></td>
<td>(Optional) Limits the display to a list of the names of all AS path sets without their configurations.</td>
</tr>
</tbody>
</table>

## Command Default

No default behavior or values

## Command Modes

XR EXEC mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

Use the optional `brief` keyword to limit the display to a list of the names of all AS path sets without their configurations.

## Examples

This example shows the following sample configuration:

```bash
RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
    if (destination in prefix_set_ex1) then
        set local-preference 100
    endif
    if (as-path in as_path_set_ex1) then
        set community (10:333) additive
    endif
end-policy
```

Given this sample configuration, the `show rpl as-path-set as_path_set_ex1` command displays the following information:

```bash
RP/0/RP0/CPU0:router# show rpl as-path-set as_path_set_ex1

as-path-set as_path_set_ex1
    ios-regex '^_65500_$',
    ios-regex '^_65501_$'
end-set
```
show rpl as-path-set attachpoints

To display all of the policies used at an attach point that reference the named AS path set, use the `show rpl as-path-set attachpoints` command in XR EXEC mode.

`show rpl as-path-set name attachpoints`

**Syntax Description**
- `name` Name of an AS path set.

**Command Default**
No default behavior or values

**Command Modes**
- XR EXEC mode

**Command History**
- **Release 6.0** This command was introduced.

**Usage Guidelines**
Use the `show rpl as-path-set attachpoints` command to display all policies used at an attach point that reference the named set either directly or indirectly.

The AS path set name is required.

**Task ID**
- **Task ID** Operations
  - route-policy read

**Examples**
This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
    !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
        !
        !
  neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
      route-policy policy_2 in
        !
        !
RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
  !
```
Given this sample configuration, the `show rpl as-path-set as_path_set_ex1 attachpoints` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl as-path-set as_path_set_ex1 attachpoints
```

<table>
<thead>
<tr>
<th>Neighbor/Group</th>
<th>type</th>

</table>
show rpl as-path-set references

To list all of the policies that reference the named AS path set, use the `show rpl as-path-set references` command in XR EXEC mode.

```
show rpl as-path-set name references [brief]
```

**Syntax Description**

- **name** Name of the prefix set.
- **brief** (Optional) Limits the output to just the brief table and not the detailed information for the named AS path set.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl as-path-set references` command to display all policies that reference the named AS path set either directly or indirectly.

Use the optional `brief` keyword to limit the output to just a summary table and not the detailed information for the AS path set.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>

<tbody>
<tr>
<td>route-policy read</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
    !
neighbor 10.0.101.2
  remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
        !
        !
RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
```

Routing Policy Language Commands

167
Given this sample configuration, the `show rpl as-path-set as_path_set_ex1 references` command displays the following information:

```
Usage Direct -- Reference occurs in this policy
Usage Indirect -- Reference occurs via an apply statement
Status UNUSED -- Policy is not in use at an attachpoint (unattached)
Status ACTIVE -- Policy is actively used at an attachpoint
Status INACTIVE -- Policy is applied by an unattached policy
```

<table>
<thead>
<tr>

</table>
show rpl community-set

To display the configuration of community sets, use the `show rpl community-set` command in XR EXEC mode.

```
show rpl community-set [{name|states|brief}]
```

**Syntax Description**

- `name` (Optional) Name of the community set.
- `states` (Optional) Shows all unused, inactive, and active states.
- `brief` (Optional) Limits the display to a list of the names of all community sets without their configurations.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the optional `brief` keyword to limit the display to a list of the names of community sets without their configurations.

**Task ID**

- `route-policy read`

The following is the sample output of the `show rpl community-set` command with graceful maintenance feature attributes displayed:

```
RP/0/0/CPU0:R5#show rpl community-set
Thu Jan 29 17:55:04.792 PST
Listing for all Community Set objects
  community-set gshut
  graceful-shutdown
  end-set
```

**Examples**

This example shows the following sample configuration:

```
route-policy policy_4
  if (destination in prefix_set_ex2) then
    if (community matches-any comm_set_ex2) then
      set community (10:666) additive
    endif
    if (extcommunity matches-any ext_comm_set_rt_ex2) then
      set community (10:999) additive
    endif
  endif
```
end-policy

Given this sample configuration, the `show rpl community-set comm_set_ex2` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl community-set comm_set_ex2
community-set comm_set_ex2
  65501:1,
  65501:2,
  65501:3
end-set
```
**show rpl community-set attachpoints**

To display all the policies used at an attach point that reference the named community set, use the `show rpl community-set attachpoints` command in XR EXEC mode.

```
show rpl community-set name attachpoints
```

**Syntax Description**

- `name` Name of a community set.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release** Modification
  
  Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `show rpl community-set attachpoints` command to display all the policies used at an attach point that reference the named community set either directly or indirectly.

The community set name is required.

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.3
  remote-as 12
  address-family ipv4 unicast
  route-policy policy_2 in
  !
  !
route-policy policy_2
  if destination in prefix_set_ex1 then
    if (community matches-any comm_set_ex1) then
      set community (10:666) additive
    endif
    if (extcommunity rt matches-any ext_comm_set_rt_ex1) then <<<
      set community (10:999) additive
    endif
  endif
end-policy
```
Given this sample configuration, the `show rpl community-set attachpoints` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl community-set ext_comm_set_rt_ex1 attachpoints
```

BGP Attachpoint:Neighbor

</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the optional brief keyword to limit the display to a list of the names of extended community sets without their configurations.

Task ID

```
route-policy read
```

Examples

In the following example, the configuration of an extended community is displayed for the RT community set named ext_comm_set_rt_ex1:

```
RP/0/RP0/CPU0:router# show rpl extcommunity-set rt ext_comm_set_rt_ex1
ext_comm_set_rt_ex1
1.2.3.4:34
end-set
```
In the following example, the configuration of an extended community is displayed with all RT set objects:

```
RP/0/RP0/CPU0:router# show rpl extcommunity-set rt
Listing for all Extended Community RT Set objects
extcommunity-set rt extrt1
  66:60001
end-set
extcommunity-set rt rtset1
  10:615,
  10:6150,
  15.15.15.15:15
end-set
extcommunity-set rt rtset3
  11:11,
  11.1.1.1:3
end-set
extcommunity-set rt extsoo1
  66:70001
end-set
extcommunity-set rt rtset11
  100:121,
  100:122,
  100:123,
  100:124,
  100:125,
  100:126,
  100:127,
  100:128,
  7.7.7.7:21
end-set
```

In the following example, the configuration of an extended community is displayed with all cost set objects:

```
RP/0/RP0/CPU0:router# show rpl extcommunity-set cost
Listing for all Extended Community COST Set objects
extcommunity-set cost costset1
  IGP:90:914,
  Pre-Bestpath:91:915
end-set
extcommunity-set cost costset2
  IGP:92:916,
  Pre-Bestpath:93:917,
  IGP:94:918,
  Pre-Bestpath:95:919
end-set
```
In the following example, the configuration of an extended community is displayed with all SoO set objects:

```
Extended Community SOO Set objects

extcommunity-set soo sooset1
  10:151,
  100.100.100.1:153
end-set
!

extcommunity-set soo sooset3
  11:11,
  11.1.1.1:3
end-set
!
```
show rpl inactive as-path-set

To display the AS path sets that are referenced by a policy but not in any policy that is used at an attach point, use the `show rpl inactive as-path-set` command in XR EXEC mode.

`show rpl inactive as-path-set [detail]`

**Syntax Description**
- `detail` (Optional): Displays the content of the object and all referenced objects for inactive AS path sets.

**Command Default**
- No default behavior or values

**Command Modes**
- XR EXEC mode

**Command History**
- **Release** 6.0  This command was introduced.

**Usage Guidelines**
- Use the `show rpl inactive as-path-set` command to display all AS path sets that are not in use at an attach point either directly or indirectly but are referenced by at least one policy in the system.

**Task ID**
- `route-policy`  read

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
    !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
      !
    neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
      route-policy policy_2 in
      !
    !
  route-policy sample
    if (destination in sample) then
      drop
      endif
  end-policy
  !
  route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
```
if (as-path in as_path_set_ex1) then
    set community (10:333) additive
endif
end-policy
!
route-policy policy_2
    if destination in prefix_set_ex1 then
        if (community matches-any comm_set_ex1) then
            set community (10:666) additive
        endif
        if (extcommunity rt matches-any ext_comm_set Rt_ex1) then
            set community (10:999) additive
        endif
    endif
end-policy
!
route-policy policy_3
    if (destination in prefix_set_ex2) then
        set local-preference 100
    endif
    if (as-path in as_path_set_ex2) then
        set community (10:333) additive
    endif
end-policy
!
route-policy policy_4
    if (destination in prefix_set_ex2) then
        if (community matches-any comm_set_ex2) then
            set community (10:666) additive
        endif
        if (extcommunity matches-any ext_comm_set Rt_ex2) then
            set community (10:999) additive
        endif
    endif
end-policy
!
route-policy policy_5
    apply sample1
    apply policy_3
end-policy

Given this sample configuration, the show rpl inactive as-path-set command displays the following information:

RP/0/RP0/CPU0:router# show rpl inactive as-path-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following as-path-sets are INACTIVE
---------------------------------------
as_path_set_ex2
show rpl inactive community-set

To display the community sets that are referenced by a policy but not any policy that is used at an attach point, use the `show rpl inactive community-set` command in XR EXEC mode.

```
show rpl inactive community-set [detail]
```

**Syntax Description**

- **detail** (Optional) Displays the content of the object and all referenced objects for inactive community sets.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

Use the `show rpl inactive rd-set` command to display all RD sets that are not in use at an attach point either directly or indirectly but are referenced by at least one policy in the system.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy read</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```plaintext
rd-set rdset1
  10:151,
  100.100.100.1:153,
  100.100.100.62/31:63
end-set
!
rd-set rdset2
  10:152,
  100.100.100.1:154,
  100.100.100.62/31:89
end-set
!
```

Given this sample configuration, the `show rpl inactive rd-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl inactive rd-set
ACTIVE -- Referenced by at least one policy which is attached INACTIVE -- Only referenced by policies which are not attached UNUSED -- Not attached (directly or indirectly) and not referenced

The following rd-sets are INACTIVE
------------------------------------------
rdset1
```

Routing Policy Language Commands
show rpl inactive rd-set

rdset2
show rpl inactive route-policy

To display the route policies that are referenced by a policy but not in any policy that is used at an attach point, use the `show rpl inactive route-policy` command in XR EXEC mode.

```
show rpl inactive route-policy [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Detail (Optional) Displays the content of the object and all referenced objects for inactive route policies.</th>
</tr>
</thead>
</table>

**Command Default**

No default behavior or values

  apply policy_3
end-policy

Given this sample configuration, the `show rpl inactive route-policy` command displays the following information:

RP/0/RP0/CPU0:router# show rpl inactive route-policy

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following policies are (INACTIVE)
-------------------------------------
sample3
policy_3
show rpl maximum

To display the maximum limits for lines of configuration and number of policies, use the `show rpl maximum` command in XR EXEC mode.

```
show rpl maximum [{lines|policies}]
```

**Syntax Description**
- `lines` (Optional) Displays the number of lines of configuration limit.
- `policies` (Optional) Displays the number of policies limit.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `show rpl maximum` command to display the current total, current limit, and maximum limit for lines of configuration and policies.

Use the optional `lines` keyword to limit the display to the number of lines of configuration limits. Use the optional `policies` keyword to limit the display to the number of policies limits.

**Examples**
The following example shows sample output from the `show rpl maximum` command:

```
RP/0/RP0/CPU0:router# show rpl maximum
Current Current Max
    Total     Limit     Limit
----------------------------------------
Lines of configuration  3     65536    131072
Policies               1     3500     5000
Compiled policies size (kB)  0
```

Table 7: `show rpl maximum` Field Descriptions, on page 190 describes the significant fields shown in the display.

**Table 7: `show rpl maximum` Field Descriptions**

<table>
<thead>
<tr>

<td>Displays the current compiled total for policies in kilobytes.</td>
</tr>
</tbody>
</table>
show rpl policy-global references

To display policy-global definitions, use the `show rpl policy-global references` command in XR EXEC mode.

```
show rpl policy-global references [brief]
```

### Syntax Description
- **brief** *(Optional)* Limits the display to a list of the policy names.

### Command Default
No default behavior or values

### Command Modes
XR EXEC mode

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
No specific guidelines impact the use of this command.

### Task ID
- **read-policy**

### Examples
This example shows the following sample configuration:

```
policy-global
  infinity '16'
end-global
!
route-policy set-rip-unreachable
  set rip-metric $infinity
end-policy
! 
```

Given this sample configuration, the `show rpl policy-global references` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl policy-global references
Usage Direct -- Reference occurs in this policy Usage Indirect -- Reference occurs via an apply statement
Status UNUSED -- Policy is not in use at an attachpoint (unattached) Status ACTIVE -- Policy is actively used at an attachpoint Status INACTIVE -- Policy is applied by an unattached policy

Usage/Status count
-----------------------------------------------
Direct                              -------------------------------
Indirect                            0
```

Routing Policy Language Commands
<table>

</tr>
</tbody>
</table>

```
ACTIVE 0
INACTIVE 0
UNUSED 1
```

**Routing Policy Language Commands**

- `show rpl policy-global references`
show rpl prefix-set

To display the configuration of prefix sets, use the `show rpl prefix-set` command in XR EXEC mode.

```
show rpl prefix-set [{name|states|brief}]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`{name</td>
<td>states</td>
</tr>
<tr>
<td><code>name</code></td>
<td>(Optional) Shows all unused, inactive, and active states.</td>
</tr>
<tr>
<td><code>states</code></td>
<td>(Optional) Limits the display to a list of the names of all extended community sets without their configurations.</td>
</tr>
<tr>
<td><code>brief</code></td>
<td>(Optional) Limits the display to a list of the names of all extended community sets without their configurations.</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or values

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Because sets cannot hierarchically reference other sets or policies, no `detail` keyword exists as with the `show rpl policy` command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

### Examples

In the following example, the configuration of prefix set `pset1` is displayed:

```
RP/0/RP0/CPU0:router# show rpl prefix-set pset1

prefix-set pset1
  10.0.0.1/0,
  10.0.0.2/0 ge 25 le 32,
  10.0.0.5/8 ge 8 le 32,
  10.168.0.0/16 ge 16 le 32,
  172.16.0.9/20 ge 20 le 32,
  192.168.0.5/20 ge 20 le 32
end-set
```
show rpl prefix-set attachpoints

To display all the policies used at an attach point that reference the named prefix set, use the `show rpl prefix-set attachpoints` command in XR EXEC mode.

`show rpl prefix-set name attachpoints`

**Syntax Description**

| **name** | Name of a prefix set. |

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl prefix-set attachpoints` command to display all the policies used at an attach point that reference the named prefix set either directly or indirectly.

The prefix set name is required.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  !
neighbor 10.0.101.2
  remote-as 100
  address-family ipv4 unicast
  route-policy policy_1 in
  !
  !
neighbor 10.0.101.3
  remote-as 12
  address-family ipv4 unicast
  route-policy policy_2 in
  !
  !
route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
end-policy
```
Given this sample configuration, the **show rpl prefix-set prefix_set_ex1 attachpoints** command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl prefix-set prefix_set_ex1 attachpoints
```

```
BGP Attachpoint:Neighbor
Neighbor/Group | type  | afi/safi | in/out | referring policy | attached policy |
---------------|-------|----------|--------|-----------------|----------------|
10.0.101.2     | --    | IPv4/uni | in     | policy_1        | policy_1       |
10.0.101.3     | --    | IPv4/uni | in     | policy_2        | policy_2       |
```

This table describes the significant fields shown in the display.

**Table 8: show rpl prefix-set attachpoints Field Descriptions**

</table>
show rpl prefix-set references

To list all the policies that reference the named prefix set, use the `show rpl prefix-set references` command in XR EXEC mode.

`show rpl prefix-set name references [brief]`

**Syntax Description**

- **name**: Name of the prefix set.
- **brief**: (Optional) Limits the output to just a summary table and not the detailed information for the named prefix set.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl prefix-set references` command to list all the policies that reference the named prefix set.

Use the optional **brief** keyword to limit the output to just a summary table and not the detailed information for the named prefix set.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```text
prefix-set ten-net
  10.0.0.0/16 le 32
end-set
prefix-set too-specific
  0.0.0.0/0 ge 25 le 32
end-set
route-policy example-one
  if destination in ten-net then
drop
else
  set local-preference 200
  apply set-comms
endif
end-policy
route-policy set-comms
  set community (10:1234) additive
end-policy
```

```text
route-policy example-three
  if destination in too-specific then
```
The following example displays information showing the usage and status of each policy that references the prefix set ten-net. The *brief* keyword limits the display to just a summary table and not the detailed information for the prefix set.

```
RP/0/RP0/CPU0:router# show rpl prefix-set ten-net references brief
```

Usage Direct -- Reference occurs in this policy
Usage Indirect -- Reference occurs via an apply statement

Status UNUSED -- Policy is not in use at an attachpoint (unattached)
Status ACTIVE -- Policy is actively used at an attachpoint
Status INACTIVE -- Policy is applied by an unattached policy

<table>
<thead>
<tr>
<th>Usage/Status</th>

<td>Number of policies that match each usage and status option.</td>
</tr>
</tbody>
</table>
show rpl rd-set

To display the configuration of route distinguisher (RD) sets, use the **show rpl rd-set** command in XR EXEC mode.

```
show rpl rd-set \[\{name\}\{states\}\{brief\}\]
```

### Syntax Description

- **name** (Optional) Name of the RD set.
- **states** (Optional) Shows all unused, inactive, and active states.
- **brief** (Optional) Limits the display to a list of the names of all RD sets without their configurations.

### Command Default

No default behavior or values

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Because sets cannot hierarchically reference other sets or policies, no **detail** keyword exists as with the **show rpl policy** command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

### Examples

In the following example, the configuration of RD set rdset1 is displayed:

```
RP/0/RP0/CPU0:router# show rpl rd-set rdset1
rd-set rdset1
  10:151,
  100.100.100.1:153,
  100.100.100.62/31:63
end-set
```
show rpl rd-set attachpoints

To display all the policies used at an attach point that reference the named route distinguisher (RD) set, use the `show rpl rd-set attachpoints` command in XR EXEC mode.

```
show rpl rd-set name attachpoints
```

**Syntax Description**

- name: Name of an RD set.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release**
  - 6.0: This command was introduced.

**Usage Guidelines**

Use the `show rpl rd-set attachpoints` command to display all the policies used at an attach point that reference the named RD set either directly or indirectly.

**Task ID**

- **Task ID**
  - route-policy

**Examples**

This example shows the following sample configuration:

```
route-policy rdsetmatch
  if rd in rdset1 then
    set community (10:112)
  elseif rd in rdset2 then
    set community (10:223)
  endif
end-policy

router bgp 10
  address-family vpnv4 unicast
  exit
  neighbor 10.0.101.1
    remote-as 11
    address-family vpnv4 unicast
    route-policy rdsetmatch in

Given this sample configuration, the `show rpl rd-set rdset1 attachpoints` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl rd-set rdset attachpoints
BGP Attachpoint: Neighbor
Neighbor/Group type  afi/safi  in/out   vrf name
```
This table describes the significant fields shown in the display.

**Table 10: show rpl rd-set attachpoints Field Descriptions**

</table>
**show rpl route-policy**

To display the configuration of route policies, use the `show rpl route-policy` command in XR EXEC mode.

```
show rpl route-policy [{name | detail|states|brief}]
```

**Syntax Description**

- `name` (Optional) Name of a route policy.
- `detail` (Optional) Displays the configuration of all policies and sets that a policy uses.
- `states` (Optional) Shows all unused, inactive, and active states.
- `brief` (Optional) Limits the display to a list of the names of all extended community sets without their configurations.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the optional `brief` keyword to limit the display to a list of the names of policies without their configurations.

**Examples**

In the following example, the configuration of a route policy named `policy_1` is displayed.

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
  if destination in prefix_set_1 and not destination in sample1 then
    if as-path in aspath_set_1 then
      set local-preference 300
      set origin igp
    elseif as-path in as_allowed then
      set local-preference 400
      set origin igp
    else
      set origin igp
    endif
  else
    set origin igp
  endif
  set med 120
  set community (8660:612) additive
  apply set_lpref_from_comm
```
If the optional **detail** keyword is used, all routing policy language (RPL) policies and sets that route policy policy_1 uses are displayed, as shown in the following example.

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_1 detail

! prefix-set sample1
  0.0.0.0/0,
  0.0.0.0/0 ge 25 le 32,

    apply set_lpref_from_comm
end-policy
show rpl route-policy attachpoints

To display all the policies used at an attach point that reference the named policy, use the `show rpl route-policy attachpoints` command in XR EXEC mode.

`show rpl route-policy name attachpoints`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>Name of a policy.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl route-policy attachpoints` command to display all the policies used at an attach point that reference the named policy either directly or indirectly.

The policy name is required.

**Examples**

This example shows the following sample configuration:

```plaintext
router bgp 2
    address-family ipv4 unicast
    neighbor 10.0.101.2
        remote-as 100
        address-family ipv4 unicast
            route-policy policy_1 in
                if (destination in prefix_set_ex1)
                    set local-preference 100
            endif
    neighbor 10.0.101.3
        remote-as 12
        address-family ipv4 unicast
            route-policy policy_2 in
                if (destination in prefix_set_ex2)
                    set local-preference 100
            endif

RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
    if (destination in prefix_set_ex1) then
        set local-preference 100
    endif
```
if (as-path in as_path_set_ex1) then
    set community (10:333) additive
endif
end-policy
!
RP/0/RP0/CPU0:router# show rpl route-policy policy_2

route-policy policy_2
if (destination in prefix_set_ex1) then
    if (community matches-any comm_set_ex1) then
        set community (10:666) additive
    endif
    if (extcommunity matches-any ext_comm_set_rt_ex1) then
        set community (10:999) additive
    endif
endif
end-policy
!

The following command displays the route policy attach points for policy_2:

RP/0/RP0/CPU0:router# show rpl route-policy policy_2 attachpoints

BGP Attachpoint: Neighbor

<table>
<thead>
<tr>
<th>Neighbor/Group</th>

</tr>
</tbody>
</table>
show rpl route-policy inline

To display all policies and sets that a policy uses expanded inline, use the show rpl route-policy inline command in XR EXEC mode.

show rpl route-policy name inline

Syntax Description

name  Name of a policy.

Command Default
No default behavior or values

Command Modes
XR EXEC mode

Command History

Release   Modification
Release 6.0  This command was introduced.

Usage Guidelines

Use the show rpl route-policy inline command to examine the configuration of a specified route policy. All policies and sets that a policy uses are gathered together and displayed expanded inline.

The policy name is required.

Task ID

Task ID  Operations
route-policy  read

Examples

The following command displays the route policy policy_1:

RP/0/RP0/CPU0:router# show rpl route-policy policy_1

! route-policy policy_1
  if destination in prefix_set_1 and not destination in martians then
    if as-path in aspath_set_1 then
      set local-preference 300
      set origin igp
    elseif as-path in as_allowed then
      set local-preference 400
      set origin igp
    else
      set origin igp
    endif
  else
    drop
  endif
  set med 120
  set community (8660:612) additive
  apply set_lpref_from_comm
end-policy
The following command displays the route policy policy_1 and all the other sets or policies it refers too inline. Adding the inline keyword causes the configuration to be displayed inline for all RPL objects that the route-policy policy_1 uses.

```
RP/0/RP0/CPU0:router# show rpl policy policy_1 inline
route-policy policy_1
  if destination in (91.5.152.0/24 ge 24 le 32, 91.220.152.0/24 ge 24 le 32, 61.106.52.0/24 ge 24 le 32, 222.168.199.0/24 ge 24 le 32, 93.76.114.0/24 ge 24 le 32, 41.195.116.0/24 ge 24 le 32, 35.92.152.0/24 ge 24 le 32, 143.144.96.0/24 ge 24 le 32, 79.218.81.0/24 ge 24 le 32, 75.213.219.0/24 ge 24 le 32, 178.220.61.0/24 ge 24 le 32, 27.195.65.0/24 ge 24 le 32, 75.213.219.0/24 ge 24 le 32, 79.218.81.0/24 ge 24 le 32, 75.213.219.0/24 ge 24 le 32) and not destination in (0.0.0.0/0, 0.0.0.0/0 ge 25 le 32, 10.0.0.0/8 ge 8 le 32, 192.168.0.0/16 ge 16 le 32, 224.0.0.0/20 ge 20 le 32, 240.0.0.0/20 ge 20 le 32) then
    if as-path in (ios-regex '_9148_', ios-regex '_5870_', ios-regex '_2408_', ios-regex '_2531_', ios-regex '_197_', ios-regex '_2992_') then
      set local-preference 300
      set origin igp
      elseif as-path in
        (ios-regex '.* _1239_ .*', ios-regex '.* _3561_ .*', ios-regex '.* _701_ .*', ios-regex '.* _666_ .*', ios-regex '.* _1755_ .*', ios-regex '.* _1756_ .*') then
        set local-preference 400
        set origin igp
      else
        set origin igp
      endif
    else
      set local-preference 300
      set origin igp
    endif
  else
    set origin igp
  endif
set med 120
set community (8660:612) additive
# apply set_lpref_from_comm
if community matches-any (2:50) then
  set local-preference 50
elseif community matches-any (2:60) then
  set local-preference 60
elseif community matches-any (2:70) then
  set local-preference 70
elseif community matches-any (2:80) then

# end-apply set_lpref_from_comm
end-policy
```
show rpl route-policy references

To list all the policies that reference the named policy, use the `show rpl route-policy references` command in XR EXEC mode.

`show rpl route-policy name references [brief]`

**Syntax Description**
- `name` Name of a prefix set.
- `brief` (Optional) Limits the output to just a summary table and not the detailed information for the named policy.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `show rpl route-policy references` command to list all the policies that reference the named policy.
Use the optional `brief` keyword to limit the output to just a summary table and not the detailed information for the policy.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
prefix-set ten-net
  10.0.0.0/16 le 32
end-set
prefix-set too-specific
  0.0.0.0/0 ge 25 le 32
end-set
route-policy example-one
  if destination in ten-net then
    drop
  else
    set local-preference 200
    apply set-comms
  endif
end-policy
route-policy example-three
  if destination in too-specific then
    drop
```
The following command displays information about the policy set-comms and how it is referenced:

```sh
RP/0/RP0/CPU0:router# show rpl route-policy set-comms references
```

Usage Direct -- Reference occurs in this policy
Usage Indirect -- Reference occurs via an apply statement

Status UNUSED -- Policy is not in use at an attachpoint (unattached)
Status ACTIVE -- Policy is actively used at an attachpoint
Status INACTIVE -- Policy is applied by an unattached policy

<table>
<thead>
<tr>
<th>Usage/Status</th>

<tr>
<td>UNUSED</td>
<td>1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>route-policy</th>
<th>usage</th>
<th>policy status</th>
</tr>
</thead>
<tbody>
<tr>
<td>example-one</td>
<td>Direct</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>example-three</td>
<td>Indirect</td>
<td>UNUSED</td>
</tr>
</tbody>
</table>

The direct usage indicates that the route policy example-one directly applies the policy set-comms, that is, example-one has a line in the form apply set-comms. The usage Indirect indicates that the route policy example-three does not directly apply the route policy set-comms. However, the route policy example-three does apply the policy example-one, which in turn applies the policy set-comms, so there is an indirect reference from example-three to the route policy set-comms.

The status column indicates one of three states. A policy is active if it is in use at an attach point. In the example provided, neither example-one nor example-three is in use at an attach point, which leaves two possible states: UNUSED or INACTIVE. The route policy example-one is inactive because it has some other policy (example-three) that references it, but neither example-one nor any of the policies that reference it (example-one) are in use at an attach point. The route policy example-three has a status of unused because it is not used at an attach point and no other route policies in the system refer to it.

This table describes the significant fields shown in the display.

<table>

### Examples

This example shows the following sample configuration:

```
prefix-set ten-net
  10.0.0.0/16 le 32
end-set
prefix-set too-specific
  0.0.0.0/0 ge 25 le 32
end-set
route-policy example-one
  if destination in ten-net then
    drop
  else
    set local-preference 200
    apply set-comms
  endif
end-policy
route-policy set-comms
  set community (10:1234) additive
end-policy
```
route-policy example-three
if destination in too-specific then
drop
else
apply example-one
pass
endif
end-policy

The following command lists the policies one and set-comms. It also lists the prefix sets too-specific and ten-net.

RP/0/RP0/CPU0:router# show rpl route-policy example-three uses all

Policies directly and indirectly applied by this policy:
-----------------------------------------------
  example-one set-comms

Sets referenced directly and indirectly (via applied policies) in this policy:
----------------------------------------
type prefix-set:
  ten-net too-specific

The sets example-one and set-comms are listed as policies that are used by the policy example-three. The policy example-one is listed because route policy example-three uses it in an apply statement. The policy set-comms is also listed because example-one applies it. Similarly, the prefix-set too-specific is used directly in the if statement in the policy example-three, and the prefix-set ten-net is used in the policy example-one. The optional direct keyword can be used to limit the output to just those sets and policies that are used within the example-three block itself, as shown in the following example:

RP/0/RP0/CPU0:router# show rpl route-policy example-three uses all direct

Policies directly applied by this policy:
-----------------------------------------------
  example-one

Sets used directly in this policy
------------------------------------
type prefix-set:
  too-specific

As can be seen in the output, the route policy set-comms and the prefix set ten-net are no longer included in the output when the direct keyword is used. The direct form of the command considers only those sets or policies used in the specified route policy and any additional policies or sets that may be used if you follow the hierarchy of apply statements.
This table describes the significant fields shown in the display.

**Table 14: show rpl route-policy uses Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Displays the type used in the policy configuration. Values for type are prefix-set, community-set, extcommunity-set, and as-path-set.</td>
</tr>
</tbody>
</table>
show rpl unused as-path-set

To display the AS path sets that are defined but not used by a policy at an attach point or referenced in a policy using an apply statement, use the show rpl unused as-path-set command in XR EXEC mode.

show rpl unused as-path-set [detail]

**Syntax Description**

| detail | (Optional) Displays the content of the object and all referenced objects for unused AS path sets. |

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release** Modification
- Release 6.0  This command was introduced.

**Usage Guidelines**

Use the show rpl unused as-path-set command to display all AS path sets that are not used in a policy at an attach point either directly or indirectly and are not referenced by any policies in the system.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```bash
router bgp 2
   address-family ipv4 unicast
   !
   neighbor 10.0.101.2
      remote-as 100
      address-family ipv4 unicast
      route-policy policy_1 in
      !
   neighbor 10.0.101.3
      remote-as 12
      address-family ipv4 unicast
      route-policy policy_2 in
      !

as-path-set as_path_set_ex1
   ios-regex '^_65500_$',
   ios-regex '^_65501_$'
end-set
!
as-path-set as_path_set_ex2
   ios-regex '^_65502_$',
   ios-regex '^_65503_$'
end-set
!```
Given this sample configuration, the `show rpl unused as-path-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl unused as-path-set
ACTIVE -- Referenced by at least one policy which is attached
```
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following as-path-sets are UNUSED
-------------------------------------
as_path_set_ex3
show rpl unused community-set

To display the community sets that are defined but not used by a policy at an attach point or referenced in a policy using an apply statement, use the `show rpl unused community-set` command in XR EXEC mode.

```
show rpl unused community-set [detail]
```

**Syntax Description**
- `detail` (Optional) Displays the content of the object and all referenced objects for unused community sets.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `show rpl unused community-set` command to display all the community sets that are not used in a policy at an attach point either directly or indirectly and are not referenced by any policies in the system.

**Task ID**
```
read-policy
```

**Examples**
This example shows the following sample configuration:

```
routing bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
  remote-as 100
  address-family ipv4 unicast
    route-policy policy_1 in
    !
  neighbor 10.0.101.3
  remote-as 12
  address-family ipv4 unicast
    route-policy policy_2 in
    !
  
  community-set comm_set_ex1
    65500:1,
    65500:2,
    65500:3
  end-set
  !
  community-set comm_set_ex2
    65501:1,
    65501:2,
```
route-policy sample	eset (destination in sample) then
drop
drop
end-policy
!
route-policy policy_1
if (destination in prefix_set_ex1) then
  set local-preference 100
endif
if (as-path in as_path_set_ex1) then
  set community (10:333) additive
endif
end-policy
!
route-policy policy_2
if (destination in prefix_set_ex1) then
  if (community matches-any comm_set_ex1) then
    set community (10:666) additive
  endif
  if (extcommunity matches-any ext_comm_set_rt_ex1) then
    set community (10:999) additive
  endif
endif
end-policy
!
route-policy policy_3
if (destination in prefix_set_ex2) then
  set local-preference 100
endif
if (as-path in as_path_set_ex2) then
  set community (10:333) additive
endif
end-policy
!
route-policy policy_4
if (destination in prefix_set_ex2) then
  if (community matches-any comm_set_ex2) then
    set community (10:666) additive
  endif
  if (extcommunity matches-any ext_comm_set_rt_ex2) then
    set community (10:999) additive
  endif
endif
end-policy
!
route-policy policy_5
apply sample
apply policy_3
end-policy

Given this sample configuration, the  show rpl unused community-set  command displays the following information:
show rpl unused community-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following community-sets are UNUSED
---------------------------------------
comm_set_ex3
show rpl unused extcommunity-set

To display the extended community sets that are defined but not used by a policy at an attach point or referenced in a policy using an `apply` statement, use the `show rpl unused extcommunity-set` command in XR EXEC mode.

```
show rpl unused extcommunity-set [{cost|detail|rt|soo}]
```

**Syntax Description**

- `cost` (Optional) Displays the unused extended-community cost objects.
- `rt` (Optional) Displays the unused extended community RT objects.
- `soo` (Optional) Displays the unused extended-community SoO objects.
- `detail` (Optional) Displays the content of the object and all referenced objects for unused extended community sets.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>

</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `show rpl unused extcommunity-set` command to display all extended community sets that are not used in a policy at an attach point either directly or indirectly and are not referenced by any policies in the system.

**Examples**
The following is sample output for the `show rpl unused extcommunity-set` command:

```
RP/0/RP0/CPU0:router# show rpl unused extcommunity-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following extcommunity-sets are UNUSED
------------------------------------------
ext_comm_set_ex3
```
show rpl unused prefix-set

To display the prefix sets that are defined but not used by a policy at an attach point or referenced in a policy using an apply statement, use the show rpl unused prefix-set command in XR EXEC mode.

```
show rpl unused prefix-set [detail]
```

**Syntax Description**

- `detail` (Optional) Displays the content of the object and all referenced objects for unused prefix sets.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

end

In the following example, route policies that are defined but not used at an attach point or referenced from another policy using an `apply` statement are displayed using the `show rpl unused route-policy` command.

RP/0/RP0/CPU0:router# show rpl unused route-policy

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following policies are (UNUSED)
-----------------------------
policy_1
policy_2
policy_4
policy_5
source in

To test the source of a Border Gateway Protocol (BGP) route against the address contained in either a named or an inline prefix set, use the source in command in route-policy configuration mode.

`source in {prefix-set-name inline-prefix-set parameter}`

**Syntax Description**

- `prefix-set-name` Name of a prefix set.
- `inline-prefix-set` Inline prefix set. The inline prefix set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the source in command as a conditional expression within an if statement to test the source of the route against the data in either a named or an inline prefix set. A comparison that references a prefix set with zero elements in it returns false.

For a list of all conditional expressions available within an if statement, see the if command.

The source of a BGP route is the IP peering address of the neighboring router from which the route was received.

The prefix set can contain both IPv4 and IPv6 prefix specifications.

**Examples**

In the following example, the source of a BGP route is tested against the data in the prefix set `my-prefix-set`:

```
RP/0/RP0/CPU0:router(config)# route-policy policy-A
RP/0/RP0/CPU0:router(config-rpl)# if source in my-prefix-set then
```

In this example, the source of a BGP route is tested against the data in an inline IPv4 prefix set:

```
RP/0/RP0/CPU0:router(config)# route-policy policy-B
```
In this example, the source of a route is tested against the data in an inline IPv6 prefix set:

RP/0/RP0/CPU0:router(config-rpl)# if source in (10.0.0.8, 10.0.0.20) then

RP/0/RP0/CPU0:router(config)# route-policy policy-C
RP/0/RP0/CPU0:router(config-rpl)# if source in (2001:0:0:1::/64, 2001:0:0:2::/64) then
**supress-route**

To indicate that a given component of a BGP aggregate should be suppressed, use the `suppress-route` command in route-policy configuration mode.

**supress-route**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>

<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `suppress-route` command to indicate that a given component of an aggregate should be suppressed, that is, not advertised by BGP. See the `unsuppress-route, on page 238` command for information on overriding the `suppress-route` command for individual neighbors.

The `suppress-route` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, if the destination is in 10.1.0.0/16, then the route is not advertised:

```plaintext
RP/0/RP0/CPU0:router(config)# route-policy check-aggregate
RP/0/RP0/CPU0:router(config-rpl)# if destination in (10.1.0.0/16) then
RP/0/RP0/CPU0:router(config-rpl-if)# suppress-route

RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl-if)# end-policy
```
tag

To match a specific tag value, use the `tag` command in route-policy configuration mode.

```
tag {eq|ge|le|is} {integerparameter}
```

**Syntax Description**

- `eq` | `ge` | `le` | `is` Equal to; greater than or equal to; less than or equal to.
- `integer` Integer value. Range is 0 to 4294967295.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `tag` command as a conditional expression within an `if` statement to match a specific tag value.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

A tag is a 32-bit integer that can be associated with a given route within the RIB. The `eq` operator matches either a specific tag value or a parameter value. Its variants `ge` and `le` match a range of tag values that are either greater than or equal to or less than or equal to the supplied value or parameter.

**Examples**

In the following example, if the tag equals 10, then the condition returns true:

```
RP/0/RSP0RP0/CPU0:router(config-rpl)# if tag eq 10 then
```
tag in

To match a tag entry in a named tag set or inline tag set, use the **tag in** command in route-policy configuration mode.

```
tag in {tag-set-nameinline-tag-setparameter}
tag-set-name Name of a tag set. The tag-set accepts 32-bit Integer value. Range is 0 to 4294967295.
inline-tag-set Inline tag set. The inline tag set must be enclosed in parentheses.
parameter Parameter name. The parameter name must be preceded with a “$.”
```

**Syntax Description**

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **tag in** command as a conditional expression within an **if** statement to match a tag entry in a named tag set or inline tag set.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

This command takes either a named tag set or an inline tag set value as an argument. The condition returns true if the tag entry matches any entry in the tag set or inline tag set. An attempt to match a tag using a tag set that is defined but contains no elements returns false.

The routing policy language (RPL) provides the ability to test tags for a match to a list of tag match specifications using the **in** operator. The **tag in** command is protocol-independent.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, a tag set named **my-tag-set** is defined and a route policy named **use-tag-in** is created. Within the **use-tag-in** route policy, the **tag in** command is used within an **if** statement to learn if the tag is in the tag-set named **my-tag-set**. If it is, then local preference is set to 100. If it is not in **my-tag-set** but does match the next tag specifications, then local preference is set to 200.

```
RP/0/RP0/CPU0:router(config)#tag-set my-tag-set
RP/0/RP0/CPU0:router(config-tag)#1000
```
RP/0/RP0/CPU0:router(config-tag)#3000
RP/0/RP0/CPU0:router(config-tag)#end-set

RP/0/RP0/CPU0:router(config)#route-policy use-tag-in
RP/0/RP0/CPU0:router(config-rpl)#if tag in my-tag-set then
RP/0/RP0/CPU0:router(config-rpl-if)#set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)#elseif tag in (2000, 4000) then
RP/0/RP0/CPU0:router(config-rpl-elseif)#set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)#endif
RP/0/RP0/CPU0:router(config-rpl)#end policy
tag-set

To enter tag set configuration mode and define a tag set, use the `tag-set` command in XR Config mode. To remove a named tag set, use the `no` form of this command.

```
tag-set name
no tag-set name
```

**Syntax Description**

- **name**
  - Name of a tag set.

**Command Default**

None

**Command Modes**

XR Config

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `tag-set` command to enter tag set configuration mode and define a tag set. A tag-set is a 32-bit integer that can be associated with a given route within the RIB.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, a tag set named `my-tag-set` is defined and a route policy named `use-tag-in` is created. Within the `use-tag-in` route policy, the `tag in` command is used within an `if` statement to learn if the tag is in the tag-set named `my-tag-set`. If it is, then local preference is set to 100. If it is not in `my-tag-set` but does match the next tag specifications, then local preference is set to 200.

```
RP/0/RP0/CPU0:router(config)#tag-set my-tag-set
RP/0/RP0/CPU0:router(config-tag)#1000
RP/0/RP0/CPU0:router(config-tag)#3000
RP/0/RP0/CPU0:router(config-tag)#end-set

RP/0/RP0/CPU0:router(config)#route-policy use-tag-in
RP/0/RP0/CPU0:router(config-rpl)#if tag in my-tag-set then
RP/0/RP0/CPU0:router(config-rpl-if)#set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)#elseif tag in (2000, 4000) then
RP/0/RP0/CPU0:router(config-rpl-elseif)#set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)#endif
RP/0/RP0/CPU0:router(config-rpl)#end policy
```
unsuppress-route

To indicate that a given component of a BGP aggregate should be unsuppressed, use the **unsuppress-route** command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **unsuppress-route** command to indicate that a given component of an aggregate should be unsuppressed, that is, allowed to be advertised by BGP again. This command affects routes that have been suppressed in the generation of BGP aggregates. If the request to unsuppress a route is encountered in a policy at a neighbor-out attach point, it guarantees that the routes that it affects are advertised to that neighbor even if that route was suppressed using the **suppress-route** command in a policy at the aggregation attach point.

The **unsuppress-route** command can be used as an action statement within an **if** statement. For a list of all action statements available within an **if** statement, see the **if** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, if the destination is in 10.1.0.0/16, then the route is not advertised:

```
RP/0/RP0/CPU0:router(config)# route-policy check-aggregate
RP/0/RP0/CPU0:router(config-rpl)# if destination in (10.1.0.0/16) then
RP/0/RP0/CPU0:router(config-rpl-if)# unsuppress-route

RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

Assuming that the policy is attached at a neighbor-out attach point, if the route 10.1.0.0/16 was suppressed in a policy at an aggregation attach point, 10.1.0.0/16 is advertised to the neighbor. Routes continue to be suppressed in advertisements to other BGP neighbors unless a specific policy is attached to unsuppress the route.
vpn-distinguisher is

To match a specific Border Gateway Protocol (BGP) VPN distinguisher, use the `vpn-distinguisher is` command in route-policy configuration mode.

```
vpn-distinguisher is {numberparameter}
```

**Syntax Description**

- **number**: Value assigned to a 32-bit unsigned integer. Range is from 1 to 4294967295.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `vpn-distinguisher is` command as a conditional expression within an `if` statement to test the value of the origin attribute.

A VPN distinguisher is used in Layer 3 VPN networks for enhanced individual VPN control and to avoid route target mapping at AS boundaries in inter-AS VPN networks. Route target extended communities are removed at neighbor outbound and the VPN distinguisher value is applied on the BGP route as an extended community. When the route is received on a neighboring router in another AS, the VPN distinguisher is removed and mapped to a route target extended community.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

This command can be parameterized.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the origin is tested within an `if` statement to learn if it is either `igp` or `egp`:

```
RP/0/RP0/CPU0:router(config-rpl)# if origin is igp or origin is egp then
```

In the following example, a parameter is used to match a specific origin type:

```
RP/0/RP0/CPU0:router(config)# route-policy bar($origin)
```
vpn-distinguisher is

RP/0/RP0/CPU0:router(config-rpl)# if origin is $origin then
RP/0/RP0/CPU0:router(config-rpl-if)# set med 20
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
