Communications, Services, and Additional Information

- To receive timely, relevant information from Cisco, sign up at [Cisco Profile Manager](#).
- To get the business impact you’re looking for with the technologies that matter, visit [Cisco Services](#).
• To submit a service request, visit Cisco Support.
• To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit Cisco Marketplace.
• To obtain general networking, training, and certification titles, visit Cisco Press.
• To find warranty information for a specific product or product family, access Cisco Warranty Finder.

Cisco Bug Search Tool

Cisco Bug Search Tool (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.
BFD Commands

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.
- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

This module describes the commands used to configure and monitor the Bidirectional Forwarding (BFD) protocol on Cisco NCS 5500 Series Routers.
For detailed information about BFD concepts, configuration tasks, and examples, see the Implementing BFD on Routing Command Reference for Cisco NCS 5500 Series Routers module in the *Routing Configuration Guide for Cisco NCS 5500 Series Routers*.

- bfd fast-detect, on page 3
- bfd minimum-interval, on page 5
- bfd multipath include location, on page 7
- bfd multiplier, on page 8
- hw-module profile offload, on page 10
- router pim, on page 11
- show bfd session, on page 12
**bfd fast-detect**

To enable Bidirectional Forwarding Detection (BFD) to detect failures in the path between adjacent forwarding engines, use the `bfd fast-detect` command in the appropriate configuration mode. To return the software to the default state in which BFD is not enabled, use the `no` form of this command.

```
bfd fast-detect [{disable | ipv4}]
no bfd fast-detect
```

**Syntax Description**

- `disable` Disables the detection of failures in the path between adjacent forwarding engines for a specified entity, such as a BGP neighbor or OSPF interface.

**Note** The `ipv4` keyword is available in IS-IS router configuration mode only.

**Command Default**

BFD detection of failures in the path between adjacent forwarding engines is disabled.

**Command Modes**

- Neighbor configuration
- Session group configuration
- Neighbor group configuration
- Interface configuration
- Interface configuration
- Router configuration
- Area configuration
- Area interface configuration
- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.1x</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- **Note** BFD can support multihop for internal and external BGP peers.

- Use the `bfd fast-detect` command to provide protocol- and media-independent, short-duration failure detection of the path between adjacent forwarding engines, including the interfaces and data links.

- BFD must be configured on directly connected neighbors for a BFD session to be established between the neighbors.
In OSPF and OSPF3 environments, the setting of the **bfd fast-detect** command is inherited from the highest-level configuration mode in which the command was configured. From the lowest to the highest configuration modes, the inheritance rules are as follows:

- If you enable BFD in area interface configuration mode, it is enabled on the specified interface only.
- If you enable BFD in area configuration mode, it is enabled on all interfaces in the specified area.
- If you enable BFD in router configuration mode, it is enabled on all areas and all associated interfaces in the specified routing process.

In OSPF environments, the **disable** option enables you to override the inheritance rules described previously. For example, if you enable BFD in an OSPF area, BFD is enabled on all interfaces in that area. If you do not want BFD running on one of the interfaces in that area, you must specify the **bfd fast-detect disable** command for that interface only.

To disable BFD or return the software to the default state in which BFD is not enabled in IS-IS router configuration mode, you must enter the **no bfd fast-detect** command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>read, write</td>
</tr>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure BFD on a BGP router:

```
RP/0/RP0/CPU0:router(config)# route-policy pass-all
RP/0/RP0/CPU0:router(config-rpl)# pass
RP/0/RP0/CPU0:router(config-rpl)# end-policy
RP/0/RP0/CPU0:router(config-rpl)# end
RP/0/RP0/CPU0:router(config)# configure
RP/0/RP0/CPU0:router(config)# router bgp 65000
RP/0/RP0/CPU0:router(config-bgp)# bfd minimum-interval 3
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.70.24
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr)# bfd fast-detect
RP/0/RP0/CPU0:router(config-bgp-nbr)# route-policy pass-all in
RP/0/RP0/CPU0:router(config-bgp-nbr)# route-policy pass-all out
```
**bfd minimum-interval**

To specify the minimum control packet interval for BFD sessions for the corresponding BFD configuration scope, use the `bfd minimum-interval` command in the appropriate configuration mode. To return the router to the default setting, use the `no` form of this command.

```
bfd minimum-interval milliseconds
no bfd minimum-interval [milliseconds]
```

**Syntax Description**
- `milliseconds` Interval between sending BFD hello packets to the neighbor. The range is 300 to 30000 milliseconds.

**Command Modes**
- Router configuration
- Interface configuration
- Router configuration
- Area configuration
- Area interface configuration
- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.1x</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In OSPF environments, the setting of the `bfd minimum-interval` command is inherited from the highest-level configuration mode in which the command was configured. From the lowest to the highest configuration modes, the inheritance rules are as follows:

- If you configure the minimum interval in area interface configuration mode, the updated interval affects the BFD sessions on the specified interface only.
- If you configure the minimum interval in area configuration mode, the updated interval affects the BFD sessions on all interfaces in the specified area.
- If you configure the minimum interval in router configuration mode, the updated interval affects the BFD sessions in all areas and all associated interfaces in the specified routing process.

If desired, you can override these inheritance rules by explicitly configuring the `bfd minimum-interval` command for a specific area interface or area.

---

**Note**

When multiple applications share the same BFD session, the application with the most aggressive timer wins locally. Then, the result is negotiated with the peer router.

Keep the following router-specific rules in mind when configuring the minimum BFD interval:
• The maximum rate in packets-per-second (pps) for BFD sessions is linecard-dependent. If you have multiple linecards supporting BFD, then the maximum rate for BFD sessions per system is the supported linecard rate multiplied by the number of linecards.

• If a session is running in asynchronous mode without echo, then PPS used for this session is (1000 / asynchronous interval in milliseconds).

• If a session is running in asynchronous mode with echo, then PPS used for this session is (1000 / echo interval in milliseconds).

This is calculated as: 1000 / value of the `bfd minimum-interval` command.

• The table below defines the maximum number of BFD sessions that is allowed per line card.

<table>
<thead>
<tr>
<th>Timer Value</th>
<th>Maximum Number of Sessions Supported in a line card.</th>
<th>Maximum Number of Sessions Supported in a system.</th>
</tr>
</thead>
<tbody>
<tr>
<td>300 ms</td>
<td>250</td>
<td>500</td>
</tr>
<tr>
<td>1 second</td>
<td>250</td>
<td>500</td>
</tr>
<tr>
<td>2 seconds</td>
<td>250</td>
<td>500</td>
</tr>
</tbody>
</table>

**Table 1: Supported Scale**

The following examples show how to set the BFD minimum interval for a BGP routing process:

```
RP/0/RP0/CPU0:router(config)# router bgp 6500
RP/0/RP0/CPU0:router(config-bgp)# bfd minimum-interval 300
```
**bfd multipath include location**

To include specific linecards to host BFD multiple path sessions, use the `bfd multipath include location` command in the XR configuration mode. To remove the configuration, use the `no` form of this command.

```plaintext
bfd multipath include location  node-id
no bfd multipath include location  node-id
```

**Syntax Description**

- `location node-id` Configures BFD multipath on the specified location. The `node-id` variable is mentioned in the rack/slot/module notation.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.3x</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>read, write</td>
</tr>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to run the `bfd multipath include location` command on a specific location:

```plaintext
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# bfd multipath include location 0/5/CPU0
```
**bfd multiplier**

To set the Bidirectional Forwarding Detection (BFD) multiplier, use the `bfd multiplier` command in the appropriate configuration mode. To return the router to the default setting, use the `no` form of this command.

```
bfd multiplier multiplier
no bfd multiplier [multiplier]
```

**Syntax Description**

`multiplier` Number of times a packet is missed before BFD declares the neighbor down. The ranges are as follows:

- BGP—2 to 16
- IS-IS—2 to 50

**Command Default**

The default multiplier is 3.

**Command Modes**

- Router configuration
- Interface configuration
- Router configuration
- Area configuration
- Area interface configuration
- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.1x</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In OSPF environments, the setting of the `bfd multiplier` command is inherited from the highest-level configuration mode in which the command was configured. From the lowest to the highest configuration modes, the inheritance rules are as follows:

- If you configure a multiplier in area interface configuration mode, the updated multiplier affects the BFD sessions on the specified interface only.
- If you configure a multiplier in area configuration mode, the updated multiplier affects the BFD sessions on all interfaces in the specified area.
- If you configure a multiplier in router configuration mode, the updated multiplier affects the BFD sessions in all areas and all associated interfaces in the specified routing process.

If desired, you can override these inheritance rules by explicitly configuring the `bfd multiplier` command for a specific area interface or area.

If the multiplier is changed using the `bfd multiplier` command, the new value is used to update all existing BFD sessions for the protocol.
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>read,</td>
<td>write</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>isis</td>
<td>read,</td>
<td>write</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ospf</td>
<td>read,</td>
<td>write</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the BFD multiplier in a BGP routing process:

```bash
RP/0/RP0/CPU0:router(config)# router bgp 65000
RP/0/RP0/CPU0:router(config-bgp)# bfd multiplier 3
```
**hw-module profile offload**

To enable the offload of IPv6 BFD to the network processing unit of the line card, use the `hw-module profile offload` command in XR Configuration mode.

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Indicates the IPv6 BFD and Precision Timing Protocol (PTP) feature.</td>
</tr>
<tr>
<td>2</td>
<td>Indicates the IPv6 BFD and acceleration of route download on the scale line card.</td>
</tr>
<tr>
<td>3</td>
<td>Indicates the acceleration of route download on the scale line card and PTP feature.</td>
</tr>
</tbody>
</table>

**Syntax Description**

This command has no arguments and keywords.

**Command Default**

The default option is 1.

**Command Modes**

XR Configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Reload the router for the `hw-module profile offload` command to take effect.

Though you can configure this command on all NCS 5500 routers, this command takes effect only on NCS5501-SE platform.

**Example**

The following example shows how to offload IPv6 BFD with the PTP feature:

```
Router# configure
Router(config)# hw-module profile offload 1
```
**router pim**

To enter Protocol Independent Multicast (PIM) configuration mode, use the `router pim` command in XR configuration mode. To return to the default behavior, use the `no` form of this command.

```
router pim [address family ipv4]
no router pim [address family ipv4]
```

**Syntax Description**

- `address-family` *(Optional)* Specifies which address prefixes to use.
- `ipv4` *(Optional)* Specifies IPv4 address prefixes.

**Command Default**
The default is IPv4 address prefixes.

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.3x</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Task ID**

- Task ID: multicast
  - Operations: read, write

**Examples**

This example shows how to enter PIM configuration mode for IPv4 address prefixes:

```
RP/0/RP0/CPU0:router(config)# router pim
RP/0/RP0/CPU0:router(config-pim-default-ipv4)#
```

This example shows how to enter PIM configuration mode for IPv4 address prefixes:

```
RP/0/RP0/CPU0:router(config)# router pim address-family ipv4
RP/0/RP0/CPU0:router(config-pim-default-ipv4)#
```
show bfd session

To display Bidirectional Forwarding Detection (BFD) session information, use the `show bfd session` command in XR Exec mode.

```
show bfd [{ipv4 | [singlehop | multihop]} | [singlehop | multihop]] | all] session [interface type interface-path-id [destination ip-address] [detail]] location node-id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>(Optional) Displays BFD over IPv4 information only.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) Displays BFD over IPv6 information only.</td>
</tr>
<tr>
<td>singlehop</td>
<td>(Optional) Displays BFD singlehop information only.</td>
</tr>
<tr>
<td>multihop</td>
<td>(Optional) Displays BFD multihop information only.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Displays both BFD over IPv4 and BFD over IPv6 information.</td>
</tr>
<tr>
<td>interface</td>
<td>(Optional) Specifies the interface for which to show information.</td>
</tr>
<tr>
<td>type</td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>Physical interface or virtual interface.</td>
</tr>
<tr>
<td>destination ip-address</td>
<td>(Optional) Displays the BFD session destined for the specified IP address.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays detailed session information, including statistics and number of state transitions.</td>
</tr>
</tbody>
</table>

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.
The default is the default address family identifier (AFI) that is set by the `set default-afi` command.

For the `interface-path-id` argument, use the following guidelines:

- If specifying a physical interface, the naming notation is `rack/slot/module/port`. The slash between values is required as part of the notation. An explanation of each component of the naming notation is as follows:
  - `rack`: Chassis number of the rack.
  - `slot`: Physical slot number of the line card.
  - `module`: Module number. A physical layer interface module (PLIM) is always 0.
  - `port`: Physical port number of the interface.

- If specifying a virtual interface, the number range varies, depending on interface type.

```
RP/0/RP0/CPU0:router# show bfd session detail
I/f:TenGigE0/2/0/0.6, Location:0/2/CPU0, dest:10.0.6.2, src:10.0.6.1
State:UP for 0d:0h:3m:4s, number of times UP:1
Received parameters:
  Version:1, desired tx interval:2 s, required rx interval:2 s
  Required echo rx interval:1 ms, multiplier:3, diag:None
  My discr:589830, your discr:590028, state UP, D/F/P/C/A:0/0/0/1/0
Transmitted parameters:
  Version:1, desired tx interval:2 s, required rx interval:2 s
  Required echo rx interval:1 ms, multiplier:3, diag:None
  My discr:590028, your discr:589830, state UP, D/F/P/C/A:0/0/0/1/0
Timer Values:
  Local negotiated async tx interval:2 s
```
Remote negotiated async tx interval: 2 s
Desired echo tx interval: 250 ms, local negotiated echo tx interval: 250 ms
Echo detection time: 750 ms (250 ms * 3), async detection time: 6 s (2 s * 3)

Local Stats:
Intervals between async packets:
  Tx: Number of intervals = 100, min = 952 ms, max = 2001 ms, avg = 1835 ms
  Last packet transmitted 606 ms ago
  Rx: Number of intervals = 100, min = 1665 ms, max = 2001 ms, avg = 1828 ms
  Last packet received 1302 ms ago

Intervals between echo packets:
  Tx: Number of intervals = 100, min = 250 ms, max = 252 ms, avg = 250 ms
  Last packet transmitted 188 ms ago
  Rx: Number of intervals = 100, min = 250 ms, max = 252 ms, avg = 250 ms
  Last packet received 187 ms ago

Latency of echo packets (time between tx and rx):
  Number of packets = 100, min = 1 ms, max = 2 ms, avg = 1 ms

Session owner information:

<table>
<thead>
<tr>
<th>Client</th>
<th>Desired interval</th>
<th>Multiplier</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>250 ms</td>
<td>3</td>
</tr>
</tbody>
</table>

The following example shows the output from the \texttt{show bfd session} command with the \texttt{all} keyword, which displays both IPv4 and IPv6 information:

```
RP/0/RP0/CPU0:router# show bfd all session location 0/1/CP00

Mon Nov 5 08:51:50.339 UTC
IPv4:
-----
<table>

IS-IS Commands

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note
- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.
- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

This module describes the commands used to configure and monitor the Intermediate System-to-Intermediate System (IS-IS) protocol on Cisco NCS 5500 Series Routers.
For detailed information about IS-IS concepts, configuration tasks, and examples, see the Implementing IS-IS on Routing Command Reference for Cisco NCS 5500 Series Routers module in the *Routing Configuration Guide for Cisco NCS 5500 Series Routers*.

address-family (IS-IS)

To enter address family configuration mode for configuring Intermediate System-to-Intermediate System (IS-IS) routing that use standard IP Version 4 (IPv4) and IP Version 6 (IPv6) address prefixes, use the `address-family` command in XR Config mode or interface configuration mode. To disable support for an address family, use the `no` form of this command.

```
address-family {ipv4 | ipv6} {unicast | multicast}
no address-family {ipv4 | ipv6} {unicast | multicast}
```

**Syntax Description**
- `ipv4` Specifies IPv4 address prefixes.
- `ipv6` Specifies IPv6 address prefixes.
- `unicast` Specifies unicast address prefixes.
- `multicast` Specifies multicast address prefixes.

**Command Default**
An address family is not specified. The default subaddress family (SAFI) is unicast.

**Command Modes**
- XR Config mode
- Interface configuration

**Command History**
- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**
Use the `address family` command to place the router or interface in address family configuration mode. In router address family configuration mode, you can configure routing that uses standard IPv4 or IPv6 address prefixes. An address family must be specified in interface configuration mode. In interface address family configuration mode, you can alter interface parameters for IPv4 or IPv6.

You must specify an address family in order to configure parameters that pertain to a single address family.

**Task ID**
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure the IS-IS router process with IPv4 unicast address prefixes:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/1/0/0
RP/0/RP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)#
```
adjacency-check disable

To suppress Intermediate System-to-Intermediate System (IS-IS) IP Version 4 (IPv4) or IP Version 6 (IPv6) protocol-support consistency checks that are performed prior to forming adjacencies on hello packets, use the adjacency-check disable command in address family configuration mode. To remove this function, use the no form of this command.

adjacency-check disable
no adjacency-check disable

Command Default
Adjacency check is enabled

Command Modes
Address family configuration

Command History
Release 6.0  This command was introduced.

Usage Guidelines
IS-IS performs consistency checks on hello packets and forms an adjacency only with a neighboring router that supports the same set of protocols. A router running IS-IS for both IPv4 and IPv6 does not form an adjacency with a router running IS-IS for IPv4 only.

Use the adjacency-check disable command to suppress the consistency checks for IPv6 IS-IS and allow an IPv4 IS-IS router to form an adjacency with a router running IPv4 IS-IS and IPv6. IS-IS never forms an adjacency between a router running IPv4 IS-IS only and a router running IPv6 only.

In addition, the adjacency-check disable command suppresses the IPv4 or IPv6 subnet consistency check and allows IS-IS to form an adjacency with other routers regardless of whether they have an IPv4 or IPv6 subnet in common.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

Examples

The command in the following example disables the adjacency checks:

The following example shows how the network administrator introduces IPv6 into an existing IPv4 IS-IS network and ensures that the checking of hello packet checks from adjacent neighbors is disabled until all neighbor routers are configured to use IPv6:

```plaintext
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv6 |ipv4
RP/0/RP0/CPU0:router(config-isis-af)# adjacency-check disable
```
To configure staggering of IS-IS adjacency during reload, process restart, and process clear, use the `adjacency stagger` command in router configuration mode. To turn off adjacency staggering, either use the `disable` keyword or use the `no` form of this command.

```
adjacency stagger {disable | initial-num-nbr max-num-nbr}
```

**disable** Disables adjacency staggering.

**initial-num-nbr** The initial number of simultaneous neighbors allowed to form adjacency to FULL in any area to bring up to FULL after a router reload, IS-IS process restart, or IS-IS process clear. Range is 1-65535. Default is 2.

**max-num-nbr** The subsequent number of simultaneous neighbors allowed to form adjacency, per IS-IS instance, after the initial set of IS-IS neighbors have become FULL. Range is 1-65535. Default is 64.

**Table 3: Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.3.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Command Default**

IS-IS adjacency staggering is enabled.

**Command Modes**

Router configuration

**Table 3: Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.3.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Staggering of the IS-IS adjacency during reload, process restart (without NSR or graceful-restart), and process clear reduces the overall adjacency convergence time.

Initially, allow 2 (configurable) neighbors to form adjacency to FULL per area. After the first adjacency reaches FULL, up to 64 (configurable) neighbors can form adjacency simultaneously for the IS-IS instance (all areas). However, areas without any FULL adjacency is restricted by the initial area limit.

**Note**

Adjacency stagger and IS-IS nonstop forwarding (NSF) are mutually exclusive. Adjacency stagger is not activated if nonstop forwarding (NSF) is configured in the router along with IS-IS configuration.

**Table 4: Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS-IS</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to configure adjacency stagger for a 2 neighbors initially and for a maximum of 32 neighbors:

Router# configure
Router(config)# router isis 1
Router(config-isis)# adjacency stagger 2 32
circuit-type

To configure the type of adjacency used for the Intermediate System-to-Intermediate System (IS-IS) protocol, use the circuit-type command in interface configuration mode. To reset the circuit type to Level 1 and Level 2, use the no form of this command.

circuit-type  {level-1 | level-1-2 | level-2-only}
no  circuit-type

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level-1</td>
<td>Establishes only Level 1 adjacencies over an interface.</td>
</tr>
<tr>
<td>level-1-2</td>
<td>Establishes both Level 1 and Level 2 adjacencies, if possible.</td>
</tr>
<tr>
<td>level-2-only</td>
<td>Establishes only Level 2 adjacencies over an interface.</td>
</tr>
</tbody>
</table>

Command Default

Default adjacency types are Level 1 and Level 2 adjacencies.

Command Modes

Interface configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Adjacencies may not be established even if allowed by the circuit-type command. The proper way to establish adjacencies is to configure a router as a Level 1, Level 1 and Level 2, or Level 2-only system using the is-type, on page 57 command. Only on networking devices that are between areas (Level 1 and Level 2 networking devices) should you configure some interfaces to be Level 2-only to prevent wasting bandwidth by sending out unused Level 1 hello packets. Remember that on point-to-point interfaces, the Level 1 and Level 2 hello packets are in the same packet.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure a Level 1 adjacency with its neighbor on tenGigE interface 0/2/0/0 and Level 2 adjacencies with all Level 2-capable routers on tenGigE interface 0/5/0/2:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# is-type level-1-2
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/0
RP/0/RP0/CPU0:router(config-isis-if)# circuit-type level-1
RP/0/RP0/CPU0:router(config-isis-if)# exit
RP/0/RP0/CPU0:router(config-isis)# interface tenGigE 0/5/0/2
RP/0/RP0/CPU0:router(config-isis-if)# circuit-type level-2-only
```
In this example, only Level 2 adjacencies are established because the **is-type** command is configured:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# is-type level-2-only
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/0
RP/0/RP0/CPU0:router(config-isis-if)# circuit-type level-1-2
```
clear isis process

To clear the link-state packet (LSP) database and adjacency database sessions for an Intermediate System-to-Intermediate System (IS-IS) instance or all IS-IS instances, use the `clear isis process` command in XR EXEC mode.

```
clear isis [instance instance-id] process
```

**Syntax Description**

- `instance instance-id` (Optional) Specifies IS-IS sessions for the specified IS-IS instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `clear isis process` command without any keyword to clear all the IS-IS instances. Add the `instance instance-id` keyword and argument to clear the specified IS-IS instance.

**Examples**

The following example shows the IS-IS LSP database and adjacency sessions being cleared for instance 1:

```
RP/0/RP0/CPU0:router# clear isis instance 1 process
```
clear isis route

To clear the Intermediate System-to-Intermediate System (IS-IS) routes in a topology, use the `clear isis route` command in XR EXEC mode.

```
clear isis [instance instance-id] {afi-all | ipv4 | ipv6} {unicast | multicast | safi-all} [topology topo-name] route
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance instance-id</td>
<td>(Optional) Specifies IS-IS sessions for the specified IS-IS instance only.</td>
</tr>
<tr>
<td></td>
<td>• The <code>instance-id</code> argument is the instance identifier (alphanumeric) defined by the <code>router isis</code> command.</td>
</tr>
<tr>
<td>afi-all</td>
<td>Specifies IP Version 4 (IPv4) and IP Version 6 (IPv6) address prefixes.</td>
</tr>
<tr>
<td>ipv4</td>
<td>Specifies IPv4 address prefixes.</td>

</tr>
<tr>
<td>unicast</td>
<td>Specifies unicast address prefixes.</td>
</tr>
<tr>
<td>multicast</td>
<td>Specifies multicast address prefixes.</td>
</tr>
<tr>
<td>safi-all</td>
<td>Specifies all secondary address prefixes.</td>
</tr>
<tr>
<td>topology topo-name</td>
<td>(Optional) Specifies topology table information and name of the topology table.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or value

**Command Modes**

XR EXEC mode

**Command History**

```
Release 6.0  This command was introduced.
```

**Usage Guidelines**

Use the `clear isis route` command to clear the routes from the specified topology or all routes in all topologies if no topology is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>execute</td>
</tr>
<tr>
<td>rib</td>
<td>read, write</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>basic-services</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear the routes with IPv4 unicast address prefixes:
clear isis route
clear isis statistics

To clear the Intermediate System-to-Intermediate System (IS-IS) statistics, use the `clear isis statistics` command in XR EXEC mode.

```
clear isis [instance instance-id] statistics [type interface-path-id]
```

**Syntax Description**

- **instance instance-id** (Optional) Clears IS-IS sessions for the specified IS-IS instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

- **type** Interface type. For more information, use the question mark (?) online help function.

- **interface-path-id** Physical interface or virtual interface.

  **Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `clear isis statistics` command to clear the information displayed by the `show isis statistics` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>execute</td>
</tr>
<tr>
<td>rib</td>
<td>read, write</td>
</tr>
<tr>
<td>basic-services</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows the IS-IS statistics for a specified interface being cleared:

```
RP/0/RP0/CPU0:router# clear isis instance 23 statistics
```
csnp-interval

To configure the interval at which periodic complete sequence number PDU (CSNP) packets are sent on broadcast interfaces, use the `csnp-interval` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
   csnp-interval  seconds  [level  {1 | 2}]
   no csnp-interval  seconds  [level  {1 | 2}]
```

**Syntax Description**

- `seconds` Interval (in seconds) of time between transmission of CSNPs on multiaccess networks. This interval applies only for the designated router. Range is 0 to 65535 seconds.
- `level  {1 | 2}` (Optional) Specifies the interval of time between transmission of CSNPs for Level 1 or Level 2 independently.

**Command Default**

```
seconds : 10 seconds
```

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

Interface configuration

**Command History**

```
Release  Modification
6.0       This command was introduced.
```

**Usage Guidelines**

The `csnp-interval` command applies only to the designated router (DR) for a specified interface. Only DRs send CSNP packets to maintain database synchronization. The CSNP interval can be configured independently for Level 1 and Level 2.

Use of the `csnp-interval` command on point-to-point subinterfaces makes sense only in combination with the IS-IS mesh-group feature.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>execute</td>
</tr>
<tr>
<td>rib</td>
<td>read, write</td>
</tr>
<tr>
<td>basic-services</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

The following example shows how to set the CSNP interval for Level 1 to 30 seconds:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/0/2/0
RP/0/RP0/CPU0:router(config-isis-if)# csnp-interval 30 level 1
```
default-information originate (IS-IS)

To generate a default route into an Intermediate System-to-Intermediate System (IS-IS) routing domain, use the `default-information originate` command in address family configuration mode. To remove the `default-information originate` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
default-information originate [{external | route-policy route-policy-name}]
no default-information originate [{external | route-policy route-policy-name}]
```

**Syntax Description**

- **external** (Optional) Enables default route to be originated as an external route.
- **route-policy** (Optional) Defines the conditions for the default route.
- **route-policy-name** (Optional) Name for the route policy.

**Command Default**

A default route is not generated into an IS-IS routing domain.

**Command Modes**

Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a router configured with the `default-information originate` command has a route to 0.0.0.0 in the routing table, IS-IS originates an advertisement for 0.0.0.0 in its link-state packets (LSPs).

Without a route policy, the default is advertised only in Level 2 LSPs. For Level 1 routing, there is another process to find the default route, which is to look for the closest Level 1 and Level 2 router. The closest Level 1 and Level 2 router can be found by looking at the attached-bit (ATT) in Level 1 LSPs.

A route policy can be used for two purposes:

- To make the router generate the default route in its Level 1 LSPs.
- To advertise 0.0.0.0/0 conditionally.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to generate a default external route into an IS-IS domain:

```
RP/0/RP0/CPU0:router (config)# router isis isp
RP/0/RP0/CPU0:router (config-isis)# address-family ipv4 unicast
```
default-information originate
disable (IS-IS)

To disable the Intermediate System-to-Intermediate System (IS-IS) topology on a specified interface, use the `disable` command in interface address family configuration mode. To remove this function, use the `no` form of this command.

```
disable
no disable
```

**Command Default**

IS-IS protocol is enabled.

**Command Modes**

Interface address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to disable the IS-IS protocol for IPv4 unicast on HundredGigE interface 0/1/0/1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)# disable
```
distance (IS-IS)

To define the administrative distance assigned to routes discovered by the Intermediate System-to-Intermediate System (IS-IS) protocol, use the distance command in address family configuration mode. To remove the distance command from the configuration file and restore the system to its default condition in which the software removes a distance definition, use the no form of this command.

```
distance weight [{prefix maskprefix/length | [{prefix-list-name}]}]
no distance [{weight}] [{prefix maskprefix/length | [{prefix-list-name}]}]
```

**Syntax Description**

- `weight` (Administrative distance to be assigned to IS-IS routes. Range is 1 to 255.
- `prefix` (Optional) The prefix argument specifies the IP address in four-part, dotted-decimal notation.
- `mask` (Optional) IP address mask.
- `/length` (Optional) The length of the IP prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value. Range is 0 to 32 for IPv4 addresses and 0 to 128 for IPv6 addresses.
- `prefix-list-name` (Optional) List of routes to which administrative distance applies.

**Command Default**

- weight : 115

**Command Modes**

Address family configuration

**Command History**

- **Release**    **Modification**
  - Release 6.0  This command was introduced.

**Usage Guidelines**

An administrative distance is an integer from 1 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. Weight values are subjective; no quantitative method exists for choosing weight values.

Use the distance command to configure the administrative distances applied to IS-IS routes when they are inserted into the Routing Information Base (RIB), and influence the likelihood of these routes being preferred over routes to the same destination addresses discovered by other protocols.

The address/prefix-length argument defines to which source router the distance applies. In other words, each IS-IS route is advertised by another router, and that router advertises an address that identifies it. This source address is displayed in the output of the show isis route detail command.

The distance command applies to the routes advertised by routers whose address matches the specified prefix. The prefix-list-name argument can then be used to refine this further so that the distance command affects only specific routes.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, a distance of 10 is assigned to all routes to 2.0.0.0/8 and 3.0.0.0/8 (or more specific prefixes) that are advertised by routers whose ID is contained in 1.0.0.0/8. A distance of 80 is assigned to all other routes.

```sh
RP/0/RP0/CPU0:router(config)# ipv4 prefix-list target_routes
RP/0/RP0/CPU0:router(config-ipv4_pfx)# permit 2.0.0.0/8
RP/0/RP0/CPU0:router(config-ipv4_pfx)# permit 3.0.0.0/8
RP/0/RP0/CPU0:router(config-ipv4_pfx)# deny 0.0.0.0/0
RP/0/RP0/CPU0:router(config-ipv4_pfx)# exit
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# distance 10 1.0.0.0/8 target_routes
RP/0/RP0/CPU0:router(config-isis-af)# distance 80
```
fast-reroute per-link (IS-IS)

To enable IP fast reroute (IPFRR) loop-free alternate (LFA) prefix independent per-link computation, use the `fast-reroute per-link` command in interface address family configuration mode. To disable this feature, use the `no` form of this command.

```
fast-reroute per-link [{exclude interface type interface-path-id | level {1 | 2} | lfa-candidate interface type interface-path-id}]
```

Syntax Description

- **exclude**: Specifies fast-reroute (FRR) loop-free alternate (LFA) computation exclusion information.
- **level {1 | 2}**: Configures FRR LFA computation for one level only.
- **lfa-candidate**: Specifies FRR LFA computation candidate information.
- **interface type interface-path-id**: Specifies an interface that needs to be either excluded from FRR LFA computation (when used with `exclude` keyword) or to be included in LFA candidate list in FRR LFA computation (when used with the `lfa-candidate` keyword).
- **type**: Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id**: Physical interface or virtual interface.

**Note**: Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**: IP fast-reroute LFA per-link computation is disabled.

**Command Modes**: Interface address family configuration

**Command History**

```
Release   Modification
6.0        This command was introduced.
```

**Usage Guidelines**: No specific guidelines impact the use of this command.

**Task ID**

</table>

This example shows how to configure per-link fast-reroute LFA computation for the IPv4 unicast topology at Level 1:
fast-reroute per-link (IS-IS)

RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)# fast-reroute per-link level 1
To enable IP fast reroute (IPFRR) loop-free alternate (LFA) prefix dependent computation, use the **fast-reroute per-prefix** command in interface address family configuration mode. LFA is supported only on Enhanced Ethernet line card. To disable this feature, use the **no** form of this command.

**fast-reroute per-prefix**

```plaintext
{exclude interface type interface-path-id | level {1 | 2} | lfa-candidate interface type interface-path-id | remote-lfa {maximum-metric metric-value | tunnel mpls-ldp | prefix-list prefix-list-name [level {1 | 2}]}]
```

no **fast-reroute per-prefix**

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>exclude</strong></td>
<td>Specifies fast-reroute (FRR) loop-free alternate (LFA) computation exclusion information.</td>
</tr>
<tr>
<td>**level {1</td>
<td>2}**</td>
</tr>
<tr>
<td><strong>lfa-candidate</strong></td>
<td>Specifies FRR LFA computation candidate information.</td>
</tr>
<tr>
<td><strong>interface</strong></td>
<td>Specifies an interface that needs to be either excluded from FRR LFA computation (when used with <strong>exclude</strong> keyword) or to be included to LFA candidate list in FRR LFA computation (when used with the <strong>lfa-candidate</strong> keyword).</td>
</tr>
<tr>
<td><strong>type</strong></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><strong>interface-path-id</strong></td>
<td>Physical interface or virtual interface. <strong>Note</strong> Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><strong>remote-lfa</strong></td>
<td>Enable remote LFA related configuration.</td>
</tr>
<tr>
<td><strong>prefix-list prefix-list-name</strong></td>
<td>Filter PQ node router ID based on prefix list.</td>
</tr>
</tbody>
</table>

### Command Default

IP fast-reroute LFA per-prefix computation is disabled.

### Command Modes

Interface address family configuration

### Command History

**Release** | **Modification**
--- | ---
Release 6.0 | This command was introduced.

### Usage Guidelines

No specific guidelines impact the use of this command.
This example shows how to configure per-prefix fast-reroute LFA computation for the IPv4 unicast topology at Level 1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)# fast-reroute per-prefix level 1
```

This example shows how to configure per-prefix remote-lfa prefix list. The prefix-list option filters PQ node router ID based on prefix list.

```
RP/0/RP0/CPU0:router(config-isis-af)# fast-reroute per-prefix remote-lfa prefix-list
```
fast-reroute per-link priority-limit (IS-IS)

To enable the IP fast route (IPFRR) loop-free alternate (LFA) prefix independent per-link computation, use the `fast-reroute per-link priority-limit` command in address family configuration mode. To disable this feature, use the `no` form of this command.

```
fast-reroute per-link priority-limit {critical | high | medium} level {1 | 2}
no fast-reroute per-link priority-limit
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>critical</td>
<td>Enables LFA computation for critical priority prefixes only.</td>
</tr>
<tr>
<td>high</td>
<td>Enables LFA computation for critical and high priority prefixes.</td>
</tr>
<tr>
<td>medium</td>
<td>Enables LFA computation for critical, high, and medium priority prefixes.</td>
</tr>
<tr>
<td>level {1</td>
<td>2}</td>
</tr>
</tbody>
</table>

**Command Default**

Fast-reroute per link priority limit LFA computation is disabled.

**Command Modes**

IPv4 unicast address family configuration
IPv6 unicast address family configuration
IPv4 multicast address family configuration
IPv6 multicast address family configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure fast-reroute prefix independent per-link computation for critical priority prefixes for level 1 only:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router isis isp_lfa
RP/0/RP0/CPU0:router(config-isis)#address-family ipv4
RP/0/RP0/CPU0:router(config-isis-af)#fast-reroute per-link priority-limit critical level 1
```
**fast-reroute per-prefix load-sharing disable (IS-IS)**

To disable load sharing prefixes across multiple backups, use the `fast-reroute per-prefix load-sharing disable` command in IPv4 address family configuration mode. To disable this feature, use the `no` form of this command.

`fast-reroute per-prefix load-sharing disable`  
`no fast-reroute per-prefix load-sharing disable`

| Syntax Description | level {1|2} | Disables load-sharing for Level 1 or Level 2 independently. |
|--------------------|----------|-------------------------------------------------------------|

**Command Default**  
Load sharing is enabled.

**Command Modes**  
IPv4 unicast address family configuration  
IPv4 multicast address family configuration

**Command History**  
Release 6.0  
This command was introduced.

**Usage Guidelines**  
No specific guidelines impact the use of this command.

**Task ID**  
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to disable load-sharing prefixes across multiple backups for level 1 routes:

```plaintext
RP/0/RP0/CPU0:router#configure  
RP/0/RP0/CPU0:router(config)#router isis isp_lfa  
RP/0/RP0/CPU0:router(config-isis)#address-family ipv4  
RP/0/RP0/CPU0:router(config-isis-af)#fast-reroute per-prefix load-sharing disable level 1
```
fast-reroute per-prefix tiebreaker (IS-IS)

To configure tie-breaker for multiple backups, use the `fast-reroute per-prefix tiebreaker` command in IPv4 address family configuration mode. To disable tie-breaker configuration, use the `no` form of this command.

```
fast-reroute per-prefix tiebreaker [downstream | lc-disjoint | lowest-backup-metric | node-protecting | primary-path | secondary-path] index index_number level {1 | 2}
no fast-reroute per-prefix tiebreaker
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>downstream</td>
<td>Configures to prefer backup path via downstream node, in case of tie-breaker.</td>
</tr>
<tr>
<td>lc-disjoint</td>
<td>Configures to prefer Prefer line card disjoint backup path.</td>
</tr>
<tr>
<td>lowest-backup-metric</td>
<td>Configures to prefer backup path with lowest total metric.</td>
</tr>
<tr>
<td>node-protecting</td>
<td>Configures to prefer node protecting backup path.</td>
</tr>
<tr>
<td>primary-path</td>
<td>Configures to prefer backup path from ECMP set.</td>
</tr>
<tr>
<td>secondary-path</td>
<td>Configures to prefer non-ECMP backup path.</td>
</tr>
<tr>
<td>index</td>
<td>Sets preference order among tie-breakers.</td>
</tr>
<tr>
<td>index_number</td>
<td>Value for the index. Range is 1-255.</td>
</tr>
<tr>
<td>level {1</td>
<td>2}</td>
</tr>
</tbody>
</table>

**Command Default**

Tie-breaker for multiple backups is not configured.

**Command Modes**

IPv4 unicast address family configuration

IPv4 multicast address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure preference of backup path via downstream node in case of a tie-breaker for selection of backup path from multiple backup paths:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router isis isp_lfa
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4
RP/0/RP0/CPU0:router(config-isis-af)# fast-reroute per-prefix tiebreaker downstream index 255
```
hello-interval (IS-IS)

To specify the length of time between consecutive hello packets sent by the Intermediate System-to-Intermediate System (IS-IS) protocol software, use the `hello-interval` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
hello-interval seconds [level {1 | 2}]
no hello-interval [seconds] [level {1 | 2}]
```

**Syntax Description**

- `seconds` Integer value (in seconds) for the length of time between consecutive hello packets. By default, a value three times the hello interval `seconds` is advertised as the `hold time` in the hello packets sent. (That multiplier of three can be changed by using the `hello-multiplier` command.) With smaller hello intervals, topological changes are detected more quickly, but there is more routing traffic. Range is 1 to 65535 seconds.

- `level {1 | 2}` (Optional) Specifies the hello interval for Level 1 and Level 2 independently. For broadcast interfaces only.

**Command Default**

- `seconds` : 10 seconds

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

Interface configuration

**Command History**

- **Release** Modification
- Release 6.0 This command was introduced.

**Usage Guidelines**

The hello interval can be configured independently for Level 1 and Level 2, except on serial point-to-point interfaces. (Because only a single type of hello packet is sent on serial links, it is independent of Level 1 or Level 2.) Configuring Level 1 and Level 2 independently is used on LAN interfaces.

**Note**

- A shorter hello interval gives quicker convergence, but increases bandwidth and CPU usage. It might also add to instability in the network.
- A slower hello interval saves bandwidth and CPU. Especially when used in combination with a higher hello multiplier, this strategy may increase overall network stability.
- For point-to-point links, IS-IS sends only a single hello for Level 1 and Level 2, making the `level` keyword meaningless on point-to-point links. To modify hello parameters for a point-to-point interface, omit the `level` keyword.
Currently, a user can configure an aggressive hello-interval (lower than the default of 10 seconds for peer-to-peer session). But, if NSR or NSF is configured, the default hello interval has to be used so that the sessions do not run into the risk of flapping during switchover.

Using LAN adjacencies in high availability (HA) scenarios is not recommended, since there is no designated intermediate system (DIS) redundancy in the protocol and traffic will either drop or be rerouted temporarily during DIS re-election.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read,</td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure HundredGigE 0/6/0/0 to advertise hello packets every 5 seconds for Level 1 topology routes. This situation causes more traffic than configuring a longer interval, but topological changes are detected more quickly.

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/6/0/0
RP/0/RP0/CPU0:router(config-isis-if)# hello-interval 5 level 1
```
hello-multiplier

To specify the number of Intermediate System-to-Intermediate System (IS-IS) hello packets a neighbor must miss before the router should declare the adjacency as down, use the `hello-multiplier` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
hello-multiplier multiplier [level {1 | 2}]
no hello-multiplier [multiplier] [level {1 | 2}]
```

**Syntax Description**

- `multiplier`  
  Advertised hold time in IS-IS hello packets is set to the hello multiplier times the hello interval. Range is 3 to 1000. Neighbors declare an adjacency to this down router after not having received any IS-IS hello packets during the advertised hold time. The hold time (and thus the hello multiplier and the hello interval) can be set on an individual interface basis, and can be different between different networking devices in one area.

  Using a smaller hello multiplier gives faster convergence, but can result in more routing instability. Increase the hello multiplier to a larger value to help network stability when needed. Never configure a hello multiplier to a value lower than the default value of 3.

- `level {1 | 2}`  
  (Optional) Specifies the hello multiplier independently for Level 1 or Level 2 adjacencies.

**Command Default**

- `multiplier : 3`
  Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

- Interface configuration

**Command History**

- `Release 6.0`  
  This command was introduced.

**Usage Guidelines**

The “holding time” carried in an IS-IS hello packet determines how long a neighbor waits for another hello packet before declaring the neighbor to be down. This time determines how quickly a failed link or neighbor is detected so that routes can be recalculated.

Use the `hello-multiplier` command in circumstances where hello packets are lost frequently and IS-IS adjacencies are failing unnecessarily. You can raise the hello multiplier and lower the hello interval (`hello-interval (IS-IS), on page 44` command) correspondingly to make the hello protocol more reliable without increasing the time required to detect a link failure.

On point-to-point links, there is only one hello for both Level 1 and Level 2. Separate Level 1 and Level 2 hello packets are also sent over nonbroadcast multiaccess (NBMA) networks in multipoint mode, such as X.25, Frame Relay, and ATM.
The following example shows how the network administrator wants to increase network stability by making sure an adjacency goes down only when many (ten) hello packets are missed. The total time to detect link failure is 60 seconds. This strategy ensures that the network remains stable, even when the link is fully congested.

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-isis-if)# hello-interval 6
RP/0/RP0/CPU0:router(config-isis-if)# hello-multiplier 10
```
hello-padding

To configure padding on Intermediate System-to-Intermediate System (IS-IS) hello protocol data units (IIH PDUs) for all IS-IS interfaces on the router, use the hello-padding command in interface configuration mode. To suppress padding, use the no form of this command.

```
hello-padding {disable | sometimes} [level {1 | 2}]
no hello-padding {disable | sometimes} [level {1 | 2}]
```

**Syntax Description**

- `disable` Suppresses hello padding.
- `sometimes` Enables hello padding during adjacency formation only.
- `level {1 | 2}` (Optional) Specifies hello padding for Level 1 or Level 2 independently.

**Command Default**

Hello padding is enabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You might want to suppress hello padding to conserve network resources. The lower the circuit speed, the higher the percentage of padding overhead. Before suppressing the hello padding, you should know your physical and data link layer configurations and have control over them, and also know your router configuration at the network layer.

For point-to-point links, IS-IS sends only a single hello for Level 1 and Level 2, making the level keyword meaningless on point-to-point links. To modify hello parameters for a point-to-point interface, omit the level keyword.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to suppress IS-IS hello padding over local area network (LAN) circuits for interface HundredGigE 0/2/0/1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-isis-if)# hello-padding disable
```
hello-password

To configure the authentication password for an Intermediate System-to-Intermediate System (IS-IS) interface, use the `hello-password` command in interface configuration mode. To disable authentication, use the `no` form of this command.

```
hello-password [hmac-md5 | text] [clear | encrypted] password [level {1 | 2}] [send-only]
no hello-password [hmac-md5 | text] [clear | encrypted] password [level {1 | 2}] [send-only]
```

**Syntax Description**

- `hmac-md5` (Optional) Specifies that the password use HMAC-MD5 authentication.
- `text` (Optional) Specifies that the password use clear text password authentication.
- `clear` (Optional) Specifies that the password be unencrypted.
- `encrypted` (Optional) Specifies that the password be encrypted using a two-way algorithm.
- `password` Authentication password you assign for an interface.
- `level {1 | 2}` (Optional) Specifies whether the password is for a Level 1 or a Level 2 protocol data unit (PDU).
- `send-only` (Optional) Specifies that the password applies only to protocol data units (PDUs) that are being sent and does not apply to PDUs that are being received.

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

- `password`: encrypted text

**Command Modes**

Interface configuration

**Command History**

- **Release 6.0**  This command was introduced.

**Usage Guidelines**

- When a `text` password is configured, it is exchanged as clear text. Therefore, the `hello-password` command provides limited security.

- When an `hmac-md5` password is configured, the password is never sent over the network and is instead used to calculate a cryptographic checksum to ensure the integrity of the exchanged data.

- For point-to-point links, IS-IS sends only a single hello for Level 1 and Level 2, making the `level` keyword meaningless on point-to-point links. To modify hello parameters for a point-to-point interface, omit the `level` keyword.

**Task ID**

- `isis read, write`
The following example shows how to configure a password with HMAC-MD5 authentication for hello packets running on HundredGigE 0/2/0/3 interface:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/3
RP/0/RP0/CPU0:router(config-isis-if)# hello-password hmac-md5 clear mypassword
```
**hello-password keychain**

To configure the authentication password keychain for an Intermediate System-to-Intermediate System (IS-IS) interface, use the `hello-password keychain` command in interface configuration mode. To disable the authentication password keychain, use the `no` form of this command.

```
hello-password keychain keychain-name [level {1 | 2}] [send-only]
no hello-password keychain keychain-name [level {1 | 2}] [send-only]
```

**Syntax Description**

- **keychain**: Keyword that specifies the keychain to be configured. An authentication password keychain is a sequence of keys that are collectively managed and used for authenticating a peer-to-peer group.

- **keychain-name**: Specifies the name of the keychain.

- **level {1 | 2}**: (Optional) Specifies whether the keychain is for a Level 1 or a Level 2 protocol data unit (PDU).

- **send-only**: (Optional) Specifies that the keychain applies only to protocol data units (PDUs) that are being sent and does not apply to PDUs that are being received.

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

**password**: encrypted text

**Command Modes**

Interface configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Specify a keychain to enable keychain authentication between two IS-IS peers. Use the `keychain keychain-name` keyword and argument to implement hitless key rollover for authentication.

**Examples**

The following example shows how to configure a password keychain for level 1, send only authentication on a HundredGigE:

```
RP/0/RP0/CPU0:router(config)# router isis
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/1/0/0
RP/0/RP0/CPU0:router(config-isis-if)# hello-password keychain mykeychain level 1 send-only
```
**hello-password accept**

To configure an additional authentication password for an Intermediate System-to-Intermediate System (IS-IS) interface, use the **hello-password accept** command in interface configuration mode. To disable authentication, use the **no** form of this command.

```plaintext
hello-password accept {clear | encrypted} password [level {1 | 2}]
no hello-password accept {clear | encrypted} password [level {1 | 2}]
```

**Syntax Description**
- **clear**: Specifies that the password be unencrypted.
- **encrypted**: Specifies that the password be encrypted using a two-way algorithm.
- **password**: Authentication password you assign.
- **level {1 | 2}**: (Optional) Specifies the password for Level 1 or Level 2 independently.

**Command Default**
Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the **hello-password accept** command to add an additional password for an IS-IS interface. An authentication password must be configured using the **hello-password** command before an accept password can be configured for the corresponding level.

**Examples**
The following example shows how to configure a password:

```plaintext
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/3
RP/0/RP0/CPU0:router(config-isis)# hello-password accept encrypted 111D1C1603
```
hostname dynamic disable

To disable Intermediate System-to-Intermediate System (IS-IS) routing protocol dynamic hostname mapping, use the **hostname dynamic** command in XR Config mode. To remove the specified command from the configuration file and restore the system to its default condition, use the **no** form of this command.

**hostname dynamic disable**

**no hostname dynamic disable**

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>disable</strong></td>
<td>Disables dynamic host naming.</td>
</tr>
</tbody>
</table>

**Command Default**

Router names are dynamically mapped to system IDs.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In an IS-IS routing domain, each router is represented by a 6-byte hexadecimal system ID. When network administrators maintain and troubleshoot networking devices, they must know the router name and corresponding system ID.

Link-state packets (LSPs) include the dynamic hostname in the type, length, and value (TLV) which carries the mapping information across the entire domain. Every router in the network, upon receiving the TLV from an LSP, tries to install it in a mapping table. The router then uses the mapping table when it wants to convert a system ID to a router name.

To display the entries in the mapping tables, use the **show isis hostname** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to disable dynamic mapping of hostnames to system IDs:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# hostname dynamic disable
```
**ignore-lsp-errors**

To override the default setting of a router to ignore Intermediate System-to-Intermediate System (IS-IS) link-state packets (LSPs) that are received with internal checksum errors, use the `ignore-lsp-errors disable` command in XR Config mode. To enable ignoring IS-IS LSP errors, use the `no` form of this command.

```
ignore-lsp-errors disable
no ignore-lsp-errors disable
```

**Syntax Description**
- `disable` Disables the functionality of the command.

**Command Default**
The system ignores corrupt LSPs.

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The IS-IS protocol definition requires that a received LSP with an incorrect data-link checksum be purged by the receiver, which causes the initiator of the packet to regenerate it. However, if a network has a link that causes data corruption and at the same time is delivering LSPs with correct data-link checksums, a continuous cycle of purging and regenerating large numbers of packets can occur. Because this situation could render the network nonfunctional, use this command to ignore these LSPs rather than purge the packets.

The receiving network devices use link-state packets to maintain their routing tables.

**Examples**
The following example shows how to instruct the router to purge LSPs that cause the initiator to regenerate LSPs:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# ignore-lsp-errors disable
```
instance-id

To allow a router to share one or more circuits among multiple Intermediate System to Intermediate System (IS-IS) routing protocol instances, use the instance-id command in router configuration mode.

instance-id identifier

Syntax Description

|------------|--------------------------------------------------------------------------------------------------|

Command Default

Disabled

Command Modes

Router configuration

Command History

<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure multiple instances on a single router:

```
RP/0/RP0/CPU0:router(config)# router isis ring
RP/0/RP0/CPU0:router(config-isis)# instance-id 1
RP/0/RP0/CPU0:router(config-isis)# exit
RP/0/RP0/CPU0:router(config)# router isis 1
RP/0/RP0/CPU0:router(config-isis)# instance-id 6
RP/0/RP0/CPU0:router(config-isis)#
```
interface (IS-IS)

To configure the Intermediate System-to-Intermediate System (IS-IS) protocol on an interface, use the `interface` command in XR Config mode. To disable IS-IS routing for interfaces, use the `no` form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

**Syntax Description**

- `type` Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id` Physical interface or virtual interface.

**Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No interfaces are specified.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

An address family must be established on the IS-IS interface before the interface is enabled for IS-IS protocol operation.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable an IS-IS multitopology configuration for IPv4 on HundredGigE interface 0/3/0/0:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# net 49.0000.0000.0001.00
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)# metric-style wide level 1

RP/0/RP0/CPU0:router(config)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-if)# ipv4 address 2001::1/64
```
**is-type**

To configure the routing level for an Intermediate System-to-Intermediate System (IS-IS) area, use the `is-type` command in XR Config mode. To set the routing level to the default level, use the `no` form of this command.

```
is-type {level-1 | level-1-2 | level-2-only}
no is-type [{level-1 | level-1-2 | level-2-only}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level-1</td>
<td>Specifies that the router perform only Level 1 (intra-area) routing. This router learns only about destinations inside its area. Level 2 (interarea) routing is performed by the closest Level 1-2 router.</td>
</tr>
<tr>
<td>level-1-2</td>
<td>Specifies that the router perform both Level 1 and Level 2 routing.</td>
</tr>
<tr>
<td>level-2-only</td>
<td>Specifies that the routing process acts as a Level 2 (interarea) router only. This router is part of the backbone, and does not communicate with Level 1-only routers in its own area.</td>
</tr>
</tbody>
</table>

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the router is configured with Level 1 routing only, this router learns about destinations only inside its area. Level 2 (interarea) routing is performed by the closest Level 1-2 router.

When the router is configured with Level 2 routing only, this router is part of the backbone, and does not communicate with Level 1 routers in its own area.

The router has one link-state packet database (LSDB) for destinations inside the area (Level 1 routing) and runs a shortest path first (SPF) calculation to discover the area topology. It also has another LSDB with link-state packets (LSPs) of all other backbone (Level 2) routers, and runs another SPF calculation to discover the topology of the backbone and the existence of all other areas.

We highly recommend that you configure the type of an IS-IS routing process to establish the proper level of adjacencies. If there is only one area in the network, there is no need to run both Level 1 and Level 2 routing algorithms.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to specify that the router is part of the backbone and that it does not communicate with Level 1-only routers:
RP/0/RP0/CPU0:router(config)# router isis lsp
RP/0/RP0/CPU0:router(config-isis)# is-type level-2-only
link-down fast-detect

To enable fast detection of link down events under ISIS, use the link-down fast-detect command in ISIS interface configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Fast detect is not enabled.

**Command Modes**

ISIS interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

The following example shows how to enable fast detection of link down events under ISIS:

```
Router(config)# router isis isp
Router(config-isis)# interface HundredGigE0/3/0/2
Router(config-isis-if)# link-down fast-detect
```
log pdu drops

To log Intermediate System-to-Intermediate System (IS-IS) protocol data units (PDUs) that are dropped, use the `log pdu drops` command in XR Config mode. To disable this function, use the `no` form of this command.

```
log pdu drops
no log pdu drops
```

**Command Default**

PDU logging is disabled.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `log pdu drops` command to monitor a network when IS-IS PDUs are suspected of being dropped. The reason for the PDU being dropped and current PDU drop statistics are recorded.

The following are examples of PDU logging output:

```
%ISIS-4-ERR_IIH_INPUT_Q_OVERFLOW: IIH input queue overflow: 86 total drops; 19 IIH drops, 44 LSP drops, 23 SNP drops
%ISIS-4-ERR_LSP_INPUT_Q_OVERFLOW: LSP input queue overflow: 17 total drops; 9 IIH drops, 3 LSP drops, 5 SNP drops
```

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

The following example shows how to enable PDU logging:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# log pdu drops
```
**Isp fast-flood threshold**

To configure the link-state packet (LSP) fast-flood threshold, use the `lsp fast-flood threshold` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
lsp fast-flood threshold lsp-number [level {1 | 2}]
no lsp fast-flood threshold [lsp-number] [level {1 | 2}]
```

**Syntax Description**
- `lsp-number` (Optional) Number of LSPs to send back to back. Range is 1 to 4294967295.
- `level {1 | 2}` (Optional) Specifies the LSP threshold for Level 1 or Level 2 independently.

**Command Default**
10 LSPs are allowed in a back-to-back window

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `lsp fast-flood threshold` command to accelerate convergence of LSP database. LSPs are sent back-to-back over an interface up to the specified limit. Past the limit, LSPs are sent out in the next batch window as determined by LSP pacing interval.

Duration of back-to-back window = LSP interval * LSP fast-flood threshold limit.

**Examples**
The following example shows how to configure the LSP threshold:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-isis-if)# lsp fast-flood threshold 234 level 1
```
## lsp-gen-interval

To customize IS-IS throttling of link-state packet (LSP) generation, use the `lsp-gen-interval` command in XR Config mode. To restore the default value, use the `no` form of this command.

### Syntax Example

```
lsp-gen-interval [initial-wait initial] [secondary-wait secondary] [maximum-wait maximum] [level {1 | 2}]
```

### Command Default

- **initial-wait initial**: 50 milliseconds
- **secondary-wait secondary**: 200 milliseconds
- **maximum-wait maximum**: 5000 milliseconds

### Command Modes

XR Config mode

### Command History

- **Release 6.0**  
  This command was introduced.

### Usage Guidelines

During prolonged periods of network instability, repeated recalculation of LSPs can cause increased CPU load on the local router. Further, the flooding of these recalculated LSPs to the other Intermediate Systems in the network causes increased traffic and can result in other routers having to spend more time running route calculations.

Use the `lsp-gen-interval` command to reduce the rate of LSP generation during periods of instability in the network. This command can help to reduce CPU load on the router and to reduce the number of LSP transmissions to its IS-IS neighbors.

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>initial-wait initial</strong></td>
<td>Specifies the initial LSP generation delay (in milliseconds). Range is 0 to 120000 milliseconds.</td>
</tr>
<tr>
<td><strong>secondary-wait secondary</strong></td>
<td>Specifies the hold time between the first and second LSP generation (in milliseconds). Range is 1 to 120000 milliseconds.</td>
</tr>
<tr>
<td><strong>maximum-wait maximum</strong></td>
<td>Specifies the maximum interval (in milliseconds) between two consecutive occurrences of an LSP being generated. Range is 1 to 120000 milliseconds.</td>
</tr>
<tr>
<td>**level {1</td>
<td>2}**</td>
</tr>
</tbody>
</table>

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to set the maximum interval between two consecutive occurrences of an LSP to 15 milliseconds and the initial LSP generation delta to 5 milliseconds:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# lsp-gen-interval maximum-wait 15 initial-wait 5
```
**lsp-interval**

To configure the amount of time between consecutive link-state packets (LSPs) sent on an Intermediate System-to-Intermediate System (IS-IS) interface, use the `lsp-interval` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
lsp-interval  milliseconds [level {1 | 2}]
no lsp-interval [milliseconds] [level {1 | 2}]
```

**Syntax Description**

- `milliseconds`: Time delay (in milliseconds) between successive LSPs. Range is 1 to 4294967295.
- `level {1 | 2}`: (Optional) Configures the LSP time delay for Level 1 or Level 2 independently.

**Command Default**

- `milliseconds`: 33 milliseconds

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

The following example shows how to cause the system to send LSPs every 100 milliseconds (10 packets per second) on Level 1 and Level 2:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-isis-if)# lsp-interval 100
```
**Isp-mtu**

To set the maximum transmission unit (MTU) size of Intermediate System-to-Intermediate System (IS-IS) link-state packets (LSPs), use the `Isp-mtu` command in XR Config mode. To restore the default, use the `no` form of this command.

```
Isp-mtu bytes [level {1 | 2}]
no lsp-mtu [bytes] [level {1 | 2}]
```

**Syntax Description**

- `bytes` *Note* Range is 128 to 8979 bytes from Release 6.6.3 onwards.
- `level {1 | 2}` (Optional) Specifies routing Level 1 or Level 2 independently.

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 6.6.3</td>
<td>The maximum packet size is increased to 8979.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Under normal conditions, the default MTU size should be sufficient. However, if the MTU size of a link is less than 1500 bytes, the LSP MTU size must be lowered accordingly on each router in the network. If this action is not taken, routing becomes unpredictable.

This guideline applies to all Cisco networking devices in a network. If any link in the network has a reduced MTU size, all devices must be changed, not just the devices directly connected to the link.

- **Note**
  
  Do not set the `Isp-mtu` command (network layer) to a value greater than the link MTU size that is set with the `mtu` command (physical layer).

  To be certain about a link MTU size, use the `show isis interface, on page 139` command to display the value.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the MTU size to 1300 bytes:
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# lsp-mtu 1300
**lsp-password**

To configure the link-state packet (LSP) authentication password, use the `lsp-password` command in XR Config mode. To remove the `lsp-password` command from the configuration file and disable link-state packet authentication, use the `no` form of this command.

```
lsp-password { [hmac-md5 | text] [clear | encrypted] password | keychain keychain-name} [level {1 | 2}] [send-only] [snp send-only] [enable-poi]
no lsp-password { [hmac-md5 | text] [clear | encrypted] password | keychain keychain-name} [level {1 | 2}] [send-only] [snp send-only] [enable-poi]
```

**Syntax Description**

- **hmac-md5**: Specifies that the password uses HMAC-MD5 authentication.
- **text**: Specifies that the password uses clear text password authentication.
- **clear**: Specifies that the password be unencrypted.
- **encrypted**: Specifies that the password be encrypted using a two-way algorithm.
- **password**: Authentication password you assign.
- **keychain** (Optional): Specifies a keychain.
- **keychain-name**: Name of the keychain.
- **level {1 | 2}**: (Optional) Specifies the password for Level 1 or Level 2 independently.
- **send-only**: (Optional) Adds passwords to LSP and sequence number protocol (SNP) data units when they are sent. Does not check for authentication in received LSPs or sequence number PDUs (SNPs).
- **snp send-only**: (Optional) Adds passwords to SNP data units when they are sent. Does not check for authentication in received SNPs. This option is available when the `text` keyword is specified.
- **enable-poi**: The `enable-poi` keyword inserts the purge originator identification (POI), if you are using cryptographic authentication. If you are not using cryptographic authentication, then the POI is inserted by default.

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 6.5.1</td>
<td>The <code>enable-poi</code> keyword is added.</td>
</tr>
</tbody>
</table>
When a text password is configured, it is exchanged as clear text. Therefore, the `lsp-password` command provides limited security.

When an HMAC-MD5 password is configured, the password is never sent over the network and is instead used to calculate a cryptographic checksum to ensure the integrity of the exchanged data.

The recommended password configuration is that both incoming and outgoing SNPs be authenticated.

To disable SNP password checking, the `snp send-only` keywords must be specified in the `lsp-password` command.

To configure an additional password, use the `lsp-password accept` command.

Specify a key chain to enable key chain authentication between two IS-IS peers. Use the `keychain keychain-name` keyword and argument to implement hitless key rollover for authentication.

The following examples show how to configure separate Level 1 and Level 2 LSP and SNP passwords, one with HMAC-MD5 authentication and encryption and one with clear text password authentication and no encryption:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# lsp-password hmac-md5 clear password1 level 1
RP/0/RP0/CPU0:router(config-isis)# lsp-password text clear password2 level 2
```
**lsp-password accept**

To configure an additional link-state packet (LSP) authentication password, use the `lsp-password accept` command in XR Config mode. To remove the `lsp-password accept` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
lsp-password accept {clear | encrypted} password [level {1 | 2}]  
nolsp-password accept [{clear | encrypted} password [level {1 | 2}]]
```

**Syntax Description**

- **clear** Specifies that the password be unencrypted.
- **encrypted** Specifies that the password be encrypted using a two-way algorithm.
- **password** Authentication password you assign.
- **level {1 | 2}** (Optional) Specifies the password for Level 1 or Level 2 independently.

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `lsp-password accept` command adds an additional password for use when the system validates incoming LSPs and sequence number PDUs (SNPs). An LSP password must be configured using the `lsp-password` command before an accept password can be configured for the corresponding level.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure an accept Level 1 LSP and SNP password:

```
RP/0/RP0/CPU0:router(config)# router isis isp  
RP/0/RP0/CPU0:router(config-isis)# lsp-password encrypted password1 level 1
```
### lsp-refresh-interval

To set the time between regeneration of link-state packets (LSPs) that contain different sequence numbers, use the `lsp-refresh-interval` command in XR Config mode. To restore the default refresh interval, use the `no` form of this command.

```
lsp-refresh-interval  seconds [level {1 | 2}]
no  lsp-refresh-interval  [seconds [level {1 | 2}]]
```

#### Syntax Description
- `seconds`  Refresh interval (in seconds). Range is 1 to 65535 seconds.
- `level {1 | 2}`  (Optional) Specifies routing Level 1 or Level 2 independently.

#### Command Default
- `seconds` : 900 seconds (15 minutes)
- Both Level 1 and Level 2 are configured if no level is specified.

#### Command Modes
- XR Config mode

#### Command History
- **Release 6.0**  This command was introduced.

#### Usage Guidelines
The refresh interval determines the rate at which the software periodically sends the route topology information that it originates. This behavior is done to keep the information from becoming too old. By default, the refresh interval is 900 seconds (15 minutes).

LSPs must be refreshed periodically before their lifetimes expire. The refresh interval must be less than the LSP lifetime specified with this router command. Reducing the refresh interval reduces the amount of time that undetected link-state database corruption can persist at the cost of increased link utilization. (This event is extremely unlikely, however, because there are other safeguards against corruption.) Increasing the interval reduces the link utilization caused by the flooding of refreshed packets (although this utilization is very small).

#### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

#### Examples
The following example shows how to change the LSP refresh interval to 10,800 seconds (3 hours):

```
RP/0/RP0/CPU0:router(config)# router isis lsp
RP/0/RP0/CPU0:router(config-isis)# lsp-refresh-interval 10800
```
maximum-paths (IS-IS)

To configure the maximum number of parallel routes that an IP routing protocol will install in the routing table, use the `maximum-paths` command in address family configuration mode. To remove the `maximum-paths` command from the configuration file and restore the system to its default condition with respect to the routing protocol, use the `no` form of this command.

```
maximum-paths maximum
no maximum-paths
```

**Syntax Description**

- `maximum`: Maximum number of parallel routes that IS-IS can install in a routing table. Range is 1 to 64.

**Command Default**

No default Command

**Command Modes**

Address family configuration

**Command History**

- **Release** Modification
  - Release 6.0  This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to allow a maximum of 16 paths to a destination:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# maximum-paths 16
```
maximum-redistributed-prefixes (IS-IS)

To specify an upper limit on the number of redistributed prefixes (subject to summarization) that the Intermediate System-to-Intermediate System (IS-IS) protocol advertises, use the maximum-redistributed-prefixes command in address family mode. To disable this feature, use the no form of this command.

maximum-redistributed-prefixes maximum [level {1 | 2}]
no maximum-redistributed-prefixes [maximum [level {1 | 2}]]

Syntax Description
- maximum: Maximum number of redistributed prefixes advertised. Range is 1 to 28000.
- level {1 | 2}: (Optional) Specifies maximum prefixes for Level 1 or Level 2.

Command Default
- maximum: 10000
- level: 1-2

Command Modes
- Address family configuration

Command History
- Release 6.0: This command was introduced.

Usage Guidelines
- Use the maximum-redistributed-prefixes command to prevent a misconfiguration from resulting in redistribution of excess prefixes. If IS-IS encounters more than the maximum number of prefixes, it sets a bi-state alarm. If the number of to-be-redistributed prefixes drops back to the maximum or lower—either through reconfiguration or a change in the redistribution source—IS-IS clears the alarm.

Task ID
- Task ID
  - isis: read, write

Examples
- The following example shows how to specify the number of redistributed prefixes at 5000 for Level 2:

  RP/0/RP0/CPU0:router(config)# router isis isp
  RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
  RP/0/RP0/CPU0:router(config-isis-af)# maximum-redistributed-prefixes 5000 level 2
**max-lsp-lifetime**

To set the maximum time that link-state packets (LSPs) persist without being refreshed, use the `max-lsp-lifetime` command in XR Config mode. To restore the default time, use the `no` form of this command.

```
max-lsp-lifetime seconds [level {1 | 2}]
no max-lsp-lifetime [seconds [level {1 | 2}]]
```

**Syntax Description**
- `seconds` : Lifetime (in seconds) of the LSP. Range from 1 to 65535 seconds.
- `level {1 | 2}` : (Optional) Specifies routing Level 1 or Level 2 independently.

**Command Default**
- `seconds` : 1200 seconds (20 minutes)
- Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**
- XR Config mode

**Command History**
- **Release 6.0** : This command was introduced.

**Usage Guidelines**
You might need to adjust the maximum LSP lifetime if you change the LSP refresh interval with the `lsp-refresh-interval` command. The maximum LSP lifetime must be greater than the LSP refresh interval.

**Task ID**
- **Task ID**
- **Operations**
  - isis : read, write

**Examples**
The following example shows how to set the maximum time that the LSP persists to 11,000 seconds (more than 3 hours):

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# max-lsp-lifetime 11000
```
mesh-group (IS-IS)

To optimize link-state packet (LSP) flooding in highly meshed networks, use the mesh-group command in interface configuration mode. To remove a subinterface from a mesh group, use the no form of this command.

```
mesh-group  {number | blocked}
no mesh-group
```

**Syntax Description**
- `number` Number identifying the mesh group of which this interface is a member. Range is 1 to 4294967295.
- `blocked` Specifies that no LSP flooding takes place on this interface.

**Command Default**
There is no mesh group configuration (normal LSP flooding).

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

LSPs first received on subinterfaces that are not part of a mesh group are flooded to all other subinterfaces in the usual way.

LSPs first received on subinterfaces that are part of a mesh group are flooded to all interfaces except those in the same mesh group. If the `blocked` keyword is configured on a subinterface, then a newly received LSP is not flooded out over that interface.

To minimize the possibility of incomplete flooding, you should allow unrestricted flooding over at least a minimal set of links in the mesh. Selecting the smallest set of logical links that covers all physical paths results in very low flooding, but less robustness. Ideally you should select only enough links to ensure that LSP flooding is not detrimental to scaling performance, but enough links to ensure that under most failure scenarios, no router is logically disconnected from the rest of the network. In other words, blocking flooding on all links permits the best scaling performance, but there is no flooding. Permitting flooding on all links results in very poor scaling performance.

**Note**
See RFC 2973 for details about the mesh group specification.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, six interfaces are configured in three mesh groups. LSPs received are handled as follows:
• LSPs first received by GigabitEthernet interface 0/1/0/0 are flooded to all interfaces except GigabitEthernet 0/1/0/1 (which is part of the same mesh group) and GigabitEthernet 0/3/0/0 (which is blocked).
• LSPs first received by GigabitEthernet 0/2/0/1 are flooded to all interfaces except GigabitEthernet 0/2/0/0 (which is part of the same mesh group) and GigabitEthernet 0/3/0/0 (which is blocked).
• LSPs first received by GigabitEthernet 0/3/0/0 are not ignored, but flooded as usual to all interfaces.
• LSPs received first through GigabitEthernet 0/3/0/1 are flooded to all interfaces, except GigabitEthernet 0/3/0/0 (which is blocked).

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface GigabitEthernet 0/1/0/0
RP/0/RP0/CPU0:router(config-isis-if)# mesh-group 10
RP/0/RP0/CPU0:router(config-isis-if)# exit
RP/0/RP0/CPU0:router(config-isis)# interface GigabitEthernet 0/1/0/1
RP/0/RP0/CPU0:router(config-isis-if)# mesh-group 10
RP/0/RP0/CPU0:router(config-isis-if)# exit
RP/0/RP0/CPU0:router(config-isis)# interface GigabitEthernet 0/2/0/0
RP/0/RP0/CPU0:router(config-isis-if)# mesh-group 11
RP/0/RP0/CPU0:router(config-isis-if)# exit
RP/0/RP0/CPU0:router(config-isis)# interface GigabitEthernet 0/2/0/1
RP/0/RP0/CPU0:router(config-isis-if)# mesh-group 11
RP/0/RP0/CPU0:router(config-isis-if)# exit
RP/0/RP0/CPU0:router(config-isis)# interface GigabitEthernet 0/3/0/1
RP/0/RP0/CPU0:router(config-isis-if)# mesh-group 12
RP/0/RP0/CPU0:router(config-isis-if)# exit
RP/0/RP0/CPU0:router(config-isis)# interface GigabitEthernet 0/3/0/0
RP/0/RP0/CPU0:router(config-isis-if)# mesh-group blocked
```
**metric (IS-IS)**

To configure the metric for an Intermediate System-to-Intermediate System (IS-IS) interface, use the `metric` command in address family or interface address family configuration mode. To restore the default metric value, use the `no` form of this command.

```
metric {default-metric | maximum} [level {1 | 2}]
no metric [{default-metric | maximum} [level {1 | 2}]]
```

### Syntax Description

- **default-metric**: Metric assigned to the link and used to calculate the cost from each other router using the links in the network to other destinations. Range is 1 to 63 for narrow metric and 1 to 16777214 for wide metric.

- **Note**: Setting the default metric under address family results in setting the same metric for all interfaces that is associated with the address family. Setting a metric value under an interface overrides the default metric.

- **maximum**: Specifies maximum wide metric. All routers exclude this link from their shortest path first (SPF).

- **level {1 | 2}**: (Optional) Specifies the SPF calculation for Level 1 or Level 2 independently.

### Command Default

**default-metric**: Default is 10.

Both Level 1 and Level 2 are configured if no level is specified.

### Command Modes

- Address family configuration
- Interface address family configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Specifying the `level` keyword resets the metric only for the specified level. We highly recommend that you configure metrics on all interfaces.

Set the default metric under address family to set the same metric for all interfaces that is associated with the address family. Set a metric value under an interface to override the default metric.

We highly recommend that you configure metrics on all interfaces.

Metrics of more than 63 cannot be used with narrow metric style.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to configure HundredGigE interface with a default link-state metric cost of 15 for Level 1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE0/1/0/1
RP/0/RP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)# metric 15 level 1
```

The following example shows how to configure a metric cost of 15 for all interfaces under address family IPv4 unicast for level 2:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# metric 15 level 2
```
metric-style narrow

To configure the Intermediate System-to-Intermediate System (IS-IS) software to generate and accept old-style type, length, and value (TLV) objects, use the `metric-style narrow` command in address family configuration mode. To remove the `metric-style narrow` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
metric-style narrow [transition] [level {1 | 2}]
no metric-style narrow [transition] [level {1 | 2}]
```

**Syntax Description**

- `transition` (Optional) Instructs the router to generate and accept both old-style and new-style TLV objects. It generates only old-style TLV objects.
- `level { 1 | 2 }` (Optional) Specifies routing Level 1 or Level 2 independently.

**Command Default**

Old-style TLVs are generated.

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

IS-IS traffic engineering extensions include new-style TLV objects with wider metric fields than old-style TLV objects. By default, the router generates old-style TLV objects only. To perform Multiprotocol Label Switching traffic engineering (MPLS TE), a router must generate new-style TLV objects.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the router to generate and accept only old-style TLV objects on router Level 1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# metric-style narrow level 1
```
**metric-style transition**

To configure the Intermediate System-to-Intermediate System (IS-IS) software to generate and accept both old-style and new-style type, length, and value (TLV) objects, use the `metric-style transition` command in address family configuration mode. To remove the `metric-style transition` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
metric-style transition [level {1 | 2}]
no metric-style transition [level {1 | 2}]
```

**Syntax Description**

- `transition` Instructs the router to generate and accept both old-style and new-style TLV objects.
- `level { 1 | 2 }` (Optional) Specifies routing Level 1 or Level 2 independently.

**Command Default**

Old-style TLVs are generated, if this command is not configured.

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

IS-IS traffic engineering extensions include new-style TLV objects which have wider metric fields than old-style TLV objects. By default, the router generates old-style TLV objects only. To perform Multiprotocol Label Switching traffic engineering (MPLS TE), a router needs to generate new-style TLV objects.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the router to generate and accept both old-style and new-style TLV objects on Level 2:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# metric-style transition level 2
```
**metric-style wide**

To configure the Intermediate System-to-Intermediate System (IS-IS) software to generate and accept only new-style type, length, and value (TLV) objects, use the `metric-style wide` command in address family configuration mode. To remove the `metric-style wide` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
metric-style wide [transition] [level {1 | 2}]
no metric-style wide [transition] [level {1 | 2}]
```

**Syntax Description**
- `transition` (Optional) Instructs the router to generate and accept both old-style and new-style TLV objects. It generates only new-style TLV objects.
- `level {1 | 2}` (Optional) Specifies routing Level 1 or Level 2 independently.

**Command Default**
- Old-style TLV lengths are generated, if this command is not configured.
- Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**
Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
IS-IS traffic engineering extensions include new-style TLV objects with wider metric fields than old-style TLV objects. If you enter the `metric-style wide` command, a router generates and accepts only new-style TLV objects. Therefore, the router uses less memory and fewer other resources rather than generating both old-style and new-style TLV objects.

To perform MPLS traffic engineering, a router needs to generate new-style TLV objects.

**Note**
This discussion of metric styles and transition strategies is oriented toward traffic engineering deployment. Other commands and models might be appropriate if the new-style TLV objects are desired for other reasons. For example, a network may require wider metrics, but might not use traffic engineering.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure a router to generate and accept only new-style TLV objects on Level 1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
```
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RSP0RP0/CPU0:router(config-isis-af)# metric-style wide level 1
**microloop avoidance**

To avoid micro-loops by delaying the convergence of all or protected prefixes, use the `microloop avoidance` command. Valid triggers for microloop avoidance feature are local link-down events only, such as link down, BFD down, and IS-IS adjacency down. Microloops caused by other triggers are not avoided by this feature. Consider microloop avoidance segment-routing command for extended trigger coverage.

To disable this function, use the `no` prefix for this command.

```
microloop avoidance [ protected | rib-update-delay delay ]
no microloop avoidance
```

**Syntax Description**

- (none) Delays convergence of all prefixes.
- `protected` (Optional) Delays convergence of protected prefixes.
- `rib-update-delay delay` (Optional) Delays convergence of all prefixes and updates RIB after the configured delay. The range is 1 to 60000 milliseconds. The default value is 5000ms (for both the flavours of loop avoidance).

**Command Default**

Micro-loop avoidance is disabled by default.

**Command Modes**

`router isis configuration`

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the network converges after a link failure restoration, micro-loops can form due to inconsistencies in the forwarding tables of different routers. By delaying the convergence of prefixes, you can avoid the formation of micro-loops.

You can delay the convergence of all or protected prefixes by using the `microloop avoidance` command. When configured, the command applies to all prefixes by default. To enable it for only protected prefixes, use the `protected` option.

If another event occurs when the microloop avoidance timer is running, the microloop avoidance process is cancelled, and RIB delay timer is cancelled and prefixes are sent to RIB immediately.

**Examples**

The following example shows how to configure micro-loop avoidance with IS-IS:

```
Router# configure
```
Router(config)# router isis 50
Router(config-isis)# microloop avoidance rib-update-delay 400
To enable the segment routing microloop avoidance and set the Routing Information Base (RIB) update delay value, use the `microloop avoidance` command. To disable segment routing microloop avoidance, use the `no` form of this command. Microloop avoidance segment-routing gets triggered by following events:

- link down
- link up
- change in link metrics
- overload bit set on node
- overload bit cleared on node

**microloop avoidance segment-routing**

**Command Default** Disabled.

**Command Modes**
- IPv4 address family configuration
- Router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.3.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The Segment Routing Microloop Avoidance feature detects if microloops are possible following a topology change. The node configures IS-IS prefixes with an explicit path by using a list of Segment Routing (SR) segments. The list of SR segments forces the traffic along the new path regardless whether nodes along the path already converged or not. This process eliminates the microloops. After the RIB update delay timer expires, the explicit list of SR segments is removed from the IS-IS prefixes.

Links or nodes that are not participating in the SPT (shortest path tree) of the given IS-IS level do not trigger the microloop avoidance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to enable Segment Routing Microloop Avoidance for IS-IS:
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router isis 1
RP/0/RSP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RSP0/CPU0:router(config-isis-af)# microloop avoidance segment-routing
RP/0/RSP0/CPU0:router(config-isis-af)# microloop avoidance rib-update-delay 3000

The `show isis protocol` command shows the configureduloop settings, for example, the topologies supported by IS-IS.

Router# show isis protocol

IPv4 Unicast
Level-2
Metric style (generate/accept): Wide/Wide
Metric: 10

**Microloop avoidance: Enabled**

  - Configuration: Type: Segment routing, RIB update delay: 3000 msec
  - State: Active, Duration: 4146 ms, Event Link down, Near: enxrr6.00 Far: enxrr5.00
**min-lsp-arrivaltime**

To control the rate of incoming LSPs (link-state packets) LSPs, use the `min-lsp-arrivaltime` command in XR Config mode. To remove this function use the `no` form of this command.

```
min-lsp-arrivaltime [initial-wait initial ] [secondary-wait secondary] [maximum-wait maximum] [level {1 | 2}]
```

**Syntax Description**

- `initial-wait initial` Initial LSP calculation delay (in milliseconds). Range is 0 to 120000.
- `secondary-wait secondary` Hold time between the first and second LSP calculations (in milliseconds). Range is 0 to 120000.
- `maximum-wait maximum` Maximum interval (in milliseconds) between two consecutive LSP calculations. Range is 0 to 120000.
- `level {1 | 2}` (Optional) Enables the LSP interval configuration for Level 1 or Level 2 independently.

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command can be used to protect a router against the possible instability of its neighbor's LSPs.

The command parameters are similar to `lsp-gen-interval` command and neighbors lsp-gen-interval values can be used to set the `min-lsp-arrivaltime`

**Note**

The initial-wait of minimum-lsp-arrival has no use in computing maximum counts and maximum window sizes of the LSP arrival time parameter.

**Task ID**

Task | Operations
---|---
isis | read, write

**Examples**

The following example shows how to configure min-lsp-arrival time commands:
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config)# router isis isp min-lsp-arrivaltime
RP/0/RP0/CPU0:router(config)# router isis 1 min-lsp-arrivaltime initial-wait
RP/0/RP0/CPU0:router(config)# router isis 1 min-lsp-arrivaltime maximum-wait
RP/0/RP0/CPU0:router(config)# router isis 1 min-lsp-arrivaltime secondary-wait
**mpls ldp auto-config**

To enable Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) interface auto-configuration, use the `mpls ldp auto-config` command in IPv4 address family configuration mode. To disable LDP IGP auto-configuration, use the `no` form of this command.

```
mpls ldp auto-config
no mpls ldp auto-config
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

LDP IGP auto-configuration is disabled.

**Command Modes**

IPv4 address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `mpls ldp auto-config` command to automatically configure LDP on a set of interfaces associated with a specified IGP instance. Further, LDP IGP auto-configuration provides a means to block LDP from being enabled on a specified interface. If you do not want an IS-IS interface to have LDP enabled, use the `igp auto-config disable` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable LDP IGP auto-configuration:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# mpls ldp auto-config
```
mpls ldp sync (IS-IS)

To configure Label Distribution Protocol (LDP) IS-IS synchronization, use the `mpls ldp sync` command in interface address family configuration mode. To disable LDP synchronization, use the `no` form of this command.

```
mpls ldp sync [level {1 | 2}]
no mpls ldp sync [level {1 | 2}]
```

**Syntax Description**

- `level {1 | 2}` (Optional) Sets LDP synchronization for the specified level.

**Command Default**

If a level is not specified, LDP synchronization is set for both levels.

**Command Modes**

Interface address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 6.0      | This command was introduced.

**Usage Guidelines**

MPLS VPN traffic forwarded using LDP labels can be dropped in the following instances:

- A new link is introduced in the network and IS-IS has converged before LDP establishes labels.
- An existing LDP session goes down while IS-IS adjacency is intact over the link.

In both instances, outbound LDP labels are not available for forwarding MPLS traffic. LDP IS-IS synchronization addresses the traffic drop. When the `mpls ldp sync` command is configured, IS-IS advertises the maximum possible link metric until LDP has converged over the link. The link is less preferred and least used in forwarding MPLS traffic. When LDP establishes the session and exchanges labels, IS-IS advertises the regular metric over the link.

**Note**

IS-IS advertises the maximum metric –1 (16777214) if wide metrics are configured since the maximum wide metric is specifically used for link exclusion from the shortest path first algorithm (SPF) (RFC 3784). However, the maximum narrow metric is unaffected by this definition.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable LDP IS-IS synchronization:

```
RP/0/RP0/CPU0:router (config)# router isis isp
RP/0/RP0/CPU0:router (config-isis)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router (config-isis-if)# address-family ipv4 unicast
```
mpls ldp sync (IS-IS)
nsf (IS-IS)

To enable nonstop forwarding (NSF) on the next restart, use the `nsf` command in XR Config mode. To restore the default setting, use the `no` form of this command.

```
nsf {cisco | ietf}
no nsf {cisco | ietf}
```

**Syntax Description**
- `cisco` Specifies Cisco-proprietary NSF restart.
- `ietf` Specifies Internet Engineering Task Force (IETF) NSF restart.

**Command Default**
NSF is disabled.

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
NSF allows an Intermediate System-to-Intermediate System (IS-IS) instance to restart using checkpointed adjacency and link-state packet (LSP) information, and to perform restart with no impact on its neighbor routers. In other words, there is no impact on other routers in the network due to the destruction and recreation of adjacencies and the system LSP.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to enable Cisco proprietary NSF:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# nsf cisco
```
**nsf interface-expires**

To configure the number of resends of an acknowledged nonstop forwarding (NSF)-restart acknowledgment, use the `nsf interface-expires` command in XR Config mode. To restore the default value, use the `no` form of this command.

```
nsf interface-expires number
no nsf interface-expires
```

**Syntax Description**

- **number**: Number of resends. Range is 1 to 3.

**Command Default**

- `number` : 3 resends

**Command Modes**

- XR Config mode

**Command History**

- **Release**
  - **Modification**
  - Release 6.0  This command was introduced.

**Usage Guidelines**

When a hello packet sent with the NSF restart flag set is not acknowledged, it is re-sent. Use the `nsf interface-expires` command to control the number of times the NSF hello is re-sent. When this limit is reached on an interface, any neighbor previously known on that interface is assumed to be down and the initial shortest path first (SPF) calculation is permitted, provided that all other necessary conditions are met.

The total time period available for adjacency reestablishment (interface-timer * interface-expires) should be greater than the expected total NSF restart time.

The `nsf interface-expires` command applies only to Internet Engineering Task Force (IETF)-style NSF. It has no effect if Cisco-proprietary NSF is configured.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to allow only one retry attempt on each interface if an IETF NSF restart signal is not acknowledged:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# nsf ietf
RP/0/RP0/CPU0:router(config-isis)# nsf interface-expires 1
```
nsf interface-timer

To configure the time interval after which an unacknowledged Internet Engineering Task Force (IETF) nonstop forwarding (NSF) restart attempt is repeated, use the `nsf interface-timer` command in router configuration mode. To restore the default value, use the `no` form of this command.

```
nsf interface-timer seconds
no nsf interface-timer
```

**Syntax Description**

- `seconds` NSF restart time interval (in seconds). Range is 3 to 20 seconds.

**Command Default**

- `seconds` : 10 seconds

**Command Modes**

- Router configuration

**Command History**

- **Release**  **Modification**
  - Release 6.0  This command was introduced.

**Usage Guidelines**

When the IETF NSF restart process begins, hello packets send an NSF restart flag that must be acknowledged by the neighbors of the router. Use the `nsf interface-timer` command to control the restart time interval after the hello packet is re-sent. The restart time interval need not match the hello interval.

The `nsf interface-timer` command applies only to IETF-style NSF. It has no effect if Cisco proprietary NSF is configured.

**Task ID**

- **Task ID**
  - `isis`  read, write

**Examples**

The following example shows how to ensure that a hello packet with the NSF restart flag set is sent again every 5 seconds until the flag is acknowledged:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# nsf ietf
RP/0/RP0/CPU0:router(config-isis)# nsf interface-timer 5
```
nsf lifetime (IS-IS)

To configure the maximum route lifetime following a nonstop forwarding (NSF) restart, use the `nsf lifetime` command in XR Config mode. To restore the default value, use the `no` form of this command.

```
nsf lifetime seconds
no nsf lifetime
```

**Syntax Description**
- `seconds`: Maximum route lifetime (in seconds) following an NSF restart. Range is 5 to 300 seconds.

**Command Default**
- `seconds`: 60 seconds (1 minute)

**Command Modes**
- XR Config mode

**Command History**
- **Modification**: Release 6.0
- **Release**: This command was introduced.

**Usage Guidelines**
Use the `nsf lifetime` command to set the maximum available time for the reacquisition of checkpointed adjacencies and link-state packets (LSPs) during a Cisco proprietary NSF restart. LSPs and adjacencies not recovered during this time period are abandoned, thus causing changes to the network topology.

**Task ID**
- Task ID: isis
  - Operations: read, write

**Examples**
The following example shows how to configure the router to allow only 20 seconds for the entire NSF process:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# nsf cisco
RP/0/RP0/CPU0:router(config-isis)# nsf lifetime 20
```
passive (IS-IS)

To suppress Intermediate System-to-Intermediate System (IS-IS) packets from being transmitted to the interface and received packets from being processed on the interface, use the `passive` command in interface configuration mode. To restore IS-IS packets coming to an interface, use the `no` form of this command.

```
passive
no passive
```

**Command Default**
Interface is active.

**Command Modes**
Interface configuration

**Command History**

```
Release   Modification
---------   ----------------
Release 6.0   This command was introduced.
```

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure the router to suppress IS-IS packets on GigabitEthernet interface 0/1/0/1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface GigabitEthernet 0/1/0/1
RP/0/RP0/CPU0:router(config-isis-if)# passive
```
point-to-point

To configure a network of only two networking devices that use broadcast media and the integrated Intermediate System-to-Intermediate System (IS-IS) routing protocol to function as a point-to-point link instead of a broadcast link, use the `point-to-point` command in interface configuration mode. To disable the point-to-point usage, use the `no` form of this command.

```
point-to-point
no point-to-point
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Interface is treated as broadcast if connected to broadcast media.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `point-to-point` command only on broadcast media in a network with two networking devices. The command causes the system to issue packets point-to-point rather than as broadcasts. Configure the command on both networking devices in the network.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure a 10-Gb Ethernet interface to act as a point-to-point interface:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/6/0/0
RP/0/RP0/CPU0:router(config-isis-if)# point-to-point
```
prefix-sid index

To specify or advertise prefix (node) segment ID (SID) on all routers, use the `prefix-sid index` command in IPv4 address family configuration mode. To stop advertising prefix SID, use the `no` form of this command.

The segment routing must be configured on the ISIS instance before configuring prefix SID value.

```plaintext
prefix-sid index sid-value
no prefix-sid index sid-value
```

**Syntax Description**

- `sid-value` Specifies the prefix SID value. Value range is between 0 and 1048575.

**Command Default**

No default behavior or values.

**Command Modes**

IPv4 address family configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

- **Operations Task ID**
  - `isis` read, write

**Examples**

This example shows how to advertise prefix SID.

```
RP/0/RP0/CPU0:router(config)# configure
RP/0/RP0/CPU0:router(config)# router isis 100
RP/0/RP0/CPU0:router(config-isis)# interface loopback0
RP/0/RP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)# prefix-sid index 16041
```
priority (IS-IS)

To configure the priority of designated routers, use the `priority` command in interface configuration mode. To reset the default priority, use the `no` form of this command.

```plaintext
priority value [level {1 | 2}]
no priority [value] [level {1 | 2}]
```

**Syntax Description**

- `value`: Priority of a router. Range is 0 to 127.
- `level {1 | 2}`: (Optional) Specifies routing Level 1 or Level 2 independently.

**Command Default**

`value`: 64

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

Interface configuration

**Command History**

- **Release 6.0**: This command was introduced.

**Usage Guidelines**

Priorities can be configured for Level 1 and Level 2 independently. Specifying Level 1 or Level 2 resets priority only for Level 1 or Level 2 routing, respectively. Specifying no level allows you to configure all levels.

The priority is used to determine which router on a LAN is the designated router or Designated Intermediate System (DIS). The priorities are advertised in the hello packets. The router with the highest priority becomes the DIS.

In the Intermediate System-to-Intermediate System (IS-IS) protocol, there is no backup designated router. Setting the priority to 0 lowers the chance of this system becoming the DIS, but does not prevent it. If a router with a higher priority comes online, it takes over the role from the current DIS. For equal priorities, the higher MAC address breaks the tie.

**Examples**

The following example shows how to give Level 1 routing priority by setting the priority level to 80. This router is now more likely to become the DIS.

```plaintext
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE /6/0/0
RP/0/RP0/CPU0:router(config-isis-if)# priority 80 level 1
```
propagate level

To propagate routes from one Intermediate System-to-Intermediate System (IS-IS) level into another level, use the `propagate level` command in address family configuration mode. To disable propagation, use the `no` form of this command.

```plaintext
propagate level {1 | 2} into level {1 | 2} route-policy route-policy-name
no propagate level {1 | 2} into level {1 | 2}
```

**Syntax Description**
- `level {1 | 2}`: Propagates from routing Level 1 or Level 2 routes.
- `into`: Propagates from Level 1 or Level 2 routes into Level 1 or Level 2 routes.
- `route-policy route-policy-name`: Specifies a configured route policy.

**Command Default**
Route leaking (Level 2 to Level 1) is disabled.

**Command Modes**
Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
In general, route propagation from Level 1 to Level 2 is automatic. You might want to use this command to better control which Level 1 routes can be propagated into Level 2.

Propagating Level 2 routes into Level 1 is called *route leaking*. Route leaking is disabled by default. That is, Level 2 routes are not automatically included in Level 1 link-state packets (LSPs). If you want to leak Level 2 routes into Level 1, you must enable that behavior by using this command.

Propagation from Level 1 into Level 1 and from Level 2 into Level 2 is not allowed.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to redistribute Level 2 routes to Level 1:

```plaintext
RP/0/RP0/CPU0:router(config)# ipv4 access-list 101 permit ip 10.0.0.0 255.0.0.0 10.1.0.1 0.255.255.255
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# net 49.1234.2222.2222.2222.00
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# propagate level 2 into level 1 route-policy policy_a
```
**redistribute (IS-IS)**

To redistribute routes from one routing protocol into Intermediate System-to-Intermediate System (IS-IS), use the `redistribute` command in address family configuration mode. To remove the `redistribute` command from the configuration file and restore the system to its default condition in which the software does not redistribute routes, use the `no` form of this command.

**Border Gateway Protocol (BGP)**

`redistribute bgp process-id [level-1 | level-2 | level-1-2] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`

`no redistribute`

**Connected Routes**

`redistribute connected [level-1 | level-2 | level-1-2] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`

`no redistribute`

**Intermediate System-to-Intermediate System (IS-IS)**

`redistribute isis process-id [level-1 | level-2 | level-1-2] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`

`no redistribute`

**Open Shortest Path First (OSPF)**

`redistribute ospf process-id [level-1 | level-2 | level-1-2] [match {external [{1 | 2}] | internal | nssa-external [{1 | 2}]]] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`

`no redistribute`

**Open Shortest Path First Version 3 (OSPFv3)**

`redistribute ospfv3 process-id [level-1 | level-2 | level-1-2] [match {external [{1 | 2}] | internal | nssa-external [{1 | 2}]]] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`

`no redistribute`

**Static Routes**

`redistribute static [level-1 | level-2 | level-1-2] [metric metric-value] [metric-type {1 | internal | external | rib-metric-as-external | 2 rib-metric-as-internal}] [route-policy route-policy-name]`

`no redistribute`

**RIP**

`redistribute rip [level-1 | level-2 | level-1-2] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`

`no redistribute rip [level-1 | level-2 | level-1-2] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`

**Subscriber Routes**

`redistribute subscriber [level-1 | level-2 | level-1-2] [metric metric-value] [metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}] [route-policy route-policy-name]`
### Syntax Description

**process-id**
- For the **bgp** keyword, an autonomous system number has the following ranges:
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in a plain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) as a dot format is 1.0 to 65535.65535.

- For the **isis** keyword, an IS-IS instance identifier from which routes are to be redistributed.

- For the **ospf** keyword, an OSPF process name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

- For the **ospfv3** keyword, an OSPFv3 process name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

**level-1**
- (Optional) Specifies that redistributed routes are advertised in the Level-1 LSP of the router.

**level-1-2**
- (Optional) Specifies that redistributed routes are advertised in the Level-1-2 LSP of the router.

**level-2**
- (Optional) Specifies that redistributed routes are advertised in the Level-2 LSP of the router.

**metric metric-value**
- (Optional) Specifies the metric used for the redistributed route. Range is 0 to 16777215. The **metric-value** must be consistent with the IS-IS metric style of the area and topology into which the routes are being redistributed.

**metric-type {internal | external | rib-metric-as-external | rib-metric-as-internal}**
- (Optional) Specifies the external link type associated with the route advertised into the ISIS routing domain. It can be one of two four values:
  - external
  - Internal – Use the **internal** keyword to set IS-IS internal metric-type
  - **external** – Use the **external** keyword to set IS-IS external metric-type
  - rib-metric-as-external – Use the **rib-metric-as-external** keyword to use RIB metric and set IS-IS external metric-type
  - rib-metric-as-internal – Use the **rib-metric-as-internal** keyword to use RIB metric and set IS-IS internal metric-type

Any route with an internal metric (however large the metric is) is preferred over a route with external metric (however small the metric is).

Use the **rib-metric-as-external** and **rib-metric-as-internal** keywords to preserve RIB metrics when redistributing routes from another IS-IS router instance or another protocol.

**route-policy route-policy-name**
- (Optional) Specifies the identifier of a configured policy. A policy is used to filter the importation of routes from this source routing protocol to IS-IS.
match \{ internal | external [ 1 | 2 ] | nsaa-external [ 1 | 2 ] \} (Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one or more of the following:

- **internal** — Routes that are internal to a specific autonomous system (intra- and interarea OSPF routes).
- **external [ 1 | 2 ]** — Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 external routes.
- **nsaa-external [ 1 | 2 ]** — Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 not-so-stubby area (NSSA) external routes.

For the **external** and **nsaa-external** options, if a type is not specified, then both Type 1 and Type 2 are assumed.

Command Default

Level 2 is configured if no level is specified.

**metric-type: internal**

**match** : If no match keyword is specified, all OSPF routes are redistributed.

Command Modes

Address family configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

When redistributing routes (into IS-IS) using both command keywords for setting or matching of attributes and a route policy, the routes are run through the route policy first, followed by the keyword matching and setting.

Use the **redistribute** command to control the redistribution of routes between separate IS-IS instances. To control the propagation of routes between the levels of a single IS-IS instance, use the **propagate level**, on page 99 command.

Only IPv4 OSPF addresses can be redistributed into IS-IS IPv4 address families and only IPv6 OSPFv3 prefixes can be distributed into IS-IS IPv6 address families.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

In this example, IS-IS instance isp_A readvertises all of the routes of IS-IS instance isp_B in Level 2 LSP. Note that the **level-2** keyword affects which levels instance isp_A advertises the routes in and has no impact on which routes from instance isp_B are advertised. (Any Level 1 routes from IS-IS instance isp_B are included in the redistribution.)
RP/0/RSP0RP0/CPU0:router(config)# router isis isp_A
RP/0/RSP0RP0/CPU0:router(config-isis)# net 49.1234.2222.2222.2222.00
RP/0/RSP0RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RSP0RP0/CPU0:router(config-isis-af)# redistribute isis isp_B level-2
!
RP/0/RSP0RP0/CPU0:router(config)# router isis isp_B
RP/0/RSP0RP0/CPU0:router(config-isis)# is-type level 1
RP/0/RSP0RP0/CPU0:router(config-isis)# net 49.4567.2222.2222.2222.00
RP/0/RSP0RP0/CPU0:router(config-isis)# address-family ipv4 unicast
retransmit-interval (IS-IS)

To configure the amount of time between retransmission of each Intermediate System-to-Intermediate System (IS-IS) link-state packet (LSP) on a point-to-point link, use the `retransmit-interval` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
retransmit-interval  seconds [level {1 | 2}]
no retransmit-interval  [seconds [level {1 | 2}]]
```

**Syntax Description**
- `seconds`: Time (in seconds) between consecutive retransmissions of each LSP. It is an integer that should be greater than the expected round-trip delay between any two networking devices on the attached network. Range is 0 to 65535 seconds.

| level | {1 | 2} | (Optional) Specifies routing Level 1 or Level 2 independently. |

**Command Default**
- `seconds`: 5 seconds

**Command Modes**
- Interface configuration

**Command History**
- Release 6.0 This command was introduced.

**Usage Guidelines**
- To prevent needless transmission results, the `seconds` argument should be conservative.

The `retransmit-interval` command has no effect on LAN (multipoint) interfaces. On point-to-point links, the value can be increased to enhance network stability.

Because retransmissions occur only when LSPs are dropped, setting this command to a higher value has little effect on reconvergence. The more neighbors networking devices have, and the more paths over which LSPs can be flooded, the higher this value can be made.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure GigabitEthernet interface 0/2/0/1 for retransmission of IS-IS LSPs every 60 seconds for a large serial line:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-isis-if)# retransmit-interval 60
```
retransmit-throttle-interval

To configure minimum interval between retransmissions of different Intermediate System-to-Intermediate System (IS-IS) link-state packets (LSPs) on a point-to-point interface, use the `retransmit-throttle-interval` command in interface configuration mode. To remove the command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
retransmit-throttle-interval milliseconds [level {1 | 2}]
no retransmit-throttle-interval [milliseconds [level {1 | 2}]]
```

**Syntax Description**
- `milliseconds` Minimum delay (in milliseconds) between LSP retransmissions on the interface. Range is 0 to 65535.
- `level { 1 | 2 }` (Optional) Specifies routing Level 1 or Level 2 independently.

**Command Default**
Default is 0.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `retransmit-throttle-interval` command to define the minimum period of time that must elapse between retransmitting any two consecutive LSPs on an interface. The `retransmit-throttle-interval` command may be useful in very large networks with many LSPs and many interfaces as a way of controlling LSP retransmission traffic. This command controls the rate at which LSPs can be re-sent on the interface.

**Task ID**
- `isis` read, write

**Examples**
The following example shows how to configure HundredGigE interface 0/2/0/1 to limit the rate of LSP retransmissions to one every 300 milliseconds:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-isis-if)# retransmit-throttle-interval 300
```
route source first-hop

To replace the originating route with first-hop for multicast traffic, use the `route source first-hop` command in ISIS address-family submode. To remove the first-hop for multicast traffic, use the `no` form of this command.

**route source first-hop**

This command has no keywords or arguments.

**Command Default**

no route source first-hop is enabled.

**Command Modes**

ISIS address-family submode

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

This command replaces the originating router address with first-hop router address in the RIB table and facilitates computing alternate paths for multicast traffic. This feature is incompatible with other IOS-XR features, such as MPLS-TE inter-area tunnels. You must use the `route source first-hop` command only to support MoFRR with multicast multipath.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to replace the originating route with first-hop:

```
RP/0/RP0/CPU0:router(config)# router isis
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-isis-af)# route source first-hop
```

**Related Commands**

<tbody>
<tr>
<td>net</td>
<td>Configures an IS-IS NET for the routing process.</td>
</tr>
</tbody>
</table>
**segment-routing**

To enable segment routing for IPv4 addresses with MPLS data plane, use the `segment-routing` command in IPv4 address family configuration mode. To disable segment routing, use the `no` form of this command.

```
segment-routing  mpls
no  segment-routing
```

**Syntax Description**

- **mpls**: Enables segment routing for IPv4 addresses with MPLS data plane.

**Command Default**

No default behavior or values

**Command Modes**

IPv4 address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The prefix SID value must be removed from all the interfaces under the same ISIS instance before disabling segment routing.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable segment routing with MPLS data plane.

```plaintext
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router isis 100
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# segment-routing mpls
```
set-attached-bit

To configure an Intermediate System-to-Intermediate System (IS-IS) instance with an attached bit in the Level 1 link-state packet (LSP), use the set-attached-bit command in address family configuration mode. To remove the set-attached-bit command from the configuration file and restore the system to its default condition, use the no form of this command.

```
set-attached-bit
no set-attached-bit
```

**Command Default**
Attached bit is not set in the LSP.

**Command Modes**
Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the set-attached bit command to set an IS-IS instance with an attached bit in the Level 1 LSP that allows another IS-IS instance to redistribute Level 2 topology. The attached bit is used when the Level 2 connectivity from another IS-IS instance is advertised by the Level 1 attached bit.

Cisco IOS XR software does not support multiple Level 1 areas in a single IS-IS routing instance. But the equivalent functionality is achieved by redistribution of routes between two IS-IS instances by using the redistribute (IS-IS), on page 100 command.

The attached bit is configured for a specific address family only if the single-topology command is not configured.

**Note**
If connectivity for the Level 2 instance is lost, the attached bit in the Level 1 instance LSP continues sending traffic to the Level 2 instance and causes the traffic to be dropped.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the attached bit for a Level 1 instance that allows the Level 2 instance to redistribute routes from the Level 1 instance:

```
RP/0/RP0/CPU0:router(config)# router isis
RP/0/RP0/CPU0:router(config-isis)# net 49.0001.0001.0001.0001.00
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# redistribute isis 2 level 2

RP/0/RP0/CPU0:router(config-isis-af)# interface HundredGigE 0/3/0/0
```
RP/0/RP0/CPU0:router(config-isis-af-if)# address-family ipv4 unicast
!
!
RP/0/RP0/CPU0:router(config)# router isis 2
RP/0/RP0/CPU0:router(config-isis)# is-type level-1
RP/0/RP0/CPU0:router(config-isis)# net 49.0002.0001.0001.0002.00
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# set-attachedbit send always-bitset
!
RP/0/RP0/CPU0:router(config-isis-af)# interface HundredGigE 0/1/0/0
RP/0/RP0/CPU0:router(config-isis-af-if)# address-family ipv4 unicast
set-overload-bit

To configure the router to signal other routers not to use it as an intermediate hop in their shortest path first (SPF) calculations, use the `set-overload-bit` command in XR Config mode. To remove the designation, use the `no` form of this command.

```
set-overload-bit [on-startup {delay | wait-for-bgp}] [level {1 | 2}] [advertise {external | interlevel}]
no set-overload-bit [on-startup {delay | wait-for-bgp}] [level {1 | 2}] [advertise {external | interlevel}]
```

**Syntax Description**

- **on-startup** (Optional) Sets the overload bit only temporarily after reboot.
- **delay** (Optional) Time (in seconds) to advertise when the router is overloaded after reboot. Range is 5 to 86400 seconds (86400 seconds = 1 day).
- **wait-for-bgp** (Optional) Sets the overload bit on startup until the Border Gateway Protocol (BGP) signals converge or time out.
- **level {1 | 2}** (Optional) Specifies the overload bit for Level 1 or Level 2 independently.
- **advertise {external | interlevel}** (Optional) Sets the overload bit set if the router advertises the following types of IP prefixes:
  - **external**—If overload-bit set advertises IP prefixes learned from other protocols
  - **interlevel**—If overload-bit set advertise IP prefixes learned from another IS-IS level

**Command Default**

The overload bit is not set.

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR Config mode

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `set-overload-bit` command to force the router to set the overload bit in its nonpseudonode link-state packets (LSPs). Normally the setting of the overload bit is allowed only when a router experiences problems. For example, when a router is experiencing a memory shortage, the reason might be that the link-state database is not complete, resulting in an incomplete or inaccurate routing table. If the overload bit is set in the LSPs of the unreliable router, other routers can ignore the router in their SPF calculations until it has recovered from its problems. The result is that no paths through the unreliable router are seen by other routers in the Intermediate System-to-Intermediate System (IS-IS) area. However, IP prefixes directly connected to this router are still reachable.

The `set-overload-bit` command can be useful when you want to connect a router to an IS-IS network, but do not want real traffic flowing through it under any circumstances.

Routers with overload bit set are:
• A test router in the lab, connected to a production network.
• A router configured as an LSP flooding server, for example, on a nonbroadcast multiaccess (NBMA) network, in combination with the mesh group feature.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td></td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the overload bit:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# set-overload-bit
```
The `show isis` command displays general information about an IS-IS instance and protocol operation. If the instance ID is not specified, the command shows information about all IS-IS instances.

```
show isis [instance instance-id]
```

### Syntax Description

- **instance instance-id** (Optional) Displays the IS-IS adjacencies for the specified IS-IS instance only.

**Note**: The instance-id argument is the instance identifier (alphanumeric) defined by the `router isis` command.

### Command Default

No instance ID specified displays IS-IS adjacencies for all the IS-IS instances.

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

For each instance, the first line of output lists the IS-IS instance ID with the following lines identifying the IS-IS system ID, supported levels (level 1, level 2, or level-1-2), configured area addresses, active area addresses, status (enabled or not) and type (Cisco or IETF) of nonstop forwarding (NSF), and the mode in which the last IS-IS process startup occurred.

Next, the status of each configured address family (or just IPv4 unicast if none are configured) is summarized. For each level (level 1 or level 2), the metric style (narrow or wide) generated and accepted is listed along with the status of incremental shortest path first (iSPF) computation (enabled or not). Then redistributed protocols are listed, followed by the administrative distance applied to the redistributed routes. From Release 6.6.1, status of incremental shortest path first (iSPF) computation (enabled or not) is not listed.

Finally, the running state (active, passive, or disabled) and configuration state (active or disabled) of each IS-IS interface is listed.

### Examples

The following is sample output from the `show isis` command:

```
Router# show isis
Wed Aug 20 23:54:55.043 PST DST

IS-IS Router: lab
System Id: 0000.0000.0002
IS Levels: level-2-only
Manual area address(es):
    49.1122
```
Routing for area address(es): 49.1122
Non-stop forwarding: Disabled
Most recent startup mode: Cold Restart
Topologies supported by IS-IS:
- IPv4 Unicast
  - Level-2
    - Metric style (generate/accept): Narrow/Narrow
    - Metric: 10
    - No protocols redistributed
    - Distance: 115
Interfaces supported by IS-IS:
- Loopback0 is running passively (passive in configuration)
- POS0/1/0/2 is running actively (active in configuration)
- POS0/1/0/3 is running actively (active in configuration)

This table describes the significant fields shown in the display.

show isis adjacency

To display Intermediate System-to-Intermediate System (IS-IS) adjacencies, use the `show isis adjacency` command in XR EXEC mode.

```
show isis [instance instance-id] adjacency [level {1 | 2}] [type interface-path-id] [detail] [systemid system-id]
```

**Syntax Description**

- `instance instance-id` (Optional) Displays the IS-IS adjacencies for the specified IS-IS instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

- `level {1 | 2}` (Optional) Displays the IS-IS adjacencies for Level 1 or Level 2 independently.

- `type` Interface type. For more information, use the question mark (?) online help function.

- `interface-path-id` Physical interface or virtual interface.

  **Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- `detail` (Optional) Displays neighbor IP addresses and active topologies.

- `systemid system-id` (Optional) Displays the information for the specified router only.

**Command Default**

No instance ID specified displays IS-IS adjacencies for all the IS-IS instances.

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR EXEC mode

**Command History**

- Release 6.0 This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

```
Task ID Operations
isis read
```

**Examples**

The following is sample output from the `show isis adjacency` command:

```
RP/0/RP0/CPU0:router# show isis adjacency
```
IS-IS p Level-1 adjacencies:
System Id  Interface      SNPA       State  Hold  Changed  NSF  BFD
12a4       PO0/1/0/1       *PtoP*     Up     23    00:00:06  Capable  Init
12a4       G10/6/0/2     0004.2893.f2f6 Up     56    00:04:01  Capable  Up

Total adjacency count: 2

IS-IS p Level-2 adjacencies:
System Id  Interface      SNPA       State  Hold  Changed  NSF  BFD
12a4       PO0/1/0/1       *PtoP*     Up     23    00:00:06  Capable  None
12a4       G10/6/0/2     0004.2893.f2f6 Up     26    00:00:13  Capable  Init

Total adjacency count: 2

</tr>
</tbody>
</table>
show isis adjacency-log

To display the Intermediate System-to-Intermediate System (IS-IS) adjacency log, use the `show isis adjacency-log` command in XR EXEC mode.

`show isis adjacency-log [level {1 | 2}] [{last number | first number}]`

**Syntax Description**

- `level {1 | 2}` (Optional) Displays the IS-IS adjacency log for Level 1 or Level 2 independently.
- `last number` (Optional) Specifies that the output is restricted to the last `number` of entries. Range is 1 to 100.
- `first number` (Optional) Specifies that the output is restricted to the first `number` of entries. Range is 1 to 100.

**Command Default**

No default behavior or values

show isis checkpoint adjacency

To display the Intermediate System-to-Intermediate System (IS-IS) checkpoint adjacency database, use the `show isis checkpoint adjacency` command in XR EXEC mode.

```
show isis [instance instance-id] checkpoint adjacency
```

**Syntax Description**

- `instance instance-id` (Optional) Displays the IS-IS checkpoint adjacencies for the specified IS-IS instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

**Command Default**

No instance ID specified displays IS-IS checkpoint adjacencies for all the IS-IS instances.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show isis checkpoint adjacency` command to display the checkpointed adjacencies. With this information you can restore the adjacency database during a Cisco proprietary nonstop forwarding (NSF) restart. This command, with the `show isis adjacency` command, can be used to verify the consistency of the two databases.

**Task ID**

<table>

show isis checkpoint lsp

To display the Intermediate System-to-Intermediate System (IS-IS) checkpoint link-state packet (LSP) protocol data unit (PDU) identifier database, use the show isis checkpoint lsp command in XR EXEC mode.

```
show isis [instance instance-id] checkpoint lsp
```

**Syntax Description**

`instance instance-id` (Optional) Displays the IS-IS checkpoint LSPs for the specified instance only.

- The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

**Command Default**

No instance ID specified displays IS-IS checkpoint LSPs for all the IS-IS instances.

**Command Modes**

XR EXEC mode

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

The checkpointed LSPs displayed by this command are used to restore the LSP database during a Cisco-proprietary nonstop forwarding (NSF) restart. The `show isis checkpoint lsp` command, with the `show isis database` command, may be used to verify the consistency of the two databases.

**Task ID**

<table>

</tbody>
</table>
show isis database

To display the Intermediate System-to-Intermediate System (IS-IS) link-state packet (LSP) database, use the show isis database command in XR EXEC mode.

```
show isis [instance instance-id] database [level {1 | 2}] [update] [summary] [detail] [verbose] [{*lsp-id}]
```

### Syntax Description

- **instance instance-id** (Optional) Displays the IS-IS LSP database for the specified instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

- **level {1 | 2}** (Optional) Displays the IS-IS LSP database for Level 1 or Level 2 independently.

- **update** (Optional) Displays contents of LSP database managed by update thread.

- **summary** (Optional) Displays the LSP ID number, sequence number, checksum, hold time, and bit information.

- **detail** (Optional) Displays the contents of each LSP.

- **verbose** (Optional) Displays the contents of each LSP.

- **{* | lsp-id}** (Optional) LSP protocol data units (PDUs) identifier. Displays the contents of a single LSP by its ID number or may contain an * as a wildcard character.

### Command Default

No instance ID specified displays the IS-IS LSP database for all the IS-IS instances.

Both Level 1 and Level 2 is configured if no level is specified.

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 6.5.1</td>
<td>The output of this command shows an additional field called Rcvd.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Each of the options for the show isis database command can be entered in an arbitrary string within the same command entry. For example, the following are both valid command specifications and provide the same output: `show isis database detail level 2` and `show isis database level 2 detail`.

The `summary` keyword used with this command allows you to filter through a large IS-IS database and quickly identify problematic areas.

### Task ID

```
<table>
<thead>

As the output shows, besides the information displayed with the `show isis database` command, the command with the `detail verbose` keyword displays the contents of each LSP.

### Table 13: show isis instance isp database detail Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSPID</td>
<td>LSP identifier. The first six octets form the system ID of the router that originated the LSP. The next octet is the pseudonode ID. When this byte is 0, the LSP describes links from the system. When it is nonzero, the LSP is a so-called nonpseudonode LSP. This is similar to a router link-state advertisement (LSA) in the Open Shortest Path First (OSPF) protocol. The LSP describes the state of the originating router. For each LAN, the designated router for that LAN creates and floods a pseudonode LSP, describing all systems attached to that LAN. The last octet is the LSP number. If there is more data than can fit in a single LSP, the LSP is divided into multiple LSP fragments. Each fragment has a different LSP number. An asterisk (*) indicates that the LSP was originated by the system on which this command is issued.</td>
</tr>
<tr>
<td>LSP Seq Num</td>
<td>Sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.</td>
</tr>
<tr>
<td>LSP Checksum</td>
<td>Checksum of the entire LSP packet.</td>
</tr>
<tr>
<td>LSP Holdtime</td>
<td>Amount of time the LSP remains valid (in seconds). An LSP hold time of 0 indicates that this LSP was purged and is being removed from the link-state database (LSDB) of all routers. The value indicates how long the purged LSP stays in the LSDB before being completely removed.</td>
</tr>
</tbody>
</table>
### Field Description

**ATT/P/OL**
- **ATT**—Attach bit. This bit indicates that the router is also a Level 2 router, and it can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 2 routers use the Attach bit to find the closest Level 2 router. They point to a default route to the closest Level 2 router.
- **P**—P bit. Detects if the intermediate system is area partition repair capable. Cisco and other vendors do not support area partition repair.
- **OL**—Overload bit. Determines if the IS is congested. If the Overload bit is set, other routers do not use this system as a transit router when calculating routers. Only packets for destinations directly connected to the overloaded router are sent to this router.

**Area Address**
- Reachable area addresses from the router. For Level 1 LSPs, these are the area addresses configured manually on the originating router. For Level 2 LSPs, these are all the area addresses for the area this route belongs to.

**NLPID**
- Network Layer Protocol Identifier.

**Hostname**
- Hostname of the node.

**IP Address:**
- Address of the node.

**Metric**
- IS-IS metric for the cost of the adjacency between the originating router and the advertised neighbor, or the metric of the cost to get from the advertising router to the advertised destination (which can be an IP address, an end system (ES), or a Connectionless Network Service (CLNS) prefix).

The following is additional sample output from the **show isis database detail** command. This is a Level 2 LSP. The area address 39.0001 is the address of the area in which the router resides.

```
RP/0/RSP0/CPU0:router# show isis database level 2 detail

IS-IS Level-2 Link State Database
LSPID    LSP Seq Num  LSP Checksum  LSP Holdtime  ATT/P/OL
0000.0C00.1111.00-00* 0x00000006 0x4DB3 1194  0/0/0
Area Address: 39.0001
NLPID:    0x81 0xCC
IP Address: 172.18.1.17
Metric: 10  IS 0000.0C00.1111.09
Metric: 10  IS 0000.0C00.1111.08
Metric: 10  IP 172.17.4.0 255.255.255.0
Metric: 10  IP 172.18.8.0 255.255.255.0
Metric: 0   IP-External 10.0.0.0 255.0.0.0
```

The IP entries are the directly connected IP subnets the router is advertising (with associated metrics). The IP-External entry is a redistributed route.

show isis database-log

To display the entries in the Intermediate System-to-Intermediate System (IS-IS) database log, use the `show isis database-log` command in XR EXEC mode.

```
show isis database-log [level {1 | 2}] [{last number | first number}]
```

**Syntax Description**

- **level**: {1 | 2} (Optional) Displays the database log for Level 1 or Level 2 independently.
- **last number** (Optional) Specifies that the output be restricted to the last number of entries. Range is 1 to 1000.
- **first number** (Optional) Specifies that the output be restricted to the first number of entries. Range is 1 to 1000.

**Command Default**

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

- XR EXEC mode

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

The following is sample output from the `show isis database-log` command:

```
RP/0/RP0/CPU0:router# show isis database-log

show isis fast-reroute

To display per-prefix LFA information, use the show isis fast-reroute command in XR EXEC mode.

```
show isis fast-reroute  
A.B.C.D/length | detail | summary | sr-only
```

**Syntax Description**

- **A.B.C.D/length**: Network to show per-prefix LFA information.
- **detail**: Use to display tiebreaker information about the backup.
- **summary**: Use to display the number of prefixes having protection per priority.
- **sr-only**: Use to display SR-labeled prefixes only.

**Command Default**

None

show isis hostname

To display the entries in the Intermediate System-to-Intermediate System (IS-IS) router name-to-system ID mapping table, use the `show isis hostname` command in XR EXEC mode.

```
show isis [instance instance-id] hostname
```

**Syntax Description**

- **instance instance-id** (Optional) Displays the IS-IS router name-to-system ID mapping table for the specified IS-IS instance only.
  
  The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

**Command Default**

No instance ID specified displays the IS-IS router name-to-system ID mapping table for all the IS-IS instances.

**Command Modes**

XR EXEC mode

**Command History**

- **Release**  
  - **Modification**
    - Release 6.0  This command was introduced.

**Usage Guidelines**

The `show isis hostname` command does not display entries if the dynamic hostnames are disabled.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show isis hostname` command with the `instance` and `instance-id` values specified:

```
RP/0/RP0/CPU0:router# show isis instance isp hostname

ISIS isp hostnames
Level  System ID     Dynamic Hostname
 1  0001.0000.0005 router
 2  * 0001.0000.0011 router-11
```

This table describes the significant fields shown in the display.

show isis lsp-log

To display link-state packet (LSP) log information, use the `show isis lsp-log` command in XR EXEC mode.

```
show isis [instance instance-id] lsp-log [level {1 | 2}] [{last number | first number}]
```

**Syntax Description**

- **instance instance-id** (Optional) Displays the LSP log information for the specified IS-IS instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.
- **level {1 | 2}** (Optional) Displays the Intermediate System-to-Intermediate System (IS-IS) link-state database for Level 1 or Level 2 independently.
- **last number** (Optional) Specifies that the output be restricted to the last `number` of entries. Range is 1 to 20.
- **first number** (Optional) Specifies that the output be restricted to the first `number` of entries. Range is 1 to 20.

**Command Default**

No instance ID specified displays the LSP log information for all the IS-IS instances.

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

XR EXEC mode

**Command History**

<table>

show isis protocol

To display summary information about an Intermediate System-to-Intermediate System (IS-IS) instance, use the `show isis protocol` command in XR EXEC mode.

```
show isis [instance instance-id] protocol
```

**Syntax Description**

- `instance instance-id` (Optional) Displays the IS-IS adjacencies for the specified IS-IS instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

**Command Default**

No instance ID specified displays IS-IS adjacencies for all the IS-IS instances.

**Command Modes**

XR EXEC mode

**Command History**

<table>

**Examples**

The following is sample output from the `show isis protocol` command:

```
Router# show isis protocol

IS-IS Router: isp
System Id: 0001.0000.0011
IS Levels: level-1-2
Manual area address(es):
  49

Routing for area address(es):
  49
Non-stop forwarding: Cisco Proprietary NSF Restart enabled
Process startup mode: Cold Restart
Topologies supported by IS-IS:
  IPV4 Unicast
    No protocols redistributed
    Distance: 115
Interfaces supported by IS-IS:
  Loopback0 is running passively (passive in configuration)
  GigabitEthernet 0/4/0/1 is running actively (active in configuration)
  GigabitEthernet 0/5/0/1 is running actively (active in configuration)
```

show isis route

To display IP reachability information for an Intermediate System-to-Intermediate System (IS-IS) instance, use the show isis route command in XR EXEC mode.

```
show isis [instance instance-id] [ipv4 | ipv6 | afi-all] [unicast | multicast [topology {all | topo-name}]] [safi-all] route [ip-address mask | ip-address/length [longer-prefixes]] [summary] [multicast-intact] [backup] [detail] [sr-only]
```

**Syntax Description**

- **instance instance-id** (Optional) Displays the IP reachability information for the specified IS-IS instance only.
  - The instance-id argument is the instance identifier (alphanumeric) defined by the router isis command.
   - ipv4 (Optional) Specifies IP Version 4 address prefixes.
   - ipv6 (Optional) Specifies IP Version 6 address prefixes.
   - afi-all (Optional) Specifies all address prefixes.
   - unicast (Optional) Specifies unicast address prefixes.
   - multicast (Optional) Specifies multicast address prefixes.
   - topology (Optional) Specifies IS-IS paths to intermediate systems.
   - all (Optional) Specifies all topologies.
   - topology topo-name (Optional) Specifies topology table information and name of the topology table.
   - safi-all (Optional) Specifies all secondary address prefixes.
   - ip-address (Optional) Network IP address about which routing information should be displayed.
   - mask (Optional) Network mask specified in either of two ways:
     - Network mask can be a four-part, dotted decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit is a network address.
     - Network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are ones, and the corresponding bits of the address are the network address.
   - / length (Optional) Length of the IP prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value. Range is 0 to 32.
   - longer-prefixes (Optional) Displays route and more-specific routes.
   - summary (Optional) Displays topology summary information.
### Command Default

No instance ID specified displays the IP reachability information for all the IS-IS instances.

### Command Modes

XR EXEC mode

### Command History

### Examples

The following is sample output from the `show isis route` command:

```
RP/0/RSP0RP0/CPU0:router# show isis route

IS-IS isp IPv4 Unicast routes
Codes: L1 - level 1, L2 - level 2, ia - interarea (leaked into level 1)
df - level 1 default (closest attached router), su - summary null
C - connected, S - static, R - RIP, B - BGP, O - OSPF
i - IS-IS (redistributed from another instance)

Maximum parallel path count: 8

L2 10.76.240.6/32 [4/115]
via 10.76.245.252, SRP0/1/0/2, isp2
via 10.76.246.252, SRP0/1/0/0, isp2
C 10.76.240.7/32 is directly connected, Loopback0
L2 10.76.240.9/32 [256/115]
via 10.76.249.2, HundredGigE 0/3/0/0, isp3
L2 10.76.240.10/32 [296/115]
via 10.76.249.2, HundredGigE 0/3/0/0, isp3
C 10.76.245.0/24 is directly connected, SRP0/1/0/2
C 10.76.246.0/24 is directly connected, SRP0/1/0/0
C 10.76.249.0/26
```
This table describes the significant fields shown in the display.

Table 25: show isis route ipv4 unicast Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C 172.18.0.0/24</td>
<td>Connected route for HundredGigE interface 0/5/0/0.</td>
</tr>
<tr>
<td>C 172.19.1.0/24</td>
<td>Connected route for HundredGigE interface 0/4/0/1.</td>
</tr>
<tr>
<td>L1 172.35.0.0/24 [10]</td>
<td>Level 1 route to network 172.35.0.0/24.</td>
</tr>
<tr>
<td>C 172.18.0/24</td>
<td>Connected route for loopback interface 0.</td>
</tr>
</tbody>
</table>

This is sample output from the `show isis route` command with `detail` keyword that shows prefix segment ID (SID) and Segment Routing Global Block (SRGB) values:

```plaintext
Sun May 4 13:05:11.073 PDT
L2 172.16.255.2/32 [10/115] medium priority
    via 172.16.2.2, HundredGigE 0/0/0/1, pe2 tag 255, SRGB Base: 16000, Weight: 0
    src pe2.00-00, 172.16.255.2, tag 255, prefix-SID index 42, R:0 N:0 P:0
    L1 adv [10] native, propagated, interarea, tag 255, prefix-SID index 42, R:0 N:0 P:0
```

This is sample output from the `show isis route` command with `sr-only` keyword that shows only routes associated with a segment routing prefix SID:

```plaintext
RP0/R00/CPU0:router# show isis route sr-only
IS-IS 1 IPv4 Unicast routes
Codes: L1 - level 1, L2 - level 2, ia - interarea (leaked into level 1)
       df - level 1 default (closest attached router), su - summary null
       C - connected, S - static, R - RIP, B - BGP, O - OSPF
       A - access/subscriber, M - mobile, a - application
       i - IS-IS (redistributed from another instance)

Maximum parallel path count: 8

C  20.1.0.100/32
    is directly connected, Loopback0
L2 20.1.0.101/32 [10/115]
    via 10.1.1.101, GigabitEthernet0/0/0/2, r101, SRGB Base: 16000, Weight: 0
L2 20.1.0.102/32 [30/115]
    via 10.1.1.101, GigabitEthernet0/0/0/2, r101, SRGB Base: 16000, Weight: 0
L2 20.1.0.103/32 [20/115]
    via 10.4.1.103, GigabitEthernet0/0/0/1, r103, SRGB Base: 16000, Weight: 0
```
show isis spf-log

To display how often and why the router has run a full shortest path first (SPF) calculation, use the `show isis spf-log` command in XR EXEC mode.

```
show isis [ instance instance-id ] [ [ { ipv4 | ipv6 | afi-all } ] [ { unicast | multicast | topology { all topo-name } | safi-all } ] ] spf-log [ level { 1 | 2 } ] [ { fspf | prc | nhc } ] [ { detail | verbose | plfrr | ppfrr } ] [ { last number | first number } ]
```

<tr>
<td></td>
<td>• The <code>instance-id</code> argument is the instance identifier (alphanumeric) defined by the <code>router isis</code> command.</td>
</tr>
<tr>
<td><code>type</code></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><code>interface-path-id</code></td>
<td>Physical interface or virtual interface.</td>
</tr>
</tbody>
</table>

**Note**

- Use the `show interfaces` command to see a list of all interfaces currently configured on the router.
- For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No instance ID specified displays IS-IS traffic statistics for all the IS-IS instances.

IS-IS traffic statistics are displayed for all interfaces.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show isis statistics` command displays IS-IS traffic counters for the specified interface or all traffic counters if no interface is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show isis statistics` command that shows all traffic counters:

```
Router#show isis statistics
IS-IS isp statistics:
  Fast PSNP cache (hits/tries): 164115/301454
  Fast CSNP cache (hits/tries): 41828/43302
  Fast CSNP cache updates: 2750
  LSP checksum errors received: 0
  LSP Dropped: 1441
  SNP Dropped: 1958
```
UPD Max Queue size: 2431

Average transmit times and rate:
- Hello: 0 s, 987947 ns, 4/s
- CSNP: 0 s, 1452987 ns, 0/s
- PSNP: 0 s, 1331690 ns, 0/s
- LSP: 0 s, 1530018 ns, 1/s

Average process times and rate:
- Hello: 0 s, 874584 ns, 41/s
- CSNP: 0 s, 917925 ns, 29/s
- PSNP: 0 s, 1405458 ns, 0/s
- LSP: 0 s, 4352850 ns, 0/s

show isis topology

To display a list of connected Intermediate System-to-Intermediate System (IS-IS) routers in all areas, use the `show isis topology` command in XR EXEC mode.

```
show isis [instance instance-id] [[(ipv4 | ipv6 | afi-all)] [unicast | multicast [topology {all | topo-name}] | safi-all]] | summary | level {1 | 2} [multicast-intact] [systemid system-id] [detail]
```

**Syntax Description**

- **instance instance-id** (Optional) Displays the IS-IS topology for the specified IS-IS instance only.
  - The `instance-id` argument is the instance identifier (alphanumeric) defined by the `router isis` command.

- **ipv4** (Optional) Specifies IP Version 4 address prefixes.

- **ipv6** (Optional) Specifies IP Version 6 address prefixes.

- **afi-all** (Optional) Specifies all address prefixes.

- **unicast** (Optional) Specifies unicast address prefixes.

- **multicast** (Optional) Specifies multicast address prefixes.

- **topology topo-name** (Optional) Specifies topology table information and name of the topology table.

- **safi-all** (Optional) Specifies all secondary address prefixes.

- **summary** (Optional) Displays a brief list of the IS-IS topology.

- **level {1 | 2}** (Optional) Displays the IS-IS link-state topology for Level 1 or Level 2 independently.

- **multicast-intact** (Optional) Displays multicast intact information on the IS-IS topology.

- **systemid system-id** (Optional) Displays the information for the specified router only.

- **detail** (Optional) Displays detailed information on the IS-IS topology.

**Command Default**

No instance ID specified displays a list of connected routers in all areas for all the IS-IS instances. Both Level 1 and Level 2 is configured if no level is specified.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show isis topology` command to verify the presence and connectivity among all routers in all areas.
The following is sample output from the `show isis topology` command:

```
RP/0/RP0/CPU0:router# show isis topology

IS-IS isp paths to (Level-1) routers
System Id  Metric  Next-hop Interface  SNPA
ensoft-5   10      ensoft-5  PO0/4/0/1  *PtoP*
ensoft-5   10      ensoft-5  G10/5/0/0  0003.6cff.0680
ensoft-11  --      --        --        --

IS-IS isp paths to (Level-2) routers
System Id  Metric  Next-hop Interface  SNPA
ensoft-5   10      ensoft-5  PO0/4/0/1  *PtoP*
ensoft-5   10      ensoft-5  G10/5/0/0  0003.6cff.0680
ensoft-11  --      --        --        --
```

This table describes the significant fields shown in the display.

<table>

show protocols (IS-IS)

To group a number of protocol show commands according to the specified address family, use the `show protocols` command in XR EXEC mode.

```
show protocols [{afi-all | ipv4 | ipv6}] [{all|protocol}]
```

**Syntax Description**

- `afi-all` (Optional) Specifies all address families.
- `ipv4` (Optional) Specifies an IPv4 address family.
- `ipv6` (Optional) Specifies an IPv6 address family.
- `all` (Optional) Specifies all protocols for a given address family.
- `protocol` (Optional) Specifies a routing protocol. For the IPv4 address family, the options are:
  - `bgp`
  - `isis`
  - `ospf`
  - `rip`
  For the IPv6 address family, the options are:
  - `bgp`
  - `isis`
  - `ospfv3`

**Command Default**

If no address family is specified, the default is IPv4.

**Command Modes**

XR EXEC mode

**Command History**

Release 6.0 This command was introduced.

**Usage Guidelines**

If IPv6 is enabled on an IS-IS instance, the instance is displayed in the `show protocols ipv6` command output. IPv4 IS-IS instances are displayed in the `show protocols ipv4` command output.

When using the `show protocols` command with the `ipv6` or `ipv4` keyword, you get all routing instances in that particular address family—not only IS-IS instances.

**Task ID**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The following example shows how to disable the IPv4 address family, with no output shown for IS-IS IPv4 instances from the `show protocols ipv4` command:

```
Router# configure
Router(config)# router isis uut
Router(config-isis)# no address-family ipv4 unicast
Router(config-isis)# commit

Router# show protocols ipv4
```
shutdown (IS-IS)

To disable the Intermediate System-to-Intermediate System (IS-IS) protocol on a particular interface, use the `shutdown` command in interface configuration mode. To re-enable the IS-IS protocol, use the `no` form of this command.

```
shutdown
no shutdown
```

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example disables the IS-IS protocol on HundredGigE interface 0/1/0/1:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-isis-if)# shutdown
```
single-topology

To configure the link topology for IP Version 4 (IPv4) when IP Version 6 (IPv6) is configured, use the `single-topology` command in address family configuration mode. To remove the `single-topology` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
single-topology
no single-topology
```

**Command Default**
Performs in multitopology mode in which independent topologies for IPv4 and IPv6 are running in a single area or domain.

**Command Modes**
IPv6 address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| Release 6.0 | This command was introduced.

**Usage Guidelines**
Use the `single-topology` command to allow Intermediate System-to-Intermediate System (IS-IS) for IPv6 to be configured on interfaces along with an IPv4 network protocol. All interfaces must be configured with the identical set of network protocols, and all routers in the IS-IS area (for Level 1 routing) or the domain (for Level 2 routing) must support the identical set of network layer protocols on all interfaces.

When single-topology support for IPv6 is being used, only old-style type, length, and value (TLV) objects may be used and a single shortest path (SPF) individual level is used to compute IPv4 (if configured) and IPv6 routes. The use of a single SPF means that both IPv4 IS-IS and IPv6 IS-IS routing protocols must share a network topology.

To allow link information to be shared between IPv4 and IPv6, you must configure the `single-topology` command for an address family. In single-topology IPv6 mode, the configured metric is always the same for both IPv4 and IPv6.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to enable single-topology mode for IPv6:

```
RP/0/RP0/CPU0:router(config)# router isis lsp
RP/0/RP0/CPU0:router(config-isis)# net 49.0000.0000.0001.00
RP/0/RP0/CPU0:router(config-isis)# address-family ipv6 unicast
RP/0/RP0/CPU0:router(config-isis-af)# single-topology
```
snmp-server traps isis

To enable the Simple Network Management Protocol (SNMP) server notifications (traps) available for IS-IS, use the `snmp-server traps isis` command in XR Config mode. To disable all available SNMP notifications, use the `no` form of this command.

```
snmp-server traps isis {all | traps set}
no snmp-server traps isis {all | traps set}
```

**Syntax Description**
- `all` Specifies all IS-IS SNMP server traps.
- `traps set` Specify any set of trap names.

**Command Default**
SNMP server traps notification is disabled.

**Command Modes**
XR Config mode

**Command History**
- **Release 6.0** This command was introduced.

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to enable all SNMP server traps available for isis:

```
RP/0/RP0/CPU0:router(config)# snmp-server traps isis?

RP/0/RP0/CPU0:router(config)#snmp-server traps isis all

The following example shows how to enable area-mismatch lsp-error-detected trap:

RP/0/RP0/CPU0:router(config)# snmp-server traps isis area-mismatch
lsp-error-detected
**spf-interval**

To customize IS-IS throttling of shortest path first (SPF) calculations, use the `spf-interval` command in address family configuration mode. To restore default values, use the no form of this command.

```
spf-interval [{initial-wait initial | secondary-wait secondary | maximum-wait maximum}] . . . [level {1 | 2}]
no spf-interval [{initial-wait initial | secondary-wait secondary | maximum-wait maximum}] . . .
```

**Syntax Description**

- **initial-wait initial**: Initial SPF calculation delay (in milliseconds) after a topology change. Range is 0 to 120000.
- **secondary-wait secondary**: Hold time between the first and second SPF calculations (in milliseconds). Range is 0 to 120000.
- **maximum-wait maximum**: Maximum interval (in milliseconds) between two consecutive SPF calculations. Range is 0 to 120000.
- **level {1 | 2}**: (Optional) Enables the SPF interval configuration for Level 1 or Level 2 independently.

**Command Default**

- initial-wait initial : 50 milliseconds
- secondary-wait secondary : 200 milliseconds
- maximum-wait maximum : 5000 milliseconds

**Command Modes**

Address family configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

SPF calculations are performed only when the topology changes. They are not performed when external routes change.

Use the `spf-interval` command to control how often the software can perform the SPF calculation. The SPF calculation is processor intensive. Therefore, it may be useful to limit how often this calculation is done, especially when the area is large and the topology changes often. Increasing the SPF interval reduces the processor load of the router, but potentially slows the rate of convergence.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to set the initial SPF calculation delay to 10 milliseconds and the maximum interval between two consecutive SPF calculations to 5000 milliseconds:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# spf-interval initial-wait 10 maximum-wait 5000
```
**spf prefix-priority (IS-IS)**

To assign a priority to an ISIS prefix for customizing the RIB update sequence, use the `spf prefix-priority` command in address family configuration mode. To restore default values, use the `no` form of this command.

```
spf prefix-priority [level {1 | 2}] {critical | high | medium} {access-list-name | tag tag}
no spf prefix-priority [level {1 | 2}] {critical | high | medium} [{access-list-name | tag tag}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2</td>
<td>(Optional) Enables the assignment of a priority to Level 1 or Level 2 independently.</td>
</tr>
<tr>
<td>critical</td>
<td>Assigns a critical priority.</td>
</tr>
<tr>
<td>high</td>
<td>Assigns a high priority.</td>
</tr>
<tr>
<td>medium</td>
<td>Assigns a medium priority.</td>
</tr>
<tr>
<td>access-list-name</td>
<td>Name of an access list.</td>
</tr>
<tr>
<td>tag</td>
<td>Specifies a tag to indicate priority. The <code>tag</code> argument range is 1 to 4294967295.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, IPv4 prefixes with a length of 32 and IPv6 prefixes with a length of 128 are given medium priority. The remaining prefixes are given low priority.

**Command Modes**

Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `spf prefix-priority` command to change the sequence of prefix updates to the RIB after an SPF is run. ISIS installs prefixes in the RIB according to the following priority order:

Critical > High > Medium > Low

The `spf prefix-priority` command supports prefix lists for the first three priorities. The unmatched prefixes are updated with low priority.

If a `spf prefix-priority` is specified, the default behavior of prioritizing either length 32 or 128 prefixes for IPv4 or IPv6, respectively, as `medium` is disabled.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the prefix priorities:

```
RP/0/RP0/CPU0:router(config)# ipv4 prefix-list isis-critical-acl
RP/0/RP0/CPU0:router(config-ipv4_pfx)# 10 permit 0.0.0.0/0 eq 32
```
!  
RP/0/RP0/CPU0:router(config)# ipv4 prefix-list isis-med-acl
RP/0/RP0/CPU0:router(config-ipv4_pfx)# 10 permit 0.0.0.0/0 eq 29
!
RP/0/RP0/CPU0:router(config)# ipv4 prefix-list isis-high-acl
RP/0/RP0/CPU0:router(config-ipv4_pfx)# 10 permit 0.0.0.0/0 eq 30
!
RP/0/RP0/CPU0:router(config)# router isis ring
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-af)# spf prefix-priority critical isis-critical-acl
RP/0/RP0/CPU0:router(config-isis-af)# spf prefix-priority high isis-high-acl
RP/0/RP0/CPU0:router(config-isis-af)# spf prefix-priority medium isis-med-acl
**summary-prefix (IS-IS)**

To create aggregate addresses for the Intermediate System-to-Intermediate System (IS-IS) protocol, use the `summary-prefix` command in address family configuration mode. To restore the default behavior, use the `no` form of this command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>Summary address designated for a range of IPv4 addresses. The <code>address</code> argument must be in four-part, dotted-decimal notation.</td>
</tr>
<tr>
<td>/ prefix-length</td>
<td>Length of the IPv4 or IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.</td>
</tr>
<tr>
<td>ipv6-prefix</td>
<td>Summary prefix designated for a range of IPv6 prefixes. The <code>ipv6-prefix</code> argument must be in the form documented in RFC 2373, in which the address is specified in hexadecimal using 16-bit values between colons.</td>
</tr>
<tr>
<td>level { 1</td>
<td>2 }</td>
</tr>
<tr>
<td>tag tag</td>
<td>Sets a tag value. The value range is 1-4294967295.</td>
</tr>
</tbody>
</table>

**Command Default**

All redistributed routes are advertised individually.

Both Level 1 and Level 2 are configured if no level is specified.

**Command Modes**

Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Multiple groups of addresses can be summarized for a given level. Routes learned from other routing protocols can also be summarized. The metric used to advertise the summary is the smallest metric of all the more-specific routes. Use the `summary-prefix` command to help reduce the size of the routing table.

This command also reduces the size of the link-state packets (LSPs) and thus the link-state database. It also helps ensure stability, because a summary advertisement depends on many more specific routes. If one more-specific route flaps, in most cases, this flap does not cause a flap of the summary advertisement.

The drawback of summary addresses is that other routes might have less information to calculate the most optimal routing table for all individual destinations.

**Note**

When IS-IS advertises a summary prefix, it automatically inserts the summary prefix into the IP routing table but labels it as a “discard” route entry. Any packet that matches the entry is discarded to prevent routing loops. When IS-IS stops advertising the summary prefix, the routing table entry is removed.
The following example shows how to redistribute Open Shortest Path First (OSPF) routes into IS-IS:

```
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 ipv6 unicast
RP/0/RP0/CPU0:router(config-isis-af)# redistribute ospf ospfv3 2 level-2
RP/0/RP0/CPU0:router(config-isis-af)# summary-prefix 10.10.10.10 3ffe:f000::/24 level-2
RP/0/RP0/CPU0:router(config-isis-af)# summary-prefix 10.10.10.10 3ffe:f000::/24 tag
```
suppressed

To allow an IS-IS interface to participate in forming adjacencies without advertising connected prefixes in the system link-state packets (LSPs), use the suppressed command in interface configuration mode. To enable advertising connected prefixes, use the no form of this command.

```plaintext
suppressed
no suppressed
```

**Command Default**

Interface is active.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the suppressed command to reduce the number of routes that IS-IS has to maintain, improving convergence times after an isolated failure. Improvement is noticeable if the command is used widely throughout the network. Other routers in the domain do not install routes to the affected connected prefixes.

**Examples**

The following example shows how to disable the advertisement of connected prefixes on HundredGigE interface 0/1/0/1:

```plaintext
RP/0/RP0/CPU0:router(config)# router isis isp
RP/0/RP0/CPU0:router(config-isis)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-isis-if)# suppressed
```
**tag (IS-IS)**

To associate and advertise a tag with the prefix of an IS-IS interface, use the `tag` command in interface address family configuration mode. To restore the default behavior, use the `no` form of this command.

```
tag tag
no tag [tag]
```

**Syntax Description**

- `tag` Interface tag. Range is 1 to 4294967295.

**Command Default**

Default is that no tag is associated and advertised.

**Command Modes**

Interface address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to associate and advertise an interface tag:

```
RP/0/RP0/CPU0:router(config)## router isis isp
RP/0/RP0/CPU0:router(config-isis)## interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-isis-if)## address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-isis-if-af)## tag 234
```
To differentiate one topology in the domain from another while configuring a multicast routing table, use the `topology-id` command in Intermediate System-to-Intermediate System (IS-IS) address family configuration submode. To disable the topology use the `no` form of the command.

```
topology-id  isis-multicast-topology-id-number
no  topology-id  isis-multicast-topology-id-number
```

**Syntax Description**

- `isis-multicast-topology-id-number`: ID number for a specific IS-IS multicast topology. Range is 6 to 4095.

**Command Default**

No topology is associated with a routing table by default.

**Command Modes**

IS-IS address family configuration

**Command History**

- **Release 6.0**: This command was introduced.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to differentiate a topology from another in the multicast routing table in IS-IS routing:

```
RP/0/RP0/CPU0:router(config)# router  isis  isp
RP/0/RP0/CPU0:router(config-isis)# address-family ipv4 multicast topology  green
RP/0/RP0/CPU0:router(config-isis-af)# topology-id 2666
```
trace (IS-IS)

To set the IS-IS buffer size, use the `trace` command in XR Config mode. To return to the default value, use the `no` form of this command.

```
trace [{detailed | severe | standard}] max-trace-entries
no trace [{detailed | severe | standard}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detailed</td>
<td>Specifies the buffer size for detailed traces. Range is detailed</td>
</tr>
<tr>
<td>severe</td>
<td>Specifies the buffer size for severe traces. Range is severe</td>
</tr>
<tr>
<td>standard</td>
<td>Specifies the buffer size for standard traces. Range is standard</td>
</tr>
<tr>
<td>max-trace-entries</td>
<td>Sets the maximum number of trace entries. Range is 1-20000</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Router IS-IS configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the isis buffer size for severe traces to 1200:

```
RP/0/RP0/CPU0:router(config)#router isis isp
RP/0/RP0/CPU0:router(config-isis)#trace sever 1200
```
trace (IS-IS)
EIGRP Commands

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.6.3.

This module describes the commands used to configure and monitor the Enhanced Interior Gateway Routing Protocol (EIGRP) protocol on Cisco NCS 5500 Series Routers.

For detailed information about EIGRP concepts, configuration tasks, and examples, see the Implementing BFD on Routing Command Reference for Cisco NCS 5500 Series Routers module in the Routing Configuration Guide for Cisco NCS 5500 Series Routers.

address-family (EIGRP)

To enable an IPv4 address family under Enhanced Interior Gateway Routing Protocol (EIGRP), use the `address-family` command in the appropriate mode. To remove the address family from the EIGRP configuration, use the `no` form of this command.

```
adress-family {ipv4 | ipv6}
no address-family {ipv4 | ipv6}
```

**Syntax Description**
- `ipv4`: Selects IPv4 address family.

**Command Default**
No default behavior or values

**Command Modes**
- Router configuration
- VRF configuration

**Command History**
- Release 6.6.3: This command was introduced.

**Usage Guidelines**
Use the `address-family ipv4` command to configure IPv4 address family sessions in EIGRP.

EIGRP Virtual Private Networks (VPNs) can be configured under IPv4 address family configuration modes after first entering VRF configuration mode. All commands in address family configuration mode can be configured in VRF address families except the `autonomous-system` and `maximum-prefix` commands.

**Task ID**
- **Task ID**: read, write

**Examples**
The following example shows how to configure an IPv4 VRF address family session after defining the VRF named vrf1:

```
Routing(config)# router eigrp 1
Routing(config-eigrp)# vrf vrf1
Routing(config-eigrp-vrf)# address-family ipv4
Routing(config-eigrp-vrf-af)# default-metric 1000 100 255 1 1500
```
authentication keychain

To authenticate all EIGRP protocol traffic on one or more interfaces based on the MD5 algorithm, use the `authentication keychain` command in an appropriate configuration mode. To disable authentication, use the `no` form of this command.

```
authentication keychain key-chain-name
no authentication keychain key-chain-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>key-chain-name</td>
<td>Name of the authentication keychain</td>
</tr>
</tbody>
</table>

| Command Default | Authentication is disabled. |

| Command Modes | IPv4 address family interface configuration  |
|               | IPv6 address family interface configuration  |
|               | IPv4 VRF address family interface configuration |
|               | IPv6 VRF address family interface configuration |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

| Usage Guidelines | Use the `address-family ipv4` command to configure IPv4 address family sessions in EIGRP and the `address-family ipv6` command to configure IPv6 address family sessions in EIGRP. EIGRP Virtual Private Networks (VPNs) can be configured under IPv4 and IPv6 address family configuration modes after first entering VRF configuration mode. |

<table>
<thead>
<tr>
<th>Examples</th>
<th>The following example shows how to enable an EIGRP authentication keychain:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Router# configure eigrp 1</td>
</tr>
<tr>
<td></td>
<td>Router(config-eigrp)# address-family ipv4</td>
</tr>
<tr>
<td></td>
<td>Router(config-eigrp-af)# interface GigabitEthernet 0/2/0/0</td>
</tr>
<tr>
<td></td>
<td>Router(config-eigrp-if)# authentication key chain key1</td>
</tr>
</tbody>
</table>
auto-summary (EIGRP)

To allow automatic summarization of subnet routes into network-level routes for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the `auto-summary` command in the appropriate configuration mode. To disable this function and send subprefix routing information across classful network boundaries, use the `no` form of this command.

```
auto-summary
no auto-summary
```

### Syntax Description
This command has no keywords or arguments.

### Command Default
The behavior of this command is disabled by default. (The software sends subnet routing information across classful network boundaries.)

### Command Modes
- IPv4 Address family configuration
- IPv4 VRF address family configuration

### Command History
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

### Usage Guidelines
Route summarization reduces the amount of routing information in the routing tables. Use the `auto-summary` command to allow the software to create summary subprefixes to the classful network boundary when crossing classful network boundaries.

EIGRP summary routes are given an administrative distance value of 5. You cannot configure this value.

### Examples
The following example shows how to enable automatic summarization for EIGRP 1:

```
Router(config)# router eigrp 1
Router(config-eigrp)# vrf vpn-1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# auto-summary
```
autonomous-system

To configure an Enhanced Interior Gateway Routing Protocol (EIGRP) routing process to run within a VPN routing and forwarding instance (VRF), use the `autonomous-system` command in IPv4 VRF address family configuration mode.

To configure the autonomous-system number for an address-family of Enhanced Interior Gateway Routing Protocol (EIGRP) routing process, use the `autonomous-system` command in the address family configuration mode. To remove the autonomous-system number for an address-family of EIGRP routing process, use the `no` form of this command.

```
autonomous-system as-number
no autonomous-system as-number
```

**Syntax Description**

- `as-number` Autonomous system number of the EIGRP routing process. Range is from 1 to 65535.

**Command Default**

None

**Command Modes**

- IPv4 address family configuration (For EIGRP configured using virtual-name only).
- IPv4 VRF address family configuration.

**Command History**

- **Release** Modification
  - Release 6.6.3 This command was introduced.

**Usage Guidelines**

- Use the `autonomous-system` command in IPv4 VRF address family configuration mode.
- The same VRF-autonomous-system combination cannot be used across multiple process instances.

**Task ID**

- **Task ID**
  - eigrp read, write

**Examples**

This example shows how to configure autonomous system 101 under VRF VPN-1:

```
Router(config)# router eigrp 1
Router(config-eigrp)# vrf vpn-1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# autonomous-system 101
```

This example shows how to configure autonomous-system 1 for default/global VRF of EIGRP configured using virtual-name:

```
Router(config)# router eigrp name
Router(config-eigrp)# address-family ipv4
```
Router(config-eigrp-af)# autonomous-system 1
bandwidth-percent (EIGRP)

To configure the percentage of bandwidth that may be used by EIGRP on an interface, use the `bandwidth-percent` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
bandwidth-percent percent
no bandwidth-percent
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>percent</td>
<td>Percentage of bandwidth that EIGRP may use.</td>
</tr>
</tbody>
</table>

**Command Default**

```
percent : 50
```

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

EIGRP uses up to 50 percent of the bandwidth of a link, as defined by the bandwidth interface configuration command. This command may be used if some other fraction of the bandwidth is desired. Values greater than 100 percent may be configured. The configuration option may be useful if the bandwidth is set artificially low for other reasons.

**Examples**

The following example shows how to configure EIGRP to use up to 75 percent (42 kbps) of an interface in autonomous system 209:

```
Router(config)# router eigrp 1
Router(config-eigrp)# address-family ipv4
Router(config-eigrp-af)# router-id 10.1.1.1
Router(config-eigrp-af)# interface GigabitEthernet 0/1/0/0
Router(config-eigrp-af-if)# bandwidth-percent 75
```
clear eigrp neighbors

To remove and re-establish Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor entries from the appropriate table, use the `clear eigrp neighbors` command in EXEC configuration mode.

```
clear eigrp [as-number] [vrf {vrf | all}] [{ipv4 | ipv6}] neighbors [{ip-address type interface-path-id}] [soft]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>as-number</code></td>
<td>(Optional) Autonomous system number. Range is from 1 to 65535.</td>
</tr>
<tr>
<td><code>vrf</code></td>
<td>(Optional) Specifies a particular VPN routing and forwarding instance (VRF) or all VRF instances.</td>
</tr>
<tr>
<td><code>ipv4</code></td>
<td>(Optional) Specifies the IPv4 address family.</td>
</tr>
<tr>
<td><code>ip-address</code></td>
<td>(Optional) Address of the neighbor.</td>
</tr>
<tr>
<td><code>type</code></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><code>interface-path-id</code></td>
<td>Physical interface or virtual interface. Use the <code>show interfaces</code> command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><code>soft</code></td>
<td>(Optional) Specifies a soft reset.</td>
</tr>
</tbody>
</table>

**Command Default**

When no autonomous system number or VRF instance is specified, all EIGRP neighbor entries are cleared from the table.

**Command Modes**

EXEC configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

The following example shows how to clear all EIGRP VRF entries for neighbor Gigabit Ethernet interface 0/5/0/0:
Router# clear eigrp customer_1 neighbors GigabitEthernet 0/5/0/0
clear eigrp topology

To remove and relearn Enhanced Interior Gateway Routing Protocol (EIGRP) topology entries from the appropriate table, use the clear eigrp topology command in EXEC configuration mode.

```
clear eigrp [as-number] [vrf {vrf | all}] [{ipv4 | ipv6}] topology [{prefix mask prefix/length}]
```

**Syntax Description**

- **as-number**: (Optional) Autonomous system number. Range is from 1 to 65535.
- **vrf {vrf | all}**: (Optional) Specifies a particular VPN routing and forwarding instance (VRF) or all VRF instances.
- **ipv4**: (Optional) Specifies the IPv4 address family.
- **prefix**: IP prefix, which limits output to a specific route.
- **mask**: IP address mask.
- **/ length**: Prefix length, which can be indicated as a slash (/) and number. For example, /8 indicates that the first eight bits in the IP prefix are network bits. If length is used, the slash is required.

**Command Default**

No EIGRP topology entries are cleared.

**Command Modes**

EXEC configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear EIGRP topology entries for a specific route:

```
Router# clear eigrp topology 10.1.0.0/8
```
default-information

To control the candidate default routing information for an Enhanced Interior Gateway Routing Protocol (EIGRP), use the `default-information` command in the appropriate configuration mode. To suppress EIGRP candidate default information in incoming or outgoing updates, use the `no` form of this command.

```
default-information allowed {in | out} [route-policy name]
no default-information allowed {in | out} [route-policy name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>allowed</code></td>
<td>Specifies EIGRP to allow default routing information.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Specifies EIGRP to allow inbound default routing information.</td>
</tr>
<tr>
<td><code>out</code></td>
<td>Specifies EIGRP to allow outbound default routing information.</td>
</tr>
<tr>
<td><code>route-policy</code></td>
<td>(Optional) Specifies a route policy.</td>
</tr>
<tr>
<td><code>name</code></td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

Default routing information is not accepted or flagged.

**Command Modes**

Address family configuration
IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure inbound default routes specified with route policy `acme` to be accepted by an EIGRP peer in autonomous system 1:

```
Router(config)# router eigrp 1
Router(config-eigrp)# vrf vrf1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# default-information accept in route-policy acme
```
default-metric (EIGRP)

To set metrics for an Enhanced Interior Gateway Routing Protocol (EIGRP), use the `default-metric` command in the appropriate configuration mode. To remove the metric values and restore the default state, use the `no` form of this command.

```
default-metric bandwidth delay reliability loading mtu
default-metric
```

**Syntax Description**

- `bandwidth` Minimum bandwidth of the route in kilobits per second. Range is 1 to 4294967295.
- `delay` Route delay in ten microsecond units. Range is 1 to 4294967295.
- `reliability` Likelihood of successful packet transmission expressed as a number between 0 and 255. The value 255 means 100-percent reliability; 0 means the link is not reliable.
- `loading` Effective bandwidth of the route expressed as a number from 1 to 255 (255 is 100-percent loading).
- `mtu` Minimum maximum transmission unit (MTU) size of the route in bytes. Range is from 1 to 65535.

**Command Default**

No default values

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `default-metric` command to provide default metric values while redistributing a protocol into EIGRP. Metric defaults have been carefully set to work for a wide variety of networks. Take great care when changing these values.

**Examples**

The following example shows how to take redistributed Routing Information Protocol (RIP) metrics and translate them into EIGRP metrics with values as follows: bandwidth = 1000, delay = 100, reliability = 250, loading = 100, and MTU = 1500.

```
Router(config)# router eigrp 1
Router(config-eigrp)# vrf vrf1
```
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# redistribute rip
Router(config-eigrp-vrf-af)# default-metric 1000 100 250 100 1500
distance (EIGRP)

To allow the use of one of two administrative distances—internal and external—that could provide a better route to a node, use the distance command in the appropriate configuration mode. To reset these values to their defaults, use the no form of this command.

```
distance internal-distance external-distance
no distance
```

**Syntax Description**

<table>
<thead>
<tr>
<th>internal-distance</th>
<th>Administrative distance for EIGRP internal routes. Internal routes are those that are learned from another entity within the same autonomous system (AS). The distance can be a value from 1 to 255.</th>
</tr>
</thead>
<tbody>
<tr>
<td>external-distance</td>
<td>Administrative distance for EIGRP external routes. External routes are those for which the best path is learned from a source external to the AS. The distance can be a value from 1 to 255.</td>
</tr>
</tbody>
</table>

**Command Default**

<table>
<thead>
<tr>
<th>internal-distance</th>
<th>90</th>
</tr>
</thead>
<tbody>
<tr>
<td>external-distance</td>
<td>170</td>
</tr>
</tbody>
</table>

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

An administrative distance is a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. Numerically, an administrative distance is an integer from 0 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored.

Use the distance command if another protocol is known to provide a better route to a node than was actually learned through the external Enhanced Interior Gateway Routing Protocol (EIGRP) or some internal routes should be preferred by EIGRP.

To display the default administrative distance for a specified routing process, use the show protocols EXEC command.

**Examples**

The following example shows how to set the administrative distance of all EIGRP 1 internal routes (within vrf vpn-1) to 80 and all EIGRP external routes to 130:
Router(config)# router eigrp 1
Router(config-eigrp)# vrf vrf1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# distance 80 130
hello-interval (EIGRP)

To configure the hello interval for an interface, use the `hello-interval` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```plaintext
hello-interval seconds
no hello-interval
```

**Syntax Description**

- `seconds` Hello interval (in seconds). Range is from 1 to 65535.

**Command Default**

- For low-speed, nonbroadcast multiaccess (NBMA) networks: 60 seconds
- For all other networks: 5 seconds

**Command Modes**

- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Task ID**

- `eigrp` read, write

**Examples**

The following example shows how to set the hello interval to 10 seconds for the interface:

```plaintext
Router(config)# router eigrp 1
Router(config-eigrp)# address-family ipv4
Router(config-eigrp)# router-id 10.1.1.1
Router(config-eigrp-af)# interface GigabitEthernet 0/1/0/0
Router(config-eigrp-af-if)# hello-interval 10
```
**hold-time (EIGRP)**

To configure the hold time for an interface, use the `hold-time` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
hold-time  seconds
no hold-time
```

**Syntax Description**

- `seconds`  Hold time (in seconds). Range is from 1 to 65535.

**Command Default**

Three times the default hello interval time of 15 seconds.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On very congested and large networks, the default hold time might not be sufficient time for all routers to receive hello packets from their neighbors. In this case, you may want to increase the hold time.

We recommend that the hold time be at least three times the hello interval. If a router does not receive a hello packet within the specified hold time, routes through this router are considered unavailable.

Increasing the hold time delays route convergence across the network.

<table>
<thead>
<tr>
<th>Task</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the hold time to 0 to 40 seconds for the interface:

```
Router(config)# router eigrp 1
Router(config-eigrp)# address-family ipv4
Router(config-eigrp)# router-id 10.1.1.1
Router(config-eigrp-af)# interface GigabitEthernet 0/1/0/0
Router(config-eigrp-af-if)# hold-time 40
```
To define the interfaces on which the Enhanced Interior Gateway Routing Protocol (EIGRP) routing protocol runs, use the `interface` command in the appropriate configuration mode. To disable EIGRP routing for interfaces, use the `no` form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

**Syntax Description**

- `type` Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id` Physical interface or virtual interface.

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

When you do not specify this command in configuration mode, EIGRP routing for interfaces is not enabled.

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `interface` command to associate a specific interface with an EIGRP process. The interface remains associated with the process even when the IPv4 address of the interface changes.

This command places the router in interface configuration mode, from which you can configure interface-specific settings. Commands configured under this mode (such as the `hello-interval` command) are automatically bound to that interface.

**Examples**

The following example shows how to enter interface configuration mode for EIGRP process 1 and set the hello interval to 10 seconds for GigabitEthernet interface 0/1/0/0:

```
Router(config)# router eigrp 1
Router(config-eigrp)# address-family ipv4
Router(config-eigrp)# router-id 10.1.1.1
Router(config-eigrp-af)# interface GigabitEthernet 0/1/0/0
```
Router(config-eigrp_af-if)# hello-interval 10
**log-neighbor-changes**

To enable the logging of changes in Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, use the **log-neighbor-changes** command in the appropriate configuration mode. To disable the logging of changes in EIGRP neighbor adjacencies, use the **no** form of this command.

```
log-neighbor-changes
no log-neighbor-changes
```

**Command Default**

This command has no keywords or arguments.

Adjacency changes are not logged.

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **log-neighbor-changes** command to log neighbor adjacency changes, monitor the stability of the routing system, and help detect problems. Logging is disabled by default. To disable the logging of neighbor adjacency changes, use the **no** form of this command.

**Examples**

The following example shows how to enable logging of neighbor changes for EIGRP 1:

```
Router(config)# router eigrp 1
Router(config-eigrp)# address-family ipv4
Router(config-eigrp-af)# log-neighbor-changes
```
**log-neighbor-warnings**

To enable the logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor warning messages, use the `log-neighbor-warnings` command in the appropriate configuration mode. To disable the logging of EIGRP neighbor warning messages, use the `no` form of this command.

```
log-neighbor-warnings
no log-neighbor-warnings
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
Neighbor warning messages are not logged.

**Command Modes**
IPv4 address family configuration
IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `log-neighbor-warnings` command to disable and enable neighbor warning messages. When neighbor warning messages occur, they are not logged by default.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure log neighbor warning messages for EIGRP process 20:

```
Router(config)# router eigrp 20
Router(config-eigrp) vrf vrf1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# log-neighbor-warnings
```
maximum-paths (EIGRP)

To control the maximum number of parallel routes that the Enhanced Interior Gateway Routing Protocol (EIGRP) can support, use the `maximum-paths` command in the appropriate configuration mode. To remove the `maximum-paths` command from the configuration file and restore the system to its default condition with respect to the routing protocol, use the `no` form of this command.

```
maximum-paths maximum
no maximum-paths
```

**Syntax Description**

- `maximum`: Maximum number of parallel routes that EIGRP can install in a routing table. Range is from 1 to 32 routes.

**Command Default**

- `maximum`: 4

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `maximum-paths` command to allow the EIGRP protocol to install multiple paths into the routing table for each prefix. Multiple paths are installed for both internal and external routes, providing these routes are learned in the same autonomous system and that they are equal cost (according to the EIGRP best path algorithm).

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to allow a maximum of 10 paths to a destination:

```
Router(config)# router eigrp 1
Router(config-eigrp) vrf vrf1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# maximum-paths 10
```
maximum-prefix (EIGRP)

To limit the number of prefixes that are accepted under a VRF address family by Enhanced Interior Gateway Routing Protocol (EIGRP), use the `maximum-prefix` command in IPv4 VRF address family configuration mode. To disable this function, use the `no` form of this command.

```
maximum-prefix maximum [threshold] [dampened] [reset-time minutes] [restart minutes] [restart-count number] [warning-only]
no maximum-prefix maximum [threshold] [dampened] [reset-time minutes] [restart minutes] [restart-count number] [warning-only]
```

### Syntax Description

- **maximum**
  - Maximum number of prefixes allowed under an address family. Range is from 1 to 4294967295.
  - The number of prefixes that can be configured is limited only by the available system resources on the router.

- **threshold**
  - (Optional) Syslog warning messages are specified as a percentage of the maximum prefix limit that was exceeded. The prefix percentage number range is from 1 to 100. The default is 75 percent.

- **dampened**
  - (Optional) A decay penalty is applied to the restart time period each time the maximum prefix limit is exceeded. The half-life for the decay penalty is 150 percent of the default or user-defined restart time value in minutes. This keyword is disabled by default.

- **reset-time minutes**
  - (Optional) The restart count is reset to 0 after the default or user-defined reset time period has expired. The range of values that can be applied with the `minutes` argument is from 1 to 65535 minutes. The default reset-time period is 15 minutes.

- **restart minutes**
  - (Optional) A time period when router adjacencies are not formed or when redistributed routes are not accepted from the RIB after the maximum prefix limit has been exceeded. The value for the `minutes` argument is from 1 to 65535 minutes. The default restart time period is 5 minutes.

- **restart-count number**
  - (Optional) Number of times a peering session is automatically reestablished after the peer session is torn down or after the redistribute route is cleared and relearned when the maximum prefix exceeds limits. The default restart count limit is 3.

  **Caution** After the restart count threshold is crossed, you need to use the `clear eigrp neighbors` command to re-establish normal peering, redistribution, or both.

- **warning-only**
  - (Optional) Configures the router to generate syslog messages only when the maximum prefix limit is reached, instead of terminating the peering session.

### Command Default

- `threshold`: 75 percent
- `dampened`: False
- `reset-time`: 15 minutes
**maximum-prefix (EIGRP)**

**Command Modes**

IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `maximum-prefix` command to limit the number of prefixes that are accepted from all sources. When the maximum prefix limit is exceeded, sessions with remote peers are torn down, all routes learned from remote peers and through redistribution are removed from the topology and routing tables, and redistribution and peering are suspended for the default or user-defined time period.

**Examples**

The following example shows how to configure the maximum prefix limit for an EIGRP process, which includes routes learned through redistribution and routes learned through EIGRP peering sessions. The maximum limit is set to 50,000 prefixes. When the number of prefixes learned through redistribution reaches 37,500 (75 percent of 50,000), warning messages are displayed in the console. When the maximum prefix limit is exceeded, all peering sessions are reset, the topology and routing tables are cleared and redistributed routes and all peering sessions are placed in a penalty state.

```
Router(config)# router eigrp 1
Router(config-eigrp)# vrf vrf1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# maximum-prefix 50000
```
metric (EIGRP)

To set metrics for an Enhanced Interior Gateway Routing Protocol (EIGRP) interface, use the `metric` command in interface configuration mode. To remove the metric values and restore the default state, use the `no` form of this command.

```
metric {bandwidth | delay | load | reliability}
no metric
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bandwidth</code></td>
<td>Minimum interface bandwidth of the route in kilobits per second. Range is 1 to 4294967295.</td>
</tr>
<tr>
<td><code>delay</code></td>
<td>Interface route delay in tens of microseconds. Delay is 1 or any positive number that is a multiple of 39.1 nanoseconds. Range is 1 to 4294967295.</td>
</tr>
<tr>
<td><code>load</code></td>
<td>Effective bandwidth of the route expressed as a number from 1 to 255 (255 is 100-percent loaded).</td>
</tr>
<tr>
<td><code>reliability</code></td>
<td>Likelihood of successful packet transmission expressed as a number between 0 and 255. The value 255 means 100-percent reliability; 0 means no reliability.</td>
</tr>
</tbody>
</table>

**Command Default**

Metric values are not set.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `metric` command to provide metric values while redistributing a protocol into an EIGRP interface. Metric defaults have been carefully set to work for a wide variety of networks. Take great care when changing these values.

This example shows how to configure metric values for interface POS 0/1/0/1 with values as bandwidth = 100, delay = 7, reliability = 250, and load = 100.

```
Router# configure
Router(config)# router eigrp 100
Router(config-eigrp)# address-family ipv4
Router(config-eigrp-af)# interface GigabitEthernet 0/1/0/1
Router(config-eigrp-af-if)# metric bandwidth 100 delay 7 reliability 250 load 100
```
metric maximum-hops

To advertise as unreachable those Enhanced Interior Gateway Routing Protocol (EIGRP) routes with a hop count higher than is specified by the command, use the **metric maximum-hops** command in the appropriate configuration mode. To reset the value to the default, use the **no** form of this command.

```
metric maximum-hops hops-number
no metric maximum-hops
```

**Syntax Description**

- **hops-number**  Maximum hop count. Range is from 1 to 255 hops.

**Command Default**

```
hops-number: 100
```

**Command Modes**

IPv4 address family configuration
IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **metric maximum-hops** command to provide a safety mechanism that breaks any potential count-to-infinity problems. This command causes the EIGRP routing protocol to advertise as unreachable routes with a hop count greater than the value assigned to the **hops-number** argument.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure a hop count to 200 for a router that has a complex WAN generating a large hop count under normal (nonlooping) operations.

```
Router(config)# router eigrp 1
Router(config-eigrp) address-family ipv4
Router(config-eigrp-af)# metric maximum-hops 200
```
**metric rib-scale**

To set a RIB scale for EIGRP, use the **metric rib-scale** command in an appropriate configuration mode. To remove the RIB scale and restore the default state, use the **no** form of this command.

```
metric rib-scale  scale-down-value
no metric rib-scale
```

**Syntax Description**

- `scale-down-value`: Amount to divide the EIGRP Wide Metric by to convert to a 4 Byte RIB metric. Legal ranges are 1-256. Results are expressed as whole integers only (no rounding).

**Command Default**

- Default RIB scale is 128 in the 64 bit mode.
- In 32 bit mode, rib scale is always 1.

**Command Modes**

- IPv4 address family configuration
- IPv6 address family configuration
- IPv4 VRF address family configuration
- IPv6 VRF address family configuration (Only supported in 64 bit mode)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The ability to scale the RIB metric is provided through the use of the **metric rib-scale** configuration command. When entered, the command will result in all routes in the RIB being cleared and replaced with the new metric values.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the metric rib-scale as 64:

```
Router#configure
Router(config)#router eigrp 1
Router(config-router)#address-family ipv4
Router(config-router-af)#metric rib-scale 64
```
**metric weights**

To allow the tuning of the Enhanced Interior Gateway Routing Protocol (EIGRP) metric calculations, use the `metric weights` command in the appropriate configuration mode. To reset the values to their defaults, use the `no` form of this command.

```
metric weights tos k1 k2 k3 k4 k5
no metric weights
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tos</code></td>
<td>Type of service (ToS) which must always be 0.</td>
</tr>
<tr>
<td><code>k1 k2 k3 k4 k5</code></td>
<td>Constants that convert an EIGRP metric vector into a scalar quantity. The range is 0 to 4294967295.</td>
</tr>
</tbody>
</table>

**Command Default**

- `tos`: 0
- `k1`: 1
- `k2`: 0
- `k3`: 1
- `k4`: 0
- `k5`: 0

**Command Modes**

IPv4 address family configuration
IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `metric weights` command to alter the default behavior of EIGRP routing and metric computation and allow the tuning of the EIGRP metric calculation for a particular ToS.

If `k5` equals 0, the composite EIGRP metric is computed according to the following formula:

\[
\text{metric} = [k1 \times \text{bandwidth} + (k2 \times \text{bandwidth})/(256 - \text{load}) + k3 \times \text{delay}]
\]

If `k5` does not equal zero, an additional operation is performed:

\[
\text{metric} = \text{metric} \times [k5/(\text{reliability} + k4)]
\]

Bandwidth is inverse minimum bandwidth of the path in BPS scaled by a factor of 2.56 * 1012. The range is from a 1200-bps line to 10 terabits per second.

Delay is in units of 10 microseconds. The range of delay is from 10 microseconds to 168 seconds. A delay of all 1s indicates that the network is unreachable.

The delay parameter is stored in a 32-bit field, in increments of 39.1 nanoseconds. The range of delay is from 1 (39.1 nanoseconds) to hexadecimal FFFFFFF (decimal 4,294,967,040 nanoseconds). A delay of all 1s (that is, a delay of hexadecimal FFFFFFF) indicates that the network is unreachable.
This table lists the default values used for several common media.

**Table 34: Bandwidth Values by Media Type**

<table>
<thead>
<tr>
<th>Media Type</th>
<th>Delay</th>
<th>Bandwidth</th>
</tr>
</thead>
<tbody>
<tr>
<td>Satellite</td>
<td>5120 (2 seconds)</td>
<td>5120 (500 megabits)</td>
</tr>
<tr>
<td>Ethernet</td>
<td>25600 (1 milliseconds [ms])</td>
<td>256000 (10 megabits)</td>
</tr>
<tr>
<td>1.544 Mbps</td>
<td>512000 (20,000 ms)</td>
<td>1,657,856 bits</td>
</tr>
<tr>
<td>64 kbps</td>
<td>512000 (20,000 ms)</td>
<td>40,000,000 bits</td>
</tr>
<tr>
<td>56 kbps</td>
<td>512000 (20,000 ms)</td>
<td>45,714,176 bits</td>
</tr>
<tr>
<td>10 kbps</td>
<td>512000 (20,000 ms)</td>
<td>256,000,000 bits</td>
</tr>
<tr>
<td>1 kbps</td>
<td>512000 (20,000 ms)</td>
<td>2,560,000,000 bits</td>
</tr>
</tbody>
</table>

Reliability is given as a fraction of 255. That is, 255 is a reliability of 100 percent or a perfectly stable link. Load is given as a fraction of 255. A load of 255 indicates a completely saturated link.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the metric weights to change the default values:

```
Router(config)# router eigrp 1
Router(config-eigrp)# address-family ipv4
Router(config-eigrp-af)# metric weights 0 2 0 2 0 0
```
**neighbor (EIGRP)**

To define a neighboring router with which to exchange Enhanced Interior Gateway Routing Protocol (EIGRP) information, use the `neighbor` command in interface configuration mode. To remove an entry, use the `no` form of this command.

```
neighbor ip-address interface [remote [max-hops]]
noneighbor ip-address interface [remote [max-hops]]
```

**Syntax Description**

- `ip-address` IP address of a peer router with which routing information is exchanged.
- `interface` Interface through which peering is established.
- `remote` Specifies that the neighbor is remote.
- `max-hops` The maximum number of hops within which the neighbor is expected to be reachable from the configured router. The default value is 100 hops.

**Command Default**

No neighboring routers are defined.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `neighbor` command to permit the point-to-point (nonbroadcast) exchange of routing information. If a neighbor is configured on an interface using the `neighbor` command, the interface stops sending or receiving multicast hello messages. However, the interface can send or receive unicast hello messages. So each neighbor on a LAN must be configured individually. Multiple `neighbor` commands can be used to specify additional neighbors or peers.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to permit the sending of EIGRP updates to specific neighbors. One copy of the update is generated for each neighbor:

```
Router(config)# router eigrp 100
Router(config-eigrp) address-family ipv4
Router(config-eigrp-af)# interface GigabitEthernet 0/0/0/3
Router(config-eigrp-af-if)# neighbor 172.20.1.2 remote 10
```
neighbor maximum-prefix

To limit the number of prefixes that are accepted from a single Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor or all EIGRP VPN neighbors, use the **neighbor maximum-prefix** command in IPv4 VRF address family configuration mode. To disable this function, use the **no** form of this command.

**Single-Neighbor Configuration CLI**
```
neighbor ip-address maximum-prefix maximum [threshold] [warning-only]
no neighbor ip-address maximum-prefix
```

**All-Neighbor Configuration CLI**
```
neighbor maximum-prefix maximum [threshold] [dampened] [reset-time minutes] [restart minutes]
[restart-count number] [warning-only]
no neighbor maximum-prefix
```

<table>

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The neighbor maximum-prefix command is configured to protect an individual peering session or all peering sessions. When this feature is enabled and the maximum prefix limit is exceeded, the router tears down the peering session, clears all routes that are learned from the peer, and then places the peer in a penalty state for the default or user-defined time period. After the penalty time period expires, normal peering is reestablished.

Note

In EIGRP, neighbor commands have been used traditionally to configure static neighbors. In the context of this feature, however, the neighbor maximum-prefix command can be used to configure the maximum prefix limit for both statically configured and dynamically discovered neighbors.

When configuring the neighbor maximum-prefix command to protect a single peering session, just the maximum prefix limit, percentage threshold, and warning only configuration options can be configured.
Session dampening, restart, and reset timers are configured on a global basis.

Examples

The following example shows how to configure the maximum prefix limit for a single peer. The maximum limit is set to 1000 prefixes, and the warning threshold is set to 80 percent. When the maximum prefix limit is exceeded, the session with this peer is torn down, all routes learned from this peer are removed from the topology and routing tables, and this peer is placed in a penalty state for 5 minutes (default penalty value).

Router(config)# router eigrp 1
Router(config-eigrp)# vrf vrf1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# neighbor 10.0.0.1 maximum-prefix 1000 80

The following example shows how to configure the maximum prefix limit for all peers. The maximum limit is set to 10,000 prefixes, the warning threshold is set to 90 percent, the restart timer is set to 4 minutes, a decay penalty is configured for the restart timer with the dampened keyword, and all
timers are configured to be reset to 0 every 60 minutes. When the maximum prefix limit is exceeded, all peering sessions are torn down, all routes learned from all peers are removed from the topology and routing tables, and all peers are placed in a penalty state for 4 minutes (user-defined penalty value). A dampening exponential decay penalty is also applied.

Router(config)# router eigrp 1
Router(config-eigrp)# vrf vrf1
Router(config-eigrp-vrf)# address-family ipv4
Router(config-eigrp-vrf-af)# neighbor maximum-prefix 10000 90 dampened reset-time 60 restart4
**next-hop-self disable**

To instruct the Enhanced Interior Gateway Routing Protocol (EIGRP) process to use the received next-hop value when advertising the routes, use the `next-hop-self disable` command in interface configuration mode. To revert to the default, use the `no` form of this command.

```
next-hop-self disable
no next-hop-self disable
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
EIGRP always sets the IP next-hop value to be itself.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
EIGRP, by default, sets the IP next-hop value to be itself for routes that it is advertising, even when advertising those routes on the same interface from which learned them. To change this default, you must use the `next-hop-self disable` interface configuration command to instruct EIGRP to use the received next-hop value when advertising these routes.

The `next-hop-self disable` feature is not available for redistributed routes.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to change the default IP next-hop value and instruct EIGRP to use the received next-hop value:

```
Router(config)# router eigrp 1
Router(config-eigrp) address-family ipv4
Router(config-eigrp-af)# interface GigabitEthernet 0/1/0/0
Router(config-eigrp-af-if)# next-hop-self disable
```
passive-interface (EIGRP)

To disable sending and receiving "hello" messages on an Enhanced Interior Gateway Routing Protocol (EIGRP) interface and to disable formation of neighbors on the interface, use the **passive-interface** command in interface configuration mode. To reenable sending and receiving "hello messages", use the **no** form of this command.

```
passive-interface
no passive-interface
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

**passive-interface** command is disabled on an interface.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **passive-interface** command to disable sending of "hello" massages. The particular subnet on that interface will continue to be advertised by EIGRP to neighbors on other interfaces.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to configure **passive-interface** command on GigabitEthernet interface 0/6/5/0:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv6
RP/0/RP0/CPU0:router(config-eigrp-af)# interface GigabitEthernet 0/6/5/0
RP/0/RP0/CPU0:router(config-eigrp-af-if)# passive-interface
```
**redistribute (EIGRP)**

To inject routes from one routing domain into the Enhanced Interior Gateway Routing Protocol (EIGRP), use the `redistribute` command in the appropriate configuration mode. To remove the `redistribute` command from the configuration file and restore the system to its default condition in which the software does not redistribute routes, use the `no` form of this command.

```
redistribute {{bgp | connected | isis | ospf | rip | static | eigrp} | [{as-numberinstance-name}] | [route-policy name]}
no redistribute
```

**Syntax Description**

- **bgp**
  - Distributes routes from the BGP protocol.

- **connected**
  - Distributes routes that are established automatically by virtue of having enabled IP on an interface.

- **isis**
  - Distributes routes from the IS-IS protocol.

- **ospf**
  - Distributes routes from the OSPF protocol. This protocol is supported in the IPv4 address family.

- **static**
  - Redistributes IP static routes.

- **as-number | instance-name**
  - Represents one of the following three options:
    
    For the **bgp** keyword:
    - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
    - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
    - Range for 4-byte Autonomous system numbers (ASNs) as asdot format is 1.0 to 65535.65535.

    For the **isis** keyword, an IS-IS instance name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

    For the **ospf** keyword, an OSPF instance name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

- **route-policy name** *(Optional)* Specifies the identifier of a configured policy. A policy is used to filter the importation of routes from this source routing protocol to EIGRP.

**Command Default**

Route redistribution is disabled.

**Command Modes**

IPv4 address family configuration

IPv4 VRF address family configuration
Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Redistributed routing information should always be filtered by the `route-policy name` keyword and argument. This filtering ensures that only those routes intended by the administrator are redistributed by EIGRP.

A default metric is usually required to redistribute routes from another protocol into EIGRP. The metric is configured through the `default-metric` command or under the route policy configured with the `redistribute` command. The one exception to this requirement is when EIGRP redistributes BGP routes on a provider edge (PE) router in an MPLS-VPN scenario. If the originating protocol of the route is EIGRP with the same autonomous system (as in MPLS-VPN), the metric would be learned automatically from the extended communities of the BGP route.

Examples

This example shows how to cause BGP routes to be redistributed into an EIGRP autonomous system:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-af)# redistribute bgp 100
```

This example shows how to redistribute the specified IS-IS process routes into an EIGRP autonomous system within a VPN routing and forwarding instance (VRF). The IS-IS routes are redistributed using route policy 3.

```
RP/0/RP0/CPU0:router(config)# router eigrp 109
RP/0/RP0/CPU0:router(config-eigrp)# vrf vpn-1
RP/0/RP0/CPU0:router(config-eigrp-vrf)# address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-vrf-af)# redistribute isis 108 route-policy 3
```
route-policy (EIGRP)

To apply a routing policy to updates advertised to or received from an Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor, use the `route-policy` command in the appropriate configuration mode. To disable applying routing policy to updates, use the `no` form of this command.

```
route-policy route-policy-name {in | out}
no route-policy route-policy-name {in | out}
```

**Syntax Description**

- `route-policy-name` Name of route policy.
- `in` Applies policy to inbound routes.
- `out` Applies policy to outbound routes.

**Command Default**

No policy is applied.

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration
- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `route-policy` command to specify a routing policy for an inbound or outbound route. The policy can be used to filter routes or modify route attributes.

**Task ID**

- `eigrp` read, write

**Examples**

The following example shows how to apply the IN-Ipv4 policy to inbound IP Version 4 (IPv4) routes:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-af)# route-policy IN-IPv4 in
```
router-id (EIGRP)

To configure a router ID for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **router-id** command in the appropriate configuration mode. To cause the software to use the default method of determining the router ID, use the **no** form of this command.

```
router-id  router-id
no  router-id
```

**Syntax Description**

- `router-id` 32-bit router ID value specified in four-part, dotted-decimal notation.

**Command Default**

If this command is not configured, EIGRP chooses an IPv4 address as the router ID from one of its interfaces.

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

It is good practice to use the **router-id** command to explicitly specify a unique 32-bit numeric value for the router ID. This action ensures that EIGRP can function regardless of the interface address configuration.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to assign the IP address of 172.20.1.1 to the EIGRP process 1:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-sf)# router-id 172.20.1.1
```
show eigrp accounting

To display prefix accounting information for Enhanced Interior Gateway Routing Protocol (EIGRP) processes, use the `show eigrp accounting` command in EXEC mode.

Syntax Description

```
show eigrp [as-number] [vrf {vrf-name | all}] [ipv4 | ipv6] accounting
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-number</td>
<td>(Optional) Autonomous system number. This option is available when a VPN routing and forwarding (VRF) instance is not specified. Range is from 1 to 65535.</td>
</tr>
<tr>
<td>vrf {vrf-name</td>
<td>all}</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies the IPv4 address family.</td>
</tr>
</tbody>
</table>

Command Default

This command has no arguments or keywords.

Command Modes

</table>

Examples

The following is sample output from the `show eigrp accounting` command:

```
Router# show eigrp accounting
IP-EIGRP accounting for AS(100)/ID(10.0.2.1) Routing Table: RED
Total Prefix Count: 4 States: A-Adjacency, P-Pending, D-Down

State     Address/Source  Interface   Prefix Restart Restart/
           Count     Count     Reset(s)
P          Redistributed  ----       0       3       211
A          10.0.1.2       Gi0/6/0/0/ 2       0       84
P          10.0.2.4       Gi00/2/0/3 0       2       114
D          10.0.1.3       Gi0/6/0/0/ 0       3       0
```

Note

Connected and summary routes are not listed individually in the output of this command but are counted in the total aggregate count for each process.
This table describes the significant fields shown in the display.

**Table 35: show eigrp accounting Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **show eigrp interfaces** command to determine on which interfaces EIGRP is active and learn information about EIGRP related to those interfaces.

If an interface is specified, only that interface is displayed. Otherwise, all interfaces on which EIGRP is running are displayed.

If an autonomous system is specified, only the routing process for the specified autonomous system is displayed. Otherwise, all EIGRP processes are displayed.
The following is sample output from the `show eigrp interfaces` command:

```
RP/0/RP0/CPU0:router# show eigrp interfaces

IP EIGRP interfaces for process 1

<table>

Usage Guidelines

Use the `show eigrp neighbors` command to determine when neighbors become active and inactive. This command is also useful for debugging certain types of transport problems.

Task ID

Task ID: EIGRP read

Examples

The following is sample output from the `show eigrp neighbors` command:

```
RP/0/RP0/CPU0:router# show eigrp neighbors
IP-EIGRP Neighbors for process 77
```
This table describes the significant fields shown in the display.

### Table 38: show eigrp neighbors Field Descriptions

<table>
<thead>
<tr>

**Examples**

The following is sample output from the `show eigrp topology` command. The EIGRP metrics for specified internal routes and external routes are displayed.

```
RP/0/RP0/CPU0:router# show eigrp topology 10.2.1.0/24

IP-EIGRP (AS 1): Topology entry for 10.2.1.0/24
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 281600
Routing Descriptor Blocks:
0.0.0.0 (GigabitEthernet0/6/0/0), from Connected, Send flag is 0x0
  Composite metric is (281600/0), Route is Internal !This is the internal route.
  Vector metric:
    Minimum bandwidth is 10000 Kbit
    Total delay is 1000 microseconds
    Reliability is 255/255
    Load is 1/255
    Minimum MTU is 1500
    Hop count is 0

RP/0/RP0/CPU0:router# show eigrp topology 10.4.80.0/20

IP-EIGRP (AS 1): Topology entry for 10.4.80.0/20
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 409600
Routing Descriptor Blocks:
10.2.1.1 (GigabitEthernet0/6/0/0), from 10.2.1.1, Send flag is 0x0
  Composite metric is (409600/128256), Route is External
  Vector metric:
    Minimum bandwidth is 10000 Kbit
    Total delay is 6000 microseconds
    Reliability is 255/255
    Load is 1/255
    Minimum MTU is 1500
    Hop count is 1
  External data:
    Originating router is 10.89.245.1
    AS number of route is 0
    External protocol is Connected, external metric is 0
    Administrator tag is 0 (0x00000000)
```

show eigrp traffic

To display the number of Enhanced Interior Gateway Routing Protocol (EIGRP) packets sent and received, use the **show eigrp traffic** command in EXEC mode.

```
show eigrp [as-number] [vrf {vrf-name | all}] [ipv4 | ipv6] traffic
```

**Syntax Description**

- `as-number` *(Optional) Autonomous system number. This option is available when a VPN routing and forwarding (VRF) instance is not specified. Range is from 1 to 65535.*
- `vrf {vrf-name | all}` *(Optional) Specifies a particular VPN routing and forwarding instance (VRF) or all VRF instances.*
- `[ipv4]` *(Optional) Specifies the IPv4 address family.*

**Command Modes**

- EXEC

**Command History**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **show eigrp traffic** command to find the number of packets sent and received.

In addition, this command is useful in determining whether packets from one node are not reaching the neighboring node due to connectivity or configuration problems.

**Examples**

The following is sample output from the **show eigrp traffic** command:

```
RP/0/RP0/CPU0:router# show eigrp traffic

IP-EIGRP Traffic Statistics for AS 1
  Hellos sent/received: 736/797
  Updates sent/received: 6/6
  Queries sent/received: 0/1
  Replies sent/received: 1/0
  Acks sent/received: 6/6
  Input queue high water mark 0, 0 drops
  SIA-Queries sent/received: 0/0
  SIA-Replies sent/received: 0/0
```
This table describes the significant fields shown in the display.

show protocols (EIGRP)

To display information about the Enhanced Interior Gateway Routing Protocol (EIGRP) process configuration, use the `show protocols` command in EXEC mode.

```
show protocols [{ipv4 | afi-all}] [{all protocol}] [{default-context | vrf vrf-name}] [{private}]
```

**Syntax Description**

- `ipv4` (Optional) Specifies an IPv4 address family.
- `afi-all` (Optional) Specifies all address families.
- `all` (Optional) Specifies all protocols for a given address family.
- `protocol` (Optional) Specifies a routing protocol. For the IPv4 address family, the options are `eigrp`, `bgp`, `isis`, `ospf`, and `rip`.
- `default-context` (Optional) Displays default context information. This keyword is available when the `eigrp` or `rip` protocol is specified.
- `vrf vrf-name` (Optional) Displays VPN routing and forwarding (VRF) information for the specified process. This keyword is available when the `eigrp` or `rip` protocol is specified.
- `private` (Optional) Displays private EIGRP data. This keyword is available when the `eigrp` is specified.

**Command Modes**

- EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show protocols` command to get information about the protocols running on the router and to quickly determine which protocols are active. The command is designed to summarize the important characteristics of the running protocol, and command output varies depending on the specific protocol selected.

For EIGRP, the command output lists the instance number, default AS context, router ID, default networks, distance, maximum paths, and so on.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

site-of-origin (EIGRP)

To configure the Site of Origin (SoO) filtering on an Enhanced Interior Gateway Routing Protocol (EIGRP) interface, use the `site-of-origin` command in interface configuration mode. To disable SoO filtering on an interface, use the `no` form of this command.

```
site-of-origin [as-number : number | ip-address : number]
no site-of-origin
```

**Syntax Description**

- `as-number`: Autonomous system number.
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
  - The colon is used to separate the autonomous system number and network number.
- `number`: Network number. Range is from 0 to 4294967295 when a 2-byte AS number is used. Range is from 0 to 65535 when a 4-byte AS number is used.
- `ip-address`: IP address in four-part, dotted-decimal notation.
  - The colon is used to separate the IP address and network number.

**Command Default**

No default behavior or values

**Command Modes**

Interface configuration

**Command History**

- **Release**: Release 6.6.3
  - **Modification**: This command was introduced.

**Usage Guidelines**

An EIGRP process must be capable of retrieving the SoO attribute on routes redistributed from the Border Gateway Protocol (BGP) when required to support complex topologies that include MPLS VPN links between sites with backdoor links.

Use the `site-of-origin` command to set an SoO BGP extended community attribute that is used to identify routes that have originated from a site so that the readvertisement of that prefix back to the source site can be prevented. The SoO extended community uniquely identifies the site from which a provider edge (PE) router has learned a route.

**Task ID**

- **Task ID**: eigrp
  - **Operations**: read, write

**Examples**

The following example shows how to configure SoO filtering on an EIGRP interface:
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) vrf customer1
RP/0/RP0/CPU0:router(config-eigrp-vrf) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-vrf-af)# interface GigabitEthernet 0/1/0/0
RP/0/RP0/CPU0:router(config-eigrp-vrf-af-if)# site-of-origin 10.0.0.1:20
split-horizon disable (EIGRP)

To disable split horizon for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the `split-horizon disable` command in interface configuration mode. To enable split horizon, use the `no` form of this command.

`split-horizon disable`  
`no split-horizon disable`

**Syntax Description**  
This command has no keywords or arguments.

**Command Default**  
Split horizon is enabled for an EIGRP process.

**Command Modes**  
Interface configuration

**Command History**  

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**  
The following example shows how to disable split horizon on a GigabitEthernet link:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-af)# interface GigabitEthernet 0/1/0/0
RP/0/RP0/CPU0:router(config-eigrp-af-if)# split-horizon disable
```
stub (EIGRP)

To configure a router as a stub for Enhanced Interior Gateway Routing Protocol (EIGRP), use the `stub` command in the appropriate configuration mode. To disable this function, use the `no` form of this command.

```
stub [{receive-only | [connected] [redistributed] [static] [summary]}]
no stub [{receive-only | [connected] [redistributed] [static] [summary]}]
```

**Syntax Description**
- `receive-only` (Optional) Sets the router as a receive-only neighbor.
- `connected` (Optional) Advertises connected routes.
- `redistributed` (Optional) Advertises redistributed routes from other protocols and autonomous systems.
- `static` (Optional) Advertises static routes.
- `summary` (Optional) Advertises summary routes.

**Command Default**
Stub routing is disabled.
When stub routing is specified, connected and summary routes are advertised by default.

**Command Modes**
- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**
- **Modification**
  - Release 6.6.3
  - This command was introduced.

**Usage Guidelines**
Use the `stub` command to configure a router as a stub in which the router directs all IP traffic to a distribution router.

The `stub` command can be modified with several options, and these options can be used in any combination except for the `receive-only` keyword.

The `receive-only` keyword restricts the router from sharing any of its routes with any other router in that EIGRP autonomous system and does not permit any other option to be specified because it prevents any type of route from being sent. The four other optional keywords (`connected`, `static`, `summary`, and `redistributed`) can be used in any combination but cannot be used with the `receive-only` keyword. If any of these four keywords is used with the `stub` command, only the route types specified by the particular keyword or keywords are sent. Route types specified by the nonused keyword or keywords are not sent.

The `connected` keyword permits EIGRP stub routing to send connected routes. If all the connected routes are not covered by EIGRP interfaces, it may be necessary to redistribute connected routes with the `redistribute connected` command under the EIGRP process. This option is enabled by default.

The `static` keyword permits EIGRP stub routing to send static routes. Without the configuration of this option, EIGRP does not send any static routes. You may still need to redistribute static routes with the `redistribute static` command.
The **summary** keyword permits EIGRP stub routing to send summary routes. Summary routes can be created manually with the **summary address** command or automatically at a major network border router with the **auto-summary** command enabled. This option is enabled by default.

The **redistributed** keyword permits EIGRP stub routing to send other routing protocols and autonomous systems. Without the configuration of this option, EIGRP does not advertise redistributed routes.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure, as a stub, the router that advertises connected and summary routes:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-af)# stub
```

The following example shows how to configure the router as a receive-only neighbor (connected, summary, and static routes are not sent):

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-af)# stub receive-only
```
summary-address (EIGRP)

To configure a summary aggregate address for the specified Enhanced Interior Gateway Routing Protocol (EIGRP) interface, use the `summary-address` command in interface configuration mode. To disable a configuration, use the `no` form of this command.

```
summary-address ip-address {/lengthmask} [admin-distance]
no summary-address ip-address {/lengthmask}
```

**Syntax Description**

- `ip-address`: The IP address argument specifies the summary IP address to apply to an interface in four-part, dotted-decimal notation.
- `/ length`: Prefix length, which can be indicated as a slash (/) and number. For example, /8 indicates that the first eight bits in the IP prefix are network bits. If `length` is used, the slash is required.
- `mask`: IP address mask.
- `admin-distance`: (Optional) Administrative distance. A value from 1 to 255.

**Command Default**

An administrative distance of 5 is applied to EIGRP summary routes. No summary addresses are predefined.

**Command Modes**

Interface configuration

**Command History**

Release 6.6.3

This command was introduced.

**Usage Guidelines**

The `summary-address` command is used to configure interface-level address summarization. EIGRP summary routes are given an administrative distance of 5. The administrative distance is used to advertise a summary without installing it in the routing table.

By default, EIGRP summarizes subnet routes to the network level. The `no auto-summary` command can be entered to configure subnet level summarization.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure an administrative distance of 95 on an EIGRP interface for the 192.168.0.0/16 summary address:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-af)# interface GigabitEthernet 0/1/0/0
```
RP/0/RP0/CPU0:router(config-eigrp-af-if)# summary-address 192.168.0.0/16 95
timers active-time

To adjust the Enhanced Interior Gateway Routing Protocol (EIGRP) routing wait time, use the `timers active-time` command in the appropriate configuration mode. To disable this function, use the `timers active-time no` form of the command.

```
timers active-time [\{time-limit | disabled\}]
no timers active-time
```

### Syntax Description

- `time-limit`  Active time limit (in minutes). Range is from 1 to 4294967295 minutes.
- `disabled`  Disables the timers and permits the routing wait time to remain active indefinitely.

### Command Default

Disabled

### Command Modes

IPv4 address family configuration
IPv4 VRF address family configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `timers active-time` command to control the time the router waits (after query is sent) before declaring the route to be in the stuck in active (SIA) state.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>eigrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure an indefinite routing wait time on the specified EIGRP route:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-sf)# timers active-time disabled
```
**variance**

To control load balancing in an Enhanced Interior Gateway Routing Protocol (EIGRP)-based internetwork, use the `variance` command in the appropriate configuration mode. To reset the variance to the default value, use the `no` form of this command.

```
variance multiplier
no variance
```

**Syntax Description**

- `multiplier` Metric value used for load balancing. Range is from 1 to 128.

**Command Default**

- `multiplier`: 1 (equal-cost load balancing)

**Command Modes**

- IPv4 address family configuration
- IPv4 VRF address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `variance` command to set a variance on the EIGRP router so that the router can determine the feasibility of a potential route. A route is feasible if the next router in the path is closer to the destination than the current router and the metric for the entire path is within the variance. Only paths that are feasible can be used for load balancing and included in the routing table.

If the following two conditions are met, the route is considered feasible and can be added to the routing table:

1. The local best metric must be greater than the metric learned from the next router.
2. The multiplier times the local best metric for the destination must be greater than or equal to the metric through the next router.

**Examples**

The following example shows how to set a variance of 4:

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp) address-family ipv4
RP/0/RP0/CPU0:router(config-eigrp-af)# variance 4
```
vrf (EIGRP)

To define a VPN routing and forwarding (VRF) instance and enter VRF configuration mode, use the `vrf` command in router configuration mode. To remove a VRF instance, use the `no` form of this command.

```
vrf  vrf-name
no  vrf  vrf-name
```

**Syntax Description**
- `vrf-name`: VPN routing and forwarding instance.

**Command Default**
No VRFs are defined.

**Command Modes**
Router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.6.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `vrf` command to configure a VRF instance. A VRF instance is a collection of VPN routing and forwarding tables maintained at the provider edge (PE) router.

From VRF configuration mode, you must enter address family configuration mode and then issue commands, such as the `auto-summary` command.

A single EIGRP routing process can support multiple VRFs. The number of VRFs that can be configured is limited by available system resources on the router, which is determined by the number of VRFs, running processes, and available memory. However, only a single VRF can be supported by each VPN. Redistribution between different VRFs is not supported.

MPLS VPN support between PE and customer edge (CE) routers is configured only on PE routers that provide VPN services over the service provider backbone. The customer site does not require any changes to equipment or configurations to support the EIGRP VPN. Typically, a metric must be configured for routes to be advertised to the CE router. The metric can be configured under the route-policy for the `redistribute` protocol command or configured with the `default-metric` command.

You must remove IPv4/IPv6 addresses from an interface prior to assigning, removing, or changing a VRF on an IP interface. If this is not done in advance, any attempt to change the VRF on an IP interface is rejected.

**Examples**

The following example shows how to enter IPv4 VRF address family configuration mode and identify EIGRP commands that can be issued from that mode.

```
RP/0/RP0/CPU0:router(config)# router eigrp 1
RP/0/RP0/CPU0:router(config-eigrp)# vrf vpn-1
```
RP/0/RP0/CPU0:router(config-eigrp-vrf)# **address-family ipv4**

RP/0/RP0/CPU0:router(config-eigrp-vrf-af)# **?**

OSPF Commands

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.
- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

This module describes the commands used to configure and monitor the Open Shortest Path First (OSPF) routing protocol.

For detailed information about OSPF concepts, configuration tasks, and examples, see the Implementing OSPF on Cisco NCS 5500 Series Routers module in the Routing Configuration Guide for Cisco NCS 5500 Series Routers.

address-family (OSPF)

To enter address family configuration mode for Open Shortest Path First (OSPF), use the `address-family` command in the appropriate mode. To disable address family configuration mode, use the `no` form of this command.

```
address-family ipv4 [unicast]
no address-family ipv4 [unicast]
```

**Syntax Description**
- `ipv4` Specifies IP Version 4 (IPv4) address prefixes.
- `unicast` (Optional) Specifies unicast address prefixes.

**Command Default**
An address family is not specified.

**Command Modes**
- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
OSPF version 2 automatically provides routing services for IPv4 unicast topologies, so this command is redundant.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure the OSPF router process with IPv4 unicast address prefixes:

```
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# address-family ipv4 unicast
```
adjacency stagger

To configure staggering of OSPF adjacency during reload, process restart, and process clear, use the adjacency stagger command in XR Config mode. To turn off adjacency staggering, either use the disable keyword or use the no form of this command.

```
adjacency stagger {disable | initial-num-nbr max-num-nbr}
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables adjacency staggering.</td>
</tr>
<tr>
<td>initial-num-nbr</td>
<td>The initial number of simultaneous neighbors allowed to form adjacency to FULL in any area to bring up to FULL after a router reload, OSPF process restart, or OSPF process clear. Range is 1-65535. Default is 2.</td>
</tr>
<tr>
<td>max-num-nbr</td>
<td>The subsequent number of simultaneous neighbors allowed to form adjacency, per OSPF instance, after the initial set of OSPF neighbors have become FULL. Range is 1-65535. Default is 64.</td>
</tr>
</tbody>
</table>

Command Default

OSPF adjacency staggering is enabled.

Command Modes

XR Config mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Staggering of the OSPF adjacency during reload, process restart (without NSR or graceful-restart), and process clear reduces the overall adjacency convergence time.

Initially, allow 2 (configurable) neighbors to form adjacency to FULL per area. After the first adjacency reaches FULL, up to 64 (configurable) neighbors can form adjacency simultaneously for the OSPF instance (all areas). However, areas without any FULL adjacency is restricted by the initial area limit.

Note

Adjacency stagger and OSPF nonstop forwarding (NSF) are mutually exclusive. Adjacency stagger will not be activated if `nsf` is configured under router ospf configuration.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure adjacency stagger for a 2 neighbors initially and for a maximum of 3 neighbors:
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# adjacency stagger 2 3
area (OSPF)

To configure an Open Shortest Path First (OSPF) area, use the area command in the appropriate mode. To terminate an OSPF area, use the no form of this command.

area area-id
no area area-id

Syntax Description

area-id  Identifier of an OSPF area. The area-id argument can be specified as either a decimal value or an IP address (dotted decimal) format. Range is 0 to 4294967295.

Command Default

No OSPF area is defined.

Command Modes

Router configuration
VRF configuration

Command History

Release 6.0  This command was introduced.

Usage Guidelines

Use the area command to explicitly configure an area. Commands configured under the area configuration mode (such as the interface [OSPF] and authentication commands), are automatically bound to that area.

To modify or remove the area, the area-id argument format must be the same as the format used when creating the area. Otherwise, even if the actual 32-bit value matches, the area is not matched. For example, if you create an area with an area-id of 10 it would not match an area-id of 0.0.0.10.

To remove the specified area from the router configuration, use the no area area-id command. The no area area-id command removes the area and all area options, such as authentication, default-cost, nssa, range, stub, virtual-link, and interface.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure area 0 and HundredGigE interface 0/2/0/0. HundredGigE interface 0/2/0/0 is bound to area 0 automatically.

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/2/0/0
area (OSPF)
authentication (OSPF)

To enable plain text, Message Digest 5 (MD5) authentication, or null authentication for an Open Shortest Path First (OSPF) interface, use the `authentication` command in the appropriate mode. To remove such authentication, use the `no` form of this command.

```
authentication [{message-digest [keychain keychain] | null}]
no authentication
```

**Syntax Description**
- `message-digest` (Optional) Specifies that MD5 is used.
- `keychain keychain` (Optional) Specifies a keychain name.
- `null` (Optional) Specifies that no authentication is used. Useful for overriding password or MD5 authentication if configured for an area.

**Command Default**
If this command is not specified in interface configuration mode, then the interface adopts the authentication parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the authentication parameter specified for the process.

If this command is not specified at any level, then the interface does not use authentication.

If no keyword is specified, plain text authentication is used.

**Command Modes**
- Interface configuration
- Area configuration
- Router configuration
- Virtual-link configuration
- VRF configuration
- Multi-area interface configuration
- Sham-link configuration

**Command History**
```
Release 6.0 This command was introduced.
```

**Usage Guidelines**
Use the `authentication` command to specify an authentication type for the interface, which overrides the authentication specified for the area to which this interface belongs. If this command is not included in the configuration file, the authentication configured in the area to which the interface belongs is assumed (as specified by the area `authentication` command).

The authentication type and password must be the same for all OSPF interfaces that are to communicate with each other through OSPF. If you specified plain text authentication, use the `authentication-key` command to specify the plain text password.
If you enable MD5 authentication with the **message-digest** keyword, you must configure a key with the **message-digest-key** interface command.

To manage the rollover of keys and enhance MD5 authentication for OSPF, you can configure a container of keys called a keychain with each key comprising the following attributes: generate/accept time, key identification, and authentication algorithm. The keychain management feature is always enabled.

---

**Note**

Changes to the system clock will impact the validity of the keys in the existing configuration.

---

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>write</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to set authentication for areas 0 and 1 of OSPF routing process 201. Authentication keys are also provided:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# router-id 10.1.1.1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf)# authentication
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# authentication-key mykey
RP/0/RP0/CPU0:router(config-ospf-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospf)# area 1
RP/0/RP0/CPU0:router(config-ospf)# area 1
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/0
RP/0/RP0/CPU0:router(config-ospf-ar-if)# authentication-key mykey1
```

The following example shows how to configure use of an authentication keychain:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# router-id 10.1.1.1
RP/0/RP0/CPU0:router(config-ospf)# authentication message-digest keychain mykeychain
```
authentication-key (OSPF)

To assign a password to be used by neighboring routers that are using the Open Shortest Path First (OSPF) simple password authentication, use the authentication-key command in the appropriate mode. To remove a previously assigned OSPF password, use the no form of this command.

`authentication-key [clear | encrypted] password`

**Syntax Description**

<table>
<thead>
<tr>
<th>clear</th>
<th>(Optional) Specifies that the key be clear text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>encrypted</td>
<td>(Optional) Specifies that the key be encrypted using a two-way algorithm.</td>
</tr>
<tr>
<td>password</td>
<td>Any contiguous string up to 8 characters in length that can be entered from the keyboard. For example, <code>mypswd2</code>.</td>
</tr>
</tbody>
</table>

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the OSPF password parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the OSPF password parameter specified for the process.

If this command is not specified at any level, then no password is specified.

Clear is the default if the clear or encrypted keyword is not specified.

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- Virtual-link configuration
- VRF configuration
- Multi-area configuration
- Sham-link configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The password created by this command is inserted directly into the OSPF header when the Cisco IOS XR software originates routing protocol packets. A separate password can be assigned to each network on an individual interface basis. All neighboring routers on the same network must have the same password to be able to exchange OSPF information.

The authentication-key command must be used with the authentication command. If the authentication command is not configured, the password provided by the authentication-key command is ignored and no authentication is adopted by the OSPF interface.
The `authentication-key` command cannot be used with the `authentication` command when the `message-digest` or `null` keyword is configured.

### Examples

The following example shows how to configure an authentication password as the string `yourpass`:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# authentication-key yourpass
```
auto-cost (OSPF)

To control how the Open Shortest Path First (OSPF) protocol calculates default metrics for the interface, use the **auto-cost** command in the appropriate mode. To revert to the default reference bandwidth, use the **no** form of this command.

```
auto-cost {reference-bandwidth mbps | disable}
no auto-cost {reference-bandwidth | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference-bandwidth mbps</td>
<td>Specifies a rate in Mbps (bandwidth). Range is 1 to 4294967.</td>
</tr>
<tr>
<td>disable</td>
<td>Assigns a cost based on interface type.</td>
</tr>
</tbody>
</table>

**Command Default**

```
mbps : 100 Mbps
```

**Command Modes**

Router configuration

VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. The OSPF metric is calculated as the **mbps** value divided by bandwidth, with **mbps** equal to 108 by default.

If you have multiple links with high bandwidth (such as OC-192), you might want to use a larger number to differentiate the cost on those links. That is, the metric calculated using the default **mbps** value is the same for all high-bandwidth links.

Recommended usage of cost configuration for OSPF interfaces with high bandwidth is to be consistent: Either explicitly configure (by using the **cost** command) or choose the default (by using the **auto-cost** command).

The value set by the **cost** command overrides the cost resulting from the **auto-cost** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the reference value for the auto cost calculation to 1000 Mbps:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# auto-cost reference-bandwidth 1000
```
**capability opaque disable**

To prevent Multiprotocol Label Switching traffic engineering (MPLS TE) topology information flooded to the network through opaque LSAs, use the `capability opaque disable` command in the appropriate mode. To restore MPLS TE topology information flooded through opaque LSAs to the network, use the `no` form of the command.

```
capability opaque disable
no capability opaque disable
```

**Command Default**
Opaque LSAs are allowed.

**Command Modes**
- XR Config mode
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `capability opaque disable` command prevents flooded MPLS TE information (Types 1 and 4) through opaque LSAs of all scope (Types 9, 10, and 11).

Control opaque LSA support capability must be enabled for OSPF to support MPLS TE.

The MPLS TE topology information is flooded to the area through opaque LSAs by default.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to prevent OSPF from supporting opaque services:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# capability opaque disable
```
clear ospf process

To reset an Open Shortest Path First (OSPF) router process without stopping and restarting it, use the `clear ospf process` command in XR EXEC mode.

```
clear ospf [process-name [vrf {vrf-name | all}]] process
```

**Syntax Description**
- `process-name` (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only the specified routing process is affected. Otherwise, all OSPF processes are reset.
- `vrf` (Optional) An OSPF VPN routing and forwarding (VRF) instance.
- `vrf-name` (Optional) Name of the OSPF VRF instance to be reset.
- `all` (Optional) Resets all OSPF VRF instances.

**Command Default**
No default behavior or value

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When the OSPF router process is reset, OSPF releases all resources allocated, cleans up the internal database, and shuts down and restarts all interfaces that belong to the process.

**Note**
The `clear ospf process` command may change the router ID unless the OSPF router ID is explicitly configured through the `router-id (OSPF)`, on page 364 command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to reset all OSPF processes:

```
RP/0/RP0/CPU0:router# clear ospf process
```

The following example shows how to reset the OSPF 1 process:
RP/0/RP0/CPU0:router# clear ospf 1 process
clear ospf redistribution

To clear all routes redistributed from other protocols out of the Open Shortest Path First (OSPF) routing table, use the **clear ospf redistribution** command in XR EXEC mode.

```
clear ospf [process-name [vrf {vrf-name | all}]] redistribution
```

**Syntax Description**

- **process-name**  (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only the specified routing process is affected. Otherwise, all OSPF routes are cleared.

- **vrf**  (Optional) OSPF VPN routing and forwarding (VRF) instance.

- **vrf-name**  (Optional) Name of the OSPF VRF instance to be reset.

- **all**  (Optional) Resets all OSPF VRF instances.

**Command Default**

No default behavior or value

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **clear ospf redistribution** command to cause the routing table to be read again. OSPF regenerates and sends Type 5 and Type 7 link-state advertisements (LSAs) to its neighbors. If an unexpected route has appeared in the OSPF redistribution, using this command corrects the issue.

**Note**

Use of this command can cause a significant number of LSAs to flood the network. We recommend that you use this command with caution.

**Task ID**

**Task**

<table>
<thead>
<tr>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear all redistributed routes across all processes from other protocols:

```
RP/0/RP0/CPU0:router# clear ospf redistribution
```
clear ospf routes

To clear all Open Shortest Path First (OSPF) routes from the OSPF routing table, use the `clear ospf routes` command in XR EXEC mode.

`clear ospf [process-name [vrf {vrf-name | all}]] routes`

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only the specified routing process is affected. Otherwise, all OSPF routes are cleared.

- **vrf** (Optional) OSPF VPN routing and forwarding (VRF) instance.

- **vrf-name** (Optional) Name of the OSPF VRF instance to be reset.

- **all** (Optional) Resets all OSPF VRF instances.

**Command Default**

No default behavior or value

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

- **Task ID**: ospf
  - **Operations**: read, write

**Examples**

The following example shows how to clear all OSPF routes from the OSPF routing table and recompute valid routes. When the OSPF routing table is cleared, OSPF routes in the global routing table are also recalculated.

`RP/0/RP0/CPU0:router# clear ospf routes`
clear ospf statistics

To clear the Open Shortest Path First (OSPF) statistics of neighbor state transitions, use the **clear ospf statistics** command in XR EXEC mode.

```
clear ospf [process-name [vrf {vrf-name | all}]] statistics [neighbor [type interface-path-id] [ip-address]]
```

**Syntax Description**

- **process-name**  (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only the specified routing process is affected. Otherwise, all OSPF statistics of neighbor state transitions are cleared.
- **vrf**  (Optional) OSPF VPN routing and forwarding (VRF) instance.
- **vrf-name**  (Optional) Name of the OSPF VRF instance to be reset.
- **all**  (Optional) Resets all OSPF VRF instances.
- **neighbor**  (Optional) Clears the state transition counters of the specified neighbor only.
- **type**  (Optional) Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id**  (Optional) Physical interface or virtual interface.
  
  Use the `show interfaces` command to see a list of all interfaces currently configured on the router.
  
  For more information about the syntax for the router, use the question mark (?) online help function.
- **ip-address**  (Optional) IP address of a specified neighbor for whom you want to clear the state transition counter.

**Command Default**

No default behavior or value

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **clear ospf statistics** command to reset OSPF counters. Reset is useful to detect changes in counter values.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to reset the OSPF transition state counters for all neighbors on Packet-over-SONET/SDH (POS) interface 0/2/0/0:

```
RP/0/RP0/CPU0:router# clear ospf statistics neighbor POS 0/2/0/0
```
cost (OSPF)

To explicitly specify the interface (network) for Open Shortest Path First (OSPF) path calculation, use the `cost` command in the appropriate mode. To remove the cost, use the `no` form of this command.

```
cost  cost
no  cost
```

**Syntax Description**

- `cost`   Unsigned integer value expressed as the link-state metric. Range is 1 to 65535.

**Command Default**

- If this command is not specified in interface configuration mode, then the interface adopts the cost parameter specified by the area.
- If this command is not specified in area configuration mode, then the interface adopts the cost parameter specified for the process.
- If this command is not specified at any level, then the cost is calculated by the `auto-cost` command.

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- VRF configuration
- Multi-area configuration
- Sham-link configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The link-state metric is advertised as the link cost in the router link advertisement. Cisco IOS XR software does not support type of service (ToS), so you can assign only one cost for each interface.

In general, the path cost is calculated using the following formula:

\[
108 / \text{bandwidth} \quad \text{(the default auto cost is set to 100 Mbps)}
\]

This calculation is the default reference bandwidth used by the auto-costing calculation which establishes the interface auto-cost. The `auto-cost` command can set this reference bandwidth to some other value. The `cost` command is used to override the auto-costing calculated default value for interfaces.

Using this formula, the default path cost is 1 for any interface that has a link bandwidth of 100 Mbps or higher. If this value does not suit the network, configure the reference bandwidth for auto calculating costs based on the link bandwidth.

The value set by the `cost` command overrides the cost resulting from the `auto-cost (OSPF)` command.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to set the cost value to 65 for HundredGigE interface 0/1/0/1:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# cost 65
```
cost-fallback (OSPF)

To apply higher cost than the normal interface cost when the cumulative bandwidth of a bundle interface goes below the threshold specified and to revert to the original cost if the cumulative bandwidth goes above the configured threshold, use the `cost-fallback` command. To remove the cost-fallback, use the `no` form of this command.

```
cost-fallback cost threshold bandwidth
no cost-fallback
```

**Syntax Description**

- `cost` threshold
  - Unsigned integer value expressed as the link-state metric. Range is 1 to 65535, but typically, cost-fallback value is supposed to be set to a value higher than the normal cost.

- `bandwidth`
  - Unsigned integer value expressed in Mbits per second. Range is 1 to 4294967.

**Command Default**

If this command is not specified in interface configuration mode, the currently effective interface cost takes effect even when the cumulative bandwidth goes down below the maximum bandwidth. Unlike the interface cost command, this cost-fallback command is available only under interface configuration mode; it is not available in area or process level. Unlike other interface specific parameters, no inheritance will take place from area or process level if this command is not specified at interface level.

**Command Modes**

Interface configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

The fallback cost must be set to a higher value than the normal interface cost. The motivation of setting the fallback cost is to cost out an interface or disfavor an interface without shutting it down when its cumulative bandwidth goes below the user specified threshold, so that the traffic can take an alternative path. The normal interface cost will take over when the cumulative bandwidth reaches or exceeds user-specified threshold.

**Task ID**

```
ospf  read, write
```

**Examples**

The following example shows how to set the cost-fallback value:

The following example shows how to set the cost-fallback value for Bundle-Ether:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 100
RP/0/RP0/CPU0:router(config-ospf)# router-id 2.2.2.2
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface bundle-Ether
RP/0/RP0/CPU0:router(config-ospf-ar-if)# cost-fallback 1000 threshold 300
```
cost-fallback (OSPF)
database-filter all out (OSPF)

To filter outgoing link-state advertisements (LSAs) to an Open Shortest Path First (OSPF) interface, use the `database-filter all out` command in the appropriate mode. To restore the forwarding of LSAs to the interface, use the `disable` form of the command.

```
database-filter all out [{disable | enable}]
```

**Syntax Description**
- **disable** (Optional) Disables filtering.
- **enable** (Optional) Enables filtering.

**Command Default**
The database filter is disabled.

**Command Modes**
- Interface configuration
- Area configuration
- Router configuration
- VRF configuration
- Multi-area configuration

**Command History**

```
Release       Modification
-------------  -----------------   
Release 6.0    This command was introduced.
```

**Usage Guidelines**
No specific guidelines impact the use of this command.

Use the `database-file all out` command to perform the same function that the `neighbor database-filter all out` command performs on a neighbor basis.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to prevent flooding of OSPF LSAs to broadcast, nonbroadcast, and point-to-point networks reachable through HundredGigE interface 0/1/0/1:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# database-filter all out
```
dead-interval (OSPF)

To set the interval after which a neighbor is declared dead when no hello packets are observed, use the `dead-interval` command in the appropriate mode. To return to the default time, use the `no` form of this command.

```
dead-interval seconds
no dead-interval
```

**Syntax Description**

- **seconds**: Integer that specifies the interval (in seconds). Range is 1 to 65535. The value must be the same for all nodes on the network.

**Command Default**

- If this command is not specified in interface configuration mode, then the interface adopts the dead interval parameter specified by the area.
- If this command is not specified in area configuration mode, then the interface adopts the dead interval parameter specified for the process.
- If this command is not specified at any level, then the dead interval is four times the interval set by the `hello-interval` (OSPF) command.

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- Virtual-link configuration
- VRF configuration
- Multi-area configuration
- Sham-link configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The dead interval value must be the same for all routers and access servers on a specific network.

If the hello interval is configured, the dead interval value must be larger than the hello interval value. The dead interval value is usually configured four times larger than the hello interval value.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the OSPF dead interval to 40 seconds:
dead-interval (OSPF)

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# dead-interval 40
```
default-cost (OSPF)

To specify a cost for the default summary route sent into a stub area or not-so-stubby area (NSSA), use the `default-cost` command in area configuration mode. To remove the assigned default route cost, use the `no` form of this command.

```
default-cost cost
default-cost cost
```

**Syntax Description**
- `cost`: Cost for the default summary route used for a stub or NSSA area. The acceptable value is a 24-bit number.

**Command Default**
- `cost`: 1

**Command Modes**
- Area configuration

**Command History**
- **Release** 6.0  This command was introduced.

**Usage Guidelines**
Use the `default-cost` command only on an Area Border Router (ABR) attached to a stub or an NSSA area. In all routers and access servers attached to the stub area, the area should be configured as a stub area using the `stub` command in the area submode. Use the `default-cost` command only on an ABR attached to the stub area. The `default-cost` command provides the metric for the summary default route generated by the ABR into the stub area.

**Task ID**
- `Task ID` Operations
  - `ospf` read, write

**Examples**
The following example shows how to assign a default cost of 20 to a stub area. The HundredGigE interface 0/4/0/3 is also configured in the stub area):

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# area 10.15.0.0
RP/0/RP0/CPU0:router(config-ospf-ar)# stub
RP/0/RP0/CPU0:router(config-ospf-ar)# default-cost 20
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/4/0/3
```
**default-information originate (OSPF)**

To generate a default external route into an Open Shortest Path First (OSPF) routing domain, use the `default-information originate` command in the appropriate mode. To disable this feature, use the `no` form of this command.

`default-information originate [always] [metric metric-value] [metric-type type-value] [route-policy policy-name] [tag tag-value]`

**no default-information originate**

### Syntax Description

- **always**
  (Optional) Always advertises the default route regardless of whether the routing table has a default route.

- **metric metric-value**
  (Optional) Specifies the metric used for generating the default route. The default metric value is 1. Range is 1 to 16777214.

- **metric-type type-value**
  (Optional) Specifies the external link type associated with the default route advertised into the OSPF routing domain. It can be one of the following values:
  - 1—Type 1 external route
  - 2—Type 2 external route

- **tag tag-value**
  (Optional) 32-bit dotted-decimal value attached to each external route. This is not used by the OSPF protocol itself. It may be used to communicate information between autonomous system boundary routers (ASBRs). If a tag is not specified, then the configured OSPF process number is used.

- **route-policy policy-name**
  (Optional) Specifies that a routing policy be used and the routing policy name.

### Command Default

When you do not use this command in router configuration mode, no default external route is generated into an OSPF routing domain.

- **metric-value**: 1
- **type-value**: 2
- **tag-value**: configured OSPF process number

### Command Modes

- Router configuration
- VRF configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Whenever you use the `redistribute` or `default-information originate` command to redistribute routes into an OSPF routing domain, the software automatically becomes an Autonomous System Boundary Router (ASBR). However, an ASBR does not, by default, generate a default route into the OSPF routing domain. The software still must have a default route for itself before it generates one, except when you have specified the `always` keyword.
The **default-information originate** route-policy attach point conditionally injects the default route 0.0.0.0/0 into the OSPF link-state database, and is done by evaluating the attached policy. If any routes specified in the policy exist in the global RIB, then the default route is inserted into the link-state database. If there is no match condition specified in the policy, the policy passes and the default route is generated into the link-state database.

For information about the default-information originate attach point, see the *OSPF Policy Attach Points* section in the *Implementing Routing Policy* chapter in *Routing Configuration Guide for Cisco NCS 5500 Series Routers*.

For information about routing policies, see the *Routing Policy Commands* chapter in the *Routing Command Reference for Cisco NCS 5500 Series Routers and Cisco NCS 540 and NCS 560 Series Routers*.

### Examples

The following example shows how to specify a metric of 100 for the default route redistributed into the OSPF routing domain and an external metric type of Type 1:

```bash
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospf 109
RP/0/RP0/CPU0:router(config-ospf)#redistribute igrp 108 metric 100
RP/0/RP0/CPU0:router(config-ospf)#default-information originate metric 100 metric-type 1
```
default-metric (OSPF)

To set default metric values for routes redistributed from another protocol into the Open Shortest Path First (OSPF) protocol, use the **default-metric** command in the appropriate mode. To return to the default state, use the **no** form of this command.

```
default-metric  value
no default-metric  value
```

**Syntax Description**
- **value**  Default metric value appropriate for the specified routing protocol. Range is 1 to 16777214.

**Command Default**
- Built-in, automatic metric translations, as appropriate for each routing protocol.

**Command Modes**
- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **default-metric** command with the **redistribute** command to cause the current routing protocol to use the same metric value for all redistributed routes. A default metric helps solve the problem of redistributing routes with incompatible metrics. Whenever metrics do not convert, use a default metric to provide a reasonable substitute and enable the redistribution to proceed.

The default-metric value configured in OSPF configuration does not apply to connected routes that are redistributed to OSPF using the **redistribute connected** command. To set a non-default metric for connected routes, configure OSPF with the **redistribute connected metric metric-value** command.

**Examples**

The following example shows how to advertise Intermediate System-to-Intermediate System (IS-IS) protocol-derived routes into OSPF and assign a metric of 10:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# default-metric 10
RP/0/RP0/CPU0:router(config-ospf)# redistribute isis IS-IS_isp
```
demand-circuit (OSPF)

To configure the Open Shortest Path First (OSPF) protocol to treat the interface as an OSPF demand circuit, use the `demand-circuit` command in the appropriate mode. To remove the demand circuit designation from the interface, use the `no` form of this command.

```
demand-circuit [{disable | enable}]
no demand-circuit
```

**Syntax Description**

- `disable` (Optional) Disables the interface as an OSPF demand circuit.
- `enable` (Optional) Enables the interface as an OSPF demand circuit.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the demand circuit parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the demand circuit parameter specified for the process.

If this command is not specified at any level, then the circuit is not a demand circuit.

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On point-to-point interfaces, only one end of the demand circuit must be configured with this command. Periodic hello messages are suppressed and periodic refreshes of link-state advertisements (LSAs) do not flood the demand circuit. Use the `demand-circuit` command to allow the underlying data link layer to be closed when the topology is stable. In point-to-multipoint topology, only the multipoint end must be configured with this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the configuration for an OSPF demand circuit:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
```
disable-dn-bit-check

To specify that down bits should be ignored, use the `disable-dn-bit-check` command in VPN routing and forwarding (VRF) configuration mode. To specify that down bits should be considered, use the `no` form of this command.

```
disable-dn-bit-check
no disable-dn-bit-check
```

**Command Default**
Down bits are considered.

**Command Modes**
VRF configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to specify that down bits be ignored:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# vrf v1
RP/0/RP0/CPU0:router(config-ospf-vrf)# disable-dn-bit-check
```
distance (OSPF)

To define an administrative distance, use the `distance` command in an appropriate configuration mode. To remove the `distance` command from the configuration file and restore the system to its default condition in which the software removes a distance definition, use the `no` form of this command.

```
distance weight [ip-address wildcard-mask [access-list-name]]
no distance weight ip-address wildcard-mask [access-list-name]
```

**Syntax Description**

- **weight**: Administrative distance. Range is 10 to 255. Used alone, the `weight` argument specifies a default administrative distance that the software uses when no other specification exists for a routing information source. Routes with a distance of 255 are not installed in the routing table. Lists the default administrative distances. Table 43: Default Administrative Distances, on page 291.

- **ip-address**: (Optional) IP address in four-part, dotted-decimal notation.

- **wildcard-mask**: (Optional) Wildcard mask in four-part, dotted decimal format. A bit set to 1 in the `mask` argument instructs the software to ignore the corresponding bit in the address value.

- **access-list-name**: (Optional) Name of an IP access list to be applied to incoming routing updates.

**Command Default**

If this command is not specified, then the administrative distance is the default, as specified in Table 43: Default Administrative Distances, on page 291.

**Command Modes**

- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

An administrative distance is an integer from 10 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. Weight values are subjective; no quantitative method exists for choosing weight values.

If an access list is used with this command, it is applied when a network is being inserted into the routing table. This behavior allows you to filter networks based on the IP prefix supplying the routing information. For example, you could filter possibly incorrect routing information from networking devices not under your administrative control.

The order in which you enter `distance` commands can affect the assigned administrative distances in unexpected ways (see the “Examples” section for further clarification).
This table lists default administrative distances.

**Table 43: Default Administrative Distances**

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Default Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected interface</td>
<td>0</td>
</tr>
<tr>
<td>Static route out on interface</td>
<td>0</td>
</tr>
<tr>
<td>State route to next-hop</td>
<td>1</td>
</tr>
<tr>
<td>External BGP</td>
<td>20</td>
</tr>
<tr>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>IS-IS</td>
<td>115</td>
</tr>
<tr>
<td>RIP version 1 and 2</td>
<td>120</td>
</tr>
<tr>
<td>Internal BGP</td>
<td>200</td>
</tr>
<tr>
<td>Unknown</td>
<td>255</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the **router ospf** command sets up OSPF routing instance 1. The first **distance** command sets the default administrative distance to 255, which instructs the software to ignore all routing updates from networking devices for which an explicit distance has not been set. The second **distance** command sets the administrative distance for all networking devices on the Class C network 192.168.40.0 0.0.0.255 to 90.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# distance 255
RP/0/RP0/CPU0:router(config-ospf)# distance 90 192.168.40.0 0.0.0.255
```
**distance ospf**

To define Open Shortest Path First (OSPF) route administrative distances based on route type, use the `distance ospf` command in router configuration mode. To restore the default value, use the `no` form of this command.

```
distance ospf {intra-area | inter-area | external} distance
no distance ospf
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>describes how to set the type of area. It can be one of the following values:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>intra-area</code> — All routes within an area.</td>
</tr>
<tr>
<td></td>
<td><code>inter-area</code> — All routes from one area to another area.</td>
</tr>
<tr>
<td></td>
<td><code>external</code> — All routes from other routing domains, learned by redistribution.</td>
</tr>
<tr>
<td></td>
<td>Any combination of the above areas is allowed.</td>
</tr>
<tr>
<td>distance</td>
<td>Route administrative distance.</td>
</tr>
</tbody>
</table>

**Command Default**

```
distance : 110
```

**Command Modes**

Router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must specify one of the keywords.

Use the `distance ospf` command to perform the same function as the `distance` command used with an access list. However, the `distance ospf` command sets a distance for an entire group of routes, rather than a specific route that passes an access list.

A common reason to use the `distance ospf` command is when you have multiple OSPF processes with mutual redistribution, and you want to prefer internal routes from one over external routes from the other.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to change the external distance to 200, making the route less reliable:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# redistribute ospf 2
RP/0/RP0/CPU0:router(config-ospf)# distance ospf external 200
RP/0/RP0/CPU0:router(config-ospf)# exit
```
RP/0/RP0/CPU0:router(config)# router ospf 2
RP/0/RP0/CPU0:router(config-ospf)# redistribute ospf 1
RP/0/RP0/CPU0:router(config-ospf)# distance ospf external 200
To filter networks received or transmitted in Open Shortest Path First (OSPF) updates, use the `distribute-list` command in the appropriate mode. To change or cancel the filter, use the `no` form of this command.

```
distribute-list {access-list-name [in | out [{bgp number | connected | ospf instance | static}] | route-policy route-policy-name in}
no distribute-list {access-list-name [in | out] | route-policy route-policy-name in}
```

**Syntax Description**

- `access-list-name` Standard IP access list name. The list defines which networks are to be received and which are to be suppressed in routing updates.
- `in` Applies the access list or route-policy to incoming routing updates.
- `out` Applies the access list to outgoing routing updates. The `out` keyword is available only in router configuration mode.
- `bgp` (Optional) Applies the access list to BGP routes.
- `connected` (Optional) Applies the access list to connected routes.
- `ospf` (Optional) Applies the access list to OSPF routes (not the current OSPF process).
- `static` (Optional) Applies the access list to statically configured routes.
- `route-policy route-policy-name` Specifies the route-policy to filter OSPF prefixes.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the distribute list parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the distribute list parameter specified for the process.

If this command is not specified at any level, then the distribute list is disabled.

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- VRF configuration
- Multi-area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Use the `distribute-list` command to limit which OSPF routes are installed on this router. The `distribute-list` command does not affect the OSPF protocol itself.

The `distribute-list in` is configurable at instance (process), area, and interface levels. Regular OSPF configuration inheritance applies. Configuration is inherited from instance > area > interface levels.

Use the `route-policy route-policy-name` keyword and argument to allow use of route policies to filter OSPF prefixes.

---

**Note**

Either an access-list, or a route-policy can be used in a single command, not both. Configuring the command with access-list removes the route-policy configuration, and vice versa.

The "if tag..." statements can be used in `distribute-list in route-policy`. The matching on route tag supports operators "eq/ge/is/le". Operator "in" is not supported.

---

**Note**

When distribute-list ACL or route-policy is modified, OSPF removes all routes from the RIB, and repopulates the RIB. Due to an expected delay in the repopulation of the RIB, there could be traffic disruption.

---

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to prevent OSPF routes from the 172.17.10.0 network from being installed if they are learned in area 0:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ipv4 access-list 3
RP/0/RP0/CPU0:router(config-ipv4-acl)# deny 172.17.10.0 0.0.0.255
RP/0/RP0/CPU0:router(config-ipv4-acl)# permit any any !
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# distribute-list 3 in
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/3
```
domain-id (OSPF)

To specify the Open Shortest Path First (OSPF) VPN routing and forwarding (VRF) domain ID, use the `domain-id` command in VRF configuration mode. To remove an OSPF VRF domain ID, use the `no` form of this command.

```plaintext
domain-id [secondary] type [{0005 | 0105 | 0205 | 8005}] value value
no domain-id [secondary] type [{0005 | 0105 | 0205 | 8005}] value value
```

**Syntax Description**
- `secondary` (Optional) OSPF secondary domain ID.
- `type` Primary OSPF domain ID in hex format.
- `value value` OSPF domain ID value in hex format (six octets).

**Command Default**
No domain ID is specified.

**Command Modes**
- VRF configuration mode

**Command History**
- **Release 6.0** This command was introduced.

**Usage Guidelines**
An OSPF domain id must be explicitly configured. The OSPF domain ID helps OSPF determine how to translate a prefix received through Border Gateway Protocol (BGP) from the remote provider edge (PE). If the domain IDs match, OSPF generates a Type 3 link state advertisement (LSA). If the domain IDs do not match, OSPF generates a Type 5 LSA.

There is only one primary domain ID. There can be multiple secondary domain IDs.

**Note**
When an IOS XR router and an IOS router are configured as peers, the two Domain IDs must match. Manually configure the IOS XR Domain ID value to match the IOS default Domain ID value. This ensures that the routes have route code "OIA" because they are learned as inter-area routes. If the Domain IDs do not match, the routes have route code, "O-E2" because they are learned as external routes. Use the `show ip ospf` command to get the OSPF Domain ID from the IOS router. Then, set the IOS XR Domain ID to the same value using the `domain-id` command.

**Task ID**
- `ospf` read,
- `write` write

**Examples**
The following example shows how to specify a domain ID:
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 01
RP/0/RP0/CPU0:router(config-ospf)# vrf v1
RP/0/RP0/CPU0:router(config-ospf-vrf)# domain-id type 0105 value AABBCDDEEFF
# domain-tag

To specify the Open Shortest Path First (OSPF) VPN routing and forwarding (VRF) domain tag, use the `domain-tag` command in VRF configuration mode. To remove an OSPF VRF domain tag, use the `no` form of this command.

```
domain-tag  tag
no  domain-tag
```

## Syntax Description

| tag | OSPF domain tag as a 32-bit value. The valid range is 0 to 4294967295. |

## Command Default

No OSPF VRF domain tag is specified.

## Command Modes

VRF configuration mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

The domain tag is added to any Type 5 link state advertisements (LSAs) generated as a result of VPN-IP routes received from Border Gateway Protocol (BGP). The domain-tag is derived from BGP autonomous system number (ASN).

## Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

## Examples

The following example shows how to specify the domain tag:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 10
RP/0/RP0/CPU0:router(config-ospf)# domain-tag 234
```
**fast-reroute (OSPFv2)**

To enable IP fast reroute loop-free alternate (LFA) computation, use the `fast-reroute` command in the appropriate OSPF configuration mode. To disable the IP fast reroute loop-free alternate computation, use the `no` form of this command.

To disable loop-free alternate computation that is enabled on a higher level, use the `fast-reroute` command with `disable` keyword.

```
fast-reroute {per-link | per-prefix} [disable]
no  fast-reroute
```

**Syntax Description**

- `per-link` Enables per-link loop-free alternate computation.
- `per-prefix` Enables per-prefix loop-free alternate computation.
- `disable` (Optional) Disables loop-free alternate computation that was enabled on a higher level.

**Command Default**

IP fast-reroute LFA computation is disabled.

**Command Modes**

- Area configuration
- Interface configuration
- Router configuration
- VRF configuration

**Command History**

- Release 6.0  This command was introduced.

**Usage Guidelines**

Only one mode of computation can be configured on an interface - per-link or per-prefix. Different modes of computations can be enabled on different interfaces; one set of interface using per-link and other set using per-prefix computation. Based on the outgoing interface of the primary path, per-link or per-prefix backup path will be computed.

**Task ID**

```
Task  Operation
ID

ospf  read, write
```

This example shows how to enable per-link computation of loop-free alternates under interface POS 0/3/0/0:

```
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/3/0/0
```
This example shows how to enable per-prefix computation of loop-free alternates under area 0:

```
RP/0/RP0/CPU0:router(config-ospf-ar-if)# fast-reroute per-link
```

This example shows how to disable computation of loop-free alternates that was configured under area 0:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospf 1
RP/0/RP0/CPU0:router(config-ospf)#area 0
RP/0/RP0/CPU0:router(config-ospf-ar)#fast-reroute per-prefix

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospf 1
RP/0/RP0/CPU0:router(config-ospf)#area 0
RP/0/RP0/CPU0:router(config-ospf-ar)#fast-reroute per-prefix
RP/0/RP0/CPU0:router(config-ospf-ar)#interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-ospf-ar-if)#fast-reroute disable
```
fast-reroute per-link exclude interface

To excludes specified interface to be used as a backup during (IPFRR) loop-free alternate (LFA) computation, use the **fast-reroute per-link exclude interface** command, in the appropriate OSPF configuration mode. To disable this feature, use the no form of this command.

**fast-reroute per-link exclude interface** type interface-path-id  
**no fast-reroute per-link exclude interface** type interface-path-id

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>Physical interface or virtual interface.</td>
</tr>
</tbody>
</table>

**Note**

Use the **show interfaces** command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No interfaces are excluded.

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to exclude an interface from IP fast reroute loop-free alternate (LFA) computation:

```
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# fast-reroute per-link exclude interface HundredGigE 0/3/2/1
```
fast-reroute per-prefix exclude interface (OSPFv2)

To exclude interface to be used as a backup path from fast-reroute loop-free alternate per-prefix computation, use the fast-reroute per-prefix exclude interface command in the appropriate OSPF configuration mode. To disable this feature, use the no form of this command.

```
fast-reroute per-prefix exclude interface type interface-path-id
no fast-reroute per-prefix exclude interface type interface-path-id
```

**Syntax Description**
- **type** Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id** Physical interface or virtual interface.

**Note**
Use the show interfaces command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

---

**Command Default**
No interfaces are excluded.

**Command Modes**
- Interface configuration
- Area configuration
- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Backup paths via the excluded interfaces will not be computed.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to exclude interface POS0/6/0/1 from being used as a backup path:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospf 100
RP/0/RP0/CPU0:router(config-ospf)#fast-reroute per-prefix exclude interface HundredGigE 0/6/0/1
```
fast-reroute per-prefix use-candidate-only (OSPFv2)

To restrict the backup interfaces to those that are present on the LFA candidate list, use the `fast-reroute per-prefix use-candidate-only` command in router OSPF configuration mode. To disable this feature, use the `no` form of this command.

```
fast-reroute per-prefix use-candidate-only [{enable | disable}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable Enables backup selection from candidate-list only.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disable Disables backup selection from candidate-list only.</td>
</tr>
</tbody>
</table>

**Command Default**
Disabled.

**Command Modes**
Router OSPF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to restrict the backup interfaces to those that are present on the LFA candidate list:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospf 100
RP/0/RP0/CPU0:router(config-ospf)#fast-reroute per-prefix use-candidate-only
```
flood-reduction (OSPF)

To suppress the unnecessary flooding of link-state advertisements (LSAs) in stable topologies, use the flood-reduction command in the appropriate mode. To remove this functionality from the configuration, use the no form of this command.

flood-reduction [{enable | disable}]
no flood-reduction [{enable | disable}]

Syntax Description

- **enable** (Optional) Turns on this functionality at a specific level.
- **disable** (Optional) Turns off this functionality at a specific level.

Command Default

If this command is not specified in interface configuration mode, then the interface adopts the flood reduction parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the flood reduction parameter specified for the process.

If this command is not specified at any level, then flood reduction is disabled.

Command Modes

- Interface configuration
- Area configuration
- Router configuration
- VRF configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

All routers supporting the OSPF demand circuit are compatible and can interact with routers supporting flooding reduction.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to reduce the flooding of unnecessary LSAs for area 0:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# flood-reduction
```
flood-reduction (OSPF)
hello-interval (OSPF)

To specify the interval between consecutive hello packets that are sent on the Open Shortest Path First (OSPF) interface, use the `hello-interval` command in the appropriate mode. To return to the default time, use the `no` form of this command.

```
hello-interval  seconds
no hello-interval
```

**Syntax Description**

- `seconds` Interval (in seconds). The value must be the same for all nodes on a specific network. Range is 1 to 65535.

**Command Default**

- If this command is not specified in interface configuration mode, then the interface adopts the hello interval parameter specified by the area.
- If this command is not specified in area configuration mode, then the interface adopts the hello interval parameter specified for the process.
- If this command is not specified at any level, then the hello interval is 10 seconds (broadcast) or 30 seconds (non-broadcast).

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- Virtual-link configuration
- VRF configuration
- Multi-area configuration
- Sham-link configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The hello interval value is advertised in the hello packets. The shorter the hello interval, the faster topological changes are detected, but more routing traffic occurs. This value must be the same for all routers and access servers on a specific network.

**Examples**

The following example shows how to set the interval between hello packets to 15 seconds:
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# hello-interval 15
ignore lsa mospf

To suppress the sending of syslog messages when the router receives link-state advertisement (LSA) Type 6 multicast Open Shortest Path First (MOSPF) packets, which are unsupported, use the `ignore lsa mospf` command in an appropriate configuration mode. To restore the sending of syslog messages, use the `no` form of this command.

```
ignore lsa mospf
no ignore lsa mospf
```

This command has no keywords or arguments.

**Command Default**
When you do not specify this command in router configuration mode, each MOSPF packet received by the router causes the router to send a syslog message.

**Command Modes**
Router configuration  
VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Cisco routers do not support LSA Type 6 (MOSPF), and they generate syslog messages if they receive such packets. If the router is receiving many MOSPF packets, you might want to configure the router to ignore the packets and thus prevent a large number of syslog messages.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure the router to suppress the sending of syslog messages when it receives MOSPF packets:

```
RP/0/RP0/CPU0:router# configure  
RP/0/RP0/CPU0:router(config)# router ospf 1  
RP/0/RP0/CPU0:router(config-ospf)# ignore lsa mospf
```
interface (OSPF)

To define the interfaces on which the Open Shortest Path First (OSPF) protocol runs, use the `interface` command in area configuration mode. To disable OSPF routing for interfaces, use the `interface` form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

### Syntax Description

- **type**: Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id**: Physical interface or virtual interface.

### Note

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

### Command Default

When you do not specify this command in configuration mode, OSPF routing for interfaces is not enabled.

### Command Modes

Area configuration

### Command History

```
Release 6.0  This command was introduced.
```

### Usage Guidelines

Use the `interface` command to associate a specific interface with an area. The interface remains associated with the area even when the IP address of the interface changes.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how the OSPF routing process 109 defines four OSPF areas (0, 2, 3, and 10.9.50.0), and associates an interface with each area:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-area)# interface HundredGigE 4/0/0/3
RP/0/RP0/CPU0:router(config-ospf-area)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospf-area)# interface HundredGigE 3/0/0/2
```
RP/0/RP0/CPU0:router(config-ospf)# area 10.9.50.0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 3/0/0/1
**log adjacency changes (OSPF)**

To configure the router to send a syslog message when the state of an Open Shortest Path First (OSPF) neighbor changes, use the **log adjacency changes** command in XR Config mode. To turn off this function, use the **disable** keyword. To log all state changes, use the **detail** keyword.

```
log adjacency changes \{detail | disable\}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>Provides all (DOWN, INIT, 2WAY, EXSTART, EXCHANGE, LOADING, FULL) adjacency state changes.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables sending adjacency change messages.</td>
</tr>
</tbody>
</table>

**Command Default**

The router sends a syslog message when the state of an OSPF neighbor changes.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **log adjacency changes** command to display high-level changes to the state of the peer relationship. Configure this command if you want to know about OSPF neighbor changes.

**Examples**

The following example shows how to configure the software to send a syslog message for any OSPF neighbor state changes:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# log adjacency changes detail
```
loopback stub-network

To enable advertising loopback as stub networks, use the loopback stub-network command in an appropriate configuration mode. To disable advertising loopback as stub networks, use the no form of this command.

```
loopback stub-network [{enable | disable}]
no loopback stub-network
```

**Syntax Description**

- `enable` (Optional) Enables advertising loopbacks as stub networks.
- `disable` (Optional) Disables advertising loopbacks as stub networks.

**Command Default**

By default, OSPF advertises loopbacks as stub hosts.

**Command Modes**

- OSPF interface configuration
- OSPF router configuration
- OSPF area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the interface submode, the command can be enabled only on loopback interfaces.

**Examples**

The following example shows how to enable advertising loopback as a stub network, under OSPF interface configuration:

```
RP/0/RP0/CPU0:router(config)#router ospf 100
RP/0/RP0/CPU0:router(config-ospf)#loopback stub-network enable
```
max-lsa

To limit the number of nonself-generated link-state advertisements (LSAs) that an Open Shortest Path First (OSPF) routing process can keep in the OSPF link-state database (LSDB), use the `max-lsa` command in XR Config mode. To remove the limit of non self-generated LSAs that an OSPF routing process can keep in the OSPF LSDB, use the `no` form of this command.

```
max-lsa max [threshold] [warning-only] [ignore-time value] [ignore-count value] [reset-time value]
no max-lsa max [threshold] [warning-only] [ignore-time value] [ignore-count value] [reset-time value]
```

### Syntax Description

- **max**
  - Maximum number of nonself-generated LSAs the OSPF process can keep in the OSPF LSBD.

- **threshold**
  - (Optional) The percentage of the maximum LSA number, as specified by the maximum-number argument, at which a warning message is logged. The default is 75 percent.

- **warning-only**
  - (Optional) Specifies that only a warning message is sent when the maximum limit for LSAs is exceeded. Disabled by default.

- **ignore-time value**
  - (Optional) Specifies the time, in minutes, to ignore all neighbors after the maximum limit of LSAs has been exceeded. The default is 5 minutes.

- **ignore-count value**
  - (Optional) Specifies the number of times the OSPF process can consecutively be placed into the ignore state. The default is 5 times.

- **reset-time value**
  - (Optional) Specifies the time, in minutes, after which the ignore count is reset to zero. The default is 2 times `ignore-time`.

### Command Default

Disabled

### Command Modes

- XR Config mode
- VRF configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command allows you to protect the OSPF routing process from the large number of received LSAs that can result from a misconfiguration on another router in the OSPF domain (for example, the redistribution of a large number of IP prefixes to OSPF).

When this feature is enabled, the router keeps count of the number of all received (nonself-generated) LSAs. When the configured `threshold` value is reached, an error message is logged. When the configured `max` number of received LSAs is exceeded, the router stops accepting new LSAs.

If the count of received LSAs is higher than the configured `max` number after one minute, the OSPF process disables all adjacencies in the given context and clears the OSPF database. This state is called the ignore state. In this state, all OSPF packets received on all interfaces belonging to the OSPF instance are ignored and no
OSPF packets are generated on its interfaces. The OSPF process remains in the ignore state for the duration of the configured **ignore-time**. When the **ignore-time** expires, the OSPF process returns to normal operation and starts building adjacencies on all its interfaces.

To prevent the OSPF instance from endlessly oscillating between its normal state and the ignore state, as a result of the LSA count immediately exceeding the **max** number again after it returns from the ignore state, the OSPF instance keeps a count of how many times it has been in the ignore state. This counter is called the **ignore-count**. If the **ignore-count** exceeds its configured value, the OSPF instance remains in the ignore state permanently.

To return the OSPF instance to its normal state, you must issue the **clear ip ospf** command. The **ignore-count** is reset to zero if the LSA count does not exceed the **max** number again during the time configured by the **reset-time** keyword.

If you use the **warning-only** keyword, the OSPF instance never enters the ignore state. When LSA count exceeds the **max** number, the OSPF process logs an error message and the OSPF instance continues in its normal state operation.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure the OSPF instance to accept 12000 nonself-generated LSAs in the global routing table, and 1000 nonself-generated LSAs in VRF V1.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 0
RP/0/RP0/CPU0:router(config-ospf)# max-lsa 12000
RP/0/RP0/CPU0:router(config-ospf)# vrf V1
RP/0/RP0/CPU0:router(config-ospf)# max-lsa 1000
```

The following example shows how to display the current status of the OSPF instance:

```
RP/0/RP0/CPU0:router# show ospf 0
Routing Process "ospf 0" with ID 10.0.0.2
NSR (Non-stop routing) is Disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
It is an area border router
Maximum number of non self-generated LSA allowed 12000
  Current number of non self-generated LSA 1
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 10 minutes
Ignore-count allowed 5, current ignore-count 0
```
max-metric

To configure the Open Shortest Path First (OSPF) protocol to signal other networking devices not to prefer the local router as an intermediate hop in their shortest path first (SPF) calculations, use the max-metric command in XR Config mode. To disable this function, use the no form of this command.

max-metric router-lsa [external-lsa overriding metric] [include-stub] [on-proc-migration] [on-proc-restart] [on-startup] [on-switchover] [wait-for-bgp] [summary-lsa]

Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>router-lsa</td>
<td>Always originates router link-state advertisements (LSAs) with the maximum metric.</td>
</tr>
<tr>
<td>external-lsa overriding metric</td>
<td>(Optional) Overrides the external-lsa metric with the max-metric value. The overriding metric argument specifies the number of in-summary-LSAs. The range is 1 to 16777215&gt;. The default is 16711680.</td>
</tr>
<tr>
<td>include-stub</td>
<td>(Optional) Advertises stub links in router-LSA with the max-metric value (0xFFFF).</td>
</tr>
<tr>
<td>on-proc-migration time</td>
<td>(Optional) Sets the maximum metric temporarily after a process migration to originate router-LSAs with the max-metric value. The time range is 5 to 86400 seconds.</td>
</tr>
<tr>
<td>on-proc-restart time</td>
<td>(Optional) Sets the maximum metric temporarily after a process restart to originate router-LSAs with the max-metric value. The time range is 5 to 86400 seconds.</td>
</tr>
<tr>
<td>on-startup time</td>
<td>(Optional) Sets the maximum metric temporarily after a reboot to originate router-LSAs with the max-metric value. The time range is 5 to 86400 seconds.</td>
</tr>
<tr>
<td>on-switchover time</td>
<td>(Optional) Sets the maximum metric temporarily after a switchover to originate router-LSAs with the max-metric value. The time range is 5 to 86400 seconds.</td>
</tr>
<tr>
<td>wait-for-bgp</td>
<td>(Optional) Causes OSPF to originate router LSAs with the maximum metric and allows Border Gateway Protocol (BGP) to decide when to start originating router LSAs with a normal metric instead of the maximum metric.</td>
</tr>
<tr>
<td>summary-lsa</td>
<td>(Optional) specifies the number of in summary-LSAs. The range is 1 to 16777215. The default is 16711680.</td>
</tr>
</tbody>
</table>

Command Default

Router LSAs are originated with normal link metrics.

overriding-metric :16711680

Command Modes

XR Config mode
VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **max-metric** command to cause the software to originate router LSAs with router link metrics set to LSInfinity (0xFFFF). This feature can be useful in Internet backbone routers that run both OSPF and BGP because OSPF converges more quickly than BGP and may begin attracting traffic before BGP has converged, resulting in dropped traffic.

If this command is configured, the router advertises its locally generated router LSAs with a metric of 0xFFFF. This action allows the router to converge but not attract transit traffic if there are better, alternative paths around this router. After the specified *announce-time* value or notification from BGP has expired, the router advertises the local router LSAs with the normal metric (interface cost).

If this command is configured with the **on-startup** keyword, then the maximum metric is temporarily set only after reboot is initiated. If this command is configured without the **on-startup** keyword, then the maximum metric is permanently used until the configuration is removed.

If the **include-stub** keyword is enabled, the stub-links in the router LSA will be sent with the max-metric. If the **summary-lsa** keyword is enabled, all self-generated summary LSAs will have a metric set to 0xFF0000, unless the metric value is specified with the max-metric value parameter. If the **external-lsa** keyword is enabled, all self-generated external LSAs will have a metric set to 0xFF0000, unless the metric value is specified with the max-metric value parameter.

This command might be useful when you want to connect a router to an OSPF network, but do not want real traffic flowing through it if there are better, alternative paths. If there are no alternative paths, this router still accepts transit traffic as before.

Some cases where this command might be useful are as follows:

- During a router reload, you prefer that OSPF wait for BGP to converge before accepting transit traffic. If there are no alternative paths, the router still accepts transit traffic.
- A router is in critical condition (for example, it has a very high CPU load or does not have enough memory to store all LSAs or build the routing table).
- When you want to gracefully introduce or remove a router to or from the network.
- When you have a test router in a lab, connected to a production network.

**Note**

For older OSPF implementations (RFC 1247), router links in received router LSAs with a metric and cost of LSInfinity are not used during SPF calculations. Hence, no transit traffic is set to the routers originating such router LSAs.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to configure OSPF to originate router LSAs with the maximum metric until BGP indicates that it has converged:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# max-metric router-lsa on-startup wait-for-bgp
```
maximum interfaces (OSPF)

To limit the number of interfaces that can be configured for an Open Shortest Path First (OSPF) process, use the `maximum interfaces` command in the appropriate mode. To return to the default limit, use the `no` form of this command.

```
maximum interfaces number-interfaces
no maximum interfaces
```

**Syntax Description**
- `number-interfaces` Number of interfaces. Range is 1 to 4294967295.

**Command Default**
If the command is not specified, the default is 1024.

**Command Modes**
- Router configuration
- VRF configuration

**Command History**
- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**
Use the `maximum interface` command to increase or decrease the limit on the number of interfaces configured for an OSPF process.

You cannot configure a limit lower than the number of interfaces currently configured for the OSPF process. To lower the limit, remove interfaces from the OSPF configuration until the number of configured interfaces is at or below the desired limit. You may then apply the new, lower limit.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to configure a maximum interface limit of 1500 on a router:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# maximum interfaces 1500
```
maximum paths (OSPF)

To control the maximum number of parallel routes that the Open Shortest Path First (OSPF) protocol can support, use the `maximum paths` command in an appropriate configuration mode. To remove the `maximum paths` command from the configuration file and restore the system to its default condition with respect to the routing protocol, use the `no` form of this command.

```
maximum paths maximum-routes-number
no maximum paths
```

**Syntax Description**

- `maximum-routes-number`  
  Maximum number of parallel routes that OSPF can install in a routing table. Range is 1 to 64.
  
  **Note**  
  The maximum number of paths that can be configured is 64.

**Command Default**

The default value for `maximum-paths` depends on the platform supported `maximum-paths` value. 32 paths

**Command Modes**

- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The default value for `maximum-path` depends on the platform supported `maximum-path` value. Any custom value you define for the `maximum-path` parameter must be within the maximum value supported by platform. The configuration will be rejected if the value you have specified is more then what the platform supports.

When the maximum number of parallel routes is reduced, all existing paths are pruned and paths reinstalled at the new maximum number. During this route-reduction period, you may experience some packet loss for a few seconds. This may impact route traffic.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to allow a maximum of two paths to a destination:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# maximum paths 2
```
maximum redistributed-prefixes (OSPF)

To limit the aggregate number of prefixes that can be redistributed into an Open Shortest Path First (OSPF) process, use the `maximum redistributed-prefix` command in the appropriate mode. To return to the default limit, use the `no` form of this command.

```
maximum redistributed-prefixes maximum [threshold-value] [warning-only]
no maximum redistributed-prefixes
```

**Syntax Description**

- `maximum` Number of routes. Range is 1 to 4294967295.
- `threshold-value` (Optional) Threshold value (as a percentage) at which to generate a warning message. Range is 1 to 100.
- `warning-only` (Optional) Gives only a warning when the limit is exceeded.

**Command Default**

If the command is not specified, the default is 10000.

The threshold value defaults to 75 percent.

**Command Modes**

- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| Release 6.0 | This command was introduced.

**Usage Guidelines**

Use the `maximum redistributed-prefixes` command to increase or decrease the maximum number of prefixes (also referred to as routes) redistributed for an OSPF process.

If the `maximum` value is less than the existing number of routes, existing routes remain configured, but no new routes are redistributed.

**Examples**

The following example shows how to configure a maximum number of routes that can be redistributed for an OSPF routing process:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# maximum redistributed-prefixes 15000
```
message-digest-key

To specify a key used with Open Shortest Path First (OSPF) Message Digest 5 (MD5) authentication, use the message-digest-key command in the appropriate mode. To remove an old MD5 key, use the no form of this command.

```
message-digest-key key-id md5 {key | clear key | encrypted key}
no message-digest-key key-id
```

**Syntax Description**

- **key-id** Key number. Range is 1 to 255.
- **md5** Enables OSPF MD5 authentication.
- **key** Alphanumeric string of up to 16 characters.
- **clear** Specifies that the key be clear text.
- **encrypted** Specifies that the key be encrypted using a two-way algorithm.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the message digest key parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the message digest key parameter specified for the process.

If this command is not specified at any level, then OSPF MD5 authentication is disabled.

**Command Modes**

Interface configuration
Area configuration
XR Config mode
Virtual-link configuration
VRF configuration
Multi-area configuration
Sham-link configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Usually, one key individual interface is used to generate authentication information when packets are sent and to authenticate incoming packets. The same key identifier on the neighbor router must have the same key value.

For authentication to be enabled, you must configure the message-digest-key command together with the authentication command and its message-digest keyword. Both the message-digest-key and authentication commands can be inherited from a higher configuration level.
The process of changing keys is as follows. Suppose the current configuration is:

```
interface HundredGigE 0/3/0/2
message-digest-key 100 md5 OLD
```

You change the configuration to the following:

```
interface HundredGigE 0/3/0/2
message-digest-key 101 md5 NEW
```

The system assumes its neighbors do not have the new key yet, so it begins a rollover process. It sends multiple copies of the same packet, each authenticated by different keys. In this example, the system sends out two copies of the same packet—the first one authenticated by key 100 and the second one authenticated by key 101.

Rollover allows neighboring routers to continue communication while the network administrator is updating them with the new key. Rollover stops after the local system finds that all its neighbors know the new key. The system detects that a neighbor has the new key when it receives packets from the neighbor authenticated by the new key.

After all neighbors have been updated with the new key, the old key should be removed. In this example, you would enter the following:

```
interface ethernet 1
no ospf message-digest-key 100
```

Then, only key 101 is used for authentication on interface 1.

We recommend that you not keep more than one key individual interface. Every time you add a new key, you should remove the old key to prevent the local system from continuing to communicate with a hostile system that knows the old key. Removing the old key also reduces overhead during rollover.

---

**Note**

The MD5 key is always stored in encrypted format on the router. The `clear` and `encrypted` keywords inform the router whether the value that is entered is encrypted or unencrypted.

---

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to set a new key 19 with the password `8ry4222`:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/1
```
RP/0/RP0/CPU0:router(config-ospf-ar-if)# message-digest-key 19 md5 8ry4222
mpls ldp auto-config (OSPF)

To enable Label Distribution Protocol (LDP)-Interior Gateway Protocol (IGP) interface automatic configuration, use the `mpls ldp auto-config` command in the appropriate mode. To disable LDP-IGP interface automatic configuration, use the `no` form of this command.

```plaintext
mpls ldp auto-config
no mpls ldp auto-config
```

**Command Default**

LDP-IGP interface automatic configuration is disabled for OSPF.

**Command Modes**

- Interface configuration
- Area configuration
- XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable LDP-IGP interface automatic configuration:

```plaintext
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 10
RP/0/RP0/CPU0:router(config-ospf)# mpls ldp auto-config
```
mpls ldp sync (OSPF)

To enable Label Distribution Protocol (LDP)-Interior Gateway Protocol (IGP) synchronization, use the `mpls ldp sync` command in the appropriate mode. To disable LDP-IGP synchronization, use the `no` form of this command.

```
mpls ldp sync [disable]
nor mpls ldp sync
```

**Syntax Description**

| disable  | (Optional) Disables MPLS LDP synchronization from within the OSPF interface and area configuration submodes only. For the OSPF router configuration mode, use the `no` form of the command. |

**Command Default**

LDP-IGP synchronization is disabled for OSPF.

**Command Modes**

- Interface configuration
- Area configuration
- XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable LDP-IGP synchronization:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# mpls ldp sync
```
**mtu-ignore (OSPF)**

To prevent Open Shortest Path First (OSPF) from checking whether neighbors are using the same maximum transmission unit (MTU) on a common interface when exchanging database descriptor (DBD) packets, use the `mtu-ignore` command in the appropriate mode. To reset to default, use the `no` form of this command.

```
mtu-ignore [disable | enable]
nomtu-ignore
```

**Syntax Description**
- `disable` (Optional) Enables checking for whether OSPF neighbors are using the MTU on a common interface.
- `enable` (Optional) Disables checking for whether OSPF neighbors are using the MTU on a common interface.

**Command Default**
The default is `mtu-ignore` with no keywords, which disables MTU checking.

If this command is not specified in interface configuration mode, then the interface adopts the MTU ignore parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the MTU ignore parameter specified for the process.

If this command is not specified at any level, then OSPF checks the MTU received from neighbors when exchanging DBD packets.

**Command Modes**
- Interface configuration
- Area configuration
- XR Config mode
- VRF configuration
- Multi-area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

OSPF checks whether OSPF neighbors are using the same MTU on a common interface. This check is performed when neighbors exchange DBD packets. If the receiving MTU in the DBD packet is higher than the MTU configured on the incoming interface, OSPF adjacency is not established.

The keywords, `disable` and `enable`, do not need to be used. If no keywords are used, the `mtu-ignore` command disables MTU checking. You can then use the `no mtu-ignore` command to activate MTU checking.
The following example shows how to disable MTU mismatch detection on receiving DBD packets:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# mtu-ignore
```
multi-area-interface

To enable multiple adjacencies for different Open Shortest Path First (OSPF) areas and enter multi-area interface configuration mode, use the `multi-area-interface` command in the area configuration mode. To reset to the default, use the `no` form of this command.

```
multi-area-interface type interface-path-id
no multi-area-interface type interface-path-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><code>interface-path-id</code></td>
<td>Physical interface or virtual interface.</td>
</tr>
</tbody>
</table>

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

An OSPF network is enabled for one area only.

**Command Modes**

Area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `multi-area-interface` command to enable area border routers (ABRs) to establish multiple adjacencies for different OSPF areas.

Each multiple area adjacency is announced as a point-to-point unnumbered link in the configured area. This point-to-point link provides a topological path for that area. The first or primary adjacency using the link advertises the link consistent with draft-ietf-ospf-multi-area-adj-06.txt.

You can configure multi-area adjacency on any interface where only two OSPF speakers are attached. In the case of native broadcast networks, the interface must be configured as an OSPF point-to-point type using the `network point-to-point` command to enable the interface for a multi-area adjacency.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable multiple area adjacency for OSPF 109:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# area 0
```
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# area 1
RP/0/RP0/CPU0:router(config-ospf-ar)# multi-area-interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-mif)#

RP/0/RP0/CPU0:router(config-ospf-ar-mif)#
neighbor (OSPF)

To configure Open Shortest Path First (OSPF) routers interconnecting to nonbroadcast networks, use the neighbor command in interface configuration mode. To remove a configuration, use the no form of this command.

```
neighbor ip-address [cost number] [priority number] [poll-interval seconds]
no neighbor ip-address [cost number] [priority number] [poll-interval seconds]
```

**Syntax Description**

- **ip-address**: Interface IP address of the neighbor.
- **cost number**: (Optional) Assigns a cost to the neighbor, in the form of an integer from 1 to 65535. Neighbors with no specific cost configured assume the cost of the interface, based on the cost command. On point-to-multipoint interfaces, cost number is the only keyword and argument combination that works. The cost keyword does not apply to nonbroadcast multiaccess (NBMA) networks.
- **priority number**: (Optional) Specifies an 8-bit number indicating the router priority value of the nonbroadcast neighbor associated with the IP address specified. The priority keyword does not apply to point-to-multipoint interfaces.
- **poll-interval seconds**: (Optional) Specifies an unsigned integer value (in seconds) reflecting the poll interval. RFC 1247 recommends that this value be much larger than the hello interval. The poll-interval keyword does not apply to point-to-multipoint interfaces.

**Command Default**

No configuration is specified.

- **priority number**: 0
- **poll-interval seconds**: 120 seconds (2 minutes)

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must include one neighbor entry in the software configuration for each known nonbroadcast network neighbor. The neighbor address must be on the primary address of the interface.

If a neighboring router has become inactive (hello packets have not been received for the router dead interval period), it may still be necessary to send hello packets to the dead neighbor. These hello packets are sent at a reduced rate called the poll interval.

When the router starts up, it sends only hello packets to those routers with nonzero priority; that is, routers that are eligible to become designated routers (DRs) and backup designated routers (BDRs). After the DR and BDR are selected, the DR and BDR start sending hello packets to all neighbors to form adjacencies.

To filter all outgoing OSPF link-state advertisement (LSA) packets for the neighbor, use the neighbor database-filter all out command.
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID Operations</th>

</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to declare a router at address 172.16.3.4 on a nonbroadcast network, with a priority of 1 and a poll interval of 180 seconds:

```
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 172.16.3.4 priority 1 poll-interval 180
```

The following example illustrates a network with nonbroadcast:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface HundredGigE 1/0/0/3
RP/0/RP0/CPU0:router(config-if)# ip address 172.16.3.10 255.255.255.0

RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 1/0/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# network nonbroadcast
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 172.16.3.4 priority 1 poll-interval 180

RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 172.16.3.5 cost 10 priority 1 poll-interval 180
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 172.16.3.6 cost 15 priority 1 poll-interval 180
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 172.16.3.7 priority 1 poll-interval 180
```
neighbor database-filter all out

To filter all outgoing link-state advertisements (LSAs) to an Open Shortest Path First (OSPF) neighbor, use the `neighbor database-filter all out` command in interface configuration mode. To restore the forwarding of LSAs to the neighbor, use the `no` form of this command.

`neighbor ip-address database-filter all out`

`no neighbor ip-address database-filter all out`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip-address</code></td>
<td>IP address of the neighbor to which outgoing LSAs are blocked.</td>
</tr>
</tbody>
</table>

**Command Default**

Instead of all outgoing LSAs being filtered to the neighbor, they are flooded to the neighbor.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `neighbor database-filter all out` command to filter all outgoing OSPF LSA packets during synchronization and flooding for point-to-multipoint neighbors on nonbroadcast networks. More neighbor options are available with the `neighbor` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to prevent flooding of OSPF LSAs from point-to-multipoint networks to the neighbor at IP address 10.2.3.4:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 1/0/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 10.2.3.4 database-filter all out
```
network (OSPF)

To configure the Open Shortest Path First (OSPF) network type to a type other than the default for a given medium, use the network command in the appropriate mode. To return to the default value, use the no form of this command.

```
network {broadcast | non-broadcast | {point-to-multipoint [non-broadcast] | point-to-point}}
no network
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcast</td>
<td>Sets the network type to broadcast.</td>
</tr>
<tr>
<td>non-broadcast</td>
<td>Sets the network type to nonbroadcast multiaccess (NBMA).</td>
</tr>
<tr>
<td>point-to-multipoint</td>
<td>Sets the network type to point-to-multipoint.</td>
</tr>
<tr>
<td>non-broadcast</td>
<td>(Optional) Sets the point-to-multipoint network to be nonbroadcast. If you use this keyword, the neighbor command is required.</td>
</tr>
<tr>
<td>point-to-point</td>
<td>Sets the network type to point-to-point.</td>
</tr>
</tbody>
</table>

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the network parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the network parameter specified for the process.

If this command is not specified at any level, then the OSPF network type is the default of the given medium. TenGigEthernet interfaces default to broadcast.

**Command Modes**

Interface configuration

Area configuration

Router configuration

VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the network command to configure broadcast networks as NBMA networks when, for example, routers in your network do not support multicast addressing.

Configuring NBMA networks as either broadcast or nonbroadcast assumes that there are virtual circuits from every router to every router or fully meshed network. However, there are other configurations where this assumption is not true; for example, a partially meshed network. In these cases, you can configure the OSPF network type as a point-to-multipoint network. Routing between two routers that are not directly connected go through the router that has virtual circuits to both routers. You need not configure neighbors when using this command.

If this command is issued on an interface that does not allow it, this command is ignored.
OSPF has two features related to point-to-multipoint networks. One feature applies to broadcast networks; the other feature applies to nonbroadcast networks:

- On point-to-multipoint, broadcast networks, you can use the `neighbor` command, and you must specify a cost to that neighbor.
- On point-to-multipoint, nonbroadcast networks, you must use the `neighbor` command to identify neighbors. Assigning a cost to a neighbor is optional.

**Examples**

The following example shows how to configure the OSPF network as a nonbroadcast network:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# network non-broadcast
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 172.16.3.4 priority 1 poll-interval 180
```
**nsf (OSPF)**

To configure nonstop forwarding (NSF) for the Open Shortest Path First (OSPF) protocol, use the `nsf` command in the appropriate mode. To remove this command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
nsf {cisco [enforce global] | ietf [helper disable]}
no nsf {cisco [enforce global] | ietf [helper disable]}
```

**Syntax Description**
- `cisco` Enables Cisco Nonstop Forwarding.
- `enforce global` (Optional) Cancels NSF restart when non-NSF network device neighbors are detected.
- `ietf` Enables Internet Engineering Task Force (IETF) graceful restart.
- `helper disable` (Optional) Disables router helper support.

**Command Default**
- NSF is disabled.

**Command Modes**
- XR Config mode
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The NSF feature allows for the forwarding of data packets to continue along known routes while routing protocol information (such as OSPF) is being restored following a switchover.

Use the `nsf` command if the router is expected to perform NSF during restart. To experience the full benefits of this feature, configure all neighboring routers with NSF.

When this command is used without the optional `cisco enforce global` keywords and non-NSF neighbors are detected, the NSF restart mechanism aborts on the interfaces of those neighbors and functions properly on others.

When this command is used with the optional `cisco enforce global` keywords and non-NSF neighbors are detected, NSF restart is canceled for the entire OSPF process.

IETF graceful restart provides an NSF mechanism to allow data traffic to flow seamlessly with no packet drops during the transient period when OSPF attempts to recover after a process restart or RP failover, within the guidelines of RFC 3623.

By default, neighbors in helper mode listen to both the NSF Cisco- and NSF IETF-type LSAs. The `nsf` command enables one type of mechanism that would undergo an RP failover or, anticipating an OSPF process restart. If the `cisco` or `ietf` keyword is not entered, NSF is not enabled, irrespective of neighbors in listening mode for both NSF Cisco and NSF IETF.
The following example shows how to cancel NSF restart for the entire OSPF process if non-NSF neighbors are detected on any network interface during restart:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# nsf cisco enforce global
```
nsf flush-delay-time (OSPF)

To configure the maximum time allowed for nonstop forwarding (NSF) external route queries for the Open Shortest Path First (OSPF) protocol, use the `nsf flush-delay-time` command in the appropriate mode. To remove this command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
nsf flush-delay-time seconds
no nsf flush-delay-time seconds
```

**Syntax Description**
- `seconds` Length of time (in seconds) allowed for NSF external route queries. Range is 1 to 3600 seconds.

**Command Default**
- `seconds`: 300

**Command Modes**
- Router configuration
- VRF configuration

**Command History**
- **Release 6.0** This command was introduced.

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**
- `ospf` read,
  - `write`

**Examples**
The following example shows how to configure the maximum time for NSF to learn external routes for OSPF at 60 seconds:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# nsf flush-delay-time 60
```
### nsf interval (OSPF)

To configure the minimum time between consecutive nonstop forwarding (NSF) restart attempts for the Open Shortest Path First (OSPF) protocol, use the `nsf interval` command in the appropriate mode. To remove this command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
nsf interval seconds
no nsf interval seconds
```

**Syntax Description**

| seconds | Length of time (in seconds) between consecutive restart attempts. Range is 90 to 3600 seconds. |

**Command Default**

`seconds : 90`

**Command Modes**

- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you use the `nsf interval` command, the OSPF process must be up for at least 90 seconds before OSPF attempts to perform an NSF restart.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the minimum time between consecutive NSF restart attempts at 120 seconds:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-router)# nsf interval 120
```
nsf lifetime (OSPF)

To configure the maximum time that routes are held in the Routing Information Base (RIB) following an Open Shortest Path First (OSPF) process restart, use the `nsf lifetime` command in the appropriate mode. To remove this command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
nsf lifetime seconds
no nsf lifetime seconds
```

**Syntax Description**

`seconds` The length of time (in seconds) that routes are held in the RIB. Range is 90 to 3600 seconds.

**Command Default**

`seconds`: 95

**Command Modes**

Router configuration
VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you use this command, the OSPF process must reconverge within the maximum length of time configured. If the convergence exceeds this length of time, routes are purged from RIB and nonstop forwarding (NSF) restart may fail.

**Task ID**

```
Task ID         Operations
ospf           read, write
```

**Examples**

The following example shows how to configure the maximum lifetime for OSPF NSF at 120 seconds:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf l
RP/0/RP0/CPU0:router(config-ospf)# nsf lifetime 120
```
nssa (OSPF)

To configure an area as a not-so-stubby area (NSSA), use the `nssa` command in area configuration mode. To remove the NSSA distinction from the area, use the `no` form of this command.

```
nssa [no-redistribution] [default-information-originate [metric metric-value] [metric-type type-value]]
[no-summary] no nssa
```

**Syntax Description**

- `no-redistribution` (Optional) Imports routes only into the normal areas, but not into the NSSA area, by the `redistribute` command when the router is an NSSA Area Border Router (ABR).

- `default-information-originate` (Optional) Generates a Type 7 default into the NSSA area. This keyword takes effect only on an NSSA ABR or NSSA Autonomous System Boundary Router (ASBR).

- `metric metric-value` (Optional) Specifies the metric used for generating the default route. If you omit a value and do not specify a value using the `defaultmetric` command, the default metric value is 10. Range is 1 to 16777214.

- `metric-type type-value` (Optional) Specifies the external link type associated with the default route advertised into the OSPF routing domain. It can be one of the following values:
  1 — Type 1 external route
  2 — Type 2 external route

- `no-summary` (Optional) Prevents an ABR from sending summary link advertisements into the NSSA.

**Command Default**

No NSSA area is defined.

**Command Modes**

Area configuration

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

An NSSA does not flood Type 5 external LSAs from the core into the area, but can import autonomous system external routes in a limited fashion within the area.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

The following example shows how to configure area 1 as an NSSA area:

```
Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 1
RP/0/RP0/CPU0:router(config-ospf-ar)# nssa
ospf name-lookup

To configure the Open Shortest Path First (OSPF) protocol to look up Domain Name System (DNS) names, use the `ospf name-lookup` command in XR Config mode. To disable this function, use the `no` form of this command.

```
ospf name-lookup
no ospf name-lookup
```

**Command Default**

Routers are displayed by router ID or neighbor ID.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ospf name-lookup` command to easily identify a router when executing all OSPF `show` command displays. The router is displayed by name rather than by its router ID or neighbor ID.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure OSPF to identify a router by name:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ospf name-lookup
```
packet-size (OSPF)

To configure the size of Open Shortest Path First (OSPF) packets up to the size specified by the maximum transmission unit (MTU), use the `packet-size` command in the appropriate configuration mode. To disable this function and reestablish the default packet size, use the `no` form of this command.

```
packet-size  bytes
no  packet-size
```

**Syntax Description**

- `bytes`: Size in bytes. Range is 576 to 10000 bytes.

**Command Default**

If the command is not specified, the default packet size is either the interface IP MTU size (if that is lower than 9000 bytes) or 9000 bytes.

**Command Modes**

- XR Config mode
- Area configuration
- Interface configuration
- VRF configuration
- Multi-area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `packet-size` command to customize the size of OSPF packets. The OSPF protocol compares the packet size and the MTU size and uses the lower packet size value.

If the command is not configured, the default packet size is equal to the interface IP MTU size (if that is lower than 9000 bytes) or 9000 bytes. For example, if the interface IP MTU size is 1500 bytes, OSPF uses packet size of 1500 bytes on the interface because the byte size is lower than 9000 bytes. If the interface IP MTU size is 9500 bytes, OSPF uses packet size of 9000 bytes on the interface because the byte size exceeds 9000 bytes. The interface IP MTU size depends on the interface and the platform. In most cases, the default interface IP MTU value will be lower than 9000 bytes.

**Examples**

The following example shows how to configure the packet size on an interface:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-router)# area 0
```
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 1/0/0/2
RP/0/RP0/CPU0:router(config-ospf-ar-if)# packet-size 3500
passive (OSPF)

To suppress the sending of Open Shortest Path First (OSPF) protocol operation on an interface, use the **passive** command in the appropriate mode. To remove the passive configuration, use the **no** form of this command.

```
passive  [[disable | enable]]
no  passive
```

**Syntax Description**

- **disable** (Optional) Sends OSPF updates.
- **enable** (Optional) Disables sending OSPF updates.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the passive parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the passive parameter specified for the process.

If this command is not specified at any level, then the passive parameter is disabled and OSPF updates are sent on the interface.

**Command Modes**

- Interface configuration
- Area configuration
- XR Config mode
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

OSPF routing information is neither sent nor received through the specified interface. The interface appears as a stub network in the OSPF router (Type 1) link-state advertisement (LSA).

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows that GigabitEthernet interface 1/0/0/2 reduces OSPF updates because passive mode is enabled; however, HundredGigE interface 0/1/0/3 receives normal OSPF traffic flow:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 1/0/0/3
```
passive (OSPF)

RP/0/RP0/CPU0:router(config-ospf-ar-if)# passive
RP/0/RP0/CPU0:router(config-ospf-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 1/0/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# end
priority (OSPF)

To set the router priority for an interface, which helps determine the designated router for an Open Shortest Path First (OSPF) link, use the `priority` command in the appropriate mode. To return to the default value, use the `no` form of this command.

```
priority value
no priority value
```

**Syntax Description**

`value` 8-bit unsigned integer indicating the router priority value. Range is 0 to 255.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the priority parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the priority parameter specified for the process.

If this command is not specified at any level, then the default priority is 1.

**Command Modes**

- Interface configuration
- Area configuration
- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When two routers attached to a network both attempt to become the designated router, the one with the higher router priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. A router with a router priority set to zero is ineligible to become the designated router or backup designated router. Router priority is configured only for interfaces to multiaccess networks (in other words, not point-to-point networks).

This priority value is used when you configure the Open Shortest Path First (OSPF) protocol for nonbroadcast networks using the `neighbor` command for OSPF.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows that priority is set through the `priority` and `neighbor` commands for Routers A and B and that the neighbor priority value must reflect that of the neighbor router:
**Router A**

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-if)# ipv4 address 10.0.0.2 255.255.255.0
RP/0/RP0/CPU0:router(config-if)# exit
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# network non-broadcast
RP/0/RP0/CPU0:router(config-ospf-ar-if)# priority 4
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 10.0.0.1 priority 6

**Router B**

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface HundredGigE POS 0/2/0/1
RP/0/RP0/CPU0:router(config-if)# ipv4 address 10.0.0.1 255.255.255.0
RP/0/RP0/CPU0:router(config-if)# exit
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# network non-broadcast
RP/0/RP0/CPU0:router(config-ospf-ar-if)# priority 6
RP/0/RP0/CPU0:router(config-ospf-ar-if)# neighbor 10.0.0.2 priority 4
**protocol shutdown**

To disable an instance of the Open Shortest Path First (OSPF) protocol so that it cannot form an adjacency on any interface, use the `protocol shutdown` command in the XR Config mode. To reenable the OSPF protocol, use the `no` form of this command.

```
protocol shutdown
no protocol shutdown
```

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `protocol shutdown` command to disable the OSPF protocol for a specific routing instance without removing any existing OSPF configuration parameters.

The OSPF protocol continues to run on the router and you can use the current OSPF configuration, but OSPF does not form any adjacencies on any interface.

This command is similar to performing the `no router ospf` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to disable the OSPF 1 instance:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospf)# protocol shutdown
```
queue dispatch flush-lsa

To change the number of LSAs scheduled (rate-limited) for flushing, that are processed in each iteration, use the `queue dispatch flush-lsa` command in XR Config mode. To return to the system default value, use the `no` form of this command.

```
queue dispatch flush-lsa count
no queue dispatch flush-lsa
```

**Syntax Description**

- `count` Maximum number of LSAs flushed per run. Range is 30 to 3000.

**Command Default**

The default LSAs flushed per run is 150 (when the count is not configured).

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to limit the number of LSAs flushed per run to 30:

```
RP/0/RP0/CPU0:router(config-ospf)# queue dispatch flush-lsa 30
```

Use the `show ospf message-queue`, on page 392 command to see the queue dispatch values, peak lengths, and limits.
queue dispatch incoming

To limit the number of incoming packets (LSAUpdates, LSAcks, DBDs, LSRequests, and Hellos that trigger a change state) processed, use the `queue dispatch incoming` command in XR Config mode. To return to the system default value, use the `no` form of this command.

```
queue dispatch incoming count
no queue dispatch incoming
```

**Syntax Description**

`count` Maximum number of continuous events processed. Range is 30 to 3000.

**Command Default**
The default incoming count is 300 packets (when the count is not configured).

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how limit the number of incoming packets processed to 500:

```
RP/0/RP0/CPU0:router(config-ospf)# queue dispatch incoming 500
```

Use the `show ospf message-queue`, on page 392 command to see the queue dispatch values, peak lengths, and limits.
queue dispatch rate-limited-lsa

To set the maximum number of rate-limited link-state advertisement (LSA) (re-)originations processed per run, use the `queue dispatch rate-limited-lsa` command in XR Config mode. To return to the system default value, use the `no` form of this command.

```
queue dispatch rate-limited-lsa count
no queue dispatch rate-limited-lsa
```

**Syntax Description**

- `count` Maximum number of rate-limited LSAs processed per run. Range is 30 to 3000.

**Command Default**

The default number of rate-limited LSAs processed per run is 300 (when this count is not configured).

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

- `ospf` read, write

**Examples**

The following example shows how to set the maximum number of rate-limited LSA (re-)originations processed per run to 300:

```
RP/0/RP0/CPU0:router(config-ospf)# queue dispatch rate-limited-lsa 300
```
queue dispatch spf-lsa-limit

To change the maximum number of Type 3-4 and Type 5-7 link-state advertisements (LSAs) processed per shortest path first (SPF) iteration within a single SPF run, use the `queue dispatch spf-lsa-limit` command in XR Config mode. To return to the system default value, use the `no` form of this command.

```
queue dispatch spf-lsa-limit count
no queue dispatch spf-lsa-limit
```

**Syntax Description**

- `count`: Maximum number of continuous Type 3-4 and Type 5-7 LSAs processed per SPF in each scheduled iteration within a single SPF run. Range is 30 to 3000.

**Command Default**

The default number of Type 3-4 and Type 5-7 processed per run is 150 LSAs (when this command is not configured).

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to limit the number of continuous Type 3-4 and Type 5-7 LSAs processed by SPF per scheduling run, to 100:

```
RP/0/RP0/CPU0:router(config-ospf)# queue dispatch spf-lsa-limit 100
```
queue limit

To set the high watermark for incoming events by priority, use the `queue limit` in XR Config mode. To return to the system default values, use the `no` form of this command.

```
queue limit {high | medium | low} count
no queue limit {high | medium | low}
```

Syntax Description

| high | High watermark for incoming high-priority events (state-changing Hellos). |
| medium | High watermark for incoming medium-priority events (LSA ACK). |
| low | High watermark for incoming low-priority events (DBD/LSUpd/LSReq). |
| count | Maximum number of events per queue. Events are dropped when the priority queue size exceeds this value. Range is 1000 to 30000. |

Command Default

High watermark: 9500 (when the corresponding configuration is not present).

Medium watermark: 9000 (when the corresponding configuration is not present).

Low watermark: 8000 (when the corresponding configuration is not present).

Command Modes

XR Config mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Always keep the limits in the following order of priority:

Limit for High > Limit for Medium > Limit for Low

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following examples show how to set the maximum number of events per queue:

```
RP/0/RP0/CPU0:router(config-ospf) # queue limit high 11000
RP/0/RP0/CPU0:router(config-ospf) # queue limit medium 10000
RP/0/RP0/CPU0:router(config-ospf) # queue limit low 9000
```
range (OSPF)

To consolidate and summarize routes at an area boundary, use the `range` command in area configuration mode. To disable this function, use the `no` form of this command.

```
range ip-address mask [{advertise | not-advertise}]
no range ip-address mask [{advertise | not-advertise}]
```

**Syntax Description**
- `ip-address` IP address in four-part, dotted-decimal notation.
- `mask` IP address mask.
- `advertise` (Optional) Sets the address range status to advertise and generates a Type 3 summary link-state advertisement (LSA).
- `not-advertise` (Optional) Sets the address range status to DoNotAdvertise. The Type 3 summary LSA is suppressed and the component networks remain hidden from other networks.

**Command Default**
When this command is not specified for Area Border Routers (ABRs), routes at an area boundary are not consolidated or summarized.
Advertise is the default.

**Command Modes**
Area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `range` command only with Area Border Router (ABRs). Use the command to consolidate or summarize routes for an area. The result is that a single summary route is advertised to other areas by the ABR. Routing information is condensed at area boundaries. External to the area, a single route is advertised for each address range. This process is called `route summarization`.

Multiple `range` configurations specifying the `range` command can be configured. Thus, the OSPF protocol can summarize addresses for many different sets of address ranges.

The summarized route uses the maximum cost of the routes assumed in the range.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows area 36.0.0.0 consisting of interfaces whose IP addresses have “10.31.x.x” as the first two octets. The `range` command summarizes interfaces. Instead of advertising eight networks individually, the single route 10.31.0.0 255.255.0.0 is advertised:
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/3/0/2
!
RP/0/RP0/CPU0:router(config-ospf)# area 36.0.0.0
RP/0/RP0/CPU0:router(config-ospf-ar)# range 10.31.0.0 255.255.0.0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/0
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/1/0/2
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/2/0/0
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/2/0/2
RP/0/RP0/CPU0:router(config-ospf-ar-if)# interface HundredGigE 0/2/0/3
RP/0/RP0/CPU0:router(config-ospf-ar-if)# end
redistribute (OSPF)

To redistribute routes from one routing domain into Open Shortest Path First (OSPF), use the redistribute command in the appropriate mode. To remove the redistribute command from the configuration file and restore the system to its default condition in which the software does not redistribute routes, use the no form of this command.

Border Gateway Protocol (BGP)
redistribute bgp process-id [preserve-med] [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]
no redistribute bgp process-id [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]

Local Interface Routes
redistribute connected [instance instance-name] [instance IPCP][metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]
no redistribute connected [instance instance-name] [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]

Directed-attached gateway redundancy (DAGR)
redistribute dagr [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]
no redistribute dagr [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]

Intermediate System-to-Intermediate System (IS-IS)
redistribute isis process-id [{level-1 | level-2 | level-1-2}] [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]
no redistribute isis process-id [{level-1 | level-2 | level-1-2}] [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]

Open Shortest Path First (OSPF)
redistribute ospf process-id [match {external [{1 | 2]} | internal | nssa-external [{1 | 2}]}] [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]
no redistribute ospf process-id [match {external [{1 | 2]} | internal | nssa-external [{1 | 2}]}] [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]

Routing Information Protocol (RIP)
redistribute rip [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]
no redistribute rip [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]

IP Static Routes
redistribute static [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]
no redistribute static [metric metric-value] [metric-type {1 | 2}] [route-policy policy-name] [tag tag-value]

Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>Distributes routes from the BGP protocol.</td>
</tr>
</tbody>
</table>
process-id

For the `bgp` keyword, an autonomous system number has the following ranges:

- Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
- Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
- Range for 4-byte Autonomous system numbers (ASNs) in asdot format is 1.0 to 65535.65535.

For the `isis` keyword, an IS-IS instance name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

For the `ospf` keyword, an OSPF instance name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

| preserve-med | (Optional) Preserves the Multi Exit Discriminator (MED) of BGP routes. |
| metric metric-value | (Optional) Specifies the metric used for the redistributed route. Range is 1 to 16777214. Use a value consistent with the source protocol. |
| metric-type { 1 | 2 } | (Optional) Specifies the external link type associated with the route advertised into the OSPF routing domain. It can be one of two values:

- 1 — Type 1 external route
- 2 — Type 2 external route |
| tag tag-value | (Optional) Specifies the value attached to each external route. This value is not used by the OSPF protocol itself, but is carried in the external LSAs. Range is 0 to 4294967295. |
| route-policy policy-name | (Optional) Specifies the identifier of a configured policy. A policy is used to filter the importation of routes from this source routing protocol to OSPF. |
| connected | Distributes routes that are established automatically by virtue of having enabled IP on an interface. |
| instance | Connected instance. |
| instance-name | Name of the connected instance. |
| instance IPCP | Distributes routes from IPCP protocols. |
| isis | Distributes routes from the IS-IS protocol. |
| level-1 | (Optional) Redistributes Level 1 routes into other IP routing protocols independently. |
| level-1-2 | (Optional) Distributes both Level 1 and Level 2 routes into other IP routing protocols. |
| level-2 | (Optional) Distributes Level 2 routes into other IP routing protocols independently. |
| ospf | Distributes routes from the OSPF protocol. |
match \{ internal \mid external [1 \mid 2] \mid nssa-external [1 \mid 2] \} (Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one or more of the following:

- **internal** — Routes that are internal to a specific autonomous system (intra- and inter-area OSPF routes).
- **external [1 \mid 2]** — Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 external routes.
- **nssa-external [1 \mid 2]** — Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 not-so-stubby area (NSSA) external routes.

For the **external** and **nssa-external** options, if a type is not specified, then both Type 1 and Type 2 are assumed.

If no match is specified, the default is no filtering.

**rip**
Distributes routes from the RIP protocol.

**static**
Distributes IP static routes.

**dagr**
Distributes routes from the directed-attached gateway redundancy (DAGR).

**Command Default**
Route redistribution is disabled.

**metric metric-value**: Default is 20 for routes from all protocols except BGP routes, for which the default is 1.

**metric-type**: Type 2 external route.

**Command Modes**
Router configuration
VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When redistributing routes (into OSPF) using both command keywords for setting or matching of attributes and a route policy, the routes are run through the route policy first, followed by the keyword matching and setting.

Redistributed routing information should always be filtered by the **policy policy-name** keyword and argument. This filtering ensures that only those routes intended by the administrator are redistributed into OSPF.

For information about routing policies, see the *Routing Policy Commands on Router Routing Command Reference Guide*. 

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers

359
Whenever you use the `redistribute` or `default-information originate (OSPF)`, on page 284 command to redistribute routes into an OSPF routing domain, the router automatically becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPF routing domain.

When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

When routes are redistributed into OSPF and no metric is specified with the `metric` keyword, OSPF uses 20 as the default metric for routes from all protocols except BGP routes, which get a metric of 1.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to cause BGP routes to be redistributed into an OSPF domain:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 110
RP/0/RP0/CPU0:router(config-ospf)# redistribute bgp 100
```

The following example shows how to redistribute the specified IS-IS process routes into an OSPF domain. The IS-IS routes are redistributed with a metric of 100.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# redistribute isis 108 metric 100
```

In the following example, network 10.0.0.0 appears as an external link-state advertisement (LSA) in OSPF 1:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-if)# ip address 10.0.0.0 255.0.0.0

RP/0/RP0/CPU0:router(config)# interface HundredGigE 0/2/0/2
RP/0/RP0/CPU0:router(config)# ip address 10.99.0.0 255.0.0.0

RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# redistribute ospf 2
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/2/0/2

RP/0/RP0/CPU0:router(config)# router ospf 2
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/1/0/1
```
retransmit-interval (OSPF)

To specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the Open Shortest Path First (OSPF) interface, use the `retransmit-interval` command in the appropriate mode. To return to the default value, use the `no` form of this command.

`retransmit-interval seconds`
`no retransmit-interval`

**Syntax Description**

`seconds` Time (in seconds) between retransmissions. It must be greater than the expected round-trip delay between any two routers on the attached network. Range is 1 to 65535 seconds.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the retransmit interval parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the retransmit interval parameter specified for the process.

If this command is not specified at any level, then the default retransmit interval is 5 seconds.

**Command Modes**

Interface configuration
Area configuration
XR Config mode
Virtual-link configuration
VRF configuration
Multi-area configuration
Sham-link configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it retransmits the LSA.

The setting of this parameter should be conservative, or needless retransmission results. The value should be larger for serial lines and virtual links.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to set the retransmit interval value to 8 seconds in interface configuration mode:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-ospf-ar-if)# retransmit-interval 8
```
route-policy (OSPF)

To specify a routing policy to filter Type 3 link-state advertisements (LSA), use the `route-policy` command in area configuration mode. To disable the routing policy, use the `no` form of this command.

```
route-policy  route-policy-name  {in | out}
no  route-policy  route-policy-name  {in | out}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Task ID</strong></td>
</tr>
<tr>
<td>ospf</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>The following example shows how to specify an OSPF route policy for inbound routes in area 0:</td>
</tr>
</tbody>
</table>

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-area)# route-policy area0_in in
```
router-id (OSPF)

To configure a router ID for the Open Shortest Path First (OSPF) process, use the `router-id` command in the appropriate mode. To cause the software to use the default method of determining the router ID, use the `no router-id` form of this command after clearing or restarting the OSPF process.

```
router-id router-id
no router-id router-id
```

**Syntax Description**

- `router-id` 32-bit router ID value specified in four-part, dotted-decimal notation.

**Command Default**

If this command is not configured, the router ID is the highest IP version 4 (IPv4) address for an interface on the router, with any loopback interface taking precedence.

**Command Modes**

- Router configuration
- VRF configuration

**Command History**

```
Release 6.0  This command was introduced.
```

**Usage Guidelines**

It is good practice to use the `router-id` command to explicitly specify a unique 32-bit numeric value for the router ID. This action ensures that OSPF can function regardless of the interface address configuration. Clear the OSPF process using the `clear ospf process` command or restart the OSPF process for the `no router-id` command to take effect.

OSPF attempts to obtain a router ID in the following ways (in order of preference):

1. By default, when the OSPF process initializes, it checks if there is a router-id in the checkpointing database.
2. The 32-bit numeric value specified by the OSPF `router-id` command in router configuration mode. (This value can be any 32-bit value. It is not restricted to the IPv4 addresses assigned to interfaces on this router, and need not be a routable IPv4 address.)
3. The ITAL selected router-id.
4. The primary IPv4 address of an interface over which this OSPF process is running. The first interface address in the OSPF interface is selected.

**Note**

Unlike OSPF version 3, OSPF version 2 is guaranteed to have at least one interface with an IPv4 address configured.
The following example shows how to assign the IP address of 172.20.10.10 to the OSPF process 109:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config-ospf)# router-id 172.20.10.10
router ospf

To configure an Open Shortest Path First (OSPF) routing process, use the `router ospf` command in XR Config mode. To terminate an OSPF routing process, use the `no` form of this command.

```
router ospf  process-name
no router ospf  process-name
```

**Syntax Description**

`process-name` Name that uniquely identifies an OSPF routing process. The process name is any alphanumeric string no longer than 40 characters without spaces.

**Command Default**

No OSPF routing process is defined.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can specify multiple OSPF routing processes in each router. Up to 10 processes can be configured. The recommendation is not to exceed 4 OSPF processes.

All OSPF configuration commands must be configured under an OSPF routing process. For example, two of these commands are the `default-metric` command and the `router-id` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
<tr>
<td>rib</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to instantiate an OSPF routing process called 109:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
```
**security ttl (OSPF)**

To set the security time-to-live (TTL) value in the IP header for Open Shortest Path First (OSPF) packets, use the `security ttl` command in the appropriate configuration mode. To remove this command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
security ttl [hops hops-number]
no security ttl
```

**Syntax Description**

```
hops hops-number  IP hops. Maximum number of hops allowed. Range is 1 to 254 hops.
```

**Command Default**

```
hops-number : 1
```

**Command Modes**

- XR Config mode
- Area configuration
- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `security ttl` command is used for the Generalized TTL Security Mechanism (GTSM) feature to prevent network attacks.

During the act of receiving Link State Advertisement (LSA) from neighbors, network attacks can occur because there are no checks that unicast or multicast packets are originating from a neighbor that is one hop away or multiple hops away over virtual links.

For virtual links, OSPF packets travel multiple hops across the network; hence, the TTL value can be decremented several times. For these type of links, a minimum TTL value must be allowed and accepted for multiple-hop packets.

To filter network attacks originating from invalid sources traveling over multiple hops, the GTSM, RFC 3682, is used to prevent the attacks. GTSM filters link-local addresses and allows for only one-hop neighbor adjacencies through the configuration of TTL value 255. The TTL value in the IP header is set to when OSPF packets are originated and checked on the received OSPF packets against the default GTSM TTL value 255 or the user configured GTSM TTL value, blocking unauthorized OSPF packets originated from TTL hops away.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the security TTL for an interface:
configure
router ospf 1
area 0
interface HundredGigE 0/6/0/3
security ttl 2
sham-link

To configure an Open Shortest Path First OSPF sham link between two provider edge routers, use the `sham-link` command in VRF area configuration mode. To terminate an (OSPF) sham link, use the `no` form of this command.

```
sham-link source-address destination-address
no sham-link
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Source Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-address</td>
<td>IP address of the local (source) sham-link endpoint specified in four-part, dotted-decimal notation.</td>
</tr>
<tr>
<td>destination-address</td>
<td>IP address of the remote (destination) sham-link endpoint specified in four-part, dotted-decimal notation.</td>
</tr>
</tbody>
</table>

**Command Default**

No sham link is configured.

**Command Modes**

VRF area configuration.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `sham-link` command to configure a point-to-point connection between two provider edge (PE) routers creating an interconnect between two VPN sites (VPN backbone). Sham links are configured on PE provider edge (PE) routers in a Multiprotocol Label Switching (MPLS) VPN backbone.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure an OSPF sham link:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 109
RP/0/RP0/CPU0:router(config_ospf)# vrf vrf_a
RP/0/RP0/CPU0:router(config_ospf_vrf)# area 0
RP/0/RP0/CPU0:router(config_ospf_vrf_ar)# sham-link 192.168.40.0 172.16.30.0
RP/0/RP0/CPU0:router(config_ospf_vrf_ar_sl)# cost 23
```
**show ospf**

To display general information about Open Shortest Path First (OSPF) routing processes, use the `show ospf` command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] [summary]
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only information for the specified routing process is displayed.

- **vrf vrf-name all** (Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance. The `vrf-name` argument can be specified as an arbitrary string. The strings “default” and “all” are reserved values of the `vrf-name` argument.

- **summary** (Optional) Displays OSPF summary information.

**Command Default**
IPv4 and unicast address prefixes

**Command Modes**
XR EXEC mode

OSPFv3

**Command History**

**Release** | **Modification**
--- | ---
Release 6.0 | This command was introduced.

**Usage Guidelines**
Use the `show ospf` command to provide basic information about the OSPF processes running on the router. Additional options provide in-depth information.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show ospf` command:

```
RP/0/RP0/CPU0:router#show ospf
Routing Process "ospf 1" with ID 1.1.1.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
It is an area border router
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Initial LSA throttle delay 500 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Minimum LSA interval 5000 msecs. Minimum LSA arrival 1 secs
```
Maximum number of configured interfaces 255
Number of external LSA 0. Checksum Sum 00000000
Number of opaque AS LSA 0. Checksum Sum 00000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 2. 2 normal 0 stub 0 nssa
External flood list length 0
Non-Stop Forwarding enabled

Area BACKBONE(0) (Inactive)
  Number of interfaces in this area is 2
  SPF algorithm executed 8 times
  Number of LSA 2. Checksum Sum 0x01ba83
  Number of opaque link LSA 0. Checksum Sum 00000000
  Number of DCbitless LSA 0
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0

Area 1
  Number of interfaces in this area is 1
  SPF algorithm executed 9 times
  Number of LSA 2. Checksum Sum 0x0153ea
  Number of opaque link LSA 0. Checksum Sum 00000000
  Number of DCbitless LSA 0
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0

This table describes the significant fields shown in the display.

Number of neighbors forming in staggered mode 0, 1 full
```
show ospf border-routers

To display the internal Open Shortest Path First (OSPF) routing table entries to an Area Border Router (ABR) and Autonomous System Boundary Router (ASBR), use the **show ospf border-routers** command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] border-routers [router-id]
```

**Syntax Description**

- **process-name** (Optional) OSPF process name. If this argument is included, only information for the specified routing process is included.
- **vrf** **vrf-name** **all** (Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance. The `vrf-name` argument can be specified as an arbitrary string. The strings “default” and “all” are reserved vrf-names.
- **router-id** (Optional) Router ID associated with the border router. The value of the `router-id` argument can be any 32-bit router ID value specified in four-part, dotted-decimal notation. No default exists.

**Command Default**

IPv4 and unicast address prefixes

**Command Modes**

XR EXEC mode

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the **show ospf border-routers** command to list all OSPF border routers visible to the specified processes and to ascertain the OSPF topology of the router.

**Examples**

The following is sample output from the **show ospf border-routers** command:

```
RP/0/RP0/CPU0:router# show ospf border-routers

OSPF 1 Internal Routing Table

Codes: i - Intra-area route, I - Inter-area route

    i 172.31.97.53 [1] via 172.16.1.53, GigabitEthernet 3/0/0/0, ABR/ASBR , Area 0, SPF 3
```
This table describes the significant fields shown in the display.

</tr>
</tbody>
</table>

**Usage Guidelines**

The various forms of the `show ospf database` command deliver information about different OSPF link-state advertisements. This command can be used to examine the link-state database (LSD) and its contents. Each router participating in an area having identical database entries pertaining to that area (with the exception of LSAs that are being flooded). Numerous options (such as `network` and `router`) are used to display portions of the database.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hello Input Queue</td>
<td>This section provides statistics on the number of events and incoming packets processed in the Hello (incoming packet) thread of the OSPF process.</td>
</tr>
<tr>
<td>Router Message Queue</td>
<td>This section provides statistics on the events and messages processed in the Router (primary) thread of the OSPF process.</td>
</tr>
<tr>
<td>TE Message Queue</td>
<td>This section provides statistics on traffic-engineering events and messages received by OSPF from TE (the te_control process). These events are processed in the Router thread of the OSPF process.</td>
</tr>
<tr>
<td>Number of Dlink errors</td>
<td>The number of enqueuing or dequeuing errors seen across all the linked-lists in the OSPF process.</td>
</tr>
</tbody>
</table>
**show ospf neighbor**

To display Open Shortest Path First (OSPF) neighbor information on an individual interface basis, use the `show ospf neighbor` command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] [area-id] neighbor [{{type interface-path-id} [neighbor-id] [detail] | area-sorted}]
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only information for the specified routing process is displayed.

- **vrf vrf-name all** (Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance. The `vrf-name` argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.

- **area-id** (Optional) Area ID. If you do not specify an area, all areas are displayed.

- **type** Interface type. For more information, use the question mark (?) online help function.

- **interface-path-id** Physical interface or virtual interface.

  **Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- **neighbor-id** (Optional) Neighbor ID.

- **detail** (Optional) Displays all neighbors given in detail (lists all neighbors).

- **area-sorted** (Optional) Specifies that all neighbors are grouped by area.

**Command Default**

All neighbors

**Command Modes**

XR EXEC mode

</table>
show ospf request-list

To display the first ten link-state requests pending that the local router is making to the specified Open Shortest Path First (OSPF) neighbor and interface, use the `show ospf request-list` command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] [area-id] request-list [type interface-path-id] [neighbor-id]
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only information for the specified routing process is displayed.

- **vrf** (Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance.

- **vrf-name** (Optional) Name of the OSPF VRF. The `vrf-name` argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.

- **all** (Optional) Specifies all OSPF VRF instances.

- **area-id** (Optional) Area ID. If you do not specify an area, all areas are displayed.

- **type** Interface type. For more information, use the question mark (?) online help function.

- **interface-path-id** Physical interface or virtual interface.

  Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- **neighbor-id** (Optional) IP address of the OSPF neighbor.

**Command Default**

All neighbors

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You might use this command when the databases of two neighboring routers are out of synchronization or if the adjacency does not form between them. Adjacency means that the routers synchronize their databases when they discover each other.

You can look at the list to determine if one router is trying to request a particular database update. Entries that are suspended in the list usually indicate that updates are not being delivered. One possible reason for this behavior is a maximum transmission unit (MTU) mismatch between the routers.

You might also look at this list to make sure it is not corrupted. The list should refer to database entries that actually exist.
Request list information is transient and normally the lists are empty.

### Task ID

show ospf retransmission-list

To display the first ten link-state entries in the Open Shortest Path First (OSPF) retransmission list that the local router sends to the specified neighbor over the specified interface, use the show ospf retransmission-list command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] [area-id] retransmission-list [type interface-path-id] [neighbor-id]
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only information for the specified routing process is displayed.

- **vrf vrf-name all** (Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance. The `vrf-name` argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.

- **area-id** (Optional) Area ID. If you do not specify an area, all areas are displayed.

- **type** Interface type. For more information, use the question mark (?) online help function.

- **interface-path-id** Physical interface or virtual interface.

  **Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- **neighbor-id** (Optional) IP address of the OSPF neighbor.

**Command Default**

All neighbors

**Command Modes**

XR EXEC mode

**Command History**

<table>

**Usage Guidelines**

You might use this command when the databases of two neighboring routers are out of synchronization or if the adjacency is not forming between them. Adjacency means that the routers synchronize their databases when they discover each other.

You can look at the list to determine if one router is trying to request a particular database update. Entries that appear to be suspended in the list usually indicate that updates are not being delivered. One possible reason for this behavior is a maximum transmission unit (MTU) mismatch between the routers.

You might also look at this list to make sure it is not corrupted. The list should refer to database entries that actually exist.

Retransmission list information is transient, and normally the lists are empty.
show ospf retransmission-list

Examples

The following is sample output from the `show ospf retransmission-list` command:

```
RP/0/RP0/CPU0:router# show ospf retransmission-list 10.0.124.4 HundredGigE 3/0/0/0
Neighbor 10.0.124.4, interface HundredGigE 3/0/0/0 address 10.3.1.2
```

This table describes the significant fields shown in the display.

### Table 62: `show ospf retransmission-list 10.0.124.4 GigabitEthernet3/0/0/0` Field Descriptions

</tbody>
</table>
**show ospf routes**

To display the Open Shortest Path First (OSPF) topology table, use the `show ospf routes` command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] routes [{connected | external | local}] [prefix mask] [prefix/length] [multicast-intact] [backup-path]
```

### Syntax Description

- **process-name** (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only information for the specified routing process is displayed.

- **vrf vrf-name all** (Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance. The `vrf-name` argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.

- **connected** (Optional) Displays connected routes.

- **external** (Optional) Displays routes redistributed from other protocols.

- **local** (Optional) Displays the local routes redistributed from the Routing Information Base (RIB).

- **prefix** (Optional) IP prefix, which limits output to a specific route.
  
  If the `prefix` argument is specified, either the `length` or `mask` argument is required.

- **mask** (Optional) IP address mask.

- **/ length** (Optional) Prefix length, which can be indicated as a slash (/) and number. For example, `/8` indicates that the first eight bits in the IP prefix are network bits. If `length` is used, the slash is required.

- **multicast-intact** (Optional) Displays multicast intact paths.

- **backup-path** (Optional) Displays fast-reroute backup path information.

### Command Default

All route types

### Command Modes

XR EXEC mode

### Command History

- **Release 6.0**  This command was introduced.

### Usage Guidelines

Use the `show ospf routes` command to display the OSPF private routing table (which contains only routes calculated by OSPF). If there is something wrong with a route in the RIB, then it is useful to check the OSPF copy of the route to determine if it matches the RIB contents. If it does not match, there is a synchronization problem between OSPF and the RIB. If the routes match and the route is incorrect, OSPF has made an error in its routing calculation.
show ospf routes command output with TI-LFA information

This is sample output from the `show ospf routes` command with `backup-path` keyword that displays backup-path information, including TI-LFA:

```
RP/0/RP0/CPU0:router# show ospf 1 routes 2.2.2.2/32 backup-path
Fri Apr  4 02:08:04.210 PDT

Topology Table for ospf 1 with ID 1.1.1.1
Codes: O - Intra area, O IA - Inter area
       O E1 - External type 1, O E2 - External type 2
       O N1 - NSSA external type 1, O N2 - NSSA external type 2

    2.2.2.2/32, metric 3
       10.1.0.2, from 2.2.2.2, via HundredGigE 0/0/0/7, path-id 1
              Backup path: TI-LFA, P node: 4.4.4.4, Labels: 16004, 123
              10.0.3.2, from 2.2.2.2, via HundredGigE 0/0/0/3, protected bitmap 0x1
              Attributes: Metric: 104, SRLG Disjoint
```

This table describes the significant fields shown in the display.

show ospf sham-links

To display Open Shortest Path First (OSPF) sham-link information, use the show ospf sham-links command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] sham-links
```

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the router ospf command. If this argument is included, only information for the specified routing process is displayed.
- `vrf` (Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance.
- `vrf-name` (Optional) Name of the OSPF VRF. The vrf-name argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.
- `all` (Optional) Specifies all OSPF VRF instances.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

Release 6.0 This command was introduced.

**Usage Guidelines**

Use the show ospf sham-links command to display OSPF sham-link information.

**Examples**

The following is sample output from the show ospf sham-links command:

```
RP/0/RP0/CPU0:router# show ospf 1 vrf vrf_1 sham-links

Sham Links for OSPF 1, VRF vrf_1
Sham Link OSPF_SL0 to address 10.0.0.3 is up
Area 0, source address 10.0.0.1
IfIndex = 185
Run as demand circuit
DoNotAge LSA allowed., Cost of using 1
Transmit Delay is 1 sec, State POINT_TO_POINT,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:04
Adjacency State FULL (Hello suppressed)
Number of DBD retrans during last exchange 0
Index 2/2, retransmission queue length 0, number of retransmission 0
```
None of the fields are described in the text. The table below provides the descriptions for the significant fields shown in the display.

show ospf summary-prefix

To display Open Shortest Path First (OSPF) aggregated summary address information, use the `show ospf summary-prefix` command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] summary-prefix
```

**Syntax Description**

- `process-name` *(Optional)* Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospf` command. If this argument is included, only information for the specified routing process is displayed.

- `vrf vrf-name all` *(Optional)* Specifies an OSPF VPN routing and forwarding (VRF) instance. The `vrf-name` argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.

**Command Default**

All summary prefixes

**Command Modes**

XR EXEC mode

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `show ospf summary-prefix` command if you configured summarization of external routes with the `summary-prefix` command and you want to display configured summary addresses.

**Task ID**

```
Task ID  Operations
ospf    read
```

**Examples**

The following is sample output from the `show ospf summary-prefix` command:

```
RP/RP0/CPU0:router# show ospf summary-prefix
OSPF Process 1, summary-prefix
10.1.0.0/255.255.0.0 Metric 20, Type 2, Tag 0
```

This table describes the significant fields shown in the display.

```
<table>
<thead>
<tr>

</tr>
</tbody>
</table>
show ospf virtual-links

To display parameters and the current state of Open Shortest Path First (OSPF) virtual links, use the **show ospf virtual-links** command in XR EXEC mode.

```
show ospf [process-name] [vrf {vrf-name | all}] virtual-links
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>process-name</td>
<td>(Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the <strong>router ospf</strong> command. If this argument is included, only information for the specified routing process is displayed.</td>
</tr>
<tr>
<td>vrf vrf-name all</td>
<td>(Optional) Specifies an OSPF VPN routing and forwarding (VRF) instance. The <em>vrf-name</em> argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.</td>
</tr>
</tbody>
</table>

**Command Default**

All virtual links

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>

</tbody>
</table>
snmp context (OSPF)

To specify an SNMP context for an OSPF instance, use the `snmp context` command in XR Config mode or in VRF configuration mode. To remove the SNMP context, use the `no` form of this command.

```
snmp context context_name
no snmp context context_name
```

**Syntax Description**
- `context_name` Specifies name of the SNMP context for OSPF instance.

**Command Default**
SNMP context is not specified.

**Command Modes**
- XR Config mode
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `snmp-server` commands need to be configured to perform SNMP request for the OSPF instance. Refer `SNMP Server Commands` module in `System Management Command Reference` for information on using the `snmp-server` commands.

**Note**
To map an SNMP context with a protocol instance, topology or VRF entity, use the `snmp-server context mapping` command. However, the `feature` option of this command does not work with OSPF protocol.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure an SNMP context `foo` for OSPF instance `100`:

```
RP/0/RP0/CPU0:router(config)#configure
RP/0/RP0/CPU0:router(config)#router ospf 100
RP/0/RP0/CPU0:router(config-ospf)#snmp context foo
```

This example shows how to configure `snmp-server` commands to be used with the `snmp context` command:

```
RP/0/RP0/CPU0:router(config)#snmp-server host 10.0.0.2 traps version 2c public udp-port 1620
RP/0/RP0/CPU0:router(config)#snmp-server community public RW
RP/0/RP0/CPU0:router(config)#snmp-server contact foo
```
This is a sample SNMP context configuration for OSPF instance 100:

```
 RP/0/RP0/CPU0:router(config)#snmp-server community-map public context foo

 snmp-server host 10.0.0.2 traps version 2c public udp-port 1620
 snmp-server community public RW
 snmp-server contact foo
 snmp-server community-map public context foo

 router ospf 100
  router-id 2.2.2.2
  bfd fast-detect
  nsf cisco
  snmp context foo
  area 0
   interface Loopback1

 area 1
  interface HundredGigE 0/2/0/1
   demand-circuit enable

  interface HundredGigE 0/3/0/0

  interface HundredGigE 0/3/0/1
```

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
To enable SNMP trap for an OSPF instance, use the `snmp trap` command in VRF configuration mode. To disable SNMP trap for the OSPF instance, use the `no` form of this command.

```
snmp trap
no snmp trap
```

### Syntax Description
This command has no keywords or arguments.

### Command Default
Disabled.

### Command Modes
VRF configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
No specific guidelines impact the use of this command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to enable SNMP trap for OSPF instance `100` under VRF `vrf-1`:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospf 100
RP/0/RP0/CPU0:router(config-ospf)#vrf vrf-1
RP/0/RP0/CPU0:router(config-ospf-vrf)#snmp trap
```
**snmp trap rate-limit (OSPF)**

To control the number of traps that OSPF sends by configuring window size and the maximum number of traps during that window, use the `snmp trap rate-limit` command in XR Config mode. To disable configuring the window size and maximum number of traps during the window, use the `no` form of this command.

```
snmp trap rate-limit window-size max-num-traps
no snmp trap rate-limit window-size max-num-traps
```

**Syntax Description**

- `window-size` Specifies the trap rate limit sliding window size.
- `max-num-traps` Specifies the maximum number of traps sent in window time.

**Command Default**

None

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read,write</td>
</tr>
</tbody>
</table>
```

**Examples**

The following example shows how to set the trap rate limit sliding window size to 30 and the maximum number of traps sent to 100:

```
RP/0/RP0/CPU0:router(config)#router ospf 100
RP/0/RP0/CPU0:router(config-ospf)#snmp trap rate-limit 30 100
```
**spf prefix-priority (OSPFv2)**

To prioritize OSPFv2 prefix installation into the global Routing Information Base (RIB) during Shortest Path First (SPF) run, use the `spf prefix-priority` command in router configuration mode. To return to the system default value, use the `no` form of this command.

```
spf prefix-priority route-policy policy-name
no spf prefix-priority route-policy policy-name
```

**Syntax Description**

- `route-policy policy-name` Specifies the route policy to apply to OSPFv2 prefix prioritization.

**Note**

If SPF prefix prioritization is configured, /32 prefixes are no longer preferred by default. To retain the /32 prefixes in higher-priority queues, define the route-policy accordingly.

**Command Default**

SPF prefix prioritization is disabled.

**Command Modes**

OSPF router configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

SPF prefix prioritization is disabled, by default. In disabled mode, the /32 prefixes are installed into the global RIB before other prefixes.

If SPF prefix prioritization is enabled, routes are matched against the route-policy criteria and are assigned to the appropriate priority queue based on the spf-priority set. Unmatched prefixes, including the /32 prefixes, are placed in the low-priority queue.

If all /32 prefixes are desired in the high-priority queue or medium-priority queue, configure the following single route map:

```
prefix-set ospf-medium-prefixes
  0.0.0.0/0 ge 32
end-set
```

**Task ID**

- **Task ID**
  - `ospf`  read, write

**Examples**

The following example shows how to configure OSPFv2 SPF prefix prioritization:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# prefix-set ospf-critical-prefixes
RP/0/RP0/CPU0:router(config-pfx)# 66.0.0.0/16
```
**OSPF Commands**

```
RP/0/RP0/CPU0:router(config-pfx)# end-set
RP/0/RP0/CPU0:router(config)# route-policy ospf-spf-priority
RP/0/RP0/CPU0:router(config-rpl)# if destination in ospf-critical-prefixes then set spf-priority critical
endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# router-id 66.0.0.1
RP/0/RP0/CPU0:router(config-ospf)# spf prefix-priority route-policy ospf-spf-priority
```
stub (OSPF)

To define an area as a stub area, use the stub command in area configuration mode. To disable this function, use the no form of this command.

```
stub  [no-summary]
no  stub
```

**Syntax Description**

- **no-summary** *(Optional) Prevents an Area Border Router (ABR) from sending summary link advertisements into the stub area.*

**Command Default**

No stub area is defined.

**Command Modes**

Area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must configure the stub command on all routers in the stub area.

Use the default-cost command on the ABR of a stub area to specify the cost of the default route advertised into the stub area by the ABR.

To further reduce the number of link-state advertisements (LSAs) sent into a stub area, you can configure the no-summary keyword on the ABR to prevent it from sending summary LSAs (LSA Type 3) into the stub area.

**Examples**

The following example shows how to assign a default cost of 20 to stub network 10.0.0.0:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# area 10.0.0.0
RP/0/RP0/CPU0:router(config-ospf-ar)# stub
RP/0/RP0/CPU0:router(config-ospf-ar)# default-cost 20
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/3/0/3
```
**summary-prefix (OSPF)**

To create aggregate addresses for routes being redistributed from another routing protocol into the Open Shortest Path First (OSPF) protocol, use the `summary-prefix` command in the appropriate mode. To stop summarizing redistributed routes, use the `no` form of the command.

```
summary-prefix  address  mask  [{not-advertise | tag  tag}]
no  summary-prefix  address  mask
```

**Syntax Description**
- `address`  Summary address designated for a range of addresses.
- `mask`  IP subnet mask used for the summary route.
- `not-advertise`  (Optional) Suppresses summary routes that match the address and mask pair from being advertised.
- `tag  tag`  (Optional) Tag value that can be used as a “match” value for controlling redistribution through route policies.

**Command Default**
When this command is not used, specific addresses are created for each route from another route source being distributed into the OSPF protocol.

**Command Modes**
Router configuration
VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `summary-prefix` command to cause an OSPF Autonomous System Boundary Router (ASBR) to advertise one external route as an aggregate for all redistributed routes that are covered by the address. This command summarizes only routes from other routing protocols that are being redistributed into OSPF.

You can use this command multiple times to summarize multiple groups of addresses. The metric used to advertise the summary is the lowest metric of all the more specific routes. This command helps reduce the size of the routing table.

If you want to summarize routes between OSPF areas, use the `range` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, summary address 10.1.0.0 includes address 10.1.1.0, 10.1.2.0, 10.1.3.0, and so on. Only the address 10.1.0.0 is advertised in an external link-state advertisement.
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# summary-prefix 10.1.0.0 255.255.0.0
timers lsa group-pacing

To change the interval at which Open Shortest Path First (OSPF) link-state advertisements (LSAs) are collected into a group and refreshed, checksummed, or aged, use the `timers lsa group-pacing` command in the appropriate mode. To restore the default value, use the `no` form of this command.

```
timers lsa group-pacing seconds
no timers lsa group-pacing
```

**Syntax Description**

| `seconds` | Interval (in seconds) at which LSAs are grouped and refreshed, checksummed, or aged. Range is 10 seconds to 1800 seconds. |

**Command Default**

`seconds`: 240 seconds

**Command Modes**

Router configuration

VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

OSPF LSA group pacing is enabled by default. For typical customers, the default group pacing interval for refreshing, checksumming, and aging is appropriate and you need not configure this feature.

The duration of the LSA group pacing is inversely proportional to the number of LSAs the router is handling. For example, if you have approximately 10,000 LSAs, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to change the OSPF pacing between LSA groups to 60 seconds:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# timers lsa group-pacing 60
```
To limit the frequency that new instances of any particular Open Shortest Path First (OSPF) link-state advertisements (LSAs) can be accepted during flooding, use the **timers lsa min-arrival** command in the appropriate mode. To restore the default value, use the no form of this command.

**timers lsa min-arrival  milliseconds**

**no timers lsa min-arrival**

---

### Syntax Description

- **milliseconds**: Minimum interval (in milliseconds) between accepting same LSA.
  - Range is 0 to 600000 milliseconds.

---

### Command Default

- **milliseconds**: 100 milliseconds

---

### Command Modes

- Router configuration
- VRF configuration

---

### Command History

- **Release 6.0**: This command was introduced.

---

### Usage Guidelines

No specific guidelines impact the use of this command.

---

### Task ID

- **ospf**: read, write

---

### Examples

The following example shows how to change the minimum interval between accepting the same LSA to 2 seconds:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# timers lsa min-arrival 2
```
**timers throttle lsa all (OSPF)**

To modify the Open Shortest Path First (OSPF) link-state advertisement (LSA) throttling, use the **timers throttle lsa all** command in the appropriate mode. To revert LSA throttling to default settings, use the **no** form of this command.

```
timers throttle lsa all  start-interval  hold-interval  max-interval
no timers throttle lsa all
```

**Syntax Description**
- **start-interval**: Delay to generate first occurrence of LSA in milliseconds. Range is 0 to 600000 milliseconds.
- **hold-interval**: Minimum delay between originating the same LSA in milliseconds. Range is 1 to 600000 milliseconds.
- **max-interval**: Maximum delay between originating the same LSA in milliseconds. Range is 1 to 600000 milliseconds.

**Command Default**
- **start-interval**: 50 milliseconds
- **hold-interval**: 200 milliseconds
- **max-interval**: 5000 milliseconds

**Command Modes**
- Router configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The **lsa-start** time is the delay before flooding the first instance of an LSA. The **lsa-hold** interval is the minimum time to elapse before flooding an updated instance of an LSA. The **lsa-max-wait** time is the maximum time that can elapse before flooding an updated instance of an LSA.

For quick convergence, use smaller times for the **lsa-start** time and **lsa-hold** interval. However, in relatively large networks, this may result in a large number of LSAs being flooded in a relatively short time. A balance with the **lsa-start** time and **lsa-hold** interval can be iteratively arrived at for the size of your network. The **lsa-max-wait** time can be used to ensure that OSPF reconverges within a reasonable amount of time.

**Note**
LSA throttling is always enabled. You can change the timer values with the **timers throttle lsa all** command or specify the **no** keyword to revert back to the default settings.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to change the start, hold, and maximum wait interval values to 500, 1000, and 90,000 milliseconds, respectively:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# timers throttle lsa all 500 1000 90000
```

The following example is output from the `show ospf` command that displays the modified LSA throttle settings:

```
RP/0/RP0/CPU0:router# show ospf
Routing Process "ospf 1" with ID 1.1.1.1
  Supports only single TOS(TOS0) routes
  Supports opaque LSA
  It is an area border router
  Initial SPF schedule delay 5000 msecs
  Minimum hold time between two consecutive SPF's 10000 msecs
  Maximum wait time between two consecutive SPF's 10000 msecs
  Initial LSA throttle delay 500 msecs
  Minimum hold time for LSA throttle 1000 msecs
  Maximum wait time for LSA throttle 90000 msecs
  Minimum LSA interval 1000 msecs. Minimum LSA arrival 1 secs
  Maximum number of configured interfaces 255
  Number of external LSA 0. Checksum Sum 00000000
  Number of opaque AS LSA 0. Checksum Sum 00000000
  Number of DCbitless external and opaque AS LSA 0
  Number of DoNotAge external and opaque AS LSA 0
  Number of areas in this router is 2. 2 normal 0 stub 0 nssa
  External flood list length 0
  Non-Stop Forwarding enabled
  Area BACKBONE(0) (Inactive)
    Number of interfaces in this area is 2
    SPF algorithm executed 8 times
    Number of LSA 2. Checksum Sum 0x01ba83
    Number of opaque link LSA 0. Checksum Sum 00000000
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
  Area 1
    Number of interfaces in this area is 1
    SPF algorithm executed 9 times
    Number of LSA 2. Checksum Sum 0x0153ea
    Number of opaque link LSA 0. Checksum Sum 00000000
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
```

**timers throttle spf (OSPF)**

To modify the Open Shortest Path First (OSPF) shortest path first (SPF) throttling, use the `timers throttle spf` command in the appropriate mode. To revert SPF throttling to default settings, use the `no` form of this command.

`timers throttle spf spf-start spf-hold spf-max-wait
no timers throttle spf`

**Syntax Description**

- **spf-start**: Initial SPF schedule delay (in milliseconds). Range is 1 to 600000 milliseconds.
- **spf-hold**: Minimum hold time (in milliseconds) between two consecutive SPF calculations. Range is 1 to 600000 milliseconds.
- **spf-max-wait**: Maximum wait time (in milliseconds) between two consecutive SPF calculations. Range is 1 to 600000 milliseconds.

**Command Default**

- `spf-start`: 50 milliseconds
- `spf-hold`: 200 milliseconds
- `spf-max-wait`: 5000 milliseconds

**Command Modes**

- Router configuration
- VRF configuration

**Command History**

- **Release 6.0**: This command was introduced.

**Usage Guidelines**

The `spf-start` time is the delay before running SPF for the first time. The `spf-hold` interval is the minimum time to elapse between subsequent SPF runs. The `spf-max-wait` time is the maximum time that can elapse before running SPF again.

**Tip**

Setting a low `spf-start` time and `spf-hold` time causes routing to switch to the alternate path more quickly if there is a failure; however, it consumes more CPU processing time.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to change the start, hold, and maximum wait interval values to 5, 1000, and 90000 milliseconds, respectively:
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# timers throttle spf 5 1000 90000
transmit-delay (OSPF)

To set the estimated time required to send a link-state update packet on the interface, use the transmit-delay command in the appropriate mode. To return to the default value, use the no form of this command.

```
transmit-delay seconds
no transmit-delay seconds
```

**Syntax Description**

```
seconds Time (in seconds) required to send a link-state update. Range is 1 to 65535 seconds.
```

**Command Default**

```
seconds: 1 second
```

**Command Modes**

- XR Config mode
- Area configuration
- Interface configuration
- Virtual-link configuration
- VRF configuration
- Multi-area configuration
- Sham-link configuration

**Command History**

```
Release Modification

Release 6.0 This command was introduced.
```

**Usage Guidelines**

Link-state advertisements (LSAs) in the update packet must have their ages incremented by the amount specified in the `seconds` argument before transmission. The value assigned should take into account the transmission and propagation delays for the interface.

If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. This setting has significance only on very low-speed networks not supported in Cisco IOS XR software or on networks such as satellite circuits that incur a very long (greater than one second) delay time.

**Task ID**

```
Task ID Operations

ospf read, write
```

**Examples**

The following example shows how to configure a transmit delay for interface HundredGigE 0/3/0/0:

```
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# area 0
RP/0/RP0/CPU0:router(config-ospf-ar)# interface HundredGigE 0/3/0/0
```
transmit-delay (OSPF)

```
RP/0/RP0/CPU0:router(config-ospf-ar-if)# transmit-delay 3
```
virtual-link (OSPF)

To define an Open Shortest Path First (OSPF) virtual link, use the `virtual-link` command in area configuration mode. To remove a virtual link, use the `no` form of this command.

```
virtual-link  router-id
no  virtual-link  router-id
```

**Syntax Description**

- `router-id` Router ID associated with the virtual link neighbor. The router ID appears in the `show ospf` command display. The router ID can be any 32-bit router ID value specified in four-part, dotted-decimal notation.

**Command Default**

No virtual links are defined.

**Command Modes**

Area configuration

**Command History**

- **Release 6.0**   This command was introduced.

**Usage Guidelines**

All areas in an OSPF autonomous system must be physically connected to the backbone area (area 0). In some cases in which this physical connection is not possible, you can use a virtual link to connect to the backbone through a nonbackbone area. You can also use virtual links to connect two parts of a partitioned backbone through a nonbackbone area. The area through which you configure the virtual link, known as a transit area, must have full routing information. The transit area cannot be a stub or not-so-stubby area.

**Task ID**

- `ospf`   read, write

**Examples**

The following example shows how to establish a virtual link with default values for all optional parameters:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# area 10.0.0.0
RP/0/RP0/CPU0:router(config-ospf-ar)# virtual-link 10.3.4.5
RP/0/RP0/CPU0:router(config-ospf-ar-vl)#
```

The following example shows how to establish a virtual link with clear text authentication called mykey:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 201
RP/0/RP0/CPU0:router(config-ospf)# area 10.0.0.0
```
virtual-link (OSPF)

RP/0/RP0/CPU0:router(config-ospf-ar)# virtual-link 10.3.4.5
RP/0/RP0/CPU0:router(config-ospf-ar-vl)# authentication-key 0 mykey
To configure an Open Shortest Path First (OSPF) VPN routing and forwarding (VRF) instance, use the \texttt{vrf} command in XR Config mode. To terminate an OSPF VRF, use the \texttt{no} form of this command.

\begin{verbatim}
\texttt{vrf vrf-name}
\texttt{no vrf vrf-name}
\end{verbatim}

**Syntax Description**

\textit{vrf-name} Identifier of an OSPF VRF. The \textit{vrf-name} argument can be specified as an arbitrary string. The strings “default” and “all” are reserved VRF names.

**Command Default**

No OSPF VRF is defined.

**Command Modes**

Router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the \texttt{vrf} command to explicitly configure a VRF. Commands configured under the VRF configuration mode (such as the \texttt{interface} [OSPF] and \texttt{authentication} commands) are automatically bound to that VRF.

To modify or remove the VRF, the \textit{vrf-id} argument format must be the same as the format used when creating the area.

**Note**

To remove the specified VRF from the router configuration, use the \texttt{no vrf vrf-id} command. The \texttt{no vrf vrf-id} command removes the VRF and all VRF options, such as \texttt{authentication}, \texttt{default-cost}, \texttt{nssa}, \texttt{range}, \texttt{stub}, \texttt{virtual-link}, and \texttt{interface}.

To avoid possibly having the router ID change under a VRF, explicitly configure the router ID using the \texttt{router-id} command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure VRF vrf1 and HundredGigE interface 0/2/0/0. HundredGigE interface 0/2/0/0 is bound to VRF vrf1 automatically.

\begin{verbatim}
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-router)# vrf vrf1
RP/0/RP0/CPU0:router(config-router)# vrf vrf1
RP/0/RP0/CPU0:router(config-router)# area area1
\end{verbatim}
RP/0/RP0/CPU0:router(config-ospf-vrf-ar)# interface HundredGigE 0/2/0/0
OSPFv3 Commands

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.
- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

This module describes the commands used to configure and monitor the IP Version 6 (IPv6) Open Shortest Path First Version 3 (OSPFv3) routing protocol.
For detailed information about OSPFv3 concepts, configuration tasks, and examples, see the Implementing OSPF on Cisco NCS 5500 Series Routers module in the "Routing Configuration Guide for Cisco NCS 5500 Series Routers".

address-family (OSPFv3)

To enter address family configuration mode for Open Shortest Path First Version 3 (OSPFv3), use the `address-family` command in the router ospfv3 configuration mode. To disable address family configuration mode, use the `no` form of this command.

```
address-family ipv6 [unicast]
no address-family ipv6 [unicast]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6</td>
<td>Specifies IP Version 6 (IPv6) address prefixes.</td>
</tr>
<tr>
<td>unicast</td>
<td>(Optional) Specifies unicast address prefixes.</td>
</tr>
</tbody>
</table>

**Command Default**

An address family is not specified.

**Command Modes**

Router ospfv3 configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the OSPFv3 router process with IPv6 unicast address prefixes:

```
RP/0/RP0/CPU0:router (config) # router ospfv3 1
RP/0/RP0/CPU0:router (config-ospfv3) # address-family ipv6 unicast
```
area (OSPFv3)

To configure an Open Shortest Path First Version 3 (OSPFv3) area, use the `area` command in an appropriate configuration mode. To remove an OSPFv3 area, use the `no` form of this command.

```
area area-id
no area area-id
```

**Syntax Description**

- `area-id` Identifier of an OSPFv3 area. The `area-id` argument can be specified as either a decimal value or as an IPv4 address.

**Command Default**

No OSPFv3 areas are defined.

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

An area must be explicitly configured with the `area` command.

Use the `area` command to place the router in area configuration mode (prompt: config-router-ar), from which you can configure area-specific settings. Commands configured under this mode (such as the `interface` command) are automatically bound to that area.

**Note**

To remove the specified OSPFv3 area from the router ospfv3 configuration, use the `no area area-id` command. The `no area area-id` command removes the OSPFv3 area including all OSPFv3 area options, and all the OSPFv3 interfaces and interface options that are configured under the area.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Read, Write</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure area 0 for OSPFv3 process 1. The HundredGigE 0/1/0/1 interface also is configured:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/1/0/1
```
**authentication (OSPFv3)**

To enable plain text, Message Digest 5 (MD5) authentication, or null authentication for an Open Shortest Path First Version 3 (OSPFv3) interface, use the `authentication` command in an appropriate configuration mode. To remove such authentication, use the `no` form of this command.

```
authentication {ipsec spi spi-value {md5 | sha1} [{clear | password}] password | disable}
no authentication
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipsec</td>
<td>Specifies IP Security (IPSec). IPSec supported only for OSPFv3.</td>
</tr>
<tr>
<td>spi spi-value</td>
<td>Specifies a security policy index (SPI) value. Range is 256 to 4294967295.</td>
</tr>
<tr>
<td>md5</td>
<td>Enables Message Digest 5 (MD5) authentication.</td>
</tr>
<tr>
<td>sha1</td>
<td>Enables SHA1 authentication.</td>
</tr>
<tr>
<td>clear</td>
<td>(Optional) Specifies that the key be unencrypted.</td>
</tr>
<tr>
<td>password</td>
<td>(Optional) Specifies that the key be encrypted using a two-way algorithm.</td>
</tr>
<tr>
<td>password</td>
<td>Any contiguous string that can be entered from the keyboard.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables authentication for OSPFv3 packets.</td>
</tr>
</tbody>
</table>

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the authentication parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the authentication parameter specified for the process.

If this command is not specified at any level, then the interface does not use authentication.

**Command Modes**

Interface configuration

Area configuration

Router configuration

Virtual-link configuration

OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `authentication` command to specify an authentication type for the interface, which overrides the authentication specified for the area to which this interface belongs. If this command is not included in the
configuration file, the authentication configured in the area to which the interface belongs is assumed (as specified by the area **authentication** command).

The authentication type and password must be the same for all OSPFv3 interfaces that are to communicate with each other through OSPFv3.

**Note**

- IPSec is supported only for Open Shortest Path First version 3 (OSPFv3).
- If OSPFv3 is configured along with IPSec authentication, then it is likely that adjacencies may flap on a Route Processor Fail Over (RPFO) even when NSR and/or Graceful Restart is enabled.

**Examples**

The following example shows how to enable MD5 authentication:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospfv3 201
RP/0/RP0/CPU0:router(config-ospfv3)# router-id 10.1.1.1
RP/0/RP0/CPU0:router(config-ospfv3)# authentication ipsec spi 500 md5
1234567890abcdef1234567890abcdef
```
auto-cost (OSPFv3)

To control how the Open Shortest Path First Version 3 (OSPFv3) protocol calculates default metrics for an interface, use the auto-cost command in an appropriate configuration mode. To set link cost based only on the interface type, use the disable form of this command. To re-enable OSPFv3 metric calculation for an interface according to the bandwidth of the interface, use the no form of this command.

```
auto-cost [ { reference-bandwidth mbps | disable } ]
no auto-cost [ { reference-bandwidth mbps | disable } ]
```

**Syntax Description**
- reference-bandwidth mbps: (Optional) Sets the rate in Mbps (bandwidth). Range is 1 to 4294967.
- disable: (Optional) Sets the link cost based only on the interface type.

**Command Default**
- mbps: 100 Mbps

**Command Modes**
- Router ospfv3 configuration
- OSPFv3 VRF configuration

**Command History**
- Release 6.0  This command was introduced.

**Usage Guidelines**
By default OSPFv3 calculates the OSPFv3 metric for an interface according to the bandwidth of the interface. The no auto-cost disable form of this command reenables OSPFv3 metric calculation for an interface according to the bandwidth of the interface.

To set link cost based only on the interface type, use the disable keyword.

If you have multiple links with high bandwidth, you might want to use a larger number to differentiate the cost on those links.

Recommended usage of cost configuration for all OSPFv3 configured interfaces is to be consistent: Either explicitly configure link costs (by using the cost command) or choose an appropriate default (by using the auto-cost command).

The value set by the cost command overrides the cost resulting from the auto-cost command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the reference value for the auto cost to 64:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
```
RP/0/RP0/CPU0:router(config-ospfv3)# auto-cost reference-bandwidth 64
capability vrf-lite (OSPFv3)

To ignore DN bit in LSAs received from peers in the given VRF and to disable automatic ABR status in that VRF, use the `capability vrf-lite` command in OSPFv3 VRF configuration mode. To disable ignoring the DN bit in LSAs and to re-enable automatic ABR status in the VRF, use the `no` form of this command.

```
capability vrf-lite
no capability vrf-lite
```

This command has no keywords or arguments.

<table>
<thead>
<tr>
<th>Command Default</th>
<th>Disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Modes</td>
<td>OSPFv3 VRF configuration</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the `capability vrf-lite` command when routers (sometimes called multi-vrf CE routers) are directly connected through interfaces associated with a VRF, but without being connected to other PEs through the MPLS/VPN BGP Backbone.

When OSPFv3 is enabled in a VRF, the router is always an ABR. With the capability vrf-lite command enabled, the router becomes an ABR only if it is connected to area 0 (backbone area), and there are other (non-backbone) areas enabled on this router in the given VRF.

Note

Routes may be re-introduced to the VPN backbone when this command is used.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read,</td>
<td>write</td>
</tr>
</tbody>
</table>

This example shows how to enable VRF-lite capability for OSPFv3 instance 1 under VRF vrf1:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)#vrf vrf1
RP/0/RP0/CPU0:router(config-ospfv3-vrf)#capability vrf-lite
```
clear ospfv3 process

To reset an Open Shortest Path First Version 3 (OSPFv3) router process without removing and reconfiguring it, use the `clear ospfv3 process` command in XR EXEC mode.

```
clear ospfv3 [process-name] [vrf vrf-name] process
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only the specified routing process is affected. Otherwise, all OSPFv3 processes are reset.

- **vrf** (Optional) Specifies VPN routing and forwarding (VRF).
  - **vrf-name** Name of a VRF.

**Command Default**

No default behavior or value

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 6.0     | This command was introduced.

**Usage Guidelines**

When the OSPFv3 router process is reset, OSPFv3 releases all resources allocated, cleans up the internal database, uninstalls routes, and resets all OSPFv3 adjacencies.

**Note**

The `clear ospfv3 process` command might clear the router ID configuration if the OSPF router ID is not explicitly configured through the `router-id` (OSPFv3), on page 510 command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to reset all OSPFv3 processes:

```
RP/0/RP0/CPU0:router# clear ospfv3 process
```

The following example shows how to reset the OSPFv3 process 1:

```
RP/0/RP0/CPU0:router# clear ospfv3 1 process
```
clear ospfv3 redistribution

To flush all the Type 5 and Type 7 link-state advertisements (LSAs) originated by an Open Shortest Path First Version 3 (OSPFv3) process, use the clear ospfv3 redistribution command in XR EXEC mode.

```
clear ospfv3 [process-name] [vrf vrf-name] redistribution
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only the specified routing process is affected. Otherwise, all OSPFv3 processes are reset.

- **vrf** (Optional) Specifies VPN routing and forwarding (VRF).

- **vrf-name** Name of a VRF.

**Command Default**

No default behavior or value

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `clear ospfv3 redistribution` command to cause the routing table to be read again. OSPFv3 regenerates and sends Type 5 and Type 7 link-state advertisements (LSAs) to its neighbors. If an unexpected route has appeared in the OSPFv3 redistribution, using this command corrects the issue.

**Note**

Use of this command can cause a significant number of LSAs to flood the network. We recommend that you use this command with caution.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear all OSPFv3 redistributed routes from other protocols:

```
RP/0/RP0/CPU0:router# clear ospfv3 redistribution
```
clear ospfv3 routes

To clear the Open Shortest Path First Version 3 (OSPFv3) internal route table, use the **clear ospfv3 routes** command in XR EXEC mode.

```
clear ospfv3 [process-name] [vrf vrf-name] routes
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>process-name</td>
<td>(Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the <strong>router ospfv3</strong> command. If this argument is included, only the specified routing process is affected. Otherwise, all OSPFv3 processes are reset.</td>
</tr>
<tr>
<td>vrf</td>
<td>(Optional) Specifies VPN routing and forwarding (VRF).</td>
</tr>
<tr>
<td>vrf-name</td>
<td>Name of a VRF.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or value

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **clear ospfv3 routes** command to force the internal route table to be repopulated by causing recalculation of the shortest path first (SPF) routing table. When the OSPFv3 routing table is cleared, OSPFv3 routes in the global routing table are also recalculated.

**Examples**

The following example shows how to clear all OSPFv3 routes from the OSPFv3 routing table and recomputes valid routes:

```
RP/0/RP0/CPU0:router# clear ospfv3 routes
```
clear ospfv3 statistics

To clear the Open Shortest Path First Version 3 (OSPFv3) statistical counters, use the `clear ospfv3 statistics` command in XR EXEC mode.

```
clear ospfv3 [process-name] [vrf vrf-name] statistics [neighbor [type interface-path-id] [router-id]]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>process-name</td>
<td>(Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the <code>router ospfv3</code> command. If this argument is included, only the specified routing process is affected.</td>
</tr>
<tr>
<td>neighbor</td>
<td>(Optional) Clears counters for the specified neighbor only.</td>
</tr>
<tr>
<td>type</td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>Physical interface or virtual interface.</td>
</tr>
<tr>
<td>router-id</td>
<td>(Optional) Specified router ID. This argument must be in 32-bit dotted-decimal notation, similar to an IPv4 address. This argument clears the counters of the specified neighbor only.</td>
</tr>
<tr>
<td>vrf</td>
<td>(Optional) Specifies VPN routing and forwarding (VRF).</td>
</tr>
<tr>
<td>vrf-name</td>
<td>Name of a VRF.</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or value

### Command Modes

XR EXEC mode

### Command History

- **Release 6.0** This command was introduced.

### Usage Guidelines

Use the `clear ospfv3 statistics` command to reset statistics so that subsequent changes are easily observed.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to clear the OSPFv3 statistical counters of all neighbors on HundredGigE interface 0/2/0/0:
clear ospfv3 statistics neighbor HundredGigE 0/2/0/0
cost (OSPFv3)

To explicitly specify the cost of the interface (network) for OSPF path calculations, use the `cost` command in an appropriate configuration mode. To remove the cost, use the `no` form of this command.

```plaintext
cost  cost
no  cost
```

**Syntax Description**
- `cost` Unsigned integer value expressed as the link-state metric. Range is 1 to 65535.

**Command Default**
- If this command is not specified in interface configuration mode, then the interface adopts the cost parameter specified by the area.
- If this command is not specified in area configuration mode, then the interface adopts the cost parameter specified for the process.
- If this command is not specified at any level, then the cost is based on the interface bandwidth, as specified by the `auto-cost` command.

**Command Modes**
- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**
- **Release 6.0** This command was introduced.

**Usage Guidelines**
- The link-state metric is advertised as the link cost in the router link advertisement.
- In general, the path cost is calculated using the following formula:
  \[ \frac{10^8}{\text{bandwidth}} \]
- Using this formula, the default path cost is 1 for OC-3 Packet-over-SONET/SDH (POS). If this value does not suit your network, you can use your own method of calculating path costs.
- The value set by the `cost` command overrides the cost resulting from the `auto-cost` command.

**Task ID**
- **Task ID**
  - `ospf` read, write

**Examples**
- The following example shows how to set the cost value to 65 for HundredGigE interface 0/1/0/1:

```plaintext
RP/0/RP0/CPU0:router(config)#  router ospfv3 201
```
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# cost 65
database-filter all out (OSPFv3)

To filter outgoing link-state advertisements (LSAs) to an Open Shortest Path First Version 3 (OSPFv3) interface, use the `database-filter all out` command in an appropriate configuration mode. To restore the forwarding of LSAs to the interface, use the `no` form of this command.

```
database-filter all out
no database-filter all out
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
If this command is not specified in interface configuration mode, then the interface adopts the database filter parameter specified for the area.

If this command is not specified in area configuration mode, then the interface adopts the database filter parameter specified for the process.

If this command is not specified in router ospfv3 configuration mode, then the database filter is disabled and all outgoing LSAs are flooded to the interface.

**Command Modes**
- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `database-filter all out` command to perform the same function that the `neighbor` command (with the `database-filter` keyword) performs on a neighbor basis.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to prevent flooding of OSPFv3 LSAs to neighbors reachable through HundredGigE interface 0/2/0/3:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/3
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# database-filter all out
```
dead-interval (OSPFv3)

To set the interval after which a neighbor is declared dead when no hello packets are observed, use the **dead-interval** command in an appropriate configuration mode. To return to the default time, use the **no** form of this command.

```
dead-interval  seconds
no  dead-interval
```

**Syntax Description**
- `seconds`: Unsigned integer that specifies the interval (in seconds). The value must be the same for all nodes on the same network link. Range is 1 to 65535.

**Command Default**
- If this command is not specified in interface configuration mode, then the interface adopts the dead interval parameter specified for the area.
- If this command is not specified in area configuration mode, then the interface adopts the dead interval parameter specified for the process.
- If this command is not specified in router ospfv3 configuration mode, then the dead interval is four times the interval set by the **hello-interval (OSPFv3)** command.

**Command Modes**
- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- Virtual-link configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
- Two Open Shortest Path First Version 3 (OSPFv3) routers do not become adjacent if their dead interval values differ.
- If the hello interval is configured, the dead interval value must be larger than the hello interval value. The dead interval value is usually configured four times larger than the hello interval value.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the OSPFv3 dead interval on HundredGigE interface 0/2/0/3 to 40 seconds:
dead-interval (OSPFv3)

RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/3
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# dead-interval 40
**default-cost (OSPFv3)**

To specify a cost for the default summary route sent into a stub area or not-so-stubby area (NSSA) for Open Shortest Path First Version 3 (OSPFv3) packets, use the `default-cost` command in area configuration mode. To remove the assigned default route cost, use the `no` form of this command.

```
default-cost  cost
no  default-cost
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cost</code></td>
<td>Cost for the default summary route used for a stub or NSSA area. The acceptable value is a 24-bit number ranging from 1 to 16777214.</td>
</tr>
</tbody>
</table>

**Command Default**

`cost`: 1

**Command Modes**

Area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `default-cost` command only on an Area Border Router (ABR) attached to a stub or an NSSA area. In all routers and access servers attached to the stub area, the area should be configured as a stub area using the `stub (OSPFv3)` command in the area configuration submode. Use the `default-cost` command only on an ABR attached to the stub area. The `default-cost` command provides the metric for the summary default route generated by the ABR into the stub area.

**Examples**

The following example shows how to assign a cost of 20 to the default route sent into area 10.15.0.0:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 201
RP/0/RP0/CPU0:router(config-ospfv3)# area 10.15.0.0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# stub
RP/0/RP0/CPU0:router(config-ospfv3-ar)# default-cost 20
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/3/0/1
```
default-information originate (OSPFv3)

To generate a default external route into an Open Shortest Path First Version 3 (OSPFv3) routing domain, use the `default-information originate` command in router ospfv3 configuration mode. To disable this feature, use the `no` form of this command.

```
default-information originate [route-policy policy-name] [always] [metric metric-value] [metric-type type-value] [tag tag-value]
```

Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy policy-name</td>
<td>(Optional) Specifies the route policy to apply to default information origination.</td>
</tr>
<tr>
<td>always</td>
<td>(Optional) Always advertises the default route regardless of whether the software has a default route.</td>
</tr>
<tr>
<td>metric metric-value</td>
<td>(Optional) Specifies a metric used for generating the default route. The default metric value is 1. The value used is specific to the protocol.</td>
</tr>
<tr>
<td>metric-type type-value</td>
<td>(Optional) Specifies an external link type associated with the default route advertised into the OSPFv3 routing domain. It can be one of the following values: 1—Type 1 external route 2—Type 2 external route</td>
</tr>
<tr>
<td>tag tag-value</td>
<td>(Optional) 32-bit dotted-decimal value attached to each external route. This is not used by the OSPFv3 protocol itself. It may be used to communicate information between autonomous system boundary routers (ASBRs). If a tag is not specified, then zero (0) is used.</td>
</tr>
</tbody>
</table>

Command Default

A default external route into an OSPFv3 routing domain is not generated.

```
metric-value : 1

type-value : Type 2

tag-value : 0
```

Command Modes

Router ospfv3 configuration

Command History

Release 6.0 This command was introduced.

Usage Guidelines

Whenever you use the `redistribute` or `default-information` command to redistribute routes into an OSPFv3 routing domain, the software automatically becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPFv3 routing domain. The software still must have a default route for itself before it generates one, except when you have specified the `always` keyword.
The default-information originate route-policy attach point conditionally injects the default route 0.0.0.0/0 into the OSPF link-state database, and is done by evaluating the attached policy. If any routes specified in the policy exist in the global RIB, then the default route is inserted into the link-state database. If there is no match condition specified in the policy, the policy passes and the default route is generated into the link-state database.

When you use the default-information originate command for the OSPFv3 process, the default network must reside in the routing table.

For information about routing policies, see the Routing Policy Commands chapter in the Routing Command Reference for Cisco NCS 5500 Series Routers and Cisco NCS 540 and NCS 560 Series Routers.

Task ID

<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to specify a metric of 100 for the default route redistributed into the OSPFv3 routing domain and an external metric type of Type 1:

```
RP/0/RP0/CPU0:router(config)#router ospfv3 109
RP/0/RP0/CPU0:router(config-ospfv3)#default-information originate metric 100 metric-type 1
```
**default-metric (OSPFv3)**

To set default metric values for routes redistributed from another protocol into Open Shortest Path First Version 3 (OSPFv3), use the **default-metric** command in an appropriate configuration mode. To return to the default state, use the **no** form of this command.

```
default-metric  value
no default-metric  value
```

**Syntax Description**

`value` Default metric value appropriate for the specified routing protocol.

**Command Default**

Built-in, automatic metric translations, as appropriate for each routing protocol

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **default-metric** command with the **redistribute** command to cause the current routing protocol to use the same metric value for all redistributed routes. A default metric helps solve the problem of redistributing routes with incompatible metrics. Whenever metrics do not convert, use a default metric to provide a reasonable substitute and enable the redistribution to proceed.

The default-metric value configured in OSPF configuration does not apply to connected routes that are redistributed to OSPF using the **redistribute connected** command. To set a non-default metric for connected routes, configure OSPF with the **redistribute connected metric** metric-value command.

**Task ID**

Task ID Operations

```
ospf  read, write
```

**Examples**

The following example shows how to configure a router with both the Intermediate System-to-Intermediate System (IS-IS) and the OSPFv3 routing protocols. The OSPFv3 routing protocol advertises IS-IS derived routes and assigns the routes a metric of 10:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# default-metric 10
RP/0/RP0/CPU0:router(config-ospfv3)# redistribute isis IS-IS_isp
```
demand-circuit (OSPFv3)

to configure the Open Shortest Path First Version 3 (OSPFv3) router process to treat the interface as an OSPFv3 demand circuit, use the demand-circuit command in an appropriate configuration mode. To remove the demand circuit designation from the interface, use the no form of this command.

demand-circuit [disable]
no demand-circuit

Syntax Description

disable (Optional) Disables the demand circuit configuration that may have been specified at a higher level in the configuration.

Command Default

If this command is not specified in interface configuration mode, then the interface adopts the demand circuit parameter specified for the area.

If this command is not specified in area configuration mode, then the interface adopts the demand circuit parameter specified for the process.

If this command is not specified at any level, then the interface is not a demand circuit.

Command Modes

Interface configuration
Area configuration
Router OSPFv3 configuration
Virtual-link configuration
OSPFv3 VRF configuration

Command History

Release Modification
Release 6.0 This command was introduced.

Usage Guidelines

On point-to-point interfaces, only one end of the demand circuit must be configured with the demand-circuit command. Periodic hello messages are suppressed and periodic refreshes of link-state advertisements (LSAs) do not flood the demand circuit. This command allows the underlying data link layer to be closed when the topology is stable. In point-to-multipoint topology, only the multipoint end must be configured with this command.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure HundredGigE interface 0/3/0/1 as an on-demand circuit:
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3)# interface HundredGigE 0/3/0/1
RP/0/RP0/CPU0:router(config-ospfv3-if)# demand-circuit
distance ospfv3

To define the Open Shortest Path First Version 3 (OSPFv3) route administrative distances based on route type, use the `distance ospfv3` command in router ospfv3 configuration mode. To restore the default value, use the `no` form of this command.

```
distance ospfv3 {intra-area | inter-area | external} distance
no distance ospfv3
```

**Syntax Description**

- `intra-area` | `inter-area` | `external`
  - Type of area. It can be one of the following values:
    - `intra-area` — All routes within an area.
    - `inter-area` — All routes from one area to another area.
    - `external` — All routes from other routing domains, learned by redistribution.
  - `distance` — The route administrative distance.

**Command Default**

- `distance`: 110

**Command Modes**

- Router ospfv3 configuration

**Command History**

- **Release** Modification
  - Release 6.0  This command was introduced.

**Usage Guidelines**

- You must specify one of the keywords.

- Use the `distance ospfv3` command to perform the same function as the `distance` command used with an access list. However, the `distance ospfv3` command sets a distance for an entire group of routes, rather than a specific route that passes an access list.

- A common reason to use the `distance ospfv3` command is when you have multiple OSPFv3 processes with mutual redistribution, and you want to prefer internal routes from one over external routes from the other.

**Task ID**

- **Task ID** Operations
  - `ospf` read, write

**Examples**

The following example shows how to change the external distance to 200, making it less reliable:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# redistribute ospfv3 2
RP/0/RP0/CPU0:router(config-ospfv3)# distance ospfv3 external 200
RP/0/RP0/CPU0:router(config-ospfv3)# exit
RP/0/RP0/CPU0:router(config)# router ospfv3 2
RP/0/RP0/CPU0:router(config-ospfv3)# redistribute ospfv3 1
```
distance ospfv3

RP/0/RP0/CPU0:router(config-ospfv3)# distance ospfv3 external 200
**distribute-list prefix-list in**

To filter the routes that Open Shortest Path First Version 3 (OSPFv3) installs in the Routing Information Base (RIB), use the `distribute-list prefix-list in` command in an appropriate configuration mode. To remove the filter, use the `no` form of this command.

```
distribute-list prefix-list prefix-list-name in
no distribute-list prefix-list prefix-list-name in
```

**Syntax Description**

- `prefix-list-name`: IP Version 6 (IPv6) prefix list name. The list defines which IPv6 prefixes are installed in the RIB.

**Command Default**

All routes learned by OSPFv3 are installed in the RIB.

**Command Modes**

- Interface configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Usage Guidelines**

Use the `distribute-list prefix-list` command to limit the routes that OSPFv3 installs in the RIB of your router. This command does not affect the information sent to other OSPFv3 routers or the routes that these routers compute and install.

**Note**

Because the other OSPFv3 routers are not aware of any omissions in the RIB, they may send traffic addressed to the missing prefixes. If no other provision has been made for these prefixes, the packets are dropped.

When this command is specified in router ospf3 configuration mode, the filter applies to all routes computed by OSPFv3.

When this command is specified in interface configuration mode, the filter applies only to routes that forward outgoing traffic over that interface.

**Examples**

The following example shows how to prevent OSPFv3 from installing any routes that have 2001:e624 as the first 32 bits of the address. OSPFv3 is also prevented from installing routes to 2002::/16 that use HundredGigE interface 0/2/0/0 as the next-hop interface:

```
RP/0/RP0/CPU0:router(config)# ipv6 prefix-list prefixlist1
RP/0/RP0/CPU0:router(config-ipv6-pfx)# deny 2001:e624::/32 le 128
RP/0/RP0/CPU0:router(config-ipv6-pfx)# permit ::/0 le 128
!
RP/0/RP0/CPU0:router(config)# ipv6 prefix-list prefixlist2
```
RP/0/RP0/CPU0:router(config-ipv6-pfx)# deny 2002::/16
RP/0/RP0/CPU0:router(config-ipv6-pfx)# permit ::/0 le 128
!
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# distribute-list prefix-list preflist1 in
RP/0/RP0/CPU0:router(config-ospfv3)# area 1
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/0
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# distribute-list prefix-list preflist2 in
**distribute-list prefix-list out**

To filter the routes redistributed into Open Shortest Path First Version 3 (OSPFv3) from other routing protocols, use the `distribute-list prefix-list out` command in an appropriate configuration mode. To remove the filter, use the `no` form of this command.

```plaintext
distribute-list prefix-list prefix-list-name out [protocol [process-id]]
no distribute-list prefix-list prefix-list-name out [protocol [process-id]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix-list-name</td>
<td>IP Version 6 (IPv6) prefix list name. The list defines which IPv6 prefixes are installed in the RIB.</td>
</tr>
<tr>
<td>protocol</td>
<td>(Optional) Source protocol from which routes are being redistributed. It can be one of the following keywords: <code>bgp</code>, <code>isis</code>, <code>ospfv3</code>, <code>static</code>, and <code>connected</code>. The static keyword is used to redistribute IPv6 static routes. The connected keyword refers to routes that are established automatically because IPv6 is enabled on an interface. For routing protocols such as OSPFv3 and Intermediate System-to-Intermediate System (IS-IS), these routes are redistributed as external to the autonomous system.</td>
</tr>
</tbody>
</table>
| process-id  | (Optional) For the `bgp` keyword, an autonomous system number has the following ranges:  
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.  
  - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.  
  - Range for 4-byte Autonomous system numbers (ASNs) in as dot format is 1.0 to 65535.65535.  
For the `isis` keyword, an optional argument that defines a meaningful name for a routing process. You can specify only one IS-IS process for each router. Creating a name for a routing process means that you use names when configuring routing.  
For the `ospfv3` keyword, an appropriate OSPFv3 process name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string. |

**Command Default**

All routes from protocols specified in the `redistribute (OSPFv3), on page 504` command are redistributed into OSPFv3.

**Command Modes**

- Router OSPFv3 configuration
- OSPFV3 VRF configuration

**Command History**

- **Release**  **Modification**
  - Release 6.0  This command was introduced.

**Usage Guidelines**

Routes may be redistributed into OSPFv3 from several other routing protocols or from other OSPFv3 processes. These routes are then communicated to other OSPFv3 routes through Type 5 (External) or Type 7 not-so-stubby...
area (NSSA) link-state advertisements (LSAs). Use the **distribute-list prefix-list out** command to control redistribution by matching redistributed routes against an IPv6 prefix list. Only routes permitted by the prefix list are redistributed into OSPFv3.

Each protocol being redistributed into OSPFv3 can have a separate prefix list. In addition, a prefix list can be defined that applies to all protocols.

**Examples**

The following examples show how to prevent OSPFv3 from redistributing routes that have 2001:e624 as the first 32 bits of the address. In addition, routes with a prefix beginning with 2064 are not redistributed from Border Gateway Protocol (BGP) autonomous system 1, and only those routes are redistributed from BGP autonomous system 5.

```
RP/0/RP0/CPU0:router(config)# ipv6 prefix-list p1
RP/0/RP0/CPU0:router(config-ipv6-pfx)# deny 2001:e624::/32 le 128
RP/0/RP0/CPU0:router(config-ipv6-pfx)# permit ::/0 le 128
!
RP/0/RP0/CPU0:router(config)# ipv6 prefix-list p2
RP/0/RP0/CPU0:router(config-ipv6-pfx)# deny 2064::/16 le 128
RP/0/RP0/CPU0:router(config-ipv6-pfx)# permit ::/0 le 128
!
RP/0/RP0/CPU0:router(config)# ipv6 prefix-list p3
RP/0/RP0/CPU0:router(config-ipv6-pfx)# permit 2064::/16 le 128
!
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# redistribute bgp 1
RP/0/RP0/CPU0:router(config-ospfv3)# redistribute bgp 5
RP/0/RP0/CPU0:router(config-ospfv3)# distribute-list prefix-list p1 out
RP/0/RP0/CPU0:router(config-ospfv3)# distribute-list prefix-list p2 out bgp 1
RP/0/RP0/CPU0:router(config-ospfv3)# distribute-list prefix-list p3 out bgp 5
```
domain-id (OSPFv3)

To specify the Open Shortest Path First Version 3 (OSPFv3) VPN routing and forwarding (VRF) domain ID, use the **domain-id** command in VRF configuration mode. To remove the OSPFv3 VRF domain ID, use the **no** form of this command.

```
domain-id [secondary] type [{0005 | 0105 | 0205}] value domain-id_value
no domain-id [secondary] type [{0005 | 0105 | 0205}] value domain-id-value
```

### Syntax Description

- **secondary** (Optional) OSPFv3 secondary domain ID.
- **type** Primary OSPFv3 domain ID in hexadecimal format.
  - 0005 — Type 0x0005
  - 0105 — Type 0x0105
  - 0205 — Type 0x0205
- **value** OSPF domain ID value in hexadecimal format.
- **domain-id-value** OSPF domain ID extended community value as a 6 byte hexadecimal number.

### Command Default
No domain ID is specified.

### Command Modes
VRF configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
If no value is specified for the domain ID, the default is Null (all zeros) primary domain ID. One or more secondary domain IDs can be specified.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to specify a domain ID with type 0105 and value AABBCDDEEFF:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf 1
RP/0/RP0/CPU0:router(config-ospf)# vrf vrf_1
RP/0/RP0/CPU0:router(config-ospf-vrf)# domain-id type 0105 value AABBCDDEEFF
```
encryption

To encrypt and authenticate Open Shortest Path First Version 3 (OSPFv3) packets, use the `encryption` command in an appropriate configuration mode. To remove the encryption, use the `no` form of this command.

```
encryption {disable | ipsec spi spi-value esp {3des | aes [{192 | 256}] | des | null [{clear | password}]}
encrypt-password} [authentication {md5 | sha1} [{clear | password}] auth-password]
```

Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables OSPFv3 packet encryption.</td>
</tr>
<tr>
<td>ipsec spi</td>
<td>Specifies IPSec ESP encryption and authentication with the Security Parameter Index (SPI) value. IPsec supported only for OSPFv3.</td>
</tr>
<tr>
<td>spi-value</td>
<td>SPI value. Range is 256 to 4294967295.</td>
</tr>
<tr>
<td>esp</td>
<td>Specifies Encryption Service Payload (ESP) encryption parameters.</td>
</tr>
<tr>
<td>3des</td>
<td>Specifies the triple DES algorithm.</td>
</tr>
<tr>
<td>aes</td>
<td>Specifies the Advanced Encryption Standard (AES) algorithm.</td>
</tr>
<tr>
<td>192</td>
<td>(Optional) Specifies the 192-bit AES algorithm</td>
</tr>
<tr>
<td>256</td>
<td>(Optional) Specifies the 256-bit AES algorithm</td>
</tr>
<tr>
<td>des</td>
<td>Specifies the Data Encryption Standard (DES) algorithm.</td>
</tr>
<tr>
<td>null</td>
<td>Specifies no AES algorithm.</td>
</tr>
<tr>
<td>md5</td>
<td>Enables Message Digest 5 (MD5) authentication.</td>
</tr>
<tr>
<td>sha1</td>
<td>Enables SHA1 authentication.</td>
</tr>
<tr>
<td>clear</td>
<td>Specifies that the key be unencrypted.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies that the key be encrypted using a two-way algorithm.</td>
</tr>
<tr>
<td>encrypt-password</td>
<td>Any contiguous string that can be entered from the keyboard as the encryption password.</td>
</tr>
<tr>
<td>auth-password</td>
<td>Any contiguous string that can be entered from the keyboard as the authentication password.</td>
</tr>
</tbody>
</table>

Command Default

No default behavior or values.

Command Modes

- Interface configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration
Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the `encryption` command to encrypt and authenticate OSPFv3 packets.

- IPSec is supported only for Open Shortest Path First version 3 (OSPFv3).
- If OSPFv3 is configured along with IPsec authentication, then it is likely that adjacencies may flap on a Route Processor Fail Over (RPFO) even when NSR and/or Graceful Restart is enabled.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to encrypt and authenticate OSPFv3 packets:

```
RP/0/RP0/CPU0:router(config)#router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)#encryption ipsec spi 256 esp 3des clear
```
flood-reduction (OSPFv3)

To suppress the unnecessary flooding of link-state advertisements (LSAs) in stable topologies, use the `flood-reduction` command in an appropriate configuration mode. To disable this feature, use the `no` form of this command.

```
flood-reduction [disable]
no flood-reduction
```

**Syntax Description**

<table>
<thead>
<tr>
<th>disable</th>
<th>(Optional) Turns off this functionality at a specific level.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note</td>
<td>The <code>disable</code> keyword is not available in router ospfv3 configuration mode.</td>
</tr>
</tbody>
</table>

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the flood reduction parameter specified by area.

If this command is not specified in area configuration mode, then the interface adopts the flood reduction parameter specified for the process.

If this command is not specified at any level, then flood reduction is disabled.

**Command Modes**

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFV3 VRF configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

All routers that support Open Shortest Path First Version 3 (OSPFv3) demand circuits are compatible with routers supporting flooding reduction.

**Task ID**

```
Task ID Operations
ospf read, write
```

**Examples**

The following example shows how to reduce the flooding of unnecessary LSAs for area 0:

```
RP/0/RP0/CPU0:router (config)# router ospfv3 1
RP/0/RP0/CPU0:router (config-ospfv3)# area 0
RP/0/RP0/CPU0:router (config-ospfv3-ar)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router (config-ospfv3-ar-if)# flood-reduction
```
graceful-restart (OSPFv3)

To enable graceful restart, use the **graceful-restart** command in an appropriate configuration mode. To disable this feature, use the **no** form of this command.

```
graceful-restart [{helper disable | interval interval | lifetime lifetime}]
no graceful-restart [{helper disable | interval interval | lifetime lifetime}]
```

**Syntax Description**

- **helper disable** (Optional) Disables the routers helper support level.
- **interval interval** (Optional) Specifies the minimum interval between graceful restarts. Range is 90 to 3600 seconds.
- **lifetime lifetime** (Optional) Specifies the maximum route lifetime following a restart. Range is 90 to 3600 seconds.

**Command Default**

No default behavior or values.

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

- Release 6.0 This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable the Graceful Restart feature with a minimum interval between restarts of 300 seconds:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# graceful-restart interval 300
```
**hello-interval (OSPFv3)**

To specify the interval between hello packets that Open Shortest Path First Version 3 (OSPFv3) sends on an interface, use the `hello-interval` command in an appropriate configuration mode. To return to the default time, use the `no` form of this command.

```
hello-interval seconds
no hello-interval
```

**Syntax Description**

`seconds` Interval (in seconds). The value must be the same for all nodes on a specific network.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the hello interval parameter specified by area.

If this command is not specified in area configuration mode, then the interface adopts the hello interval parameter specified for the process.

If this command is not specified at any level, then the hello interval is 10 seconds (broadcast) or 30 seconds (non-broadcast).

**Command Modes**

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- Virtual-link configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The hello interval value is advertised in the hello packets. The shorter the hello interval, the faster topological changes are detected, but more routing traffic ensues. This value must be the same for all routers and access servers on a specific network.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the interval between hello packets to 15 seconds on GigabitEthernet interface 0/3/0/2:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface GigabitEthernet 0/3/0/2
```
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# hello-interval 15
**instance (OSPFv3)**

To set the 8-bit instance ID used in Open Shortest Path First Version 3 (OSPFv3) packets sent on an interface, use the `instance` command in an appropriate configuration mode. To remove the instance ID, use the `no` form of this command.

```
instance instance-id
no instance instance-id
```

**Syntax Description**

- `instance-id`: Instance identifier sent in OSPFv3 packets. Range is 0 to 255. The same value must be used by all the communicating OSPFv3 routers on a link.

**Command Default**

- If this command is not specified in interface configuration mode, then the interface adopts the instance parameter specified by the area.
- If this command is not specified in area configuration mode, then the interface adopts the instance parameter specified for the process.
- If this command is not specified at any level, then the instance is 0.

**Command Modes**

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The OSPFv3 routing protocol allows multiple unrelated OSPFv3 processes to share a link by using an 8-bit “instance” value to demultiplex the protocol packets. Each OSPFv3 process sets its configured instance value in the OSPFv3 packets that it sends, and ignores received packets with instance values from other OSPFv3 processes.

**Note**

The `instance-id` argument should not be confused with the `process-name` argument that is specified by the `router ospf3` command. The former is an 8-bit integer that is sent to other routers as part of the OSPFv3 protocol, and the latter is a 1- to 40-character ASCII string that is significant only within a given router. The instance ID value is also unrelated to the router ID that is specified by the `router-id` command, which is a 32-bit integer value that uniquely identifies a router within an OSPFv3 routing domain.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to set the instance value for HundredGigE interface 0/3/0/1 to 42:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/3/0/1
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# instance 42
```
interface (OSPFv3)

To define the interfaces on which Open Shortest Path First Version 3 (OSPFv3) runs, use the `interface` command in an appropriate configuration mode. To disable OSPFv3 routing for an interface, use the `no` form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>type</code></th>
<th>Interface type. For more information, use the question mark (?) online help function.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface-path-id</code></td>
<td>Physical interface or virtual interface.</td>
</tr>
</tbody>
</table>

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

An interface is not defined.

**Command Modes**

Area configuration

OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `interface` command to associate a specific interface with an OSPFv3 area. The interface remains associated with the area even when the IPv6 address of the interface changes.

Similar to IPv4 address behavior for the `interface` command, all configured IPv6 addresses are advertised on an interface after the interface is associated to the OSPF routing process. The only difference is, IPv6 addresses can have multiple primary addresses.

This command places the router in interface configuration mode (prompt: config-router-ar-if), from which you can configure interface-specific settings. Commands configured under this mode (such as the `cost` command) are automatically bound to that interface.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to define two interfaces that belong to area 1. The cost value for packets on HundredGigE interface 0/3/0/1 is set at 40; the cost value for HundredGigE interface 0/3/0/2 is 65:
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 1
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/3/0/1
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# cost 40
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/3/0/2
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# cost 65
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
log adjacency changes (OSPFv3)

To change the default syslog messages for Open Shortest Path First Version 3 (OSPFv3) neighbor state changes, use the `log adjacency changes` command in an appropriate configuration mode. To suppress all adjacency change messages, use the `disable` keyword.

```
log adjacency changes [ { detail | disable } ]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>detail</code></td>
<td>(Optional) Provides all (DOWN, INIT, 2WAY, EXSTART, EXCHANGE, LOADING, FULL) adjacency state changes.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>(Optional) Disables the neighbor state change messages.</td>
</tr>
</tbody>
</table>

**Command Default**

Neighbor state change messages are enabled.

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, you are notified of OSPFv3 neighbor changes without explicitly configuring the `log adjacency changes` command. The syslog messages that are sent provide a high-level view of changes to the state of the OSPFv3 peer relationship.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td></td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to disable neighbor state change messages:

```bash
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# log adjacency changes disable
```

The following example shows how to re-enable syslog messages for any OSPFv3 neighbor state changes:

```bash
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# log adjacency changes
```
maximum interfaces (OSPFv3)

To control the maximum number of interfaces that can be configured under an Open Shortest Path First Version 3 (OSPFv3) process, use the **maximum interfaces** command in an appropriate configuration mode. To remove the **maximum interfaces** command from the configuration file and restore the system to its default condition with respect to the routing protocol, use the **no** form of this command.

**maximum interfaces number-interfaces**

**no maximum interfaces**

<tr>
<td>RP/0/RP0/CPU0:router(config-ospfv3)# maximum interfaces 1500</td>
<td></td>
</tr>
</tbody>
</table>
maximum paths (OSPFv3)

To control the maximum number of parallel routes that the Open Shortest Path First Version 3 (OSPFv3) can support, use the **maximum paths** command in an appropriate configuration mode. To remove the **maximum paths** command from the configuration file and restore the system to its default condition with respect to the routing protocol, use the **no** form of this command.

```
maximum paths maximum-routes-number
no maximum paths
```

**Syntax Description**

- `maximum-routes-number`  
  Maximum number of parallel routes that OSPFv3 can install in a routing table. Range is 1 to 32.
  - **Note** The maximum number of paths that can be configured is 32.
  - **Note** The maximum number of paths that can be configured is 16.

**Command Default**

- 32 paths
- 16 paths

**Command Modes**

- Router OSPFv3 configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the maximum number of parallel routes is reduced, all existing paths are pruned and paths reinstalled at the new maximum number. During this route-reduction period, you may experience some packet loss for a few seconds. This may impact route traffic.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to allow a maximum of two paths to a destination:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# maximum paths 2
```
maximum redistributed-prefixes (OSPFv3)

To limit the number of prefixes redistributed into Open Shortest Path First Version 3 (OSPFv3) or to generate a warning when the number of prefixes redistributed into OSPFv3 reaches a maximum, use the **maximum redistributed-prefixes** command in an appropriate configuration mode. To remove the values, use the no form of this command.

```
maximum redistributed-prefixes  limit  [threshold]  [warning-only]
no  maximum redistributed-prefixes
```

**Syntax Description**

- **limit**
  - Maximum number of IP Version 6 (IPv6) prefixes that are allowed to be redistributed into OSPFv3, or, if the **warning-only** keyword is present, sets the number of prefixes allowed to be redistributed into OSPFv3 before the system logs a warning message. Range is 1 to 4294967295.
  - **Note** If the **warning-only** keyword is also configured, this value does not limit redistribution; it is simply the number of redistributed prefixes that, when reached, causes a warning message to be logged.

- **threshold** (Optional) Percentage of the value set for the maximum number of redistributed prefixes that, when reached, causes a warning message to be logged.

- **warning-only** (Optional) Causes a warning to be logged when the number of routes defined by the **limit** argument have been redistributed. Additional redistribution is not prevented.

**Command Default**

- **limit**: 10240
- **threshold**: 75 percent

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

- **Release** 6.0  This command was introduced.

**Usage Guidelines**

If someone mistakenly injects a large number of IPv6 routes into OSPFv3, perhaps by redistributing Border Gateway Protocol (BGP) into OSPFv3, the network can be severely flooded. Limiting the number of redistributed routes prevents this potential problem.

When the **maximum redistributed-prefixes** command is configured, if the number of redistributed routes reaches the maximum value configured, no more routes are redistributed (unless the **warning-only** keyword is configured).

The redistribution limit applies only to external IPv6 prefixes. Default routes and summarized routes are not limited.

The limit is tracked separately for each not-so-stubby-area (NSSA) because redistribution to NSSAs is done independently for each NSSA and independently of all other regular areas.
Select a maximum value based on your knowledge of how many prefixes are redistributed on the router to the OSPFv3 process.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set a maximum of 2000 prefixes that can be redistributed into OSPFv3 process 1. If the number of prefixes redistributed reaches 75 percent of 2000 (1500 prefixes), a warning message is logged. Another warning is logged if the limit is reached and no more routes are redistributed.

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# redistribute bgp 2406
RP/0/RP0/CPU0:router(config-ospfv3)# maximum redistributed-prefixes 2000
```
mtu-ignore (OSPFv3)

To prevent the Open Shortest Path First Version 3 (OSPFv3) router process from checking whether neighbors are using the same maximum transmission unit (MTU) on a common interface when exchanging database descriptor (DBD) packets, use the `mtu-ignore` command in an appropriate configuration mode. To return to the default state, use the `no` form of this command.

```
mtu-ignore [disable]
no mtu-ignore
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>(Optional) Disables the attribute in instances in which it is specified at a higher level in the configuration.</td>
</tr>
</tbody>
</table>

**Note** The `disable` keyword is not available in router ospfv3 configuration mode.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the MTU ignore parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the MTU ignore parameter specified for the process.

If this command is not specified at any level, then OSPFv3 checks the MTU received from neighbors when exchanging DBD packets.

**Command Modes**

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `mtu-ignore` command to check whether OSPFv3 neighbors are using the same MTU on a common interface. This check is performed when neighbors exchange DBD packets. If the receiving MTU in the DBD packet is higher than the MTU configured on the incoming interface, OSPF adjacency is not established.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to disable MTU mismatch detection on received DBD packets on HundredGigE interface 0/1/0/3:
mtu-ignore (OSPFv3)

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# mtu-ignore
```
neighbor (OSPFv3)

To configure Open Shortest Path First Version 3 (OSPFv3) routers interconnecting to nonbroadcast networks, use the `neighbor` command in interface configuration mode. To remove a configuration, use the `no` form of this command.

```
neighbor ipv6-address [priority number] [poll-interval seconds] [cost number] [database-filter all out]
no neighbor ipv6-address [priority number] [poll-interval seconds] [cost number] [database-filter all out]
```

**Syntax Description**

- `ipv6-address`: Link-local IP Version 6 (IPv6) address of the neighbor. This argument must be in the form documented in RFC 2373, in which the address is specified in hexadecimal using 16-bit values between colons.

- `priority number`: (Optional) Specifies an 8-bit number indicating the router priority value of the nonbroadcast neighbor associated with the IP address specified. The `priority` keyword does not apply to point-to-multipoint interfaces.

- `poll-interval seconds`: (Optional) Specifies an unsigned integer value (in seconds) reflecting the poll interval. RFC 1247 recommends that this value be much larger than the hello interval. The `poll-interval` keyword does not apply to point-to-multipoint interfaces.

- `cost number`: (Optional) Assigns a cost to the neighbor, in the form of an integer from 1 to 65535. Neighbors with no specific cost configured assume the cost of the interface, based on the `cost` command. On point-to-multipoint interfaces, `cost number` is the only keyword and argument combination that works. The `cost` keyword does not apply to nonbroadcast multiaccess (NBMA) networks.

- `database-filter all out`: (Optional) Filters outgoing link-state advertisements (LSAs) to an OSPFv3 neighbor.

**Command Default**

No configuration is specified.

- `priority number`: 0
- `poll-interval seconds`: 120 seconds (2 minutes)

**Command Modes**

Interface configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

One neighbor entry must be included in the software configuration for each known nonbroadcast network neighbor. The neighbor address must be the IPv6 link-local address of the interface.

If a neighboring router has become inactive (hello packets have not been seen for the router dead interval period), it may still be necessary to send hello packets to the dead neighbor. These hello packets are sent at a reduced rate called the poll interval.
When the router starts up, it sends only hello packets to those routers with nonzero priority; that is, routers that are eligible to become designated routers (DRs) and backup designated routers (BDRs). After the DR and BDR are selected, the DR and BDR then start sending hello packets to all neighbors to form adjacencies.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to declare a router at address fe80::3203:a0ff:fe9d:f3fe on a nonbroadcast network:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# network non-broadcast
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# neighbor fe80::3203:a0ff:fe9d:f3fe
```
network (OSPFv3)

To configure the Open Shortest Path First Version 3 (OSPFv3) network type to a type other than the default for a given medium, use the `network` command in an appropriate configuration mode. To return to the default value, use the `no` form of this command.

```
network {broadcast | non-broadcast | {point-to-multipoint | non-broadcast | point-to-point}}
no network
```

**Syntax Description**

- **broadcast** Sets the network type to broadcast.
- **non-broadcast** Sets the network type to nonbroadcast multiaccess (NBMA).
- **point-to-multipoint** Sets the network type to point-to-multipoint.
- **[non-broadcast]** (Optional) Sets the point-to-multipoint network to be nonbroadcast. If you use the `non-broadcast` keyword, the `neighbor` command is required.
- **point-to-point** Sets the network type to point-to-point.

**Command Default**

If this command is not specified in interface configuration mode, then the interface adopts the network parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the network parameter specified for the process.

If this command is not specified at any level, then the OSPFv3 network type is the default of the given medium.

**Command Modes**

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

Use the `network` command to configure broadcast networks as NBMA networks when, for example, routers in your network do not support multicast addressing.

Most times, it is assumed that when you configure NBMA networks as either broadcast or nonbroadcast, there are virtual circuits from every router to every router or fully meshed network. However, there are other configurations where this assumption is not true; for example, a partially meshed network. In these cases, you can configure the OSPFv3 network type as a point-to-multipoint network. Routing between two routers that are not directly connected goes through the router that has virtual circuits to both routers. You need not configure neighbors when using this command.

If the `network` command is issued on an interface that does not allow it, this command is ignored.
OSPFv3 has two features related to point-to-multipoint networks. One feature applies to broadcast networks and the other feature applies to nonbroadcast networks:

- On point-to-multipoint, broadcast networks, you can use the `neighbor` command, and you must specify a cost to that neighbor.
- On point-to-multipoint, nonbroadcast networks, you must use the `neighbor` command to identify neighbors. Assigning a cost to a neighbor is optional.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure an Ethernet interface as point-to-point:

```plaintext
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/1/0/3
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# network point-to-point
```
To configure an area as a not-so-stubby area (NSSA), use the `nssa` command in area configuration mode. To remove the NSSA distinction from the area, use the `no` form of this command.

```
nssa [no-redistribution] [default-information-originate [metric metric-value | metric-type type-value]] [no-summary]
```

### Syntax Description

- **no-redistribution** (Optional) Imports routes into the normal areas, but not into the NSSA area, by the `redistribute` command when the router is an NSSA area border router (ABR).
- **default-information-originate** (Optional) Generates a Type 7 default into the NSSA area. This keyword takes effect only on an NSSA ABR or NSSA autonomous system boundary router (ASBR).
- **metric metric-value** (Optional) Specifies a metric used for generating the default route. If you do not specify a default route metric value using the `nssa` and `default-metric` commands, the default metric value is 10. The value used is specific to the protocol.
- **metric-type type-value** (Optional) Specifies an external link type associated with the default route advertised into the Open Shortest Path First Version 3 (OSPFv3) routing domain. It can be one of the following values:
  1 — Type 1 external route
  2 — Type 2 external route
- **no-summary** (Optional) Prevents an (ABR) from sending summary link advertisements into the NSSA area.

### Command Default

No NSSA area is defined.

If you do not specify a value using the `default-metric` command, the default metric value is 10.

The default `type-value` is Type 2 external route.

### Command Modes

Area configuration

### Command History

```
Release  Modification

Release 6.0 This command was introduced.
```

### Usage Guidelines

A default route need not be defined in an NSSA ABR when the `nssa` command is configured. However, if this command is configured on an NSSA ASBR, then a default route must be defined.

### Note

NSSA cannot be configured for area 0 (backbone area).
The following example shows how to configure area 1 as an NSSA area:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# router-id 10.18.1.1
RP/0/RP0/CPU0:router(config-ospfv3)# area 1
RP/0/RP0/CPU0:router(config-ospfv3-ar)# nssa
```
ospfv3 name-lookup

To configure Open Shortest Path First Version 3 (OSPFv3) to look up Domain Name System (DNS) names, use the ospfv3 name-lookup command in XR Config mode mode. To disable this function, use the no form of this command.

ospfv3 name-lookup
no ospfv3 name-lookup

Syntax Description
This command has no arguments or keywords.

Command Default
Routers are displayed by router ID or neighbor ID.

Command Modes
XR Config mode

Command History
Release   Modification
Release 6.0  This command was introduced.

Usage Guidelines
Use the ospfv3 name-lookup command to simplify the task of searching for a router. Routers are displayed by name rather than by router ID or neighbor ID.

Task ID
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples
The following example shows how to configure OSPFv3 to look up DNS names for use in all OSPFv3 show command displays:

RP/0/RP0/CPU0:router(config)# ospfv3 name-lookup
packet-size (OSPFv3)

To configure the size of Open Shortest Path First Version 3 (OSPFv3) packets up to the size specified by the maximum transmission unit (MTU), use the `packet-size` command in an appropriate configuration mode. To disable this function and reestablish the default packet size, use the `no` form of this command.

```
packet-size  bytes
no packet-size
```

**Syntax Description**

| bytes | Size in bytes. Range is 256 to 10000 bytes. |

**Command Default**

If not specified, the default packet size is 1500 bytes.

**Command Modes**

- Router OSPFv3 configuration
- Area configuration
- Interface configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `packet-size` command to customize the size of OSPFv3 packets. The OSPFv3 protocol compares the packet size and the MTU size and uses the lower packet size value.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the packet size:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospf osp3
RP/0/RP0/CPU0:router(config-ospf3)# packet-size 3500
```
passive (OSPFv3)

To suppress the sending of Open Shortest Path First Version 3 (OSPFv3) packets on an interface, use the `passive` command in an appropriate configuration mode. To remove the passive configuration, use the `no` form of this command.

```
passive [disable]
no passive
```

Syntax Description

- **disable** (Optional) Sends OSPFv3 updates.

  **Note** The `disable` keyword is not available in router ospfv3 configuration mode.

Command Default

If this command is not specified in interface configuration mode, then the interface adopts the passive parameter specified by the area.

If this command is not specified in area configuration mode, then the interface adopts the passive parameter specified for the process.

If this command is not specified at any level, then the passive parameter is disabled and OSPFv3 updates are sent on the interface.

Command Modes

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

OSPF routing information is neither sent nor received through the specified router interface. The specified interface address appears as a stub network in the OSPF domain.

Task ID

- **Task ID**
  - ospf read, write

Examples

The following example shows that OSPFv3 updates run over HundredGigE interface 0/3/0/0, 0/2/0/0, and 0/2/0/2. All other interfaces suppress sending OSPFv3 updates because they are in passive mode.

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# router-id 10.0.0.206
```
RP/0/RP0/CPU0:router(config-ospfv3)\# passive
RP/0/RP0/CPU0:router(config-ospfv3)\# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# passive disable
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/3/0/1
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospfv3-ar)# exit
RP/0/RP0/CPU0:router(config-ospfv3)# area 1
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/0
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/1
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/2
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# exit
priority (OSPFv3)

To set the router priority for an interface, which helps determine the designated router for an Open Shortest Path First Version 3 (OSPFv3) link, use the `priority` command in an appropriate configuration mode. To return to the default value, use the `no` form of this command.

```
priority value
no priority
```

**Syntax Description**

- `value`: 8-bit unsigned integer indicating the router priority value. Range is 0 to 255.

**Command Default**

- If this command is not specified in interface configuration mode, then the interface adopts the priority parameter specified by the area.
- If this command is not specified in area configuration mode, then the interface adopts the priority parameter specified by the process.
- If this command is not specified at any level, then the default priority is 1.

**Command Modes**

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When two routers attached to a network both attempt to become the designated router, the one with the higher router priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. A router with a router priority set to zero is ineligible to become the designated router or backup designated router. Router priority is configured only for interfaces to broadcast and nonbroadcast multiaccess (NBMA) networks.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the router priority value to 4 on HundredGigE interface 0/1/0/1:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-area)# interface HundredGigE 0/1/0/1
```
**protocol shutdown (OSPFv3)**

To disable an instance of the Open Shortest Path First protocol, version 3 (OSPFv3), so that it cannot form an adjacency on any interface, use the **protocol shutdown** command in the ospfv3 configuration mode. To re-enable the OSPF protocol, use the **no** form of this command.

```
protocol shutdown
no protocol shutdown
```

**Command Default**

| None |

**Command Modes**

ospfv3 configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **protocol shutdown** command to disable the OSPFv3 protocol for a specific routing instance without removing any existing OSPF configuration parameters.

The OSPFv3 protocol continues to run on the router and you can use the current OSPFv3 configuration, but OSPFv3 does not form any adjacencies on any interface.

This command is similar to performing the **no router ospf** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to disable the OSPFv3:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospfv3 100
RP/0/RP0/CPU0:router(config-ospfv3)# protocol shutdown
```
To consolidate and summarize routes at an area boundary for Open Shortest Path First Version 3 (OSPFv3), use the `range` command in area configuration mode. To restore the default values, use the `no` form of this command.

```
range ipv6-prefix/prefix-length [ { advertise | not-advertise } ] [ cost number ]
no range ipv6-prefix/prefix-length [ { advertise | not-advertise } ] [ cost number ]
```

**Syntax Description**

- `ipv6-prefix` Summary prefix designated for a range of IP Version 6 (IPv6) prefixes. This argument must be in the form documented in RFC 2373, in which the address is specified in hexadecimal using 16-bit values between colons.

- `/ prefix-length` Length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.

- `advertise` (Optional) Sets the address range status to advertise and generates a Type 3 summary link-state advertisement (LSA).

- `not-advertise` (Optional) Sets the address range status to DoNotAdvertise. The Type 3 summary LSA is suppressed and the component networks remain hidden from other networks.

- `cost number` (Optional) Specifies a cost for the range. Range is 1 to 16777214.

**Command Default**

Routes are not consolidated and summarized for an area.

**Command Modes**

Area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 6.0     | This command was introduced.

**Usage Guidelines**

Use the `range` command only with Area Border Routers (ABRs). It is used to consolidate or summarize routes for an area. The result is that a single summary route is advertised to other areas by the ABR. Routing information is condensed at area boundaries. External to the area, a single route is advertised for each address range. This process is called route summarization.

You can use the `range` command to configure multiple ranges. Thus, OSPFv3 can summarize addresses for many different sets of address ranges.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to specify one summary route to be advertised by the ABR to other areas for all IPv6 prefixes within the range defined by summary prefix 4004::f000::/32:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 201
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# range 4004::f000::/32
```
redistribute (OSPFv3)

To redistribute routes from one routing domain into Open Shortest Path First Version 3 (OSPFv3), use the redistribute command in an appropriate configuration mode. To remove the redistribute command from the configuration file and restore the system to its default condition in which the software does not redistribute routes, use the no form of this command.

Border Gateway Protocol (BGP)
redistribute bgp process-id [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]
no redistribute bgp process-id [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]

Local Interface Routes
redistribute connected [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]
no redistribute connected [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]

Intermediate System-to-Intermediate System (IS-IS)
redistribute isis process-id [{level-1 | level-2 | level-1-2}] [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]
no redistribute isis process-id [{level-1 | level-2 | level-1-2}] [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]

Open Shortest Path First Version 3 (OSPFv3)
redistribute ospfv3 process-id match {external | 1 | 2 | internal | nssa-external} [{1 | 2}] [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]
no redistribute ospfv3 process-id match {external | 1 | 2 | internal | nssa-external} [{1 | 2}] [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]

Static
redistribute static [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]
no redistribute static [metric metric-value] [metric-type {1 | 2}] [policy policy-name] [tag tag-value]

Syntax Description
- **bgp**: Distributes routes from the BGP protocol.
For the `bgp` keyword, an autonomous system number has the following ranges:
- Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
- Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
- Range for 4-byte Autonomous system numbers (ASNs) is adot format is 1.0 to 65535.65535.

For the `isis` keyword, an IS-IS instance name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

For the `ospf` keyword, an OSPF instance name from which routes are to be redistributed. The value takes the form of a string. A decimal number can be entered, but it is stored internally as a string.

<table>
<thead>
<tr>
<th><strong>process-id</strong></th>
<th>For the <code>bgp</code> keyword, an autonomous system number has the following ranges:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.</td>
</tr>
<tr>
<td></td>

<table>
<thead>
<tr>
<th><strong>metric metric-value</strong></th>
<th>(Optional) Specifies the metric used for the redistributed route. Range is 1 to 16777214. Use a value consistent with the destination protocol.</th>
</tr>
</thead>
</table>

| **metric-type { 1 | 2 }** | (Optional) Specifies the external link type associated with the route advertised into the OSPF routing domain. It can be one of two values: |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|                             | • 1—Type 1 external route |
|                             | • 2—Type 2 external route |

If no `metric-type` is specified, the default is Type 2 external routes.

<table>
<thead>
<tr>
<th><strong>tag tag-value</strong></th>
<th>(Optional) Specifies the 32-bit dotted-decimal value attached to each external route. This value is not used by the OSPF protocol itself, but is carried in the External LSAs. Range is 0 to 4294967295.</th>
</tr>
</thead>
</table>

</thead>
</table>
match \{ internal | external [ 1 | 2 ] | nssa-external [ 1 | 2 ] \}

(Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one or more of the following:

- **internal** — Routes that are internal to a specific autonomous system (intra- and inter-area OSPF routes).
- **external [ 1 | 2 ]** — Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 external routes.
- **nssa-external [ 1 | 2 ]** — Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 not-so-stubby area (NSSA) external routes.

For the **external** and **nssa-external** options, if a type is not specified, then both Type 1 and Type 2 are assumed.

If no match is specified, the default is no filtering.

<table>

| Command History | Release 6.0 This command was introduced. |

| Usage Guidelines | When redistributing routes (into OSPF) using both command keywords for setting or matching of attributes and a route policy, the routes are run through the route policy first, followed by the keyword matching and setting. \n\nDisabling or changing the arguments of any keyword does not affect the state of other keywords. In general, route redistribution from Level 1 to Level 2 is automatic. You might want to use this command to better control which Level 1 routes can be redistributed into Level 2. The redistribution of Level 2 routes into Level 1 is called route leaking. Route leaking is disabled by default. That is, Level 2 routes are not automatically included in Level 1 link-state protocols. If you want to leak Level 2 routes into Level 1, you must enable that behavior by using this command. Redistribution from Level 1 into Level 1 and from Level 2 into Level 2 is not allowed. |

Redistributes IP static routes.
A router receiving a link-state packet with an internal metric considers the cost of the route from itself to the redistributing router plus the advertised cost to reach the destination. An external metric considers only the advertised metric to reach the destination.

Redistributed routing information should always be filtered by the `distribute-list prefix-list out` command. Use of this command ensures that only those routes intended by the administrator are passed along to the receiving routing protocol.

**OSPFv3 Considerations**

Whenever you use the `redistribute` or the `default-information` command to redistribute routes into an OSPFv3 routing domain, the router automatically becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPFv3 routing domain.

When routes are redistributed between OSPFv3 processes, no OSPFv3 metrics are preserved.

When routes are redistributed into OSPF and no metric is specified with the `metric` keyword, OSPF uses 20 as the default metric for routes from all protocols except BGP routes, which get a metric of 1. Furthermore, when the router redistributes from one OSPFv3 process to another OSPFv3 process on the same router, and if no default metric is specified, the metrics in one process are carried to the redistributing process.

**BGP Considerations**

The only connected routes affected by this command are the routes not specified by the `network` (BGP) command.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to cause static routes to be redistributed into an OSPFv3 domain:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 109
RP/0/RP0/CPU0:router(config-ospfv3)# redistribute isis level-1
```
retransmit-interval (OSPFv3)

To specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the Open Shortest Path First Version 3 (OSPFv3) interface, use the `retransmit-interval` command in an appropriate configuration mode. To return to the default value, use the `no` form of this command.

```
retransmit-interval  seconds
no retransmit-interval
```

**Syntax Description**

- `seconds` Time (in seconds) between retransmissions. It must be greater than the expected round-trip delay between any two routers on the attached network. Range is 1 to 65535 seconds.

**Command Default**

- If this command is not specified in interface configuration mode, then the interface adopts the retransmit interval parameter specified by the area.
- If this command is not specified in area configuration mode, then the interface adopts the retransmit interval parameter specified by the process.
- If this command is not specified at any level, then the default retransmit interval is 5 seconds.

**Command Modes**

- Interface configuration
- Area configuration
- Router OSPFv3 configuration
- Virtual-link configuration
- OSPFv3 VRF configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA.

The setting of this parameter should be conservative, or needless retransmission results. The value should be larger for serial lines and virtual links.

**Task ID**

- **Task ID**
- **Operations**
- ospf  read, write

**Examples**

The following example shows how to set the retransmit interval value to 8 seconds while in interface configuration mode:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
```
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/2/0/0
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# retransmit-interval 8
router-id (OSPFv3)

To configure a router ID for the Open Shortest Path First Version 3 (OSPFv3) routing process, use the `router-id` command in an appropriate configuration mode. To cause the software to use the default method of determining the router ID, use the `no` form of this command after clearing or restarting the OSPF process.

```
router-id  router-id
no  router-id  router-id
```

**Syntax Description**

- `router-id`  32-bit router ID value specified in four-part, dotted-decimal notation.

**Command Default**
If this command is not configured, the router ID is the highest IP address for an interface on the router, with any loopback interface taking precedence.

**Command Modes**
- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
We recommend that you use the `router-id` command to explicitly specify a unique 32-bit numeric value for the router ID. This configuration ensures that OSPFv3 can function regardless of the interface address configuration. Clear the OSPF process using the `clear ospf process` command or restart the OSPF process for the `no router-id` command to take effect.

In router OSPFv3 configuration mode, OSPF attempts to obtain a router ID in the following ways (in order of preference):

1. By default, when the OSPF process initializes, it checks if there is a router-id in the checkpointing database.
2. The 32-bit numeric value specified by the OSPF `router-id` command in router configuration mode. (This value can be any 32-bit value. It is not restricted to the IPv4 addresses assigned to interfaces on this router, and need not be a routable IPv4 address.)
3. A global router ID provided by the system (possibly, the first loopback address found at the boot time).

If the OSPFv3 process cannot obtain a router ID from any of these sources, the router issues the following error message:

```
%OSPFV3-4-NORTRID : OSPFv3 process 1 cannot run - configure a router ID for this process
```

At this point, OSPFv3 is effectively passive on all its interfaces. To run OSPFv3, make a router ID available by one of the methods described.

In VRF configuration mode, it is mandatory to configure a router ID manually. Otherwise, the OSPFv3 process will not become operational in the VRF.
**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to assign the IP address of 10.0.0.10 to the OSPFv3 process 109:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 109
RP/0/RP0/CPU0:router(config-ospfv3)# router-id 10.0.0.10
```
**router ospfv3**

To configure an Open Shortest Path First Version 3 (OSPFv3) routing process, use the `router ospfv3` command in XR Config mode. To terminate an OSPFv3 routing process, use the `no` form of this command.

```
router ospfv3 process-name
no router ospfv3 process-name
```

**Syntax Description**

`process-name` Name that uniquely identifies an OSPFv3 routing process. The process name is any alphanumeric string no longer than 40 characters.

**Command Default**
No OSPFv3 routing process is defined.

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can specify multiple OSPFv3 routing processes in each router. Up to 10 processes can be configured. The recommendation is not to exceed 4 OSPFv3 processes.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to instantiate an OSPFv3 routing process with a process name of 1:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
```
sham-link (OSPFv3)

To configure an Open Shortest Path First version 3 (OSPFv3) sham link between two provider edge routers on a non-default VRF, use the sham-link command in OSPFv3 router area sub-configuration mode. To terminate an OSPFv3 sham link, use the no form of this command.

```
sham-link source-address destination-address
no sham-link
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-address</td>
<td>IP address of the local (source) sham-link endpoint specified in four-part, dotted-decimal notation.</td>
</tr>
<tr>
<td>destination-address</td>
<td>IP address of the remote (destination) sham-link endpoint specified in four-part, dotted-decimal notation.</td>
</tr>
</tbody>
</table>

**Command Default**

No sham link is configured.

**Command Modes**

OSPFv3 router area sub-configuration.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Release 6.0</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the sham-link command to configure a point-to-point connection between two provider edge (PE) routers creating an interconnect between two VPN sites (VPN backbone). Sham links are configured on PE provider edge (PE) routers in a Multiprotocol Label Switching (MPLS) VPN backbone.

**Examples**

This example shows how to configure an OSPFv3 sham link:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router ospfv3 ospfv3
RP/0/RP0/CPU0:router(config_ospfv3)# vrf 1
RP/0/RP0/CPU0:router(config_ospfv3_vrf)# area 1
RP/0/RP0/CPU0:router(config_ospfv3_vrf_ar)# sham-link 100::1 200::1
RP/0/RP0/CPU0:router(config_ospf_vrf_ar_sl)# cost 23
```
show ospfv3

To display general information about Open Shortest Path First Version 3 (OSPFv3) routing processes, use the `show ospfv3` command in XR EXEC mode.

```
show ospfv3 [process-name] [vrf {all | vrf-name}] sham-links
```

**Syntax Description**

- **process-name**  (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- **vrf** Specifies an OSPF VPN routing and forwarding (VRF) instance.

- **all** Display all the VRFs, excluding the default VRF.

- **vrf-name** Specifies the name of the of the OSPFv3 VRF.

- **sham-links** Displays OSPFv3 Sham-link information.

**Command Default**
None

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is a sample output from the `show ospfv3` command:

```
RP/0/RP0/CPU0:router# show ospfv3 1
Routing Process "ospfv3 test" with ID 3.3.3.3
It is an autonomous system boundary router
Redistributing External Routes from, static
  Maximum number of redistributed prefixes 10240
  Threshold for warning message 75%
  Initial SPF schedule delay 5000 msecs
  Minimum hold time between two consecutive SPFs 10000 msecs
  Maximum wait time between two consecutive SPFs 10000 msecs
  Initial LSA throttle delay 0 msecs
  Minimum hold time for LSA throttle 5000 msecs
  Maximum wait time for LSA throttle 5000 msecs
```
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Maximum number of configured interfaces 255
Number of external LSA 1. Checksum Sum 0x004468
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
Area BACKBONE(0) (Inactive)
  Number of interfaces in this area is 1
  SPF algorithm executed 1 times
Number of LSA 3. Checksum Sum 0x018109
Number of DCbitless LSA 0
Number of indication LSA 0
Number of DoNotAge LSA 0
Flood list length 0

The following is a sample output from the show ospfv3 command when OSPFv3 graceful shutdown has been initiated but not yet completed:

RP/0/RP0/CPU0:router# show ospfv3 1
Routing Process "ospfv3 test" with ID 3.3.3.3 transitioning to OSPFV3_ADMIN_DOWN state
Routing Process "ospfv3 test" with ID 3.3.3.3
It is an autonomous system boundary router
Redistributing External Routes from, static
  Maximum number of redistributed prefixes 10240
  Threshold for warning message 75%
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFIs 10000 msecs
Maximum wait time between two consecutive SPFIs 10000 msecs
Initial LSA throttle delay 0 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Maximum number of configured interfaces 255
Number of external LSA 1. Checksum Sum 0x004468
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
Area BACKBONE(0) (Inactive)
  Number of interfaces in this area is 1
  SPF algorithm executed 1 times
Number of LSA 3. Checksum Sum 0x018109
Number of DCbitless LSA 0
Number of indication LSA 0
Number of DoNotAge LSA 0
Flood list length 0

The following is a sample output from the show ospfv3 command when OSPFv3 graceful shutdown is completed:

RP/0/RP0/CPU0:router# show ospfv3 1
Routing Process "ospfv3 test" with ID 3.3.3.3 in OSPFV3_ADMIN_DOWN state
%ROUTING-OSPFV3-6-GRACEFUL_SHUTDOWN : Shutdown Complete
Routing Process "ospfv3 test" with ID 3.3.3.3
It is an autonomous system boundary router
Redistributing External Routes from,
static
  Maximum number of redistributed prefixes 10240
  Threshold for warning message 75%
  Initial SPF schedule delay 5000 msecs
  Minimum hold time between two consecutive SPF 10000 msecs
  Maximum wait time between two consecutive SPF 10000 msecs
  Initial LSA throttle delay 0 msecs
  Minimum hold time for LSA throttle 5000 msecs

This is sample output from the `show ospfv3 vrf` command that displays domain -id configuration:

```
RP/0/RP0/CPU0:router#show ospfv3 0 vrf V1
Mon May 10 14:52:31.332 CEST
Routing Process "ospfv3 0" with ID 100.0.0.2 VRF V1
It is an area border and autonomous system boundary router
Redistributing External Routes from,
  bgp 1
  Maximum number of redistributed prefixes 10240
  Threshold for warning message 75%
Primary Domain ID:
  0x0005:0xc0fe00112233
Secondary Domain ID:
  0x0105:0x0e00000001
  0x0205:0x0e000000002
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPF's 10000 msecs
Minimum wait time between two consecutive SPF's 10000 msecs
Initial LSA throttle delay 0 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Maximum number of configured interfaces 255
Maximum number of configured paths 16
Number of external LSA 2. Checksum Sum 0x015bb3
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
Auto cost is enabled. Reference bandwidth 100
  Area BACKBONE(0)
  Number of interfaces in this area is 1
  SPF algorithm executed 2 times
```
This is sample output from the show ospfv3 vrf command that displays vrf-lite configuration:

RP/0/RP0/CPU0:router#show ospfv3 0 vrf V2
Mon May 10 18:01:38.654 CEST
Routing Process "ospfv3 0" with ID 2.2.2.2 VRF V2
VRF lite capability is enabled
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Initial LSA throttle delay 0 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Maximum number of configured interfaces 255
Maximum number of configured paths 16
Number of external LSA 0. Checksum Sum 00000000
Number of areas in this router is 0. 0 normal 0 stub 0 nssa
Auto cost is enabled. Reference bandwidth 100

This is sample output from the show ospfv3 command to verify that (Non-stop routing (NSR) is enabled:

RP/0/RP0/CPU0:router#show ospfv3
Routing Process "ospfv3 100" with ID 3.3.3.3
NSR (Non-stop routing) is Enabled
It is an area border and autonomous system boundary router
Redistributing External Routes from,
  bgp 100
    Maximum number of redistributed prefixes 10240
    Threshold for warning message 75%
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Initial LSA throttle delay 0 msecs
Minimum hold time for LSA throttle 5000 msecs
Maximum wait time for LSA throttle 5000 msecs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Maximum number of configured interfaces 512
Maximum number of configured paths 16
Number of external LSA 0. Checksum Sum 00000000
Number of areas in this router is 15. 15 normal 0 stub 0 nssa
Auto cost is enabled. Reference bandwidth 100

The following is a sample output from the show ospfv3 command with sham-links keyword:
RP/0/RP0/CPU0:router# show ospf vrf vrf1 sham-links

Sham Links for OSPFv3 100, VRF vrf1

Sham Link OSPF_SL1 to address 300::1 is up
Area 2, source address 100::1
IfIndex = 2
Run as demand circuit
DoNotAge LSA allowed., Cost of using 1
Transmit Delay is 1 sec, State POINT TO POINT,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:08
Adjacency State FULL (Hello suppressed)
Number of DBD retrans during last exchange 0
Index 2/2, retransmission queue length 0, number of retransmission 0
First 0(0)/0(0) Next 0(0)/0(0)
Last retransmission scan length is 0, maximum is 0
Last retransmission scan time is 0 msec, maximum is 0 msec

Sham Link OSPF_SL0 to address 200::1 is up
Area 2, source address 100::1
IfIndex = 2
Run as demand circuit
DoNotAge LSA allowed., Cost of using 1
Transmit Delay is 1 sec, State POINT TO POINT,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:01
Adjacency State FULL (Hello suppressed)
Number of DBD retrans during last exchange 0
Index 3/3, retransmission queue length 0, number of retransmission 0
First 0(0)/0(0) Next 0(0)/0(0)
Last retransmission scan length is 0, maximum is 0
Last retransmission scan time is 0 msec, maximum is 0 msec
show ospfv3 border-routers

To display the internal Open Shortest Path First Version 3 (OSPFv3) routing table entries to an area border router (ABR) and autonomous system boundary router (ASBR), use the `show ospfv3 border-routers` command in XR EXEC mode.

```
show ospfv3 [process-name] [vrf {all vrf-name}] border-routers [router-id]
```

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- `vrf` Specifies an OSPF VPN routing and forwarding (VRF) instance.

- `all` Display all the VRFs, excluding the default VRF.

- `vrf-name` Specifies the name of the of the OSPFv3 VRF.

- `router-id` (Optional) 32-bit router ID value specified in four-part, dotted-decimal notation.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

The following is sample output from the `show ospfv3 border-routers` command:

```
RP/0/RP0/CPU0:router# show ospfv3 border-routers

OSPFv3 1 Internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
  i 10.0.0.207 [1] via fe80::3034:30ff:fe33:3742, HundredGigE 0/3/0/0, ABR/ASBR, Area 1, SPF 3
  i 10.0.0.207 [10] via fe80::204:c0ff:fe22:73fe, Ethernet0/0/0/0, ABR/ASBR, Area 0, SPF 7
```
This table describes the significant fields shown in the display.

show ospfv3 [process-name [area-id]] [vrf {all vrf-name}] [database [unknown [[area | as | link]]] [link-state-id] [internal] [adv-router [router-id]] [self-originate]]

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- **area-id** (Optional) Area number used to define the particular area.

- **adv-router [router-id]** (Optional) Displays all link-state advertisements (LSAs) of the specified router.

- **asbr-summary** (Optional) Displays information only about the Autonomous System Boundary Router (ASBR) summary LSAs.

- **database-summary** (Optional) Displays how many of each type of LSA are in the database for each area and the total.

- **external** (Optional) Displays information only about external LSAs.

- **grace** (Optional) Displays information about the state for the graceful restart link.

- **internal** (Optional) Displays information only about internal LSAs.

- **self-originate** (Optional) Displays only self-originated LSAs (from the local router).

- **link-state-id** (Optional) LSA ID that uniquely identifies the LSA. For network LSAs and link LSAs, this ID is the interface ID of the link of the router originating the LSA.

- **inter-area prefix** (Optional) Displays information only about the interarea prefix LSAs.

- **inter-area router** (Optional) Displays information only about the interarea router LSAs.

- **link** (Optional) Displays information only about the link LSAs.

- **network** (Optional) Displays information only about the network LSAs.

- **nssa-external** (Optional) Displays information only about the not-so-stubby area (NSSA) external LSAs.

- **prefix** (Optional) Displays information only about the prefix LSAs.

- **ref-lsa** (Optional) Displays referenced LSA information.

- **router** (Optional) Displays information only about the router LSAs.

- **unknown** (Optional) Displays information only about unknown LSAs.

- **area** (Optional) Displays information only about the area LSAs.

- **as** (Optional) Displays information only about the autonomous system LSAs.
Specifies an OSPF VPN routing and forwarding (VRF) instance.

Displays all the VRFs, excluding the default VRF.

Specifies the name of the OSPFV3 VRF.

Command Default

No default behavior or values

Command Modes

XR EXEC mode

Command History

Release 6.0 This command was introduced.

Usage Guidelines

The various forms of this command deliver information about different OSPFV3 link-state advertisements.

Task ID

Task ID Operations

ospf read

Examples

The following is sample output from the show ospfv3 database command with no arguments or keywords:

```
RP/0/RP0/CPU0:router# show ospfv3 database

OSPFv3 Router with ID (10.0.0.207) (Process ID 1)

show ospfv3 flood-list

To display a list of Open Shortest Path First Version 3 (OSPFv3) link-state advertisements (LSAs) waiting to be flooded over an interface, use the `show ospfv3 flood-list` command in XR EXEC mode.

```
show ospfv3 [process-name] [area-id] [vrf { all vrf-name }] flood-list [type interface-path-id]
```

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- `area-id` (Optional) Area number used to define the particular area.

- `type` Interface type. For more information, use the `show interfaces` command to see a list of all interfaces currently configured on the router.

- `interface-path-id` Physical interface or virtual interface.

  **Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- `vrf` Specifies an OSPF VPN routing and forwarding (VRF) instance.

- `all` Display all the VRFs, excluding the default VRF.

- `vrf-name` Specifies the name of the of the OSPFv3 VRF.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>

show ospfv3 interface

To display Open Shortest Path First Version 3 (OSPFv3) interface information, use the `show ospfv3 interface` command in XR EXEC mode.

`show ospfv3 [process-name] [area-id] interface [vrf {all vrf-name} ][type interface-path-id]`

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- `area-id` (Optional) Area number used to define the particular area.

- `type` Interface type. For more information, use the question mark (?) online help function.

- `interface-path-id` Physical interface or virtual interface.

**Note**
Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

- `vrf` Specifies an OSPF VPN routing and forwarding (VRF) instance.

- `all` Display all the VRFs, excluding the default VRF.

- `vrf-name` Specifies the name of the of the OSPFv3 VRF.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ospfv3 interface` command when the adjacency between two neighboring routers is not forming. Adjacency means that the routers synchronize their databases when they discover each other.

You can look at the output to check the physical link and line protocol status and to confirm that the network type and timer intervals match those of the neighboring routers.

If you have configured BFD interface at the process level, then that applies to both area and interface level, unless area and interface level have different interval configurations specified.

**Task ID**

<table>

show ospfv3 neighbor

To display Open Shortest Path First Version 3 (OSPFv3) neighbor information on an individual interface basis, use the `show ospfv3 neighbor` command in XR EXEC mode.

```
show ospfv3 [process-name] [area-id] [vrf {all vrf-name}] neighbor [type interface-path-id] [neighbor-id] [detail]
```

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- `area-id` (Optional) Area ID. If you do not specify an area, all areas are displayed.

- `type` Interface type. For more information, use the question mark (?) online help function.

- `interface-path-id` Physical interface or virtual interface.

  **Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- `neighbor-id` (Optional) Neighbor router ID.

- `detail` (Optional) Displays all neighbors given in detail (lists all neighbors).

- `vrf` Specifies an OSPF VPN routing and forwarding (VRF) instance.

- `all` Display all the VRFs, excluding the default VRF.

- `vrf-name` Specifies the name of the of the OSPFv3 VRF.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `show ospfv3 neighbor` command when the adjacency between two neighboring routers is not forming. Adjacency means that the routers synchronize their databases when they discover each other.

**Task ID**

- **Task ID** **Operations**
  - ospf read
The following is sample output from the `show ospfv3 neighbor` command showing two lines of summary information for each neighbor:

```
RP/0/RP0/CPU0:router# show ospfv3 neighbor
Neighbors for OSPFV3 1
Neighbor ID Pri State Dead Time Interface ID Interface
10.0.0.207 1 FULL/ - 00:00:35 3 HundredGigE 0/3/0/0
Neighbor is up for 01:08:05
10.0.0.207 1 FULL/DR 00:00:35 2 Ethernet0/0/0/0
Neighbor is up for 01:08:05
Total neighbor count: 2
```

This table describes the significant fields shown in the display.

```

</table>
**Field** | **Description**
--- | ---
link-local address | Link local address of the interface.
Neighbor priority | Router priority of neighbor and neighbor state.
State | OSPFv3 state.
state changes | Number of state changes for this neighbor.
DR is | Neighbor ID of the designated router.
BDR is | Neighbor ID of the backup designated router.
Options | Hello packet options field contents (E-bit only; possible values are 0 and 2; 2 indicates that area is not a stub; 0 indicates that area is a stub).
Dead timer | Time (in hh:mm:ss) to elapse before OSPFv3 declares the neighbor dead.
Neighbor is up | Time (in hh:mm:ss) that the OSPFv3 neighbor has been up.
Index | Index and the remaining lines of this command give detailed information about flooding information received from the neighbor.

The following is sample output showing neighbor information with BFD enabled for HundredGigE interface 0/5/0/0:

```
RP/0/RP0/CPU0:router# show ospfv3 neighbor detail
Thu Sep 11 02:02:46.267 UTC

Neighbors for OSPFv3 foo

Neighbor 2.2.2.2
  In the area 0 via interface HundredGigE 0/5/0/0 BFD enabled
  Neighbor: interface-id 2, link-local address fe80::21b:53ff:fe74:eab6
  Neighbor priority is 1, State is FULL, 6 state changes
  DR is 2.2.2.2 BDR is 1.1.1.1
  Options is 0x13
  Dead timer due in 00:00:32
  Neighbor is up for 00:06:16
  Index 1/1/1, retransmission queue length 0, number of retransmission 1
    First 0(0)/0(0)/0(0) Next 0(0)/0(0)/0(0)
    Last retransmission scan length is 1, maximum is 1
    Last retransmission scan time is 0 msec, maximum is 0 msec

Total neighbor count: 1
```
show ospfv3 request-list

To display the first ten link-state requests pending that the local router is making to the specified Open Shortest Path First Version 3 (OSPFv3) neighbor and interface, use the show ospfv3 request-list command in XR EXEC mode.

```
show ospfv3 [process-name] [area-id] [vrf {all vrf-name}] request-list [type interface-path-id] [neighbor-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>process-name</td>
<td>(Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the router ospfv3 command. If this argument is included, only information for the specified routing process is displayed.</td>
</tr>
<tr>
<td>area-id</td>
<td>(Optional) Area ID. If you do not specify an area, all areas are displayed.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>(Optional) Physical interface or virtual interface.</td>
</tr>
<tr>
<td>neighbor-id</td>
<td>(Optional) Router ID of the OSPFv3 neighbor. This argument must be in 32-bit dotted-decimal notation, similar to an IPv4 address.</td>
</tr>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You might use this command when the databases of two neighboring routers are out of synchronization or if the adjacency is not forming between them. Adjacency means that the routers synchronize their databases when they discover each other.

You can look at the list to determine if one router is trying to request a particular database update. Entries that appear to be suspended in the list usually indicate that updates are not being delivered. One possible reason for this behavior is a maximum transmission unit (MTU) mismatch between the routers.
You might also look at this list to make sure it is not corrupted. The list should refer to database entries that actually exist.

| Task ID | Task ID | Operations | ID | ospf | read |

**Examples**

The following sample output shows request lists for neighbor 10.0.0.207 on the OSPFv3 1 process:

```
RP/0/RP0/CPU0:router# show ospf v3 1 request-list 10.0.0.207 HundredGigE 0/3/0/0

Request Lists for OSPFv3 1

show ospfv3 retransmission-list

To display the first ten link-state entries in the retransmission list that the local router sends to the specified neighbor over the specified interface, use the `show ospfv3 retransmission-list` command in XR EXEC mode.

`show ospfv3 [process-name] [area-id] [vrf {all vrf-name}] retransmission-list [type interface-path-id] [neighbor-id]`

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an Open Shortest Path First Version 3 (OSPFv3) routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- `area-id` (Optional) Area ID. If you do not specify an area, all areas are displayed.

- `type` (Optional) Interface type. For more information, use the question mark (?) online help function.

- `interface-path-id` (Optional) Physical interface or virtual interface.

  **Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- `neighbor-id` (Optional) IP address of the OSPFv3 neighbor.

- `vrf` Specifies an OSPF VPN routing and forwarding (VRF) instance.

- `all` Display all the VRFs, excluding the default VRF.

- `vrf-name` Specifies the name of the of the OSPFv3 VRF.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

<td>IPv6 address of the neighbor.</td>
</tr>
</tbody>
</table>
**show ospfv3 routes**

To display the Open Shortest Path First Version 3 (OSPFv3) route table, use the `show ospfv3 routes` command in XR EXEC mode.

```
show ospfv3 [process-name] [vrf {all vrf-name}] routes [{external | connected}] [ipv6-prefix/prefix-length]
show ospfv3 [process-name] [vrf {all vrf-name}] routes summary
```

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospf` command. If this argument is included, only information for the specified routing process is displayed.
- `external` (Optional) Displays routes redistributed from other protocols.
- `connected` (Optional) Displays connected routes.
- `ipv6-prefix` (Optional) IP Version 6 (IPv6) prefix, which limits output to a specific route. This argument must be in the form documented in RFC 2373, in which the address is specified in hexadecimal using 16-bit values between colons.
- `/prefix-length` (Optional) Length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `summary` Displays a summary of the route table.
- `vrf` Specifies an OSPF VPN routing and forwarding (VRF) instance.
- `all` Display all the VRFs, excluding the default VRF.
- `vrf-name` Specifies the name of the of the OSPFv3 VRF.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release 6.0**  This command was introduced.

**Usage Guidelines**

Use the `show ospfv3 routes` command to display the OSPFv3 private routing table (which contains only routes calculated by OSPFv3). If there is something wrong with a route in the Routing Information Base (RIB), check the OSPFv3 copy of the route to determine if it matches the RIB contents. If it does not match, there is a synchronization problem between OSPFv3 and the RIB. If the routes match and the route is incorrect, OSPFv3 has made an error in its routing calculation.
The following sample output shows the route table for OSPFv3 process 1:

```
RP/0/RP0/CPU0:router# show ospfv3 1 routes

Route Table for OSPFV3 1 with ID 10.3.4.2

* 3000:11:22::/64, Inter, cost 21/0, area 1
  HundredGigE 0/3/0/0, fe80::3034:30ff:fe33:3742
  10.0.0.207/200
* 3000:11:22:1::/64, Inter, cost 31/0, area 1

</table>
show ospfv3 statistics rib-thread

To display RIB thread statistics, use the `show ospfv3 statistics rib-thread` command in XR EXEC mode.

```
show ospfv3 [process-name [area-id]] statistics rib-thread
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPF routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- **area id** (Optional) Area number used to define the particular area.

**Command Default**

None

show ospfv3 summary-prefix

To display Open Shortest Path First Version 3 (OSPFv3) aggregated summary address information, use the `show ospfv3 summary-prefix` command in XR EXEC mode.

```
show ospfv3 [process-name] [vrf {all vrf-name}] summary-prefix
```

**Syntax Description**

- `process-name` (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- `vrf` Specifies an OSPF VPN routing and forwarding (VRF) instance.

- `vrf-name` Specifies the name of the of the OSPFv3 VRF.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release** Modification
  - Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `show ospfv3 summary-prefix` command if you configured summarization of external routes with the `summary-prefix` command and you want to display configured summary addresses.

**Task ID**

<table>

</table>
show ospfv3 virtual-links

To display parameters and the current state of Open Shortest Path First Version 3 (OSPFv3) virtual links, use the `show ospfv3 virtual-links` command in XR EXEC mode.

```
show ospfv3 [process-name] [vrf {all vrf-name}] virtual-links
```

**Syntax Description**

- **process-name** (Optional) Name that uniquely identifies an OSPFv3 routing process. The process name is defined by the `router ospfv3` command. If this argument is included, only information for the specified routing process is displayed.

- **vrf** Specifies an OSPF VPN routing and forwarding (VRF) instance.

- **vrf-name** Specifies the name of the of the OSPFv3 VRF.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The information displayed in the `show ospfv3 virtual-links` command is useful in debugging OSPFv3 routing operations.

**Examples**

The following sample output shows the virtual links for the OSPFv3 1 process:

```
RP/0/RP0/CPU0:router# show ospfv3 1 virtual-links

Virtual Links for OSPFv3 1
Virtual Link to router 172.31.101.2 is up
    Interface ID 16, IPv6 address 3002::206
    Transit area 0.0.0.1, via interface HundredGigE 0/3/0/0, Cost of using 11
    Transmit Delay is 5 sec, State POINT_TO_POINT,
    Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 0:00:08
    Adjacency State FULL
```
This table describes the significant fields shown in the display.

**Table 93: show ospfv3 virtual-links Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Link to router is up</td>
<td>Specifies the OSPFv3 neighbor, and if the link to that neighbor is up or down.</td>
</tr>
<tr>
<td>Interface ID</td>
<td>ID of the virtual link interface.</td>
</tr>
<tr>
<td>IPv6 address</td>
<td>IPv6 address of virtual link endpoint.</td>
</tr>
<tr>
<td>Transit area</td>
<td>Transit area through which the virtual link is formed.</td>
</tr>
<tr>
<td>via interface</td>
<td>Interface through which the virtual link is formed.</td>
</tr>
<tr>
<td>Cost</td>
<td>Cost of reaching the OSPF neighbor through the virtual link.</td>
</tr>
<tr>

<td>Various timer intervals configured for the link.</td>
</tr>
<tr>
<td>Hello due in</td>
<td>When the next hello message is expected from the neighbor (in hh:mm:ss).</td>
</tr>
<tr>
<td>Adjacency State</td>
<td>Adjacency state between the neighbors.</td>
</tr>
</tbody>
</table>
show protocols (OSPFv3)

To display information about the Open Shortest Path First Version 3 (OSPFv3) process running on the router, use the `show protocols` command in XR EXEC mode.

```
show protocols [{afi-all | ipv4 | ipv6}] [{all protocol}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>afi-all</td>
<td>(Optional) Specifies all address families.</td>
</tr>
<tr>
<td>ipv4</td>

Area 0
    HundredGigE 0/2/0/2
    Loopback1
```
snmp context (OSPFv3)

To specify an SNMP context for an OSPFv3 instance, use the `snmp context` command in router configuration mode or in VRF configuration mode. To remove the SNMP context, use the `no` form of this command.

```
snmp context context_name
no snmp context context_name
```

**Syntax Description**

- `context_name`: Specifies name of the SNMP context for OSPFv3 instance.

**Command Default**

SNMP context is not specified.

**Command Modes**

- Router OSPFv3 configuration
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `snmp-server` commands need to be configured to perform SNMP request for the OSPF instance. Refer to the `SNMP Server Commands` module in the `System Management Command Reference` for information on using the `snmp-server` commands.

**Note**

To map an SNMP context with a protocol instance, topology or VRF entity, use the `snmp-server context mapping` command. However, the `feature` option of this command does not work with OSPFv3 protocol.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure an SNMP context `foo` for OSPFv3 instance 100:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospfv3 100
RP/0/RP0/CPU0:router(config-ospf)#snmp context foo
```

This example shows how to configure `snmp-server` commands to be used with the `snmp context` command:
This is a sample SNMP context configuration for OSPFv3 instance 100:

snmp-server host 10.0.0.2 traps version 2c public udp-port 1620
snmp-server community public RW
snmp-server contact foo
snmp-server community-map public context foo

router ospfv3 100
router-id 2.2.2.2
bfd fast-detect
nsf cisco
snmp context foo
area 0
  interface Loopback1
  !
area 1
  interface HundredGigE 0/2/0/1
demand-circuit enable
  !
  interface POS0/3/0/0
  !
  interface POS0/3/0/1
  !
  !

**snmp trap (OSPFv3)**

To enable SNMP trap for an OSPFv3 instance, use the `snmp trap` command in VRF configuration mode. To disable SNMP trap for the OSPFv3 instance, use the `no` form of this command.

```
snmp trap
no snmp trap
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Disabled.

**Command Modes**

OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to enable SNMP trap for OSPFv3 instance 100 under VRF `vrf-1`:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospfv3 100
RP/0/RP0/CPU0:router(config-ospf)#vrf vrf-1
RP/0/RP0/CPU0:router(config-ospf-vrf)#snmp trap
```
snmp trap rate-limit (OSPFv3)

To control the number of traps that OSPFv3 sends by configuring window size and the maximum number of traps during that window, use the `snmp trap rate-limit` command in router OSPFv3 configuration mode or OSPFv3 VRF configuration mode. To disable configuring the window size and maximum number of traps during the window, use the `no` form of this command.

```
snmp trap rate-limit window-size max-num-traps
no snmp trap rate-limit window-size max-num-traps
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>window-size</code></td>
<td>Specifies the trap rate limit sliding window size. The range is 2 to 60 windows.</td>
</tr>
<tr>
<td><code>max-num-traps</code></td>
<td>Specifies the maximum number of traps sent in window time. The range is 0 to 300 traps.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Router OSPFv3 configuration

OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the trap rate limit sliding window size to 50 and the maximum number of traps sent to 250 for OSPFv3 instance 100 under vrf vrf1:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospfv3 100
RP/0/RP0/CPU0:router(config-ospfv3)#vrf vrf1
RP/0/RP0/CPU0:router(config-ospfv3-vrf)#snmp trap rate-limit 50 250
```
spf prefix-priority (OSPFv3)

To prioritize OSPFv3 prefix installation into the global Routing Information Base (RIB) during Shortest Path First (SPF) run, use the `spf prefix-priority` command in XR Config mode or VRF configuration mode. To return to the system default value, use the `no` form of this command.

```
spf prefix-priority route-policy policy-name [disable]
spf prefix-priority route-policy policy-name
```

**Syntax Description**

- `route-policy` Specifies the route-policy to prioritize route installation.

- `policy-name` Name of the route policy.

- `disable` Disables SPF prefix priority

**Command Default**

SPF prefix prioritization is disabled.

**Command Modes**

- XR Config mode
- VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure OSPFv3 SPF prefix prioritization:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# prefix-set ospf3-critical-prefixes
RP/0/RP0/CPU0:router(config-pfx)# 66.0.0.0/16
RP/0/RP0/CPU0:router(config-pfx)# end-set
RP/0/RP0/CPU0:router(config)# route-policy ospf3-spf-priority
RP/0/RP0/CPU0:router(config-rpl)# if destination in ospf-critical-prefixes then set spf-priority critical
endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
RP/0/RP0/CPU0:router(config-rpl)# commit
RP/0/RP0/CPU0:router(config-rpl)# exit
RP/0/RP0/CPU0:router(config)# router ospf 3
RP/0/RP0/CPU0:router(config-ospf)# router-id 66.0.0.1
RP/0/RP0/CPU0:router(config-ospf)# spf prefix-priority route-policy ospf-spf-priority
```
stub (OSPFv3)

To define an area as a stub area for Open Shortest Path First Version 3 (OSPFv3), use the `stub` command in area configuration mode. To disable this function, use the `no` form of this command.

```
stub [no-summary]
no stub
```

**Syntax Description**

`no-summary` (Optional) Prevents an area border router (ABR) from sending summary link advertisements into the stub area. Areas with this option are known as totally stubby areas.

**Command Default**

No stub area is defined.

**Command Modes**

Area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must configure the `stub` command on all routers in the stub area. Use the `default-cost area` command on the ABR of a stub area to specify the cost of the default route advertised into the stub area by the ABR.

Two stub area router configuration commands exist: the `stub` and `default-cost` commands. In all routers attached to the stub area, the area should be configured as a stub area using the `stub` command. Use the `default-cost` command only on an ABR attached to the stub area. The `default-cost` command provides the metric for the summary default route generated by the ABR into the stub area.

To further reduce the number of link-state advertisements (LSAs) sent into a stub area, you can configure the `no-summary` keyword on the ABR to prevent it from sending summary LSAs (LSA Type 3) into the stub area.

A stub area does not accept information about routes external to the autonomous system.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to create stub area 5 and specifies a cost of 20 for the default summary route sent into this stub area:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 201
RP/0/RP0/CPU0:router(config-ospfv3)# area 5
RP/0/RP0/CPU0:router(config-ospfv3-ar)# stub
RP/0/RP0/CPU0:router(config-ospfv3-ar)# default-cost 20
```
**stub-router**

To modify self originated router LSAs when stub router is active, use the **stub-router** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

```
stub-router router-lsa [ { r-bit | v6-bit | max-metric } ] [ always ] [ on-proc-migration interval ]
[ on-proc-restart interval ] [ on-switchover interval ] [ on-startup [ { interval | wait-for-bgp } ] ]
[ summary-lsa [ metric ] ] [ external-lsa [ metric ] ] [ include-stub ]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>router-lsa</td>
<td>Specifies that always originate router link-state advertisements (LSAs) with the stub-router.</td>
</tr>
<tr>
<td>r-bit</td>
<td>Router-LSAs are originated with R-bit clear (v6 bit set), which means the node does not act as a transit router. Directly connected networks (native to OSPF) are still reachable within the OSPF area.</td>
</tr>
<tr>
<td>v6-bit</td>
<td>Router-LSAs are originated with V6 bit clear (and also r-bit clear). That means the node is not willing to receive any ipv6 traffic. Other ospfv3 routers won't install any route to a node with v6-bit clear.</td>
</tr>
<tr>
<td>max-metric</td>
<td>Router-LSAs are originated with maximum metric. Unlike the r-bit and v6-bit mode, the router may still act as a transit node, if there is no alternate path.</td>
</tr>
<tr>
<td>always</td>
<td>Stub-router mode is activated unconditionally.</td>
</tr>
<tr>
<td>on-proc-migration</td>
<td>Stub-router mode is activated for the desired period of time, upon ospfv3 process migration.</td>
</tr>
<tr>
<td>on-proc-restart</td>
<td>Stub-router mode is activated for the desired period of time, upon ospfv3 process restart.</td>
</tr>
<tr>
<td>on-switchover</td>
<td>Stub-router mode is activated for the desired period of time, upon RP failover.</td>
</tr>
<tr>
<td>on-startup</td>
<td>Stub-router mode is activated (for configured time, or until BGP converges) upon router startup (boot).</td>
</tr>
<tr>
<td>wait-for-bgp</td>
<td>Stub-router mode is terminated upon BGP convergence in ipv6 unicast address family. This option could only be used in the global routing table, not in a non-default VRF. This option is only supported with the on-startup trigger when the router boots.</td>
</tr>
<tr>
<td>summary-lsa</td>
<td>If enabled, summary LSAs are advertised with modified metric when stub-router is active. This configuration is applicable to max-metric mode. In r-bit mode, ABR/ASBR functionality is implicitly disabled and routers will not use this node as an ABR/ASBR, since it declares no transit capability (r-bit clear). If enabled and metric is not explicitly configured, the default metric for summary LSAs when stub-router active is 16711680 (0xFF0000).</td>
</tr>
</tbody>
</table>
**external-lsa**

If enabled, external LSAs are advertised with modified metric when stub-router is active. This configuration is applicable to max-metric mode.

In r-bit mode, ABR/ASBR functionality is implicitly disabled and routers will not use this node as an ABR/ASBR, since it declares no transit capability (r-bit clear).

If enabled and metric is not explicitly configured, the default metric for external LSAs when stub-router active is 16711680 (0xFF0000).

**include-stub**

If enabled, intra-area-prefix LSAs that are referencing router LSA are advertised with maximum metric (0xffff) when stub-router is active.

Intra-area-prefix LSAs that are referencing network LSA do not change metric.

Can be used in r-bit and max-metric modes.

/128 prefixes that are normally advertised with LA-bit set and 0 metric are also advertised with maximum metric and LA-bit clear when stub-router is active.

---

**Command Default**

Disabled.

**Command Modes**

Router OSPFv3 configuration

OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only one method (r-bit, v6-bit, max-metric) could be activated at a time. Configuring the methods simultaneously, or different method per trigger, is not supported.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure router LSAs are originated with R-bit clear under OSPFv3 VRF, vrf_1:

```bash
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)#vrf vrf_1
RP/0/RP0/CPU0:router(config-ospfv3-vrf)#stub-router router-lsa r-bit
```
summary-prefix (OSPFv3)

To create aggregate addresses for routes being redistributed from another routing protocol into Open Shortest Path First Version 3 (OSPFv3) protocol, use the `summary-prefix` command in an appropriate configuration mode. To stop summarizing redistributed routes, use the `no` form of the command.

```
summary-prefix ipv6-prefix/prefix-length [not-advertise] tag tag
no summary-prefix ipv6-prefix/prefix-length
```

**Syntax Description**

- **ipv6-prefix**
  - Summary prefix designated for a range of IP Version 6 (IPv6) prefixes.
  - This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.

- **/ prefix-length**
  - Length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.

- **not-advertise**
  - (Optional) Suppresses summary routes that match the address and mask pair from being advertised.

- **tag**
  - (Optional) Specifies a tag value that can be used as a “match” value for controlling redistribution.

**Command Default**

When this command is not used in router configuration mode, aggregate addresses are not created for routes being redistributed from another routing protocol into the OSPFv3 protocol.

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `summary-prefix` command to cause an OSPFv3 Autonomous System Boundary Router (ASBR) to advertise one external route as an aggregate for all redistributed routes that are covered by the address. This command summarizes only routes from other routing protocols that are being redistributed into OSPFv3.

You can use this command multiple times to summarize multiple groups of addresses. The metric used to advertise the summary is the lowest metric of all the more specific routes. This command helps reduce the size of the routing table.

If you want to summarize routes between OSPFv3 areas, use the `range` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
In the following example, if summary prefix 4004:f000:132 is configured and routes 4004:f000:1::/64, 4004:f000:2::/64, and 4004:f000:3::/64 are redistributed into OSPFv3; only route 4004:f000::/32 is advertised in an external link-state advertisement:

```
RP/0/RP0/CPU0:router(config-ospfv3)# summary-prefix 4004:f000::/32
```
**timers lsa arrival**

To set the minimum interval at which the software accepts the same link-state advertisement (LSA) from Open Shortest Path First Version 3 (OSPFv3) neighbors, use the `timers lsa arrival` command in an appropriate configuration mode. To restore the default value, use the `no` form of this command.

```
timers lsa arrival milliseconds
no timers lsa arrival
```

**Syntax Description**

- `milliseconds` Minimum delay (in milliseconds) that must pass between acceptance of the same LSA arriving from neighbors. Range is 0 to 60000 milliseconds.

**Command Default**

1000 milliseconds

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

```
Release 6.0 This command was introduced.
```

**Usage Guidelines**

Use the `timers lsa arrival` command to control the minimum interval for accepting the same LSA. The same LSA is an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner than the interval that is set, the LSA is dropped.

We recommended that the `milliseconds` value of the `timers lsa arrival` command be less than or equal to the `hold-interval` value of the `timers throttle lsa all` command for the neighbor.

**Task ID**

```
Task ID
```

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds:

```
RP/0/RP0/CPU0# router ospfv3 1
RP/0/RP0/CPU0# timers throttle lsa all 200 10000 45000
RP/0/RP0/CPU0# timers lsa arrival 2000
```
timers pacing flood

To configure link-state advertisement (LSA) flood packet pacing, use the `timers pacing flood` command in an appropriate configuration mode. To restore the default flood packet pacing value, use the `no` form of this command.

```
timers pacing flood milliseconds
no timers pacing flood
```

**Syntax Description**

- `milliseconds`: Time (in milliseconds) at which LSAs in the flooding queue are paced in between updates. Range is 5 milliseconds to 100 milliseconds.

**Command Default**

- `milliseconds`: 33

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

- Release 6.0: This command was introduced.

**Usage Guidelines**

Configuring OSPFv3 flood pacing timers allows you to control interpacket spacing between consecutive link-state update packets in the OSPF transmission queue. Use the `timers pacing flood` command to control the rate at which LSA updates occur, thereby preventing high CPU or buffer utilization that can result when an area is flooded with a very large number of LSAs.

The default settings for OSPFv3 packet pacing timers are suitable for the majority of OSPFv3 deployments. Do not change the packet pacing timers unless all other options to meet OSPFv3 packet flooding requirements have been exhausted. Specifically, network operators should prefer summarization, stub area usage, queue tuning, and buffer tuning before changing the default flood timers. Furthermore, no guidelines exist for changing timer values; each OSPFv3 deployment is unique and should be considered on a case-by-case basis. The network operator assumes risks associated with changing the default flood timer values.

**Task ID**

- `ospf read, write`

**Examples**

The following example shows how to configure LSA flood packet-pacing updates to occur in 55-millisecond intervals for OSPFv3 routing process 1:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# timers pacing flood 55
```
timers pacing lsa-group

To change the interval at which Open Shortest Path First Version 3 (OSPFv3) link-state advertisements (LSAs) are collected into a group and refreshed, checksummed, or aged, use the **timers pacing lsa-group** command in an appropriate configuration mode. To restore the default value, use the **no** form of this command.

```
timers pacing lsa-group seconds
no timers pacing lsa-group
```

**Syntax Description**

- `seconds`: Interval (in seconds) at which LSAs are grouped and refreshed, checksummed, or aged. Range is 10 to 1800 seconds.

**Command Default**

- `seconds`: 240

OSPFv3 LSA group pacing is enabled by default.

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **timers pacing lsa-group** command to control the rate at which LSA updates occur so that high CPU or buffer utilization that can occur when an area is flooded with a very large number of LSAs can be reduced. The default settings for OSPFv3 packet pacing timers are suitable for the majority of deployments. Do not change the packet pacing timers unless all other options to meet OSPFv3 packet flooding requirements have been exhausted. Specifically, network operators should prefer summarization, stub area usage, queue tuning, and buffer tuning before changing the default flooding timers. Furthermore, no guidelines exist for changing timer values; each OSPFv3 deployment is unique and should be considered on a case-by-case basis. The network operator assumes the risks associated with changing the default timer values.

Cisco IOS XR software groups the periodic refresh of LSAs to improve the LSA packing density for the refreshes in large topologies. The group timer controls the interval used for group refreshment of LSAs; however, this timer does not change the frequency that individual LSAs are refreshed (the default refresh rate is every 30 minutes).

The duration of the LSA group pacing is inversely proportional to the number of LSAs the router is handling. For example, if you have about 10,000 LSAs, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to configure OSPFv3 group packet-pacing updates between LSA groups to occur in 60-second intervals for OSPFv3 routing process 1:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# timers pacing lsa-group 60
```
timers pacing retransmission

To configure link-state advertisement (LSA) retransmission packet pacing, use the `timers pacing retransmission` command in an appropriate configuration mode. To restore the default retransmission packet pacing value, use the `no` form of this command.

```
timers pacing retransmission milliseconds
no timers pacing retransmission
```

**Syntax Description**

```
milliseconds    Time (in milliseconds) at which LSAs in the retransmission queue are paced. Range is 5 milliseconds to 100 milliseconds.
```

**Command Default**

```
milliseconds : 66
```

**Command Modes**

Router OSPFv3 configuration

OSPFv3 VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `timers pacing retransmission` command to control interpacket spacing between consecutive link-state update packets in the OSPFv3 retransmission queue. This command controls the rate at which LSA updates occur. When an area is flooded with a very large number of LSAs, the LSA updates can result in high CPU or buffer utilization. Using this command reduces CPU or buffer utilization.

The default settings for OSPFv3 packet retransmission pacing timers are suitable for the majority of deployments. Do not change the packet retransmission pacing timers unless all other options to meet OSPFv3 packet flooding requirements have been exhausted. Specifically, network operators should prefer summarization, stub area usage, queue tuning, and buffer tuning before changing the default flooding timers. Furthermore, no guidelines exist for changing timer values; each OSPFv3 deployment is unique and should be considered on a case-by-case basis. The network operator assumes risks associated with changing the default packet retransmission pacing timer values.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure LSA flood pacing updates to occur in 55-millisecond intervals for OSPFv3 routing process 1:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# timers pacing retransmission 55
```
timers throttle lsa all (OSPFv3)

To set rate-limiting values for Open Shortest Path First Version 3 (OSPFv3) link-state advertisement (LSA) generation, use the `timers throttle lsa all` command in an appropriate configuration mode. To restore the default values, use the `no` form of this command.

```
timers throttle lsa all start-interval hold-interval max-interval
no timers throttle lsa all
```

**Syntax Description**

- **start-interval** Minimum delay (in milliseconds) for the generation of LSAs. The first instance of LSA is always generated immediately upon a local OSPFv3 topology change. The generation of the next LSA is not before the start interval. Range is 0 to 600000 milliseconds.

- **hold-interval** Incremental time (in milliseconds). This value is used to calculate the subsequent rate limiting times for LSA generation. Range is 1 to 600000 milliseconds.

- **max-interval** Maximum wait time (in milliseconds) between generation of the same LSA. Range is 1 to 600000 milliseconds.

**Command Default**

- **start-interval**: 500 milliseconds 50 milliseconds
- **hold-interval**: 5000 milliseconds 200 milliseconds
- **max-interval**: 5000 milliseconds

**Command Modes**

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

The “same LSA” is defined as an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. We recommend that you keep the `millisecs` value of the `timers lsa arrival` command less than or equal to the `hold-interval` value of the `timers throttle lsa all` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to customize OSPFv3 LSA throttling so that the start interval is 200 milliseconds, the hold interval is 10,000 milliseconds, and the maximum interval is 45,000 milliseconds. The minimum interval between instances of receiving the same LSA is 2000 milliseconds.

```bash
RP/0/RP0/CPU0:router(config)# router ospfv3 1
```
RP/0/RP0/CPU0:router(config-ospfv3)# timers throttle lsa all 200 10000 45000
RP/0/RP0/CPU0:router(config-ospfv3)# timers lsa arrival 2000
timers throttle spf (OSPFv3)

To turn on Open Shortest Path First Version 3 (OSPFv3) shortest path first (SPF) throttling, use the `timers throttle spf` command in an appropriate configuration mode. To turn off SPF throttling, use the `no` form of this command.

```
timers throttle spf spf-start spf-hold spf-max-wait
no timers throttle spf spf-start spf-hold spf-max-wait
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spf-start</code></td>
<td>Initial SPF schedule delay (in milliseconds). Range is 1 to 600000 milliseconds.</td>
</tr>
<tr>
<td><code>spf-hold</code></td>
<td>Minimum hold time (in milliseconds) between two consecutive SPF calculations. Range is 1 to 600000 milliseconds.</td>
</tr>
<tr>
<td><code>spf-max-wait</code></td>
<td>Maximum wait time (in milliseconds) between two consecutive SPF calculations. Range is 1 to 600000 milliseconds.</td>
</tr>
</tbody>
</table>

### Command Default

- `spf-start`: 5000 milliseconds
- `spf-hold`: 10000 milliseconds
- `spf-max-wait`: 10000 milliseconds

### Command Modes

- Router OSPFv3 configuration
- OSPFv3 VRF configuration

### Command History

- **Release 6.0** This command was introduced.

### Usage Guidelines

The first wait interval between SPF calculations is the amount of time (in milliseconds) specified by the `spf-start` argument. Each consecutive wait interval is twice the current hold level (in milliseconds) until the wait time reaches the maximum time (in milliseconds) as specified by the `spf-max-wait` argument. Subsequent wait times remain at the maximum until the values are reset or a link-state advertisement (LSA) is received between SPF calculations.

---

**Tip**

Setting a low `spf-start` time and `spf-hold` time causes routing to switch to the alternate path more quickly if a failure occurs. However, it consumes more CPU processing time.
The following example shows how to change the start, hold, and maximum wait interval values to 5, 1000, and 90,000 milliseconds, respectively:

RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# timers throttle spf 5 1000 90000
trace (OSPFv3)

To specify the Open Shortest Path First Version 3 (OSPFv3) buffer size, use the `trace` command in router ospfv3 configuration mode. To return to the default value, use the `no` form of this command.

```
trace size buffer_name size
no trace size buffer_name size
```

**Syntax Description**

- `size` Deletes existing buffer and creates one with N entries.
- `buffer_name` Specifies a buffer from one of the 15 listed buffers. Refer Table 95: Buffer Types, on page 580 table for details on the buffers.
- `size` Specifies allowed size for the selected buffer. Options are: 0, 256, 1024, 2048, 4096, 8192, 16384, 32768, and 65536.
  
  Select 0 to disable traces.

**Command Default**

No default behavior or values

**Command Modes**

Router ospfv3 configuration

**Command History**

Release 6.0 This command was introduced.

**Usage Guidelines**

Trace buffers are used to store various traffic and processing events during the runtime. Large buffers can store more events. If the buffer becomes full, old entries are overwritten by the latest entries. In a large network, user may want to increase the trace buffer size to accommodate more events.

**Table 95: Buffer Types**

#### Examples

This example shows how to set 1024 error trace entries:

```bash
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospf3 osp3
RP/0/RP0/CPU0:router(config-ospfv3)#trace size errors ?
   0     disable trace
   256   trace entries
   512   trace entries
  1024   trace entries
  2048   trace entries
  4096   trace entries
  8192   trace entries
 16384   trace entries
 32768   trace entries
 65536   trace entries
RP/0/RP0/CPU0:router(config-ospfv3)#trace size errors 1024
```
transmit-delay (OSPFv3)

To set the estimated time required to send a link-state update packet on the interface, use the transmit-delay command in an appropriate configuration mode. To return to the default value, use the no form of this command.

`transmit-delay seconds`
`no transmit-delay seconds`

**Syntax Description**

| seconds | Time (in seconds) required to send a link-state update. Range is 1 to 65535 seconds. |

**Command Default**

1 second

**Command Modes**

Process configuration

Area configuration

Interface configuration

Virtual-link configuration

OSPFv3 VRF configuration

**Command History**

Release 6.0 This command was introduced.

**Usage Guidelines**

Link-state advertisements (LSAs) in the update packet must have their ages incremented by the amount specified in the `seconds` argument before transmission. The value assigned should take into account the transmission and propagation delays for the interface.

If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. This setting has more significance on very low-speed links.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure a transmit delay of 3 seconds for HundredGigE interface 0/3/0/0:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 1
RP/0/RP0/CPU0:router(config-ospfv3)# area 0
RP/0/RP0/CPU0:router(config-ospfv3-ar)# interface HundredGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-ospfv3-ar-if)# transmit-delay 3
```
**virtual-link (OSPFv3)**

To define an Open Shortest Path First Version 3 (OSPFv3) virtual link, use the `virtual-link` command in area configuration mode. To remove a virtual link, use the `no` form of this command.

```
virtual-link router-id
no virtual-link
```

**Syntax Description**

| router-id | Router ID associated with the virtual link neighbor. The router ID appears in the `show ospfv3` display. This value must be entered in 32-bit dotted-decimal notation, similar to an IP Version 4 (IPv4) address. There is no default. |

**Command Default**

No virtual links are defined.

**Command Modes**

Area configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In OSPFv3, when there exists a path through another non-backbone area over which the virtual link can function, all areas must be connected to a backbone area. If the connection to the backbone is lost, it can be repaired by establishing a virtual link.

Virtual links, which are defined in the submode of the area they transit, are in effect virtual point-to-point interfaces belonging to area 0 (the backbone). The virtual links inherit parameter values from the backbone area, rather than the transit area in which they are defined.

Each virtual link neighbor must include the router ID of the virtual link neighbor for the link to be properly established. Use the `show ospfv3` command to display the router ID of an OSPFv3 process.

Use the `virtual-link` command to place the router in virtual-link configuration mode (config-router-ar-vl), from which you can configure virtual-link-specific settings. Commands configured under this mode (such as the `transmit-delay` command) are automatically bound to that virtual link.

**Examples**

The following example shows how to establish a virtual link with default values for all optional parameters:

```
RP/0/RP0/CPU0:router(config)# router ospfv3 201
RP/0/RP0/CPU0:router(config-ospfv3)# area 1
RP/0/RP0/CPU0:router(config-ospfv3-ar)# virtual-link 10.3.4.5
```
vrf (OSPFv3)

To configure an Open Shortest Path First Version 3 (OSPFv3) VPN routing and forwarding (VRF) instance and enter OSPFv3 VRF configuration submode, use the vrf command in XR Config mode. To terminate an OSPFv3 VRF, use the no form of this command.

```
vrf vrf-name
no vrf vrf-name
```

**Syntax Description**
- `vrf-name` Specifies a name for the OSPFV3 vrf. If a name is not specified, the default vrf is assumed.

**Command Default**
No OSPFv3 VRF is configured.

**Command Modes**
XR Config mode

**Command History**
- **Release**
  - 6.0 This command was introduced.

**Usage Guidelines**
Use the vrf command to explicitly configure a VRF. This command creates a separate instance of OSPFv3 within the process. Commands configured under the VRF configuration mode (such as the interface [OSPFv3] and authentication [OSPFv3] commands) are automatically bound to that VRF.

To modify or remove the VRF, the vrf-name argument format must be the same as the format used when creating the VRF.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure VRF vrf_1 and enter OSPFv3 VRF configuration submode:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router ospfv3 osp3
RP/0/RP0/CPU0:router(config-ospfv3)#vrf vrf_1
RP/0/RP0/CPU0:router(config-ospfv3-vrf)#
```
RIB Commands

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

• Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.

• References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.

• Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  • N540-28Z4C-SYS-A
  • N540-28Z4C-SYS-D
  • N540X-16Z4G8Q2C-A
  • N540X-16Z4G8Q2C-D
  • N540-12Z20G-SYS-A
  • N540-12Z20G-SYS-D
  • N540X-12Z16G-SYS-A
  • N540X-12Z16G-SYS-D

This module describes the commands used to display and clear information in the Routing Information Base (RIB).
For detailed information about RIB concepts, configuration tasks, and examples, see the Implementing RIB on Cisco NCS 5500 Series Routers module in *Routing Configuration Guide for Cisco NCS 5500 Series Routers*.

address-family next-hop dampening disable

To disable Routing Information Base (RIB) next-hop dampening, use the `address-family next-hop dampening disable` command in XR Config mode. To enable RIB next-hop dampening, use the `no` form of this command.

```
address-family {ipv4 | ipv6} next-hop dampening disable
do address-family {ipv4 | ipv6} next-hop dampening disable
```

**Syntax Description**
- `ipv4` Specifies IP Version 4 (IPv4) address prefixes.
- `ipv6` Specifies IP Version 6 (IPv6) address prefixes.

**Command Default**
RIB next-hop dampening is enabled.

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to disable RIB next-hop dampening for IPv6 address families:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router rib
RP/0/RP0/CPU0:router(config-rib)# address-family ipv6 next-hop dampening disable
```
## clear route

To clear routes from the IP routing table, use the `clear route` command in XR EXEC mode.

```
clear route [vrf {vrf-name | all}] {ipv4 | ipv6 | afi-all | safi-all} {unicast | multicast | safi-all} [topology topo-name] [ip-address mask]
```

### Syntax Description

- **vrf** `{vrf-name | all}` *(Optional)* Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **ipv4**
  - Specifies IP Version 4 address prefixes.
- **ipv6**
  - Specifies IP Version 6 address prefixes.
- **afi-all**
  - Specifies IP Version 4 and IP Version 6 address prefixes.
- **safi-all**
  - Specifies unicast address prefixes.
- **unicast**
  - Specifies multicast address prefixes.
- **multicast**
  - Specifies unicast and multicast address prefixes.
- **safi-all** *(Optional)* Specifies topology table information and name of the topology table.
- **topology** `topo-name`
  - *(Optional)* Specifies topology table information and name of the topology table.
- **ip-address**
  - Network IP address about which routing information should be displayed.
- **node-id** *(Optional)* Clears hardware resource counters from the designated node. The `node-id` argument is entered in the `rack/slot/module` notation.
- **mask**
  - Network mask specified in either of two ways:
    - Network mask can be a four-part, dotted-decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit is a network address.
    - Network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are 1s, and the corresponding bits of the address are the network address.

### Command Default

If a `vrf` `vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `clear route` command to clear routes from an IP routing table to a specific network, a matching subnet address, or all routes.
The topology keyword must be accompanied by the ipv4 multicast keywords, except when the afi-all keyword or the safi-all keyword is specified.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td></td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to remove all routes matching the subnet address 192.168.2.0 and mask 255.255.255.0 from the IPv4 unicast routing table:

```
RP/0/RP0/CPU0:router# clear route ipv4 unicast 192.168.2.0 255.255.255.0
```

The following example shows how to remove all routes from the IPv4 unicast routing table:

```
RP/0/RP0/CPU0:router# clear route ipv4 unicast
```
maximum prefix (RIB)

To set the prefix limit for the VPN routing and forwarding (VRF) instance, use the `maximum prefix` command in global VRF address family configuration mode. To set the prefix limits to the default values, use the `no` form of this command.

```
maximum prefix maximum [mid-threshold]
no maximum prefix
```

### Syntax Description

- **maximum**
  - Maximum number of prefixes allowed in the VRF instance. Range is 32 to 2000000.

- **mid-threshold**
  - (Optional) Integer specifying at what percentage of the `maximum` argument value the software starts to generate a Simple Network Management Protocol (SNMP) trap. Range is 1 to 100.

### Command Default

No default behavior or values

### Command Modes

Global VRF address family configuration

### Command History

- **Release**
  - **Modification**
  - Release 6.0
    - This command was introduced.

### Usage Guidelines

Use the `maximum prefix` command to configure a maximum number of prefixes that a VRF instance is allowed to receive.

### Task ID

- **Operations**
  - **Task ID**
    - **read**, **write**

### Examples

The following example shows how to set the maximum number of prefixes allowed to 1000:

```
RP/0/RP0/CPU0:router(config)# vrf vrf-A
RP/0/RP0/CPU0:router(config-vrf)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-vrf-af)# maximum prefix 1000
```

A maximum number of routes is applicable to dynamic routing protocols as well as static or connected routes. When maximum prefix is configured, an `syslog` message is generated in the following conditions:

1. if the number of routes is above the threshold when “maximum prefix” configuration has been committed
2. if the number routes reaches the configured “maximum prefix” values for the VRF
**Icc**

To enable Label Consistency Checker (lcc) background scan for IPv6 or IPv4 labels, use the `lcc enable` command in XR Config mode. To disable lcc background scan, use the `no` for of this command.

```
lcc {ipv4 | ipv6} unicast {enable | period milliseconds}
nolcc {ipv4 | ipv6} unicast {enable | period milliseconds}
```

### Syntax Description

- `ipv4` Specifies IP Version 4 address prefixes.
- `ipv6` Specifies IP Version 6 address prefixes.
- `unicast` Specifies unicast address prefixes.
- `period milliseconds` Specifies the period between scans in milliseconds. Range is 100 to 600000 milliseconds.

### Command Default

Label consistency checker is disabled.

### Command Modes

XR Config mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

No specific guidelines impact the use of this command.

### Task ID

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>read, write</td>
</tr>
<tr>
<td>ipv6</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

This example shows how to enable lcc for IPv6 labels:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#lcc ipv6 unicast enable
```
To enable Route Consistency Checker (rcc) background scan for IPv6 or IPv4 routes, use the `rcc enable` command in XR Config mode. To disable rcc background scan, use the `no` form of this command.

```
rcc {ipv4 | ipv6} unicast {enable | period milliseconds}
no rcc {ipv4 | ipv6} unicast {enable | period milliseconds}
```

**Syntax Description**
- `ipv4` Specifies IP Version 4 address prefixes.
- `ipv6` Specifies IP Version 6 address prefixes.
- `unicast` Specifies unicast address prefixes.
- `period milliseconds` Specifies the period between scans in milliseconds. Range is 100 to 600000 milliseconds.

**Command Default**
Route consistency checker is disabled.

**Command Modes**
XR Config mode

**Command History**

```
Release                  Modification

Release 6.0              This command was introduced.
```

**Usage Guidelines**
Use the `period` option to control how often the scan be triggered. Each time the scan is triggered, the background scan process resumes verification from where it was left out and sends one buffer’s worth of routes to the forwarding information base (FIB).

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>read, write</td>
</tr>
<tr>
<td>ipv6</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure rcc for IPv6 unicast:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#rcc ipv6 unicast enable
```

This example shows how to enable rcc with a scan period of 500 milliseconds for IPv6 unicast:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#rcc ipv6 unicast period 500
```
recursion-depth-max

To set the maximum depth for route recursion checks, use the `recursion-depth-max` command in XR Config mode. To set the recursion checks to the default value, use the `no` form of this command.

```
recursion-depth-max maximum
no recursion-depth-max maximum
```

**Syntax Description**
- `maximum` Maximum depth for recursion checks. Range is 5 to 16.

**Command Default**
The default recursion depth is 128.

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `recursion-depth-max` command to configure a specific maximum number of recursion checks in the range of 5 to 16.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to set the maximum depth for route recursion checks to 12:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router rib
RP/0/RP0/CPU0:router(config-rib)# recursion-depth-max 12
```
router rib

To enter Routing Information Base (RIB) configuration mode, use the `router rib` command in XR Config mode. To remove all RIB configurations and terminate the RIB routing process, use the `no` form of this command.

```
router rib
no router rib
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Router configuration mode is not enabled.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>read, write</td>
</tr>
<tr>
<td>ospf</td>
<td>read, write</td>
</tr>
<tr>
<td>hsrp</td>
<td>read, write</td>
</tr>
<tr>
<td>isis</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enter RIB configuration mode:

```
RP/0/RP0/CPU0:router(config)# router rib
```
rump always-replicate

To enable replication from uRIB to muRIB as usual even after features such as MTR are configured, use the **rump always-replicate** command in XR Config mode. To disable replication from uRIB to muRIB, use the **no** form of this command.

```
rump always-replicate [access-list]  
no rump always-replicate [access-list]
```

**Syntax Description**

```
access-list-name  (Optional) Name of the access list.
```

**Command Default**

Replication from uRIB to muRIB is enabled.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Configuring the **rump always-replicate** command allows routers in a network to be upgraded to multitopology routing gradually without a flag day where all routers need to be configured at the same time without major service disruption. When **rump always-replicate** is configured, replicated routes are added into the muRIB with the lowest admin distance. So if protocols are populating the muRIB, they continue to do so. For the same route, protocol routes win over replicated routes because of higher admin distance.

If an unwanted more specific route comes from the uRIB, optionally provide an access list through which the replicated routes are run. If the route passes the access list, the route is replicated by RUMP.

**Examples**

The following example shows how to enable replication from uRIB to muRIB:

```
RP/0/RP0/CPU0:router(config)# router rib  
RP/0/RP0/CPU0:router(config-rib)# address-family ipv4  
RP/0/RP0/CPU0:router(config-rib-afi)# rump always-replicate
```
show lcc statistics

To view results of a label consistency checker (lcc) background scan, use the `show lcc statistics` command in XR EXEC mode.

```
show lcc {ipv4 | ipv6} unicast statistics {scan-id | summary}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>ipv4</th>
<th>IPv4 address prefix.</th>
</tr>
</thead>
<tbody>
<tr>

show rcc

To display route consistency checker (RCC) information, use the `show rcc` command in XR EXEC mode.

```
show rcc {ipv4 | ipv6} unicast [{prefix netmask vrf vrf-name}]
```

### Syntax Description

- **ipv4**: Specifies IP Version 4 address prefixes.
- **ipv6**: Specifies IP Version 6 address prefixes.
- **unicast**: Specifies unicast address prefixes.
- **prefix**: (Optional) Starting prefix.
- **netmask**: (Optional) Network mask.
- **vrf vrf-name**: (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.

### Command Default

show rcc statistics

To view results of a route consistency checker (rcc) background scan, use the show rcc statistics command in XR EXEC mode.

```
show rcc {ipv4 | ipv6} unicast statistics {scan-id | summary}
```

**Syntax Description**

- `ipv4` IPv4 address prefix.
- `ipv6` IPv6 address prefix.
- `unicast` Specifies unicast address prefixes.
- `scan-id` Specifies the scan ID value. The range is between <0-100000>.
- `summary` Displays a summary of the BG route consistency check statistics.

End Of Logs
**show rcc vrf**

To run on-demand route consistency checker (rcc) scan on AFI, SAFI, table, and prefix or the entire set of prefixes in the table, use the `show rcc vrf` command in XR EXEC mode.

```bash
show rcc [ipv4 | ipv6] unicast prefix/mask vrf vrfname
```

**Syntax Description**

- **ipv4**: IPv4 address prefix.
- **ipv6**: IPv6 address prefix.
- **prefix/mask**: Specifies unicast address prefix.
- **vrf**: Specifies VPN routing and forwarding (VRF) instance.
- **vrfname**: Name of the VRF.

**Command Default**

None.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>

<tr>
<td>ipv6</td>
<td>read</td>
</tr>
</tbody>
</table>

This example shows how to run on-demand rcc scan for an IPv6 prefix:

```
RP/0/RP0/CPU0:router#show rcc ipv6 unicast 2001::DB8::/32 vrf vrf_1
```

This example shows how to run on-demand rcc scan for an IPv4 prefix:

```
RP/0/RP0/CPU0:router#show rcc ipv4 unicast 10.2.3.4/32 vrf vrf-1
```
show rib

To display Routing Information Base (RIB) data, use the `show rib` command in XR EXEC mode.

```plaintext
show rib {ipv4 | ipv6} {unicast | multicast} {firsthop | [type interface-path-id] | next-hop | [type interface-path-id]} | opaques | {attribute | ip-nexthop | ipfrr | safi-tunnel | summary | tunnel-nexthop | protocols | [standby] | statistics | [name] | [standby] | topology | {topo-name | all}}
```

### Syntax Description

- **ipv4** (Optional) Specifies IP Version 4 address prefixes.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes. This is the default.
- **multicast** (Optional) Specifies multicast address prefixes.
- **firsthop** (Optional) Specifies registered first-hop notification addresses.
- **type** Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id** Identifies a physical interface or a virtual interface.
  
  **Note** Use the show interfaces command to see a list of all possible interfaces currently configured on the router.
  
  For more information about the syntax for the router, use the question mark (?) online help function.
- **next-hop** (Optional) Specifies registered next-hop notification addresses.
- **opaques** (Optional) Specifies opaque data installed in the RIB.
- **attribute** (Optional) Specifies opaque attributes installed in the RIB.
- **ip-nexthop** (Optional) Specifies P next-hop data installed in the RIB.
- **ipfrr** (Optional) Specifies IP fast reroute (IPFRR) opaque data installed in the RIB.
- **safi-tunnel** (Optional) Specifies subaddress family (SAFI) tunnel opaque data installed in the RIB.
- **summary** (Optional) Specifies a summary of opaque data installed in the RIB.
- **tunnel-nexthop** (Optional) Specifies tunnel next-hop opaque data installed in the RIB.
- **protocols** (Optional) Specifies registered protocols.
- **statistics name** (Optional) Specifies RIB statistics of a given name.
- **standby** (Optional) Specifies standby information.
- **topology topo-name** (Optional) Specifies topology table information and name of the topology table.
- **all** (Optional) Specifies that all topology table information should be displayed.
**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>

</table>

**Examples**
The following example illustrates the `show rib` command:

```
RP/0/RSP0RP0/CPU0:router# show rib

ipv4 multicast

 topology
BLUE
```

```
RP/0/RSP0RP0/CPU0:router# show rib topology BLUE ipv4 multicast protocols
Protocol Handle Instance
isis 0 mt
```
show rib afi-all

To display Routing Information Base (RIB) data for both IPv4 and IPv6 address families, use the show rib afi-all command in XR EXEC mode.

```
show rib afi-all [attributes] [client-id] [clients] [extcomms] [firsthop] [history] [multicast] [next-hop] [opaques] [protocols] [recursion-depth-max] [safi-all] [statistics] [tables] [trace] [unicast] [vpn-attributes]
```

### Syntax Description

Examples

The following example illustrates the `show rib afi-all attributes` command:

```
RP/0/RP0/CPU0:router# show rib afi-all attributes
BGP attribute data in IPv4 RIB:
0 Attributes, for a total of 0 bytes.
BGP attribute data in IPv6 RIB:
0 Attributes, for a total of 0 bytes.
```
show rib attributes

To display Border Gateway Protocol (BGP) attributes installed in the Routing Information Base (RIB), use the `show rib attributes` command in XR EXEC mode.

`show rib attributes [summary] [standby]`

**Syntax Description**

- `summary` (Optional) Displays a summary of BGP attribute data installed in the RIB.
- `standby` (Optional) Displays standby information.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show rib attributes` command:

```
RP/0/RP0/CPU0:router# show rib attributes

BGP attribute data in IPv4 RIB:

Attribute ID (0x2):size (68)
Attribute ID (0x3):size (52)
Attribute ID (0x4):size (68)
Attribute ID (0x5):size (52)

4 Attributes, for a total of 240 bytes.

Attribute ID : ID assigned for the attribute by BGP
size : size of the attribute data.
```
show rib client-id

To display Routing Information Base (RIB) redistribution histories, use the `show rib client-id` command in XR EXEC mode.

```
show rib client-id id redistribution history [standby]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>id</code></td>
<td>ID of the client. Range is 0 to 4294967295.</td>
</tr>
<tr>
<td><code>redistribution history</code></td>
<td>Displays longer history of redistributed routes sent to RIB clients.</td>
</tr>
<tr>
<td><code>standby</code></td>
<td>(Optional) Displays standby information.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rib client-id` command to display a history of the route additions, deletions, and updates sent from RIB to the client across VRFs.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rib</code></td>
<td><code>read</code></td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show rib client-id` command:

```
RP/0/RP0/CPU0:router# show rib client-id 13 redistribution history

PID JID Client Location
151630 113 bcdl.agent node0_5_CPU0
Table ID: 0xe0000000
S 80.80.80.0/24[1/0] update, 5 path(s), 0x0 Jan 31 09:54:57.224
S 80.80.80.0/24[1/0] update, 6 path(s), 0x0 Jan 31 09:53:39.736

<td>Location node on which the client is present.</td>
</tr>
</tbody>
</table>
show rib clients

To display Routing Information Base (RIB) clients, use the `show rib clients` command in XR EXEC mode.

```
show rib [afi-all | ipv4 | ipv6] clients [protocols | redistribution [history]] [standby]
```

**Syntax Description**

- `afi-all` (Optional) Specifies all address families.
- `ipv4` (Optional) Specifies IP Version 4 address prefixes. This is the default.
- `ipv6` (Optional) Specifies IP Version 6 address prefixes.
- `protocols` (Optional) Specifies client protocols.
- `redistribution` (Optional) Specifies protocols redistributed by clients.
- `history` (Optional) Specifies redistributed routes sent to RIB clients.
- `standby` (Optional) Displays standby information.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rib clients` command to display the list of clients who have registered with RIB, what protocol routes they are redistributing, and a history of the routes sent to the client.

The maximum number of redistribution entries is 5000 for Bulk Content Downloader (BCDL) and 500 for other protocols.

**Task ID**

- **Task ID**
  - rib
  - read

**Examples**

The following is sample output from the `show rib clients` command:

```
RP/0/RP0/CPU0:router# show rib clients

<table>
<thead>
<tr>
<th>Process</th>
<th>Location</th>
<th>Client ID</th>
<th>Redist</th>
<th>Proto</th>
</tr>
</thead>
<tbody>
<tr>

<td>node0_5_CPU0</td>
<td>0</td>
<td>insync</td>
<td>insync</td>
</tr>
<tr>
<td>ospf</td>
<td>node0_5_CPU0</td>
<td>2</td>
<td>insync</td>
<td>insync</td>
</tr>
</tbody>
</table>

RP/0/RP0/CPU0:router# show rib clients redistribution

isis node0_5_CPU0
```
This table describes the significant fields shown in the display.

### Table 97: show rib clients Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process</td>
<td>Client process name.</td>
</tr>
<tr>
<td>Location</td>
<td>Location where the client process in running.</td>
</tr>
<tr>
<td>Client ID</td>
<td>ID assigned to the client by RIB.</td>
</tr>
<tr>
<td>Redist</td>
<td>Whether the client is redistributing any protocols or not and whether it has read all routes from RIB or not.</td>
</tr>
<tr>
<td></td>
<td>• insync—read</td>
</tr>
<tr>
<td></td>
<td>• outsync—not read.</td>
</tr>
<tr>
<td>Proto</td>
<td>Whether the protocol has sent all its routes to RIB and signaled update complete or not.</td>
</tr>
<tr>
<td></td>
<td>• insync—read</td>
</tr>
<tr>
<td></td>
<td>• outsync—not read.</td>
</tr>
</tbody>
</table>
### show rib extcomms

To display all extended communities installed in the Routing Information Base (RIB), use the `show rib extcomms` command in XR EXEC mode.

```
show rib [afi-all | ipv4 | ipv6] extcomms [summary] [standby]
```

#### Syntax Description

- **afi-all** (Optional) Specifies all address families.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes. This is the default.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **summary** (Optional) Specifies a summary of all extended communities in the RIB.
- **standby** (Optional) Displays standby information.

#### Command Default

No default behavior or values

#### Command Modes

System Admin EXEC mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

No specific guidelines impact the use of this command.

#### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

#### Examples

The following is sample output from the `show rib extcomms` command:

```
RP/0/RP0/CPU0:router# show rib extcomms

Extended community data in RIB:

Extended community          Ref count
COST:128:128:41984           1
```
This table describes the significant fields shown in the display.

**Table 98: show rib extcomms Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extended Community</td>
<td>Type of extended communities. Different protocols can add different extended communities.</td>
</tr>
<tr>
<td>Ref Count</td>
<td>Number of routes referring to the Extended community.</td>
</tr>
</tbody>
</table>
**show rib firsthop**

To display registered first-hop notification addresses, use the `show rib firsthop` command in System Admin EXEC mode.

```
show rib [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | safi-all}] firsthop [client-name] [{type interface-path-id | ip-address /prefix-length | ip-address mask | resolved | unresolved | damped}] [summary] [standby]
```

### Syntax Description

**vrf** { vrf-name | all } (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.

**afi-all** (Optional) Specifies all address families.

**ipv4** (Optional) Specifies IP Version 4 address prefixes. This is the default.

**ipv6** (Optional) Specifies IP Version 6 address prefixes.

**unicast** (Optional) Specifies unicast address prefixes. This is the default.

**multicast** (Optional) Specifies multicast address prefixes.

**safi-all** (Optional) Specifies unicast and multicast address prefixes.

**client-name** (Optional) Name of the RIB client.

**type** Interface type. For more information, use the question mark ( `?` ) online help function.

**interface-path-id** Physical interface or virtual interface.

**ip-address** (Optional) Network that BGP advertises.

**/ prefix-length** (Optional) Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (`/`) must precede the decimal value.

**ip-address mask** (Optional) Network mask applied to the `ip-address` argument.

**resolved** (Optional) Specifies resolved next-hops.

**unresolved** (Optional) Specifies unresolved next-hops.

**damped** (Optional) Specifies next-hops that are damped.

**summary** (Optional) Specifies a summary of the next-hop information.

**standby** (Optional) Displays standby information.
**Command Default**

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**

System Admin EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rib firsthop` command to display the list of first hops registered by various clients with RIB and the address and interface through which they are resolved.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show rib firsthop` command:

```
RP/0/RP0/CPU0:router# show rib firsthop
Registered firsthop notifications:
  0.0.0.0/0 via 1.1.0.1 - MgmtEth0/5/CPU0/0, ospf/node0_5_CPU0
  1.1.0.1/32 via 1.1.0.1 - MgmtEth0/5/CPU0/0, ipv4_static/node0_5_CPU0
  1.1.1.1/32 via 1.1.1.1 - MgmtEth0/5/CPU0/0, ipv4_static/node0_5_CPU0
  10.10.10.1/32 via 10.10.10.1 - Loopback0, ipv4_static/node0_5_CPU0
  10.10.10.3/32 via 10.10.10.3 - Loopback0, ipv4_static/node0_5_CPU0
  15.15.15.1/32 via 10.10.10.1 - Loopback0, ipv4_static/node0_5_CPU0
  20.20.20.1/32 via 1.1.1.1 - MgmtEth0/5/CPU0/0, ipv4_static/node0_5_CPU0
  30.30.30.1/32 via 1.1.1.2 - MgmtEth0/5/CPU0/0, ipv4_static/node0_5_CPU0
```
show rib history

To display history information for Routing Information Base (RIB) clients, use the `show rib history` command in XR EXEC mode.

```
show rib [{afi-all | ipv4 | ipv6}] history [client-id client-id] [standby]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>afi-all</td>
<td>(Optional) Specifies all address families.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IP Version 4 address prefixes. This is the default.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) Specifies IP Version 6 address prefixes.</td>
</tr>
<tr>
<td>client-id</td>
<td>(Optional) Specifies the ID of the client. Range for client-id argument is 0 to 4294967295.</td>
</tr>
<tr>
<td>standby</td>
<td>(Optional) Displays standby information.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rib history` command to display the list of routes that RIB has sent to various clients.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show rib history` command:

```
RP/0/RP0/CPU0:router# show rib history

JID Client Location
229  isis  node0_5_CPU0
  Table ID: 0xe0000000
  S  80.80.80.0/24[1/0]  update, 6 path(s), 04:32:09
  S 100.100.0.0/24[1/0]  update, 1 path(s), 04:32:09
  S 40.40.40.0/24[1/0]  update, 1 path(s), 04:32:09
  S 15.15.15.0/24[1/0]  update, 1 path(s), 04:32:09

JID Client Location
260  ospf  node0_5_CPU0
  Table ID: 0xe0000000
  S  80.80.80.0/24[1/0]  update, 6 path(s), 04:32:09
  S 100.100.0.0/24[1/0]  update, 1 path(s), 04:32:09
  S 40.40.40.0/24[1/0]  update, 1 path(s), 04:32:09
  S 15.15.15.0/24[1/0]  update, 1 path(s), 04:32:09
```
This table describes the significant fields shown in the display.

*Table 99: show rib history Field Descriptions*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JID</td>
<td>Job ID of the client process.</td>
</tr>
<tr>
<td>Client</td>
<td>Name of the client process.</td>
</tr>
<tr>
<td>Location</td>
<td>Information about where the client process is running.</td>
</tr>
</tbody>
</table>
show rib next-hop

To display registered next-hop notification addresses, use the **show rib next-hop** command in XR EXEC mode.

```
show rib [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | safi-all}] next-hop [client-name] [{type interface-path-id | ip-address /prefix-length | ip-address mask | resolved | unresolved | damped}] [summary] [standby]
```

**Syntax Description**

- **vrf {vrf-name | all}** (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **afi-all** (Optional) Specifies all address families.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes. This is the default.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes. This is the default.
- **multicast** (Optional) Specifies multicast address prefixes.
- **safi-all** (Optional) Specifies unicast and multicast address prefixes.
- **client-name** (Optional) Name of the RIB client.
- **type** Interface type. For more information, use the question mark (?) online help function.
  
  **Note** Use the **show interfaces** command to see a list of all interfaces currently configured on the router.
  
  For more information about the syntax for the router, use the question mark (?) online help function.
- **ip-address** (Optional) Network IP address about which routing information should be displayed.
- **mask** (Optional) Network mask specified in either of two ways:
  
  - Network mask can be a four-part, dotted-decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit is a network address.
  - Network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are 1s, and the corresponding bits of the address are the network address.
- **/prefix-length** (Optional) Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
- **resolved** (Optional) Specifies resolved next-hops.
unresolved  (Optional) Specifies unresolved next-hops.
damped     (Optional) Specifies next-hops that are damped.
summary    (Optional) Specifies a summary of the next-hop information.
standby    (Optional) Displays standby information.

Command Default
No default behavior or values

Command Modes
XR EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use the **show rib next-hop** command to display the list of next-hops registered by various clients with the RIB and the address and interface through which they are resolved.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

Examples
The following is sample output from the **show rib next-hop** command:

```
RP/0/RP0/CPU0:router# show rib next-hop

Registered nexthop notifications:

  0.0.0.0/0 via 172.29.52.1 - MgmtEth0/RP1/CPU0/0, ospf/node0_RP0_CPU0
  172.29.52.1/32 via 172.29.52.1 - MgmtEth0/RP1/CPU0/0, ipv4_static/node0_RP0_CPU0
```
show rib opaques

To display opaque data installed in the Routing Information Base (RIB), use the show rib opaques command in XR EXEC mode.

```
show rib [vrf {vrf-name | all}] [[afi-all | ipv4 | ipv6]] [[unicast | multicast | safi-all]] opaques {attribute | ip-nexthop | ipfrr | safi-tunnel | summary | tunnel-nexthop} [rib-client-name] [standby]
```

**Syntax Description**

- **vrf** { vrf-name | all } (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **afi-all** (Optional) Specifies all address families.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes. This is the default.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes. This is the default.
- **multicast** (Optional) Specifies multicast address prefixes.
- **safi-all** (Optional) Specifies unicast and multicast address prefixes.
- **attribute** Displays opaque attributes installed in the RIB.
- **ip-nexthop** Displays IP next-hop data installed in the RIB.
- **ipfrr** Displays IP fast reroute (IPFRR) opaque data installed in the RIB.
  
  **Note** Since the IP/LDP per-prefix LFA-FRR feature was introduced in IOS XR Software Release 4.0.1, the show rib opaques ipfrr command has been deprecated. Use show route command as part of the per-prefix LFA-FRR feature to determine backup paths.

  - **show route** output displays all FRR Backup paths. The FRR Backup paths are indicated with a (!).
  - **show route detail** output displays path ID and backup-path ID to identify if a path is protected and if so by which path.

- **safi-tunnel** Displays subaddress family (SAFI) tunnel opaque data installed in the RIB.
- **summary** Displays a summary of opaque data installed in the RIB.
- **tunnel-nexthop** Displays tunnel next-hop opaque data installed in the RIB.
- **rib-client-name** (Optional) Name of the RIB client.
- **standby** (Optional) Displays standby information.

**Command Default** No default behavior or values
**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If information is not used by the RIB server process, it is viewed as opaque data. Use the `show rib opaques` command to display opaque data installed in the RIB.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show rib opaques` command:

```
RP/0/RP0/CPU0:router# show rib opaques safi-tunnel

Summary of safi tunnel opaque data in IPv4 RIB:
Opaque key: 1:10.1.0.2
Opaque data:
  Tunnel Encap = ifhandle=0x1000180, type=L2TPv3, Params=[Session-id=0x1EB1127C, 'Cookie len=8, Cookie=0xA73A3E0AFCD419A6] Opaque key: 65535:10.0.101.1 Opaque data:

RP/0/RP0/CPU0:router# show rib ipv6 opaques tunnel-nexthop

Summary of 6PE/6VPE IP over tunnel nexthop opaque data in IPv6 RIB:
Opaque key: 1::ffff:10.1.0.2
Opaque key: 65535::ffff:10.0.101.1
Opaque key: 65535::ffff:10.0.101.2
Opaque key: 65535::ffff:10.0.101.3
Opaque key: 65535::ffff:10.0.101.4
Opaque key: 65535::ffff:10.0.101.5
```

This table describes the significant fields shown in the display.

**Table 100: show rib opaques Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>

<td>Data for the given key.</td>
</tr>
</tbody>
</table>
show rib protocols

To display protocols registered for route addition, use the `show rib protocols` command in XR EXEC mode.

```
show rib [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | safi-all}] protocols [standby]
```

**Syntax Description**

- **vrf** `{vrf-name | all}` (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **afi-all** (Optional) Specifies all address families.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes. This is the default.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes. This is the default.
- **multicast** (Optional) Specifies multicast address prefixes.
- **safi-all** (Optional) Specifies unicast and multicast address prefixes.
- **standby** (Optional) Displays standby information.

**Command Default**

If a `vrf vrf-name` is not specified, the registered first-hop notification addresses are displayed for the default IPv4 unicast VRF.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show rib protocols` command:

```
RP/0/RP0/CPU0:router# show rib protocols
Protocol  Handle  Instance
isis       0        rib
connected  1        
static     2        
local      3        
bgp        4        102
ospf       5        1
```
This table describes the significant fields shown in the display.

**Table 101: show rib protocols Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol</td>
<td>Name of the protocol.</td>
</tr>
<tr>

<td>Handle assigned to the protocol instance.</td>
</tr>
<tr>
<td>Instance</td>
<td>Protocol instance.</td>
</tr>
</tbody>
</table>
show rib recursion-depth-max

To display the maximum recursion depth in the Routing Information Base (RIB), use the `show rib recursion-depth-max` command in XR EXEC mode.

`show rib {afi-all | ipv4 | ipv6} recursion-depth-max [standby]`

**Syntax Description**
- `afi-all` (Optional) Specifies all address families.
- `ipv4` (Optional) Specifies IP Version 4 address prefixes. This is the default.
- `ipv6` (Optional) Specifies IP Version 6 address prefixes.
- `standby` (Optional) Displays standby information.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `show rib recursion-depth-max` command to display the maximum recursion depth for RIB. Recursion depth is the number of next-hops that can be specified.

**Examples**
The following is sample output from the `show rib recursion-depth-max` command:

```
RP/0/RP0/CPU0:router# show rib recursion-depth-max
IPv4:
-----
Maximum recursion depth in RIB:

  Configured: 12
  In Use: 128

IPv6:
-----
Maximum recursion depth in RIB:

  Configured: 12
  In Use: 128
```
This table describes the significant fields shown in the display.

**Table 102: show rib recursion-depth-max Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configured</td>
<td>Value of maximum recursion depth currently configured.</td>
</tr>
<tr>
<td>In Use</td>
<td>Value of maximum recursion depth RIB is using. This value can be different from the configured value because RIB has to be restarted after the configuration is changed for the new configuration to be effective.</td>
</tr>
</tbody>
</table>
show rib statistics

To display Routing Information Base (RIB) statistics, use the **show rib statistics** command in XR EXEC mode.

```
show rib [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | safi-all}] statistics [client-name] [standby]
```

**Syntax Description**

- **vrf {vrf-name | all}** (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **afi-all** (Optional) Specifies all address families.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes. This is the default.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes. This is the default.
- **multicast** (Optional) Specifies multicast address prefixes.
- **safi-all** (Optional) Specifies unicast and multicast address prefixes.
- **client-name** (Optional) Name of the RIB client.
- **standby** (Optional) Displays standby information.

**Command Default**

If a **vrf vrf-name** is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **show rib statistics** command to display RIB statistics. The statistics include requests sent from the clients to the RIB and the information redistributed to the client.

RIB maintains counters for all requests sent from a client including:

- Route operations
- Table registrations
- Next-hop registrations
- Redistribution registrations
- Attribute registrations
- Synchronization completion

RIB also maintains the results of the requests.
The following is sample output from the `show rib statistics` command:

RP/0/RP0/CPU0:router# show rib statistics

RIB Statistics:
Received 142 batch messages
  137 route operations, 0 attribute operations
  0 opaque operations
  11 complete operations, 0 convergent operations
Results of the batch message received:
  142 successes
  0 forward references, 0 invalid client id, 0 unknown errors
  0 memory allocation errors, 0 client lookup errors, table lookup errors 0
  0 proto lookup errors, 0 client proto lookup errors
  ipv4_connected/node0_RP0_CPU0 last performed route operation
  with status BATCH_SUCCESS at Jun 26 21:43:33.601

Received 217422 light weight messages
  4 route add requests, 2 route delete requests
  10 protocol registered, 1 protocol unregistered
  0 protocol modify, 0 protocol purged
  14 protocol redistributions, 0 unregistered protocol redistributions
  0 reset protocol redistributions
  3 first hop registered, 1 first hop unregistered
  3 advertisements, 0 unregistered advertisement
  57 bind data, 97 update completes, 217230 other requests
  udp/node0_RP0_CPU0 last performed firsthop lookup operation
  with status success at Jun 27 10:09:59.990

Received 0 nexthop batch messages
  0 successes
  0 inits
  0 registers, 0 unregisters
  0 register complete, 0 sync unregistered, 0 batch finished

This table describes the significant fields shown in the display.

**Table 103: show rib statistics Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received</td>
<td>Statistics received including batch messages and route, attribute, complete, and convergent operations.</td>
</tr>
<tr>
<td>Results of the batch message received</td>
<td>Batch message results.</td>
</tr>
<tr>
<td>Received $n$ light weight messages</td>
<td>Number of lightweight API messages sent from RIB clients.</td>
</tr>
<tr>
<td>Received $n$ nexthop batch messages</td>
<td>Number of batch API messages sent from RIB clients received by the RIB.</td>
</tr>
</tbody>
</table>
show rib tables

To display all tables known to the Routing Information Base (RIB), use the show rib tables command in XR EXEC mode.

```
show rib [{afi-all | ipv4 | ipv6}] tables [summary] [standby]
```

**Syntax Description**

- `afi-all` (Optional) Specifies all address families.
- `ipv4` (Optional) Specifies IP Version 4 address prefixes. This is the default.
- `ipv6` (Optional) Specifies IP Version 6 address prefixes.
- `summary` (Optional) Displays summary table information.
- `standby` (Optional) Displays standby information.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the show rib tables command to display all tables known to the RIB, including table attributes. Attributes include VPN routing and forwarding (VRF) instance, address family, and maximum prefix information.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the show rib tables command when entered without an address:

```
RP/0/RP0/CPU0:router# show rib tables

Codes: N - Prefix Limit Notified, F - Forward Referenced
       D - Table Deleted, C - Table Reached Convergence

VRF    SAFI Table ID   PrfxLmt PrfxCnt TblVersion  N  F  D  C
default uni 0xe0000000 2000000   72        137   N  N  N  Y
default  multi 0xe0100000 2000000   0       0       D  N  N  N  Y
```
This table describes the significant fields shown in the display.

# show rib trace

To display all Routing Information Base (RIB) library call tracer (ltrace) entries, use the `show rib trace` command in XR EXEC mode.

```
show rib [ {afi-all | ipv4 | ipv6} ] trace [ {clear | counts | event-manager | startup | sync | timing} ] [ {unique | wrapping} ] [ last entries ] [ hexdump ] [ reverse ] [ tailif ] [ stats ] [ verbose ] [ {file name original location node-id | location {all | node-id} } ]
```

## Syntax Description

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
**show rib vpn-attributes**

To display all VPN attributes installed in the Routing Information Base (RIB), use the `show rib vpn-attributes` command in XR EXEC mode.

```
show rib [afi-all | ipv4 | ipv6] vpn-attributes [summary] [standby]
```

**Syntax Description**

- `afi-all` (Optional) Specifies all address families.
- `ipv4` (Optional) Specifies IP Version 4 address prefixes.
- `ipv6` (Optional) Specifies IP Version 6 address prefixes.
- `summary` (Optional) Displays VPN attribute information.
- `standby` (Optional) Displays standby information.

**Command Default**
The default is IPv4 address prefixes.

**Command Modes**
XR EXEC mode

</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>read</td>
</tr>
</tbody>
</table>
```

### Examples

The following example shows output from the `show rib vrf all statistics` command:

```
RP/0/RP0/CPU0:router# show rib vrf all statistics
RP/0/RP0/CPU0:router#
```
show route

To display the current routes in the Routing Information Base (RIB), use the show route command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [afi-all | ipv4 | ipv6] [unicast | multicast topology topo-name | safi-all] [protocol [instance] | ip-address [mask] | ip-address/prefix-length] [standby] [detail]
```

### Syntax Description

- **vrf**
  - 
    - `vrf-name` | `all` (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
  - `afi-all` (Optional) Specifies all address families.
  - `ipv4` (Optional) Specifies IP Version 4 address prefixes. This is the default.
  - `ipv6` (Optional) Specifies IP Version 6 address prefixes.
  - `unicast` (Optional) Specifies unicast address prefixes. This is the default.
  - `multicast` (Optional) Specifies multicast address prefixes.
  - `topo-name` (Optional) Specifies topology table information and name of the topology table.
  - `safi-all` (Optional) Specifies unicast and multicast address prefixes.
  - `protocol` (Optional) Name of a routing protocol. If you specify a routing protocol, use one of the following keywords:
    - `bgp`
    - `isis`
    - `ospf`
    - `rip`
    - `static`
    - `local`
    - `connected`
  - `instance` (Optional) Number or name used to identify an instance of the specified protocol.
  - `ip-address` (Optional) Network IP address about which routing information should be displayed.
  - `mask` (Optional) Network mask specified in either of two ways:
    - Network mask can be a four-part, dotted-decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit is a network address.
    - Network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are 1s, and the corresponding bits of the address are the network address.
  - `/prefix-length` (Optional) Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
show route

**standby**  (Optional) Displays standby information.

**detail**  (Optional) Displays detailed information for the specified prefix.

**Command Default**
If a **vrf vrf-name** is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the **afi-all** keyword is used, the **ip-address** and **mask** arguments are not available.

The **topology** keyword must be accompanied by the **ipv4 multicast** keywords, except when the **afi-all** keyword or the **safi-all** keyword is specified.

**Examples**
The following is sample output from the **show route** command when entered without an address:

```
RP/0/RP0/CPU0:router# show route

Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - ISIS, L1 - IS-IS level-1, L2 - IS-IS level-2
       * - IS-IS inter area, su - IS-IS summary null, * - candidate default
       U - per-user static route, o - ODR, L - local, G - DAGR
       A - access/subscriber, (!) - FRR Backup path

Gateway of last resort is 1.0.0.1 to network 0.0.0.0

```
This table describes the significant fields shown in the display.

**Table 106: show route Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S*</td>
<td>Code indicating how the route was derived. See the code legend preceding the output. In this case, the route was derived from a static (candidate default).</td>
</tr>
<tr>
<td>[1/0]</td>
<td>First number in the brackets is the administrative distance of the information source; the second number is the metric for the route.</td>
</tr>
<tr>
<td>1.0.0.0/16</td>
<td>Address and prefix length of the remote network.</td>
</tr>
<tr>
<td>MgmtEthernet 0/5/CPU0/0</td>
<td>Specifies the interface through which the specified network can be reached.</td>
</tr>
<tr>
<td>C</td>
<td>Code indicating how the route was derived. See the code legend preceding the output. In this case, the route was connected.</td>
</tr>
<tr>
<td>L</td>
<td>Code indicating how the route was derived. See the code legend preceding the output. In this case, the route was local.</td>
</tr>
<tr>
<td>O</td>
<td>Code indicating how the route was derived. See the code legend preceding the output. In this case, the route was on-demand routing (ODR).</td>
</tr>
<tr>
<td>E2</td>
<td>Code indicating how the route was derived. See the code legend preceding the output. In this case, the route was OSPF external type 2.</td>
</tr>
<tr>
<td>8.2.8.0/24</td>
<td>Address and prefix length of the remote network connected to the static route.</td>
</tr>
<tr>
<td>via 3.3.3.1</td>
<td>Specifies the address of the next router to the remote network.</td>
</tr>
<tr>
<td>13:14:59</td>
<td>Specifies the last time the route was updated.</td>
</tr>
<tr>
<td>(1)</td>
<td>Code indicating fast re-route (FRR) backup path information.</td>
</tr>
</tbody>
</table>

When you specify that you want information about a particular network, more detailed statistics are displayed. The following is sample output from the **show route** command when entered with an IP address:

```
RP/0/RP0/CPU0:router# show route 10.0.0.0
Routing entry for 10.0.0.0/16
  Known via "connected", distance 0, metric 0 (connected)
  Installed Mar 22 22:10:20.906
  Routing Descriptor Blocks
    directly connected, via HundredGigE 0/0/0/0
    Route metric is 0
  No advertising protos.
```

Intermediate System-to-Intermediate System (IS-IS) includes an IP address typed length value (TLV) in its link-state packet (LSP) that helps identify the node injecting the route into the network. The IS-IS node uses one of its own interface addresses in this TLV. A loopback address is preferred
among interfaces configured under IS-IS. When other networking devices calculate IP routes, they can store the IP address as the originator address with each route in the routing table.

The following example shows the output from the `show route` command for a specific IP address on a router configured with IS-IS. Each path that is shown under the Routing Descriptor Blocks report displays two IP addresses. The first address (10.0.0.9) is the next-hop address; the second is the originator IP address from the advertising IS-IS router.

```
RP/0/RP0/CPU0:router# show route 10.0.0.1

Routing entry for 10.0.0.0/8
Known via "isis", distance 115, metric 10, type level-2
    Installed Jan 22 09:26:56.210
Routing Descriptor Blocks:
    * 10.0.0.9, from 10.0.0.9, via HundredGigE 2/1
    Route metric is 10
No advertising protos.
```

This table describes the significant fields shown in the display.

**Table 107: show route with IP Address Field Descriptions**

```

This example is a sample `show route summary` command output that displays fast-reroute (FRR) Backup path information. The FRR Backup paths are indicated with a (!).
This example is a sample `show route detail` command output that displays path ID and backup-path ID information:

```
RP/0/RP0/CPU0:router# show route 10.1.1.3 detail
Routing entry for 10.1.1.16/32
  Known via "ospf 2", distance 110, metric 21, type intra area
  Installed Oct 28 16:07:05.752 for 00:01:56
  Routing Descriptor Blocks
    40.1.10.1, from 10.1.1.16, via Bundle-Ether10, Protected
     Route metric is 21
     Label: None
     Tunnel ID: None
     Extended communities count: 0
     Path id:2    Path ref count:0
     Backup path id:33
    200.40.1.101, from 10.1.1.16, via Bundle-Ether1.1, Protected
     Route metric is 21
     Label: None
     Tunnel ID: None
     Extended communities count: 0
     Path id:1    Path ref count:0
     Backup path id:33
    100.100.2.1, from 10.1.1.16, via HundredGigE 0/2/0/3.1, Backup
     Route metric is 0
     Label: None
     Tunnel ID: None
     Extended communities count: 0
     Path id:33    Path ref count:2
  Route version is 0xe (14)
  No local label
  IP Precedence: Not Set
  QoS Group ID: Not Set
  Route Priority: RIB_PRIORITY_NON_RECURSIVE_LOW (6) SVD Type RIB_SVD_TYPE_LOCAL
  No advertising protos.
```

This example is a sample `show route ipv6` command output:

```
RP/0/RP0/CPU0:router# show route ipv6
Fri May 18 14:00:10.996 EDT
Codes: C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
i - ISIS, L1 - IS-IS level-1, L2 - IS-IS level-2
* - candidate default
u - per-user static route, o - ODR, G - DAGR
A - access/subscriber, (!) - FRR Backup path
Gateway of last resort is not set
C 1111:2222::abcd/128 is directly connected, 06:20:02, HundredGigE 0/0/0/4
```

This example is a sample `show route ipv6 detail` command output:

```
RP/0/RP0/CPU0:router# show route ipv6 1111:2222::abcd/128 detail
Fri May 18 14:00:20.798 EDT
```
Routing entry for 1111:2222::abcd/128
Known via "connected l2tpv3_xconnect", distance 0, metric 0 (connected)
Installed May 18 07:40:08.522 for 06:20:12
Routing Descriptor Blocks
1111:2222::abcd directly connected, via HundredGigE 0/0/0/4
Route metric is 0
Label: 0x2 (2)

Extended communities count: 0
Route version is Ox (13)
No local label
IP Precedence: Not Set
QoS Group ID: Not Set
Route Priority: RIB_PRIORITY_CONNECTED (2) SVD Type RIB_SVD_TYPE_LOCAL
Download Priority 0, Download Version 13
No advertising protos.

This example is a sample show route ipv6 summary command output:

RP/0/RP0/CPU0:router#show route ipv6 summary
Fri May 18 14:00:28.988 EDT
Route Source Routes Backup Deleted Memory (bytes)
local 0 0 0 0
connected l2tpv3_xconnect 1 0 0 160
cconnected 0 0 0 0
Total 1 0 0 160
show route backup

To display backup routes from the Routing Information Base (RIB), use the **show route backup** command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | topology topo-name} | safi-all] backup [{ip-address [mask] ip-address /prefix-length}] [[standby]]
```

### Syntax Description

- **vrf** \{vrf-name | all\} (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **afi-all** (Optional) Specifies all address families.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes.
- **multicast** (Optional) Specifies multicast address prefixes.
- **topology topo-name** (Optional) Specifies topology table information and name of the topology table.
- **safi-all** (Optional) Specifies unicast and multicast address prefixes.
- **ip-address** (Optional) Network IP address about which backup routing information should be displayed.
- **mask** (Optional) Network mask specified in either of two ways:
  - Network mask can be a four-part, dotted decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit is a network address.
  - Network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are ones, and the corresponding bits of the address are the network address.
- **/prefix-length** (Optional) Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
- **standby** (Optional) Displays standby information.

### Command Default

If a **vrf** vrf-name is not specified, routes are cleared from the default IPv4 unicast VRF.

### Command Modes

- XR EXEC mode

### Command History

- **Release**
  - Release 6.0
  - This command was introduced.
Usage Guidelines

Use the **show route backup** command to display information about routes that have been installed into the RIB as backup routes. This command also displays information about the currently selected active route for which there is a backup.

When the **afi-all** keyword is used, the **ip-address** and **mask** arguments are not available.

The **topology** keyword must be accompanied by the **ipv4 multicast** keywords, except when the **afi-all** keyword or the **safi-all** keyword is specified.

show route best-local

To display the best local address to use for return packets from the given destination, use the `show route best-local` command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [ipv4 | ipv6] [unicast | multicast | topology topo-name | safi-all] best-local ip-address [standby]
```

**Syntax Description**

- `vrf {vrf-name | all}` (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- `ipv4` (Optional) Specifies IP Version 4 address prefixes.
- `ipv6` (Optional) Specifies IP Version 6 address prefixes.
- `unicast` (Optional) Specifies unicast address prefixes.
- `multicast` (Optional) Specifies multicast address prefixes.
- `topology topo-name` (Optional) Specifies topology table information and name of the topology table.
- `safi-all` (Optional) Specifies unicast and multicast address prefixes.
- `ip-address` IP address about which best local information should be displayed.
- `standby` (Optional) Displays standby information.

**Command Default**

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**

XR EXEC mode

**Command History**

- **Release**: Release 6.0
  - **Modification**: This command was introduced.

**Usage Guidelines**

Use the `show route best-local` command to display information about the best local routes in the routing table.

The `topology` keyword must be accompanied by the `ipv4 multicast` keywords, except when the `afi-all` keyword or the `safi-all` keyword is specified.

**Examples**

The following is sample output from the `show route best-local` command:

```
RP/0/RP0/CPU0:router# show route best-local 10.12.12.1/32
```
Routing entry for 10.12.12.1/32
   Known via "local", distance 0, metric 0 (connected)
Routing Descriptor Blocks
   10.12.12.1 directly connected, via HundredGigE 3/0/0/1
      Route metric is 0

This table describes the significant fields shown in the display.

**Table 109: show route best-local Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>
show route connected

To display the current connected routes of the routing table, use the show route connected command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | topology topo-name} | safi-all] connected [ standby]
```

### Syntax Description
- **vrf** {vrf-name | all} (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **afi-all** (Optional) Specifies all address families.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes.
- **multicast** (Optional) Specifies multicast address prefixes.
- **topology** topo-name (Optional) Specifies topology table information and name of the topology table.
- **safi-all** (Optional) Specifies unicast and multicast address prefixes.
- **standby** (Optional) Displays standby information.

### Command Default
If a **vrf** vrf-name is not specified, routes are cleared from the default IPv4 unicast VRF.

### Command Modes
XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
Use the show route connected command to display information about connected routes in the routing table. The topology keyword must be accompanied by the ipv4 multicast keywords, except when the afi-all keyword or the safi-all keyword is specified.

### Examples
The following is sample output from the show route connected command:

```
RP/0/RP0/CPU0:router# show route connected
```
This table describes the significant fields shown in the display.

Table 110: show route connected Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Code to indicate the route is connected.</td>
</tr>
<tr>
<td>1.68.0.0/16</td>
<td>IP address and length of the route.</td>
</tr>
<tr>
<td>13:43:40</td>
<td>Time (in hh:mm:ss) since the route was installed in the RIB.</td>
</tr>
<tr>
<td>MgmtEth0/5/CPU0/0</td>
<td>Outbound interface for the route.</td>
</tr>
</tbody>
</table>
show route local

To display local routes receiving routing updates from the Routing Information Base (RIB), use the `show route local` command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | topology topo-name} | safi-all] local [{type interface-path-id}] [standby]
```

### Syntax Description

- **vrf {vrf-name | all}**: (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **afi-all**: (Optional) Specifies all address families.
- **ipv4**: (Optional) Specifies IP Version 4 address prefixes.
- **ipv6**: (Optional) Specifies IP Version 6 address prefixes.
- **unicast**: (Optional) Specifies unicast address prefixes.
- **multicast**: (Optional) Specifies multicast address prefixes.
- **topology topo-name**: (Optional) Specifies topology table information and name of the topology table.
- **safi-all**: (Optional) Specifies unicast and multicast address prefixes.
- **type**: Interface type. For more information, use the `show interfaces` command to see a list of all interfaces currently configured on the router.
- **interface-path-id**: Physical interface or virtual interface.

**Note**: Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

- **standby**: (Optional) Displays standby information.

### Command Default

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `show route local` command to display information about local routes in the routing table.

The topology keyword must be accompanied by the ipv4 multicast keywords, except when the afi-all keyword or the safi-all keyword is specified.
Examples

The following is sample output from the show route local command:

RP/0/RP0/CPU0:router# show route local

L 10.10.10.1/32 is directly connected, 00:14:36, Loopback0
L 10.91.36.98/32 is directly connected, 00:14:32, HundredGigE6/0/0/1
L 172.22.12.1/32 is directly connected, 00:13:35, HundredGigE3/0/0/1
L 192.168.20.2/32 is directly connected, 00:13:27, HundredGigE4/0/0/1
L 10.254.254.1/32 is directly connected, 00:13:26, HundredGigE5/0/0/1

This table describes the significant fields shown in the display.

Table 111: show route local Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td>Loopback0</td>
<td>Outbound interface for the route.</td>
</tr>
</tbody>
</table>
show route longer-prefixes

To display the current routes in the Routing Information Base (RIB) that share a given number of bits with a given network, use the `show route longer-prefixes` command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [[ipv4 | ipv6]] [[unicast | multicast | {topology topo-name} | safi-all]]
longer-prefixes {ip-address mask ip-address/prefix-length} [ standby]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Time (in hh:mm:ss or nd/h) since the route was installed in the RIB.</td>
</tr>
<tr>
<td>MgmtEth0/RSP0 RP0/CPU0/0</td>
<td>Outbound interface for the route.</td>
</tr>
</tbody>
</table>
show route next-hop

To filter routes by the next-hop address or interface, use the `show route next-hop` command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [[ipv4 | ipv6] [{unicast | multicast | topology topo-name} | safi-all}] next-hop [ip-address] [({standby})]
```

**Syntax Description**

- `vrf` {vrf-name | all} (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- `ipv4` (Optional) Specifies IP Version 4 address prefixes.
- `ipv6` (Optional) Specifies IP Version 6 address prefixes.
- `unicast` (Optional) Specifies unicast address prefixes.
- `multicast` (Optional) Specifies multicast address prefixes.
- `topology topo-name` (Optional) Specifies topology table information and name of the topology table.
- `safi-all` (Optional) Specifies unicast and multicast address prefixes.
- `ip-address` (Optional) IP address about which next-hop information is to be displayed.
- `standby` (Optional) Displays standby information.

**Command Default**

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show route next-hop` command to find all routes going through a next-hop address or interface.

The topology keyword must be accompanied by the ipv4 multicast keywords, except when the afi-all keyword or the safi-all keyword is specified.

**Task ID**

<table>

show route quarantined

To display mutually recursive (looping) routes, use the `show route quarantined` command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [ipv4 | ipv6] [{unicast | multicast | topology topo-name} | safi-all] quarantined [{ip-address/prefix-length]|ip-address mask} [standby]
```

### Syntax Description

- **vrf {vrf-name | all}** (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- **ipv4** (Optional) Specifies IP Version 4 address prefixes.
- **ipv6** (Optional) Specifies IP Version 6 address prefixes.
- **unicast** (Optional) Specifies unicast address prefixes.
- **multicast** (Optional) Specifies multicast address prefixes.
- **topology topo-name** (Optional) Specifies topology table information and name of the topology table.
- **safi-all** (Optional) Specifies unicast and multicast address prefixes.
- **ip-address** (Optional) IP address about which looping routes information is to be displayed.
- **/prefix-length** (Optional) Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
- **ip-address mask** (Optional) Network mask applied to the `ip-address` argument.
- **standby** (Optional) Displays standby information.

### Command Default

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

### Command Modes

XR EXEC mode

### Command History

- **Release** 6.0

  - **Modification** This command was introduced.

### Usage Guidelines

RIB quarantining detects mutually recursive routes and quarantines the last route that actually completes the mutual recursion. The quarantined route is periodically evaluated to see if the mutual recursion has gone away. If the recursion still exists, the route remains quarantined. If the recursion has gone away, the route is released from quarantine.

Use the `show route quarantined` command to display mutually recursive (looping) routes.

The topology keyword must be accompanied by the ipv4 multicast keywords, except when the safi-all keyword or the safi-all keyword is specified.
The following is sample output from the `show route quarantined` command:

```
RP/0/RP0/CPU0:routerr# show route quarantined

Codes:  C - connected, S - static, R - RIP, M - mobile, B - BGP
       0 - OSPF, IA - OSPF inter area

</tbody>
</table>
show route resolving-next-hop

To display the next-hop gateway or host to a destination address, use the `show route resolving-next-hop` command in XR EXEC mode.

```
show route [vrf {vrf-name|all}] [(ipv4|ipv6)] [(unicast|multicast|topology topo-name) |safi-all]]
resolving-next-hop  ip-address  [ standby]
```

**Syntax Description**

- `vrf {vrf-name | all}`: (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- `ipv4`: (Optional) Specifies IP Version 4 address prefixes.
- `ipv6`: (Optional) Specifies IP Version 6 address prefixes.
- `unicast`: (Optional) Specifies unicast address prefixes.
- `multicast`: (Optional) Specifies multicast address prefixes.
- `topology topo-name`: (Optional) Specifies topology table information and name of the topology table.
- `safi-all`: (Optional) Specifies unicast and multicast address prefixes.
- `ip-address`: IP address about which resolved next-hop information is to be displayed.
- `standby`: (Optional) Displays standby information.

**Command Default**

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show route resolving-next-hop` command to perform a recursive route lookup on the supplied destination address and return information on the next immediate router (next hop) to the destination.

The topology keyword must be accompanied by the ipv4 multicast keywords, except when the afi-all keyword or the safi-all keyword is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show route resolving-next-hop` command:

```
RP/0/RP0/CPU0:router# show route resolving-next-hop 10.1.1.1
```
Next hop matches 10.1.1.1/32
Known via "local", distance 0, metric 0 (connected)
Installed Aug 22 01:57:08.514
Directly connected nexthops
10.1.1.1 directly connected, via Loopback0
  Route metric is 0

This table describes the significant fields shown in the display.

Table 115: show route resolving-next-hop Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Known via</td>
<td>Name of the routing protocol that installed the matching route.</td>
</tr>
<tr>
<td>Route metric is</td>
<td>Metric of the route.</td>
</tr>
</tbody>
</table>
show route static

To display the current static routes of the Routing Information Base (RIB), use the `show route static` command in XR EXEC mode.

```
show route [vrf {vrf-name | all}] [{afi-all | ipv4 | ipv6}] [{unicast | multicast | topology topo-name} | safi-all] static [standby]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf</td>
<td>(Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.</td>
</tr>
<tr>
<td>afi-all</td>

<td>topology</td>
<td>(Optional) Specifies topology table information and name of the topology table.</td>
</tr>
<tr>
<td>safi-all</td>
<td>(Optional) Specifies unicast and multicast address prefixes.</td>
</tr>
<tr>
<td>standby</td>
<td>(Optional) Displays standby information.</td>
</tr>
</tbody>
</table>

**Command Default**

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show route static` command to display information about static routes in the routing table. The topology keyword must be accompanied by the ipv4 multicast keywords, except when the afi-all keyword or the safi-all keyword is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>rib</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show route static` command:

```
RP/0/RP0/CPU0:router# show route static
```
S 10.1.1.0/24 is directly connected, 00:54:05, HundredGigE3/0/0/1

This table describes the significant fields shown in the display.

*Table 116: show route static Field Descriptions*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>Code to indicate the route is static.</td>

</tr>
<tr>
<td>[1/0]</td>
<td>Distance and metric for the route.</td>
</tr>
</tbody>
</table>
show route summary

To display the current contents of the Routing Information Base (RIB), use the `show route summary` command in XR EXEC mode mode.

```
show route [vrf {vrf-name | all}] [ {afi-all | ipv4 | ipv6}] [ {unicast | multicast | topology topo-name} | safi-all] summary [detail] [standby]
```

**Syntax Description**

- `vrf {vrf-name | all}`: (Optional) Specifies a particular VPN routing and forwarding (VRF) instance or all VRF instances.
- `afi-all`: (Optional) Specifies all address families.
- `ipv4`: (Optional) Specifies IP Version 4 address prefixes.
- `ipv6`: (Optional) Specifies IP Version 6 address prefixes.
- `unicast`: (Optional) Specifies unicast address prefixes.
- `multicast`: (Optional) Specifies multicast address prefixes.
- `topology topo-name`: (Optional) Specifies topology table information and name of the topology table.
- `safi-all`: (Optional) Specifies unicast and multicast address prefixes.
- `detail`: (Optional) Displays a detailed summary of the contents of the RIB, including the number of paths and some protocol-specific route attributes.
- `standby`: (Optional) Displays standby information.

**Command Default**

If a `vrf vrf-name` is not specified, routes are cleared from the default IPv4 unicast VRF.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show route summary` command to display information about routes in the routing information base. When a route summary is needed frequently—for instance, in a polling situation—use the `show route summary` command without the `detail` keyword. The `detail` keyword is used less frequently for verification purposes, because it is much more expensive (in bandwidth), requiring a scan of the entire routing database.

The topology keyword must be accompanied by the ipv4 multicast keywords, except when the afi-all keyword or the safi-all keyword is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>

Routing Policy Language Commands

Note

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.
- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.
- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.
- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  - N540-28Z4C-SYS-A
  - N540-28Z4C-SYS-D
  - N540X-16Z4G8Q2C-A
  - N540X-16Z4G8Q2C-D
  - N540-12Z20G-SYS-A
  - N540-12Z20G-SYS-D
  - N540X-12Z16G-SYS-A
  - N540X-12Z16G-SYS-D

This module describes the Cisco IOS XR software routing policy language (RPL) commands used to create, modify, monitor, and maintain routing policies.
For detailed information about RPL concepts, configuration tasks, and examples, see the Implementing Routing Policy on Cisco NCS 5500 Series Routers module in the *Routing Configuration Guide for Cisco NCS 5500 Series Routers*.

abort (RPL)

To discard a route policy or set definition and return to XR Config mode, use the `abort` command in the appropriate configuration mode.

**abort**

**Syntax Description**

This command has no keywords or arguments.

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration
Prefix set configuration
Route distinguisher set configuration
AS path set configuration
Community set configuration
Extended community set configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to discard a route policy definition that was started and return to XR Config mode:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# if as-path is-local then
RP/0/RP0/CPU0:router(config-rpl-if)# abort
RP/0/RP0/CPU0:router(config)#
```

The following example shows how to discard a prefix set definition that was started and return to XR Config mode:

```
RP/0/RP0/CPU0:router(config)# prefix-set legal-ipv4-prefix-examples
RP/0/RP0/CPU0:router(config-pfx)# 10.0.1.1,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.2.0/24,
```
RP/0/RP0/CPU0:router(config-pfx)# abort
RP/0/RP0/CPU0:router(config)#
**add**

To add a value to an Routing Information Protocol (RIP) existing metric, use the `add` command in route-policy configuration mode.

```
add {rip-metric {numberparameter}}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rip-metric</code></td>
<td>Specifies an RIP metric attribute.</td>
</tr>
<tr>
<td><code>number</code></td>
<td>Value assigned to a four-bit unsigned integer. Range is from 0 to 16.</td>
</tr>
<tr>
<td><code>parameter</code></td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If the add value is greater than the maximum allowed value, the metric is added. If the resulting metric exceeds the maximum for the routing protocol, then the route is dropped (by the client routing protocol).

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to offset the RIP metric value:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# add rip-metric 4
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
apply

To execute a parameterized or unparameterized policy from within another policy, use the `apply` command in route-policy configuration mode.

```
apply  policy_name  [{argument1, argument2, . . . , argumentN}]
```

**Syntax Description**

- **policy_name**: Name of a route policy.
- **argument**: (Optional) Parameter name. The `argument` can be a value (for example, '100') or a parameter (for example, '$parameter')

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `apply` command to execute a policy (either parameterized or unparameterized) from within another policy, which allows for the reuse of common blocks of policy.

Wildcards can be used in apply policy names. This supports the nested wildcard apply scenario. A wildcard is specified by inserting an asterisk (*) in place of one of the portions of the apply policy name; the wildcard indicates that any value for that portion of the apply policy name matches. The nested wildcard apply policy allows wildcard (*) based apply nesting. The wildcard operation permits declaration of a generic apply statement that calls all policies that contain a specific defined set of alphanumeric characters, defined on the router.

**Examples**

In the following example, the policy CustomerIn applies the route-policy SetLocalPref to conditionally set the local preference on a route. The parameters 20, 30, 40, and 50 are passed to the parameterized policy SetLocalPref, where the local preference is set to:

- 20, if the community 217:20 is present in the route
- 30, if the community 217:30 is present in the route
- 40, if the community 217:40 is present in the route
- 50, if the community 217:50 is present in the route

```bash
RP/0/RP0/CPU0:router(config) # route-policy SetLocalPref ($lp0, $lp1, $lp2, $lp3, $lp4)
RP/0/RP0/CPU0:router(config-rpl) # if community matches-any ($lp0:$lp1)then
RP/0/RP0/CPU0:router(config-rpl-elseif) # set local-preference $lp1
RP/0/RP0/CPU0:router(config-rpl-elseif) # elseif community matches-any ($lp0:$lp2) then
```
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference $lp2
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif community matches-any ($lp0:$lp3) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference $lp3
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif community matches-any ($lp0:$lp4) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference $lp4
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy

RP/0/RP0/CPU0:router(config)# route-policy CustomerIn($cust)
RP/0/RP0/CPU0:router(config-rpl)# apply SetLocalPref ($cust, 20, 30, 40, 50)
RP/0/RP0/CPU0:router(config-rpl)# end-policy

RP/0/RP0/CPU0:router(config)# route-policy Cust_217
RP/0/RP0/CPU0:router(config-rpl)# apply CustomerIn(217)
RP/0/RP0/CPU0:router(config-rpl)# end-policy
as-path in

To match the AS path of a route to an AS path set, use the as-path in command in route-policy configuration mode.

**as-path in {as-path-set-nameinlie-as-path-setparameter}**

**Syntax Description**

- **as-path-set-name** Name of an AS path set.
- **inline-as-path-set** Inline AS path set. The inline AS path set must be enclosed in parentheses.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

**Release Modification**

- Release 6.0 This command was introduced.

**Usage Guidelines**

Use the as-path in command as a conditional expression within an if statement to match the AS path of a route to an AS path set. The AS path is a sequence of autonomous system numbers traversed by a route.

For a list of all conditional expressions available within an if statement, see the if command.

The as-path in command evaluates to true if at least one of the regular expressions defined in the associated AS path set matches the AS path attribute of the route.

In the case where the AS path set is defined but contains no elements in it, the as-path in conditional expression command returns false.

**Examples**

For example, assume we have an AS path set named my-as-set defined as follows:

```
RP/0/RP0/CPU0:router(config)# as-path-set my-as-set
RP/0/RP0/CPU0:router(config-as)# ios-regex '_12$',
RP/0/RP0/CPU0:router(config-as)# ios-regex '_13$'
RP/0/RP0/CPU0:router(config-as)# end-set
```

and the following policy excerpt using an as-path-set-name argument:
The AS path in condition evaluates to true if one or more of the regular expression matches in the set my-as-set match the AS path associated with the route. In the case of a defined but empty AS path set, this operator returns false.

The preceding policy excerpt is equivalent to the following version, which uses an `inline-as-path` set variable:

```plaintext
RP/0/RP0/CPU0:router(config-rpl)# if as-path in (ios-regex \'_12$\',ios-regex \'_13$\') then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
as-path is-local

To determine if this router or another router within this autonomous system or confederation originated a Border Gateway Protocol (BGP) route, use the **as-path is-local** command in route-policy configuration mode.

**as-path is-local**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the **as-path is-local** command as a conditional expression within an **if** statement to determine if this router (or another router within this autonomous system or confederation) originated the route.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

Routes that are locally originated within the autonomous system or confederation carry an empty AS path. For the Border Gateway Protocol (BGP) specification, when a route is advertised across the autonomous system boundary or a confederation boundary, the local autonomous system number or confederation ID is appended to the autonomous system path. The AS path of a locally originated aggregate is also empty unless it has been modified by policy.

The **is-local** operator evaluates to true for autonomous system paths that are empty. An empty AS path is how an AS path that is local to our autonomous system is represented in BGP.

**Examples**
In the following example, if the AS path is local, then the local preference is set to 100:

```plaintext
RP/0/RP0/CPU0:router(config-rpl)# if as-path is-local then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
as-path length

To compare the number of ASN in the AS path of a Border Gateway Protocol (BGP) route, use the **as-path length** command in route-policy configuration mode.

**Syntax:**

```
as-path length \{eq | is | ge | le\} \{numberparameter\}
```

**Syntax Description**

- `eq` | `is` | `ge` | `le`: Equal to; greater than or equal to; less than or equal to.
- `number`: Value assigned to an 11-bit unsigned integer. Range is from 0 to 2047.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release**: 6.0
  - **Modification**: This command was introduced.

**Usage Guidelines**

Use the **as-path length** command as a conditional expression within an **if** statement to perform a conditional check based on the length of the AS path.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

This command takes either a specific integer value or a range of integer values specified with the `ge` and `le` operators. Any or all of these integers can be parameterized. The operator counts one for each autonomous system in the path. In the case where the route may be aggregated and contain one or more AS sets, the length operator adds one for each set present, the occurrence of an AS set typically indicates that this route is an aggregated route, and the aggregated route had a component route that contained one of the autonomous systems in the set. Likewise, in the case of confederations, a count of one is added for each confederation in the path or each confederation set in the path. A null AS path has a length of zero.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, if the AS path length equals 10, then the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path length eq 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
as-path neighbor-is

To test autonomous system numbers at the head of the AS path against a sequence of one or more values or parameters, use the `as-path neighbor-is` command in route-policy configuration mode.

```
 as-path neighbor-is  as-number-list  [exact]
```

**Syntax Description**

- `as-number-list` Numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers.
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) in asdot format is 1.0 to 65535.65535.

- `exact` (Optional) Specifies that with the `exact` keyword, the `as-number-list` value must identically match the AS path for the route; without the `exact` keyword, any element in the `as-number-list` argument matches one or more occurrences of that element in the AS path for the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

Use the `as-path neighbor-is` command as a conditional expression within an `if` statement to test the autonomous system number or numbers at the head of the AS path against a sequence of one or more integral values or parameters. In other words, to test to learn if the sequence of autonomous system numbers matches the path beginning with the neighboring autonomous system from which this route was heard.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

This command has an equivalent regular expression (ios-regex). For example, AS path neighbor-is ‘1’ would be ‘^1_’.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following are incomplete configuration examples:
These statements evaluate to true when the first autonomous system numbers on the AS path match, in the same order, the supplied parameters or integer values in the `neighbor-is` statement. If the neighboring autonomous system location happens to be an AS-set, the operator evaluates to true if the corresponding argument to the `neighbor-is` operator is an element of the AS-set.

Without the `exact` keyword, repeated autonomous system numbers in the AS path are ignored. For example,

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path neighbor-is '10 20' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path neighbor-is '$asnum' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path neighbor-is '10 20' then
```

matches an AS path beginning

```
10 10 10 20 ...
```

and an AS path beginning:

```
10 20 ....
```

With the `exact` keyword, repetitions are not ignored, therefore

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path neighbor-is '10 20' exact then
```

matches the second of these AS paths but not the first.
as-path originates-from

To compare an AS path against the AS sequence beginning with the AS number that originated a route, use the **as-path originates-from** command in route-policy configuration mode.

```
as-path originates-from as-number-list [exact]
```

**Syntax Description**

- **as-number-list** Numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers.
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) as adot format is 1.0 to 65535.65535.

- **exact** (Optional) Specifies that with the *exact* keyword, the *as-number-list* value must identically match the AS path for the route; without the *exact* keyword, any element in the *as-number-list* argument matches one or more occurrences of that element in the AS path for the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **as-path originates-from** command as a conditional expression within an **if** statement to compare an AS path to the autonomous system sequence.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

The **originates-from** operator is similar to the **neighbor-is** operator, except that it looks at the autonomous system number at the opposite end of the AS path. In other words, it is comparing to the autonomous system that originated the route. It can take numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers. When more than one number is specified in the list, the sequence of autonomous system numbers listed must appear as a subsequence in the AS path, with the last number corresponding to the autonomous system that originated the route.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following are incomplete configuration examples:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path originates-from '10 11' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path originates-from '$asnum 11' then
```

The first line of the preceding example evaluates to true if autonomous system 11 originated the route and then advertised it to autonomous system 10, from which the route was eventually propagated to us. In the case where the route has been aggregated, and the location of the originating autonomous system contains an AS-set, the `originates-from` operator evaluates to true if the argument to the `originates-from` operator is contained in the AS-set.

Without the `exact` keyword, repeated autonomous system numbers in the AS path are ignored. For example,

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path originates-from '10 11' then
```

matches an autonomous system path ending
```
...10 10 10 11
```

and an autonomous system path ending
```
...10 11
```

With the `exact` keyword, repetitions are not ignored, therefore

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path originates-from '10 11' exact then
```

matches the second of these autonomous system paths but not the first.
as-path passes-through

To verify if the supplied integer or parameter appears anywhere in the AS path or if the supplied sequence of integers and parameters appears, in the same order, anywhere in the AS path, use the `as-path passes-through` command in route-policy configuration mode.

```
as-path passes-through as-number-list [exact]
```

**Syntax Description**

- `as-number-list`: Numbers or parameters, enclosed in single quotation marks, that represent a sequence of autonomous system numbers.
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in a plain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) in a dotted format is 1.0 to 65535.65535.

- `exact`: (Optional) Specifies that with the `exact` keyword, the `as-number-list` value must identically match the AS path for the route; without the `exact` keyword, any element in the `as-number-list` argument matches one or more occurrences of that element in the AS path for the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `as-path passes-through` command as a conditional expression within an `if` statement to verify if the specified integer or parameter appears anywhere in the AS path or if the sequence of integers and parameters appears.

- For a list of all conditional expressions available within an `if` statement, see the `if` command.

The `passes-through` operator takes a sequence of integers or parameters, enclosed in single quotation marks, as an argument. It can also take a single integer or parameter as an argument. It evaluates to true if the supplied integer or parameter appears anywhere in the AS path, or if the supplied sequence of integers and parameters appears, in the same order, anywhere in the AS path. This includes the `originates-from` or `neighbor-is` location in the AS path.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following are incomplete configuration examples:

RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '10' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path passes-through '$asnum' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path passes-through '10 11' then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path passes-through '10 $asnum 12' then

Without the exact keyword, repeated autonomous system numbers in the AS path are ignored. For example:

RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '9 10 11' then

matches an AS path containing

...9 10 10 10 11 ....

and an AS path containing:

...9 10 11...

With the exact keyword, repetitions are not ignored. Therefore:

RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '9 10 11' exact then

matches the second of these AS paths but not the first.
as-path-set

To create a named AS path set, use the `as-path-set` command in XR Config mode. To remove the named AS path set, use the `no` form of this command.

```
as-path-set name
no as-path-set name
```

**Syntax Description**

- `name` Name of the AS path set.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `as-path-set` command to create a named AS path set.

An AS path set comprises operations for matching an AS path attribute.

This command enters AS path set configuration mode, in which you can use any of the below option to specify an operation.

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dfa-regex</td>
<td>Indicates the DFA (deterministic finite automata) style regular expression. It performs better for complex regular expressions. Single quotation marks are required around the regular expression.</td>
</tr>
<tr>
<td>ios-regex</td>
<td>Indicates the traditional IOS style regular expression. It performs better with simpler regular expressions. Single quotation marks are required around the regular expression.</td>
</tr>
<tr>
<td>length</td>
<td>Indicates the number of ASN (Autonomous System Number) in the AS path of a Border Gateway Protocol (BGP) route.</td>
</tr>
<tr>
<td>neighbor-is</td>
<td>Indicates the neighbor's AS-path number that can be matched with.</td>
</tr>
<tr>
<td>originates-from</td>
<td>Indicates the BGP AS from which the route originated.</td>
</tr>
<tr>
<td>passes-through</td>
<td>Indicates if the supplied integer or parameter appears anywhere in the AS path, or if the supplied sequence of integers and parameters appear, in the same order, anywhere in the AS path.</td>
</tr>
</tbody>
</table>
**Options** | **Description**
--- | ---
unique-length | Indicates the length of BGP AS-path, ignoring duplicates.

The above options can also be used as an inline set in a parenthesized list of comma-separated expressions.

### Examples

The following is a sample definition of an AS path set named aset1. This AS path set is composed of two elements. When used in a matching operation, this AS path set matches any route whose AS path ends with either the autonomous system number 42 or 127.

```
RP/0/RP0/CPU0:router(config)# as-path-set aset1
RP/0/RP0/CPU0:router(config-as)# ios-regex '_42$'
RP/0/RP0/CPU0:router(config-as)# ios-regex '_127$'
RP/0/RP0/CPU0:router(config-as)# end-set
```

The following is a sample of the as-path options used as an inline set.

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path in (ios-regex '_42$', ios-regex '_127$')
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
as-path unique-length

To perform specific checks based on the length of the AS path (match against the number of unique ASNs in the AS path), use the \texttt{as-path unique-length} command in route-policy configuration mode.

\texttt{as-path unique-length \{eq | is | ge | le\} \{numberparameter\}}

**Syntax Description**

- \texttt{eq} | \texttt{is} | \texttt{ge} | \texttt{le}  Equal to; greater than or equal to; less than or equal to.
- \texttt{number} Value assigned to an 11-bit unsigned integer. Range is from 0 to 2047.
- \texttt{parameter} Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release** 6.0  This command was introduced.

**Usage Guidelines**

Use the \texttt{as-path unique-length} command as a conditional expression within an \texttt{if} statement to perform a match based on the length of the AS path.

For a list of all conditional expressions available within an \texttt{if} statement, see the \texttt{if} command.

The \texttt{unique-length} operator is similar to the length operator, except that when an AS path has been padded with the same autonomous system number multiple times, the operator counts only one when the route is padded. Therefore, given an AS path of 333 333 111 222 123 444 444 444, the \texttt{unique-length} operator would return a value of 5, whereas the length operator would return a value of 8.

**Task ID**

- **Task ID**  Operations
  - route-policy  read, write

**Examples**

The following example shows how to perform checks based on the AS path length. If the AS path matches the specified values, the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path unique-length eq 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length ge 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length le 10 then
RP/0/RP0/CPU0:router(config-rpl)# if as-path unique-length eq $integerparam then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length ge $geparam then
RP/0/RP0/CPU0:router(config-rpl-if)# if as-path unique-length le $leparam then
```
set local-preference 100
endif
community is-empty

To check if a route has no community attributes associated with it, use the **community is-empty** command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **community is-empty** command as a conditional expression within an **if** statement to check if a route has community attributes associated with it.

---

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

This command takes no arguments and evaluates to true only if the route has no community attributes associated with it.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, if the route has no community attributes associated with it, then the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config-rpl) # if community is-empty then
RP/0/RP0/CPU0:router(config-rpl-if) # set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if) # endif
```
community matches-any

To match any elements of a community set, use the **community matches-any** command in route-policy configuration mode.

```
community matches-any {community-set-name inline-community-set parameter}
```

**Syntax Description**

- `community-set-name` Name of a community set.
- `inline-community-set` Inline community set. The inline community set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 6.0     | This command was introduced.

**Usage Guidelines**

Use the **community matches-any** command as a conditional expression within an **if** statement to match any element of a community set.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

A simple condition using the **matches-any** operator evaluates as true if at least one community element of the community attribute for the route matches an element in the community set operand. If no community in the route matches any of the specifications in the named or inline set, then the condition evaluates to false. Likewise, when there is no community at all in the route, the condition evaluates to false.

Matching of a community in the route to a specification in a named or an inline set is intuitive. If the community specification in a set is the familiar colon-separated decimal 16-bit numbers specification, or one of the well-known communities, the community matches the specification if the specification denotes the same 32-bit number as that in the route. If the community specification uses a wildcard, then the community in the route matches if it is one of the many communities denoted by the wildcard specification. In inline sets, community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

Communities may also be matched using range and regular expression operators. Range specifications are entered as follows: `[low-value .. high-value]`. Either or both colon-separated halves of a community value may contain a range. The following are valid range specifications:

- `10:[100..1000]`
- `[10..100]:80`
- `[10..100]:[100..2000]`
In addition, the `private-as` keyword may be used to specify the range from 64512 to 65534. Regular expressions are specified as the `ios-regex` keyword followed by a valid regular expression string.

Community values from the route are matched one at a time to the match specifications. Therefore, regex match specifications are expected to represent one individual community value and not a sequence of community values.

</tr>
</tbody>
</table>

### Examples

In the following example, a named community set called `my-community-set` and a route policy called `community-matches-any-example` are created. The policy sets the local-preference to 100 for any route that has one or more of the communities in the `my-community-set` community set. If the route does not have any of these communities, the policy checks whether it has any communities whose first half is in the range from 10 to 25 and whose second half is the value 35, in which case it sets the local-preference to 200. Otherwise, it checks for a community value in the range of 30:100 to 30:500, in which case it sets the local-preference to 300.

```
RP/0/RP0/CPU0:router(config)# community-set my-community-set
RP/0/RP0/CPU0:router(config-comm)# 10:20,
RP/0/RP0/CPU0:router(config-comm)# 10:30,
RP/0/RP0/CPU0:router(config-comm)# 10:40
RP/0/RP0/CPU0:router(config-comm)# end-set
RP/0/RP0/CPU0:router(config)# route-policy community-matches-any-example
RP/0/RP0/CPU0:router(config-rpl)# if community matches-any my-community-set then
  RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
  RP/0/RP0/CPU0:router(config-rpl-if)# elseif community matches-any ([10..25]:35) then
    RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
  RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif community matches-any (30:[100..500]) then
    RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
  RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
  RP/0/RP0/CPU0:router(config-rpl-if)# end-if
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
community matches-every

To match every element of a community set, use the **community matches-every** command in route-policy configuration mode.

```
community matches-every {community-set-name inline-community-set parameter}
```

**Syntax Description**

- **community-set-name**  Name of a community set.
- **inline-community-set**  Inline community set. The inline community set must be enclosed in parentheses.
- **parameter**  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0**  This command was introduced.

**Usage Guidelines**

Use the **community matches-every** command as a conditional expression within an **if** statement to match every element of a community set.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

A simple condition using the **matches-every** operator evaluates as true if every specification in the named set or inline set specified matches at least one community value in the route. If any community specification in the named or inline set is not matched, then the operation evaluates to false.

Matching of a community in the route to a specification in a named or an inline set is intuitive. If the community-specification in a set is the familiar colon-separated decimal 16-bit numbers specification, or one of the well-known communities, the community matches the specification if the specification denotes the same 32-bit number as that in the route. If the community specification uses a wildcard, then the community in the route matches if it is one of the many communities denoted by the wildcard specification. In inline sets, community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

Communities may also be matched using range and regular expression operators. Range specifications are entered as follows: `[low-value .. high-value]`. Either or both colon-separated halves of a community value may contain a range. The following are valid range specifications:

```
10:[100..1000]  
[10..100]:80  
[10..100]:[100..2000]
```
Therefore, a **matches-every** operation with two community range specifications means that a community must be present in the route that corresponds to each range. For example, in the following statement:

```plaintext
if community matches-every (10:[100..200],20:[100..200]) then
```

the statement evaluates as true if one or more communities in the route lie in the range 10:[100..200] and one or more communities in the route lie in the range 20:[100..200].

In addition, the **private-as** keyword may be used to specify the range from 64512 to 65534.

Regular expressions are specified as the **ios-regex** keyword followed by a valid single-quoted regular expression string. Community values from the route are matched one at a time against the match specifications. Therefore, regex match specifications are expected to represent one individual community value and not a sequence of community values.

In the following example, the route policy named *community-matches-every-example* sets the local-preference value to 100 for all routes that have all three communities in the *my-community-set* community set. Routes that do not have all three communities but have a community that matches the first regular expression match have the local-preference value set to 200. Finally, any remaining routes that match the last regular expression have the local-preference values set to 300.

```plaintext
RP/0/RP0/CPU0:router(config)# community-set my-community-set
RP/0/RP0/CPU0:router(config-comm)# 10:20,
RP/0/RP0/CPU0:router(config-comm)# 10:30,
RP/0/RP0/CPU0:router(config-comm)# 10:40
RP/0/RP0/CPU0:router(config-comm)# end-set

RP/0/RP0/CPU0:router(config)# route-policy community-matches-every-example
RP/0/RP0/CPU0:router(config-rpl)# if community matches-every my-community-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif community matches-every (ios-regex '10:[0-9]0_') then
    RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
    RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif community matches-every (ios-regex '20:[0-9]0_') then
        RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
        RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# endif
```
community-set

To define a community set, use the `community-set` command in XR Config mode. To remove the community set, use the `no` form of this command.

```
community-set name
no community-set name
```

**Syntax Description**
- `name` Name of the community set.

**Command Default**
No default behavior or values

**Command Modes**
XR Config mode

**Command History**
- Release 6.0  This command was introduced.

**Usage Guidelines**
Regular expressions and ranges can be specified to match the communities. An attempt to use a community set that contains a range or regular expression to set a community value is rejected when an attempt to attach such a policy is made.

A community set holds community values for matching against the Border Gateway Protocol (BGP) community attribute. A community is a 32-bit quantity. For notational convenience, each community value must be split in half and expressed as two unsigned decimal integers in the range from 0 to 65535, separated by a colon.

The inline form of a community set also supports parameterization. Each 16-bit portion of the community may be parameterized.

The routing policy language (RPL) provides symbolic names for the standard well-known community values:
- `accept-own` is 0xFFFF0001,
- `internet` is 0:0,
- `no-export` is 65535:65281,
- `no-advertise` is 65535:65282,
- `local-as` is 65535:65283.

RPL also provides a facility for using wildcards in community specifications. A wildcard is specified by inserting an asterisk (*) in place of one of the 16-bit portions of the community specification, which indicates that any value for that portion of the community matches.

Every community set must contain at least one community value. An empty community set is invalid and the policy configuration system rejects it.

Community sets can be entered in these formats:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#-remark</td>
<td>Remark beginning with '#'</td>
</tr>
<tr>
<td>*</td>
<td>Wildcard (any community or part thereof)</td>
</tr>
<tr>
<td>0-65535</td>
<td>16-bit half-community number</td>
</tr>
<tr>
<td>[</td>
<td>Left bracket to begin range</td>
</tr>
<tr>
<td>accept-own</td>
<td>Accept-Own (BGP well-known community)</td>
</tr>
</tbody>
</table>
The DFA and IOS regex syntax for community set is "['']^""; & < > \*^"; & < > ^"'"." This means that regex starts with a single-quote ('') followed by a string of any character (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by a colon, and a string of any characters (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by single-quote.

### Table: `community-set`

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dfar-regex</td>
<td>DFA (deterministic finite automata) style regular expression</td>
</tr>
<tr>
<td>internet</td>
<td>Internet (BGP well-known community)</td>
</tr>
<tr>
<td>ios-regex</td>
<td>Traditional IOS style regular expression</td>
</tr>
<tr>
<td>local-AS</td>
<td>Do not send outside local AS (BGP well-known community)</td>
</tr>
<tr>
<td>no-advertise</td>
<td>Do not advertise to any peer (BGP well-known community)</td>
</tr>
<tr>
<td>no-export</td>
<td>Do not export to next AS (BGP well-known community)</td>
</tr>
<tr>
<td>private-as</td>
<td>Match within BGP private AS range [64512..65534]</td>
</tr>
</tbody>
</table>

### Examples

In the following example, a community set named cset_accept_own is created:

```
RP/0/RPO/CPU0:router#configure
RP/0/RPO/CPU0:router(config)#community-set cset_accept_own
RP/0/RPO/CPU0:router(config-comm)#accept-own
RP/0/RPO/CPU0:router(config-comm)#end-set
```

In the following example, a community set named cset1 is created:

```
RP/0/RPO/CPU0:router(config)# community-set cset1
RP/0/RPO/CPU0:router(config-comm)# 12:34,
RP/0/RPO/CPU0:router(config-comm)# 12:56,
RP/0/RPO/CPU0:router(config-comm)# 12:78,
RP/0/RPO/CPU0:router(config-comm)# internet
RP/0/RPO/CPU0:router(config-comm)# end-set
```

In the following example, a community set named cset2 is created:

```
RP/0/RPO/CPU0:router(config)# community-set cset2
RP/0/RPO/CPU0:router(config-comm)# 123:456,
RP/0/RPO/CPU0:router(config-comm)# no-advertise,
```
In the following example, a community set named cset3 is created. This policy uses wildcards and matches all communities where the autonomous system part of the community is 123.

```
RP/0/RP0/CPU0:router(config-comm)# end-set

In the following example, a community set named cset3 is created. This policy uses wildcards and matches all communities where the autonomous system part of the community is 123.

RP/0/RP0/CPU0:router(config)# community-set cset3
RP/0/RP0/CPU0:router(config-comm)# 123:*
RP/0/RP0/CPU0:router(config-comm)# end-set
```
delete community

To delete community attributes associated with a Border Gateway Protocol (BGP) route, use the `delete community` command in route-policy configuration mode.

```
delete community {all | in {community-set-name in inline-community-set parameter} | not in {community-set-name in inline-community-set parameter}}
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Removes all communities except the well-known communities.</td>
</tr>
<tr>
<td>in</td>
<td>Removes any communities associated with the route that are listed in either the named community set or the inline community set.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Command Default

No default behavior or values

Command Modes

Route-policy configuration

Command History

```
Release Modification
Release 6.0  This command was introduced.
```

Usage Guidelines

Use the `delete community` command to delete community attributes associated with a BGP route.

```
The delete community command can be used as an action statement within an if statement. For a list of all action statements available within an if statement, see the if command.

Communities are 32-bit values carried in Border Gateway Protocol (BGP) routes. Each route may have zero or more communities in an unordered list.

You can remove a well-known community (internet, no-export, no-advertise, or local-as) from a route, but this removal must be done explicitly. This command should be used with a degree of caution. In general, few circumstances exist in which you would need to remove a well-known community.
```

Task ID

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```
The following example shows how to delete any communities associated with the routes that are listed in either the named community set or inline community set, respectively.

```
RP/0/RP0/CPU0:router(config-rpl)# delete community in my_community_set
RP/0/RP0/CPU0:router(config-rpl)# delete community in (10:[0..50],20:[60..80])
```

The following example shows how to remove all communities including well-known communities.

```
RP/0/RP0/CPU0:router(config-rpl)# delete community in (internet, no-export, no-advertise, local-as, *:* *)
```

The following example shows how to remove all communities except for the well-known communities.

```
RP/0/RP0/CPU0:router(config-rpl)# delete community all
```

The following example shows how to delete the well-known community value internet from a route:

```
RP/0/RP0/CPU0:router(config-rpl)# delete community in (internet)
```
delete extcommunity rt

To delete route target (RT) extended community attributes associated with a Border Gateway Protocol (route), use the `delete extcommunity rt` command in route-policy configuration mode.

```
delete extcommunity rt {all | in {extcommunity-set-nameinline-extcommunity-setparameter} | not in {extcommunity-set-nameinline-extcommunity-setparameter}}
```

**Syntax Description**

<table>
<thead>
<tr>

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `delete extcommunity rt` command to delete extended community values from a BGP route target extended community list in a route.

**Note**

The `delete extcommunity rt` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

Extended communities are similar to regular Border Gateway Protocol (BGP) communities but contain more data and have a richer structure for encoding information in them.

The forms of this command that take a named extended community set or an inline extended community set value as arguments are equivalent. They delete any extended communities that are listed in either the named set or the inline set, respectively.
### Examples

In the following example, all extended communities are deleted:

```
RP/0/RP0/CPU0:router(config-rpl)# delete extcommunity rt all
```

In this example, any extended communities that are listed in my-extcommunity-set are deleted:

```
RP/0/RP0/CPU0:router(config-rpl)# delete extcommunity rt in my-extcommunity-set
```

In this example, extended communities associated with the route listed in the named inline extended community sets are deleted:

```
RP/0/RP0/CPU0:router(config-rpl)# delete extcommunity rt in (67:29, 67:55)
```
destination in

To match a destination entry in a named prefix set or inline prefix set, use the destination in command in route-policy configuration mode.

destination in \{prefix-set-name\inline-prefix-set\parameter\}

**Syntax Description**
- **prefix-set-name** Name of a prefix set.
- **inline-prefix-set** Inline prefix set. The inline prefix set must be enclosed in parentheses.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the destination in command as a conditional expression within an if statement to match a destination entry in a named prefix set or inline prefix set.

**Note**
For a list of all conditional expressions available within an if statement, see the if command.

This command takes either a named prefix set or an inline prefix set value as an argument. The condition returns true if the destination entry matches any entry in the prefix set or inline prefix set. An attempt to match a destination using a prefix set that is defined but contains no elements returns false.

The routing policy language (RPL) provides the ability to test destinations for a match to a list of prefix match specifications using the in operator. The destination in command is protocol-independent.

In Border Gateway Protocol (BGP), the destination of a route is also known as its network-layer reachability information (NLRI). It comprises a prefix value and a mask length.

RPL supports both 32-bit IPv4 prefixes, specified in dotted-decimal format, and 128-bit IPv6 prefixes, specified in colon-separated hexadecimal format.

**Examples**

In the following example, a prefix set named my-prefix-set is defined and a route policy named use-destination-in is created. Within the use-destination-in route policy, the destination in command
is used within an \texttt{if} statement to learn if the destination is in the prefix-set named my-prefix-set. If it is, then local preference is set to 100. If it is not in my-prefix-set but does match the next
prefix specifications, then local preference is set to 200.

```
RP/0/RP0/CPU0:router (config)\# prefix-set my-prefix-set
RP/0/RP0/CPU0:router (config-pfx)\# 10.0.0.1/32,
RP/0/RP0/CPU0:router (config-pfx)\# fe80::203:0:0:0/64,
RP/0/RP0/CPU0:router (config-pfx)\# 10.0.0.2/24 le 32
RP/0/RP0/CPU0:router (config-pfx)\# end-set
```

```
RP/0/RP0/CPU0:router (config)\# route-policy use-destination-in
RP/0/RP0/CPU0:router (config-rpl)\# if destination in my-prefix-set then
RP/0/RP0/CPU0:router (config-rpl-if)\# set local-preference 100
RP/0/RP0/CPU0:router (config-rpl-if)\# elseif destination in (10.0.0.1/32, 10.0.0.2/24 le 32) then
RP/0/RP0/CPU0:router (config-rpl-elseif)\# set local-preference 200
RP/0/RP0/CPU0:router (config-rpl-elseif)\# endif
RP/0/RP0/CPU0:router (config-rpl)\# end-policy
```

In the following example, a prefix set named ipv6-prefix-set is defined and a route policy named ipv6-destination-in is created. Within the ipv6-destination-in route policy, the \texttt{destination in} command is used within an \texttt{if} statement to learn if the destination is in the prefix-set named ipv6-prefix-set. If it is, then the next-hop is set to 2001:abcd:fedc::1. If it is not in ipv6-prefix-set but does match the next prefix specifications, then the next-hop is set to 1111:2222:3333:4444:5555:6666:7777:8888.

```
RP/0/RP0/CPU0:router (config)\# prefix-set ipv6-prefix-set
RP/0/RP0/CPU0:router (config-pfx)\# 2001:0:0:1::/64,
RP/0/RP0/CPU0:router (config-pfx)\# 2001:0:0:2::/64,
RP/0/RP0/CPU0:router (config-pfx)\# 2001:0:0:3::/64,
RP/0/RP0/CPU0:router (config-pfx)\# 2001:0:0:4::/64
RP/0/RP0/CPU0:router (config-pfx)\# end-set
```

```
RP/0/RP0/CPU0:router (config)\# route-policy ipv6-destination-in
RP/0/RP0/CPU0:router (config-rpl)\# if destination in ipv6-prefix-set then
RP/0/RP0/CPU0:router (config-rpl-if)\# set next-hop 2001:abcd:fedc::1
RP/0/RP0/CPU0:router (config-rpl-if)\# elseif destination in (2001::1, 2002:1:2:3::/64) then
RP/0/RP0/CPU0:router (config-rpl)\# endif
RP/0/RP0/CPU0:router (config-rpl-if)\# endif
```

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
To stop executing a policy and accept the route, use the `done` command in route-policy configuration mode.

**done**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `done` command to stop executing the policy and accept the route.

**Note**

The `done` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

When encountering a `done` statement the route is passed and no further policy statements are executed. All modifications made to the route prior to the `done` statement are still valid.

**Note**

The default action of a route policy is to drop or discard any routes that have not been either explicitly passed or for which no attempt has been made to modify with an action. The routing policy language (RPL) does not have specific “match clauses,” which means the default drop behavior is controlled by whether a route has been explicitly passed or an attempt has been to modify the route using an action statement.

**Examples**

In the following example, if the destination match succeeds for 29.0.0.0/8 le 32, the execution continues past set community 102:12 and onto the next statement. If the destination match succeeds for 39.0.0.0/8 le 32 execution, then the policy execution stops when in encounters the `done` statement.

```bash
RP/0/RP0/CPU0:router(config)# route-policy done_st_example
RP/0/RP0/CPU0:router(config-rpl)# if destination in (29.0.0.0/8 le 32) then
   RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:12
   RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# if destination in (39.0.0.0/8 le 32) then
   RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:39
   RP/0/RP0/CPU0:router(config-rpl-if)# done
```
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# if destination in (49.0.0.0/8 le 32) then
RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:49
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# if destination in (59.0.0.0/8 le 32) then
RP/0/RP0/CPU0:router(config-rpl-if)# set community 102:59
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
drop

To discard a route, use the `drop` command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `drop` command within a route policy to drop a route.

**Note**

The `drop` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command causes the route to be dropped. After a route is dropped, no further execution of policy occurs. Therefore, if after executing the first two statements of a policy the `drop` statement is encountered, the route is discarded and execution stops immediately even when the policy contains further statements.

**Note**

The default action of a route policy is to drop or discard any routes that have not been either explicitly passed or attempted to be modified with an action. The routing policy language (RPL) does not have specific “match clauses,” which means the default drop behavior is controlled by whether a route has been explicitly passed or an attempt has been to modify the route using an action statement.

**Examples**

In the following example, any route with a destination address contained within the prefix set pset1 is dropped:

```plaintext
RP/0/RP0/CPU0:router(config-rpl)# if destination in pset1 then
RP/0/RP0/CPU0:router(config-rpl-if)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
To edit the contents of a route policy, a prefix set, an AS path set, a community set, or an extended community set, use the `edit` command in XR EXEC mode.

```
edit {route-policy | prefix-set | as-path-set | community-set | extcommunity-set \{rt | soo\} | policy-global \| rd-set\} \name \{\nano | emacs | vim | inline \{add | prepend | remove\} \set-element\}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>Edits the contents of a route policy.</td>
</tr>
<tr>
<td>prefix-set</td>
<td>Edits the contents of a prefix set.</td>
</tr>
<tr>
<td>as-path-set</td>
<td>Edits the contents of an AS path set.</td>
</tr>
<tr>
<td>community-set</td>
<td>Edits the contents of a community set.</td>
</tr>
<tr>
<td>extcommunity-set</td>
<td>Edits the contents of an extended community set of the specified type.</td>
</tr>
<tr>
<td>rt</td>
<td>Edits the BGP route target (RT) extended community.</td>
</tr>
<tr>
<td>soo</td>
<td>Edits the BGP site of origin (SoS) extended community.</td>
</tr>
<tr>
<td>policy-global</td>
<td>Edits the contents of policy-global definitions.</td>
</tr>
<tr>
<td>rd-set</td>
<td>Edits the contents of a route-distinguisher set.</td>
</tr>
<tr>
<td>name</td>
<td>Name of a route policy, a prefix set, an AS path set, a community set, or an extended community set, RD set, or global parameters.</td>
</tr>
<tr>
<td>nano</td>
<td>(Optional) Uses GNU Nano text editor.</td>
</tr>
<tr>
<td>emacs</td>
<td>(Optional) Uses Micro Emacs editor.</td>
</tr>
<tr>
<td>vim</td>
<td>(Optional) Uses VI Improved editor.</td>
</tr>
<tr>
<td>inline</td>
<td>(Optional) Uses the command line.</td>
</tr>
<tr>
<td>add</td>
<td>Appends the element to the set.</td>
</tr>
<tr>
<td>prepend</td>
<td>Prepends the element to the set.</td>
</tr>
<tr>
<td>remove</td>
<td>Removes the element from the set.</td>
</tr>
<tr>
<td>set-element</td>
<td>Value of the set element.</td>
</tr>
</tbody>
</table>

**Note**

To inline edit multiple set elements separated with comma, use quotes to club the entries as a single argument. Example:

```
edit extcommunity-set rt rt_set inline add "4:4,5:4"
```

**Command Default**

Default editor is GNU nano text editor

**Command Modes**

XR EXEC mode
### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `edit` command to edit the contents of a route policy, a prefix set, an AS path set, a community set, an extended community set, a global policy, or a route destination set.

After editing with Nano, save the edit buffer and exit the editor using the Ctrl-X keystroke.

After editing with Emacs, save the editor buffer by using the Ctrl-X and Ctrl-S keystrokes. To save and exit the editor, use the Ctrl-X and Ctrl-C keystrokes.

After editing with VIM, to write to a current file and exit use the :wq or :x or ZZ keystrokes. To quit and confirm, use the :q keystrokes. To quit and discard changes, use the :q! keystrokes.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, the policy_A policy is opened in the editor:

```
RP/0/RP0/CPU0:router# edit route-policy policy_A
```

```
-- MicroEMACS 3.8b () -- rpl_edit.139281 --
  if destination in (2001::/8) then
    drop
  endif
end-policy
!
```

```
Parsing.
83 bytes parsed in 1 sec (82)bytes/sec
Committing.
1 items committed in 1 sec (0)items/sec
Updating.
Updated Commit database in 1 sec
```

If there are parse errors, you are asked whether editing should continue:

```
RP/0/RP0/CPU0:router# edit route-policy policy_B
```

```
-- MicroEMACS 3.8b () -- rpl_edit.141738
route-policy policy_B
  set metric-type type_1
  if destination in (2001::/8) then
    drop
  endif
end-policy
!
```

```
Parsing.
105 bytes parsed in 1 sec (103)bytes/sec
% Syntax/Authorization errors in one or more commands.!! CONFIGURATION
```
FAILED DUE TO SYNTAX/AUTHORIZATION ERRORS
set metric-type type_1
if destination in (2001::/8) then
drop
endif
end-policy!

Continue editing? [no]:

If you answer yes, the editor continues on the text buffer from where you left off. If you answer no, the running configuration is not changed and the editing session is ended.

After the policy is opened, it may be manipulated using normal editor commands, then saved and committed to the running configuration.
end-global

To end the definition of global parameters and exit global parameter configuration mode, use the **end-global** command in global parameter configuration mode.

end-global

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No default behavior or values

**Command Modes**
Global parameter configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the **end-global** command to end the definition of global parameters and exit global parameter configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the **end-global** command ends the definition of global parameters:

```
RP/0/RP0/CPU0:router(config)＃policy-global
RP/0/RP0/CPU0:router(config-rp-gl)＃ glbpapathype 'ebgp'
RP/0/RP0/CPU0:router(config-rp-gl)＃ glbtag '100'
RP/0/RP0/CPU0:router(config-rp-gl)＃ end-global
```
end-policy

To end the definition of a route policy and exit route-policy configuration mode, use the `end-policy` command in route-policy configuration mode.

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values

Command Modes

Route-policy configuration

Command History

Release 6.0  This command was introduced.

Usage Guidelines

Use the `end-policy` command to end the definition of a route policy and exit route-policy configuration mode.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

In the following example, the `end-policy` command ends the definition of a route policy:

```
RP/0/RP0/CPU0:router(config)#route-policy med-to-local-pref
RP/0/RP0/CPU0:router(config-rpl)#if med eq 150 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 10
RP/0/RP0/CPU0:router(config-rpl-if)# elseif med eq 200 then
RP/0/RP0/CPU0:router(config-elseif)# set local-preference 60
RP/0/RP0/CPU0:router(config-elseif)# elseif med eq 250 then
RP/0/RP0/CPU0:router(config-elseif)# set local-preference 0
RP/0/RP0/CPU0:router(config-elseif)# endif
RP/0/RP0/CPU0:router(config-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
end-set

To end the definition of an AS path set, a prefix set, a community set, an extended community set, or an RD set and return to XR Config mode, use the **end-set** command in route-policy configuration mode.

**end-set**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

- AS path set configuration
- Prefix set configuration
- Community set configuration
- Extended community set configuration
- Route distinguisher set configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **end-set** command to end the definition of an AS path set, a prefix set, a community set, or an extended community set.

**Examples**

In the following example, the **end-set** command ends the definition of an AS path set named aset1:

```
RP/0/RP0/CPU0:router(config)# as-path-set aset1
RP/0/RP0/CPU0:router(config-as)# ios-regex '_42$',
RP/0/RP0/CPU0:router(config-as)# ios-regex '_127$'
RP/0/RP0/CPU0:router(config-as)# end-set

RP/0/RP0/CPU0:router(config)#
```

The following example shows how to create an RD set called my_rd_set and use the **end-set** command to end the definition:

```
RP/0/RP0/CPU0:router(config)# rd-set my_rd_set
RP/0/RP0/CPU0:router(config-rd)# 172.16.0.0/16:*,
RP/0/RP0/CPU0:router(config-rd)# 172.17.0.0/16:100,
RP/0/RP0/CPU0:router(config-rd)# 192::*
RP/0/RP0/CPU0:router(config-rd)# 192:100
```
end-set
extcommunity rt is-empty

To check if a Border Gateway Protocol (BGP) route has route target (RT) extended community attributes associated with it, use the `extcommunity rt is-empty` command in route-policy configuration mode.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No default behavior or value

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `extcommunity rt is-empty` command as a conditional expression within an `if` statement to check if a BGP route has extended community attributes associated with it.

**Note**
For a list of all conditional expressions available within an `if` statement, see the `if` command.

The `is-empty` operator takes no arguments and evaluates to true if the route has no extended community attributes associated with it.

**Task ID**
Read, write

**Examples**
In the following example, if the extended community is empty, then the local preference is set to 100:

```bash
RP/0/RP0/CPU0:router(config)# route-policy extcommunity-is-empty-example
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity rt is-empty then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100

RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity rt matches-any

To match any element of a Border Gateway Protocol (BGP) route target (RT) extended community set, use the `extcommunity rt matches-any` command in route-policy configuration mode.

```
extcommunity rt matches-any  \{extcommunity-set-name\inline-extcommunity-set\parameter\}
```

**Syntax Description**

- `extcommunity-set-name` Name of an RT extended community set.
- `inline-extcommunity-set` Inline RT extended community set. The inline extended community set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `extcommunity rt matches-any` command as a conditional expression within an `if` statement to match elements of an extended community set.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the `matches-any` operator evaluates as true if at least one extended community in the route matches an extended community specification in the named or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, an extended community set named my-extcommunity-set and a parameterized route-policy named my-extcommunity-set-example($tag,$ip) are defined. The `extcommunity rt matches-any` command is used in an `if` statement such that if at least one extended community in the route matches an extended community specification in the named set, then the local preference is set to 100. If there is no extended community in the route that matches any of the
specifications in the named set, then the condition evaluates as false and the extended community is compared to the inline extended sets.

```
RP/0/RP0/CPU0:router(config)# extcommunity-set rt my-extcommunity-set
RP/0/RP0/CPU0:router(config-ext)# 10:615,
RP/0/RP0/CPU0:router(config-ext)# 10:6150,
RP/0/RP0/CPU0:router(config-ext)# 15.15.15.15:15
RP/0/RP0/CPU0:router(config-ext)# end-set

RP/0/RP0/CPU0:router(config)# route-policy my-extcommunity-set-example($tag,$ip)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity rt matches-any my-extcommunity-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# elseif extcommunity rt matches-any (10:20, 10:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif extcommunity rt matches-any ($ip:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif extcommunity rt matches-any (2.3.4.5:$tag) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 400
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity rt matches-every

To match every element of a Border Gateway Protocol (BGP) route target (RT) extended community set, use the `extcommunity rt matches-every` command in route-policy configuration mode.

`extcommunity rt matches-every {extcommunity-set-name inline-extcommunity-set parameter}`

**Syntax Description**

- `extcommunity-set-name` Name of an RT extended community set.
- `inline-extcommunity-set` Inline RT extended community set. The inline extended community set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `extcommunity rt matches-every` command as a conditional expression within an `if` statement to match every element of an RT extended community set.

**Note**
For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the `matches-every` operator evaluates as true if every extended community value in the extended community attribute for the route matches at least one element of the extended community set or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
In the following example, an extended community set named my-extcommunity-set and a parameterized route policy named extcommunity-matches-every-example ($as, $tag) are defined. The condition `extcommunity rt matches-every` is used in an if statement in this policy. If it evaluates to true, the local-preference value is set to 100. If it evaluates to false, the extended community is
evaluated using an inline set. If that condition evaluates to true, the local-preference value is set to 200. If it evaluates to false, the local-preference value is set to 300.

```
RP/0/RP0/CPU0:router(config)# extcommunity-set rt my-extcommunity-set
RP/0/RP0/CPU0:router(config-ext)# 10:20,
RP/0/RP0/CPU0:router(config-ext)# 10:30,
RP/0/RP0/CPU0:router(config-ext)# 10:40
RP/0/RP0/CPU0:router(config-ext)# end-set
RP/0/RP0/CPU0:router(config)# route-policy extcommunity-matches-every-example($as,$tag)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity rt matches-every my-extcommunity-set then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# elseif extcommunity rt matches-every (10:20, 10:$tag, $as:30) then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity rt matches-within

To match at least one element of an extended community set of a Border Gateway Protocol (BGP) route target (RT), use the `extcommunity rt matches-within` command in route-policy configuration mode.

```
extcommunity rt matches-within  {rt-type-extcommunity-set-nameinline-extcommunity-setparameter}
```

**Syntax Description**
- `rt-type-extcommunity-set-name`: Name of an RT extended community set.
- `inline-extcommunity-set`: Inline RT extended community set, enclosed in parentheses.
- `parameter`: Parameter name preceded with a “$” symbol.

**Command Default**
None

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `extcommunity rt matches-within` command as a conditional expression within an `if` statement to match elements of an extended community set.

**Note**
For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the matches-within operator evaluates as true if all the elements in extended community from the route match any element in the extended community set. For example, let ‘c’ be the RTs from the route and ‘m’ be the RT set from the policy. With the `extcommunity rt matches-within` configuration, each value in ‘c’ must match any (or at least one) value in ‘m’.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Task ID**
- **Task ID**: read, write
- **Operation**: route-policy

In the following example, an extended community set named `my-extcommunity-set` and a parameterized route-policy named `my-extcommunity-set-example($tag,$ip)` are defined. The `extcommunity rt matches-within` command is used in an `if` statement such that if all extended community values in the route match any element of the extended community specification in the named set, then the local preference is set to 100.

```
RP/0/RP0/CPU0:router(config)#extcommunity-set rt my-extcommunity-set
```
RP/0/RP0/CPU0:router(config-ext)#10:615,
RP/0/RP0/CPU0:router(config-ext)#10:6150,
RP/0/RP0/CPU0:router(config-ext)#15.15.15.15
RP/0/RP0/CPU0:router(config-ext)#end-set
RP/0/RP0/CPU0:router(config)#route-policy my-extcommunity-set-example($tag,$ip)
RP/0/RP0/CPU0:router(config-rpl)#if extcommunity rt matches-within my-extcommunity-set then
RP/0/RP0/CPU0:router(config-rpl-if)#set local-preference 100
extcommunity-set cost

To define a cost extended community set, use the extcommunity-set cost command in XR Config mode. To remove the cost extended community set, use the no form of this command.

```
  extcommunity-set cost name
  no extcommunity-set cost name
```

**Syntax Description**

- `name`: Name of a cost extended community set. The name argument is case sensitive, can contain any alphanumeric characters, and can be up to 63 characters in length.

**Command Default**
No default behavior or values

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the extcommunity-set cost command to define a cost extended community set.

An extended community set is analogous to a community set except that it contains extended community values instead of regular community values. Extended community values are 64-bit structured values. An extended community set also supports named forms and inline forms.

Cost extended communities can be entered in these formats:

- `#-remark` --- Remark beginning with '#'
- `0-255` --- Decimal number
- `abort` --- Discard RPL definition and return to top level config
- `end-set` --- End of set definition
- `exit` --- Exit from the submode
- `igp:` --- Cost Community with IGP as point of insertion
- `pre-bestpath:` --- Cost Community with Pre-Bestpath as point of insertion
- `show` --- Show partial RPL configuration

Multiple cost community set clauses can be configured in each route policy block or sequence. Each cost community set clause must have a different ID (0-255). The cost community set clause with the lowest cost-value is preferred by the best path selection process when all other attributes are equal.

As with community sets, the inline form supports parameterization within parameterized policies. Either portion of the extended community value can be parameterized.

Every extended community set must contain at least one extended community value. Empty extended community sets are invalid and the policy configuration system rejects them.

Wildcards (*) and regular expressions are allowed for extended community set elements.
Examples

In the following example, a cost extended community set named extcomm-cost is defined:

```
RP/0/RP0/CPU0:router(config)# extcommunity-set cost extcomm-cost
RP/0/RP0/CPU0:router(config-ext)# IGP: 90:914,
RP/0/RP0/CPU0:router(config-ext)# Pre-Bestpath: 91:915
RP/0/RP0/CPU0:router(config-ext)# end-set
```
**extcommunity-set rt**

To define a Border Gateway Protocol (BGP) route target (RT) extended community set, use the `extcommunity-set rt` command in XR Config mode. To remove the RT community set, use the `no` form of this command.

```
  extcommunity-set rt name
  no extcommunity-set rt name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Name of an RT extended community set.</th>
</tr>
</thead>
</table>

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `extcommunity-set rt` command to define an RT extended community set for BGP.

Regular expressions and ranges can be specified to match the extended communities. Regular expressions and ranges can be specified in an extended community set to support the matching of communities. An attempt to use an extended community set that contains a range or regular expression to set an extended community set value is rejected when an attempt to attach such a policy is made.

An extcommunity set RT holds RT extended community values to match against the Border Gateway Protocol (BGP) RT extended community attribute. RT extended communities can be entered in these formats:

- `#-remark` --- Remark beginning with `#`
- `*` --- Wildcard (any community or part thereof)
- `1-4294967295` --- 32-bit decimal number
- `1-65535` --- 16-bit decimal number
- `A.B.C.D/M:N` --- Extended community - IPv4 prefix format
- `A.B.C.D:N` --- Extended community - IPv4 format
- `ASN:N` --- Extended community - ASPLAIN format
- `X.Y:N` --- Extended community - ASDOT format
- `dfa-regex` --- DFA (deterministic finite automata) style regular expression
- `ios-regex` --- Traditional IOS style regular expression
The dfa-regex and ios-regex syntax for community set is "[']\[^':&<>\]*:[^':&<>\]*[']". This means that regex starts with a single-quote ("), followed by a string of any character (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by a colon, and a string of any characters (that does not include single-quote, colon, ampersand, less-than, greater-than, or space) followed by single-quote.

\(N\) is a number within the range of 1 to 65535.

**Examples**

In the following example, an RT extended community set named extcomm-rt is defined:

```
RP/0/RP0/CPU0:router(config)# extcommunity-set rt extcomm-rt
RP/0/RP0/CPU0:router(config-ext)# 10002:666
RP/0/RP0/CPU0:router(config-ext)# 10.0.0.2:666
RP/0/RP0/CPU0:router(config-ext)# end-set
```
**extcommunity-set soo**

To define a Border Gateway Protocol (BGP) Site-of-Origin (SoO) extended community set, use the `extcommunity-set soo` command in XR Config mode mode. To remove the SoO extended community set, use the `no` form of this command.

```
    extcommunity-set soo name
    no extcommunity-set soo name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

</tr>
<tr>
<td>------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `extcommunity-set soo` command to define an SoO extended community set.

An extcommunity set soo holds SoO extended community values to match against the Border Gateway Protocol (BGP) SoO extended community attribute. SoO extended communities can be entered in these formats:

- `#-remark` --- Remark beginning with '#'
- `*` --- Wildcard (any community or part thereof)
- `1-4294967295` --- 32-bit decimal number
- `1-65535` --- 16-bit decimal number
- `A.B.C.D/M:N` --- Extended community - IPv4 prefix format
- `A.B.C.D:N` --- Extended community - IPv4 format
- `ASN:N` --- Extended community - ASPLAIN format
- `X.Y:N` --- Extended community - ASDOT format
- `abort` --- Discard RPL definition and return to top level config
- `dfa-regex` --- DFA style regular expression
- `end-set` --- End of set definition
- `exit` --- Exit from the submode
- `ios-regex` --- Traditional IOS style regular expression
- `show` --- Show partial RPL configuration

*N* is a site-specific number.
Examples

In the following example, a SoO extended community set named extcomm-soo is defined:

```
RP/0/RP0/CPU0:router(config)# extcommunity-set soo extcomm-soo
RP/0/RP0/CPU0:router(config-ext)# 66:60001,
RP/0/RP0/CPU0:router(config-ext)# 77:70001,
RP/0/RP0/CPU0:router(config-ext)# 88:80001,
RP/0/RP0/CPU0:router(config-ext)# 99:90001,
RP/0/RP0/CPU0:router(config-ext)# 100.100.100.1:153
RP/0/RP0/CPU0:router(config-ext)# end-set
```
**extcommunity soo is-empty**

To determine if a Border Gateway Protocol (BGP) route has any Site-of-Origin (SoO) extended communities associated with it, use the **extcommunity soo is-empty** command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **extcommunity soo is-empty** command as a conditional expression within an **if** statement to check if a BGP SoO route has extended community attributes associated with it.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

The **is-empty** operator takes no arguments and evaluates to true if the route has no SoO extended community attributes associated with it.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, if a route has no SoO extended communities associated with it, the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config)# route-policy extcommunity-is-empty-example
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity soo is-empty then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity soo matches-any

To match any element of a Border Gateway Protocol (BGP) Site-of-Origin (SoO) extended community set, use the `extcommunity soo matches-any` command in route-policy configuration mode.

```
extcommunity soo matches-any {extcommunity-set-name inline-extcommunity-set parameter}
```

**Syntax Description**

- `extcommunity-set-name` Name of a SoO extended community set.
- `inline-extcommunity-set` Inline SoO extended community set. The inline extended community set must be enclosed in parentheses.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `extcommunity soo matches-any` command as a conditional expression within an `if` statement to match elements of an extended community set.

```
For a list of all conditional expressions available within an `if` statement, see the `if` command.

A simple condition using the `matches-any` operator evaluates as true if at least one extended community in the route matches an extended community specification in the named or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, an SoO extended community set named extcomm-soo and a parameterized route policy named my-extcommunity-set-example($tag,$ip) are defined.

The condition route policy named extcommunity soo matches-any is used in an if statement in this policy. If it evaluates to true, the local preference value is set to 100.
If it evaluates to false, the SoO extended community is evaluated using an inline set. If it evaluates to true, the local preference value is set to 200.

If it evaluates to false, the SoO extended community is evaluated using a different inline set. If it evaluates to true, the local preference value is set to 300.

If it evaluates to false, the SoO extended community is evaluated using a different inline set. If it evaluates to true, the local preference value is set to 400.

```
RP/0/RP0/CPU0:router(config)# extcommunity-set soo extcomm-soo
RP/0/RP0/CPU0:router(config-ext)# 66:60001,
RP/0/RP0/CPU0:router(config-ext)# 77:70001,
RP/0/RP0/CPU0:router(config-ext)# 88:80001,
RP/0/RP0/CPU0:router(config-ext)# 99:90001,
RP/0/RP0/CPU0:router(config-ext)# 100.100.100.1:153
RP/0/RP0/CPU0:router(config-ext)# end-set

RP/0/RP0/CPU0:router(config)# route-policy my-extcommunity-set-example($tag,$ip)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity soo matches-any extcomm-soo then
  RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
  elseif extcommunity soo matches-any (10:20, 10:$tag) then
    RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
    elseif extcommunity soo matches-any ($ip:$tag) then
      RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
      elseif extcommunity soo matches-any (2.3.4.5:$tag) then
        RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 400
      endif
    endif
  endif
else
  RP/0/RP0/CPU0:router(config-rpl-else-if)# set local-preference 500
endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
extcommunity soo matches-every

To match every element of a Border Gateway Protocol (BGP) Site-of-Origin (SoO) extended community set, use the **extcommunity soo matches-every** command in route-policy configuration mode.

**Syntax Description**

```plaintext
extcommunity soo matches-every \{extcommunity-set-name inline-extcommunity-set parameter\}
```

- **extcommunity-set-name** Name of a SoO extended community set.
- **inline-extcommunity-set** Inline SoO extended community set. The inline extended community set must be enclosed in parentheses.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **extcommunity soo matches-every** command as a conditional expression within an **if** statement to match every element of a SoO extended community set.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

**Note**

A simple condition using the **matches-every** operator evaluates as true if every extended community value in the extended community attribute for the route matches at least one element of the extended community set or inline set. If no extended community in the route matches any of the specifications in the named or inline set, then this simple condition evaluates to false. Likewise, when there is no extended community at all in the route, the condition evaluates to false.

Matching an extended community in the route to a specification in a named or an inline set is intuitive. In inline sets, extended community specifications may be parameterized, in which case the relevant matching is done when the value of the parameter has been supplied.

**Examples**

In the following example, an extended community set named my-extcomm-rt-set and a parameterized route policy named extcommunity-matches-every-example($as, $tag) are defined. The condition extcommunity soo matches-every is used in an if statement in this policy and if it evaluates to true, the local-preference value is set to 100. If it evaluates to false, the extended community is evaluated using an inline set. If that condition evaluates to true, the local-preference value is set to 200. If it evaluates to false, the local-preference value is set to 300.

```plaintext
RP/0/RP0/CPU0:router(config)# extcommunity-set soo my-extcomm-rt-set
RP/0/RP0/CPU0:router(config-ext)# 10:20,
RP/0/RP0/CPU0:router(config-ext)# 10:30,
```
extcommunity soo matches-every

```
RP/0/RP0/CPU0:router(config-ext)# 10:40
RP/0/RP0/CPU0:router(config-ext)# end-set
RP/0/RP0/CPU0:router(config)# route-policy extcommunity-matches-every-example($as, $tag)
RP/0/RP0/CPU0:router(config-rpl)# if extcommunity soo matches-every my-extcomm-rt-set then
  RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
  RP/0/RP0/CPU0:router(config-rpl-if)# elseif extcommunity soo matches-every (10:20, 10:$tag, $as:30) then
    RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 200
  RP/0/RP0/CPU0:router(config-rpl-elseif)# else
    RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 300
    RP/0/RP0/CPU0:router(config-rpl-elseif)# endif
```

```
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**if**

To decide which actions or dispositions should be taken for a given route, use the `if` command in route-policy configuration mode.

```
if conditional-expression then action-statement [action-statement] [elseif conditional-expression then action-statement [action-statement]] [else action-statement [action-statement]] endif
```

### Syntax Description

- **conditional-expression**
  - Expression to decide which actions or dispositions should be taken for the given route.
- **then**
  - Executes an action statement if the `if` condition is true.
- **elseif**
  - Strings together a sequence of tests.
- **else**
  - Executes an action statement if the `if` condition is false.
- **endif**
  - Ends the `if` statement.
- **action-statement**
  - Sequence of operations that modify a route.

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `if` command uses a conditional expression to decide which actions or dispositions should be taken for a given route. Table 119: Conditional Expressions, on page 732 lists the conditional expressions.

An action statement is a sequence of operations that modify a route, most of which are distinguished by the `set` keyword. In a route policy, these operations can be grouped. Table 120: Action Statements, on page 733 lists the action statements.

Apply Condition policies allow usage of a route-policy in an "if" statement of another route-policy.

```
Route-policy policy_name
If apply policyA and apply policyB then
Set med 100
Else if not apply policyD then
Set med 200
Else
Set med 300
Endif
End-policy
```
### Table 119: Conditional Expressions

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-path in, on page 675</td>
<td>Matches the AS path of a route to an AS path set. The AS path is a sequence of autonomous system numbers traversed by a route.</td>

</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

In the following example, any route whose AS path is in the set as-path-set-1 is dropped:

```
RP/0/RP0/CPU0:router(config-rpl)# if as-path in as-path-set-1 then
RP/0/RP0/CPU0:router(config-rpl-if)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
```

The contents of the **then** clause may be an arbitrary sequence of action statements.

The following example shows an **if** statement with two action statements:

```
RP/0/RP0/CPU0:router(config-rpl)# if origin is igp then
RP/0/RP0/CPU0:router(config-rpl-if)# set med 42
RP/0/RP0/CPU0:router(config-rpl-if)# prepend as-path 73 5
RP/0/RP0/CPU0:router(config-rpl-if)# endif
```

The **if** command also permits an **else** clause to be executed if the expression is false, as follows:

```
RP/0/RP0/CPU0:router(config-rpl)# if med eq 200 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 10
RP/0/RP0/CPU0:router(config-rpl-if)# else
RP/0/RP0/CPU0:router(config-rpl-else)# set community (12:56) additive
RP/0/RP0/CPU0:router(config-rpl-else)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```

The routing policy language (RPL) also provides syntax using the **elseif** command to string together a sequence of tests, as shown in the following example:

```
RP/0/RP0/CPU0:router(config-rpl)# if med eq 150 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 10
RP/0/RP0/CPU0:router(config-rpl-if)# elseif med eq 200 then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 60
```
The statements within an `if` statement may themselves be `if` statements, as shown in this example:

```plaintext
RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif med eq 250 then
RP/0/RP0/CPU0:router(config-rpl-elseif)# set local-preference 110
RP/0/RP0/CPU0:router(config-rpl-elseif)# else
RP/0/RP0/CPU0:router(config-rpl-else)# set local-preference 0
RP/0/RP0/CPU0:router(config-rpl-else)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```

The policy configuration shown sets the value of the local preference attribute to 100 on any route that has a community value of 12:34 or 56:78 associated with it. However, if any of these routes has a Multi Exit Discriminator (MED) value of 150, then each route with both the community value of 12:34 or 56:78 and a MED of 150 is dropped.
if route-aggregated

To match the aggregated routes from the other routes, use the `if route-aggregated` command in route policy configuration mode.

Syntax Description

<table>
<thead>
<tr>
<th>Command Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-aggregated</td>
<td>Checks if route is an aggregation of multiple routes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Modes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route-policy configuration</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>

</tr>
</tbody>
</table>

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

This example shows how to match the aggregated routes from other routes:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# route-policy route-policy atomic_agg
RP/0/RP0/CPU0:router(config-rpl)# if route-aggregated then
RP/0/RP0/CPU0:router(config-rpl-if)# set extcommunity rt (1:1)
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**if track is**

To track whether the state of the object is up or down, use the `if track is` command in route-policy configuration mode.

```
if track  track-id  is  { up | down }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Description</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>If track is up</td>
<td>Evaluates to TRUE if the track status is UP.</td>
</tr>
<tr>
<td>If track is down</td>
<td>Evaluates to TRUE if the track status is DOWN.</td>
</tr>
<tr>
<td>is (up</td>
<td>down)</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.2.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

None

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

```
Router(config)#configure
Router(config)#route-policy rpl
Router(config-rpl)# if track bgp-nbr1 is up
```
is-best-path

To tag the path selected as the best path use the `is-best-path` command in route policy configuration mode.

**is-best-path**

**Syntax Description**

- **is-best-path** Checks and tags the path selected as best-path.

**Command Default**

No default behavior or values.

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

```
RP/0/RSP0RP00/CPU0:router(config)# route-policy
RP/0/RSP0RP00/CPU0:router(config)# route-policy sample
RP/0/RSP0RP00/CPU0:router(config-rpl)# if destination in is-backup-path is-best-external is-best-path
    if destination is-best-path then
        set community community
    endif
end-policy
```

RP/0/RSP0RP00/CPU0:router(config-rpl)#end-policy
RP/0/RSP0RP00/CPU0:router(config)#commit
Wed Jul 8 16:08:23.436 IST
```
**local-preference**

To compare the local-preference attribute of a BGP route to an integer value or a parameterized value, use the local-preference command in route-policy configuration mode.

```
local-preference  {eq | is | ge | le}  {number|parameter}
```

**Syntax Description**
- `eq | is | ge | le` Equal to; exact match; greater than or equal to; less than or equal to.
- `number` Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `local-preference` command as a conditional expression within an `if` statement to compare the local-preference attribute to an integer value or a parameterized value.

**Note**
For a list of all conditional expressions available within an `if` statement, see the `if` command.

The MED is a 32-bit unsigned integer. The `eq` operation compares the local-preference to either a static value or a parameterized value passed to a parameterized policy for equality with that value. A greater than or equal to comparison can also be done with the `ge` operator, and a less than or equal to comparison can be performed using the `le` operator.

**Examples**
The following example shows that if the `local-preference` is 10, local-preference is set to 100:

```
RP/0/RSP0RP0/CPU0:router(config-rpl)# if local-preference eq 10 then
RP/0/RSP0RP0/CPU0:router(config-rpl-if)# set weight 100
RP/0/RSP0RP0/CPU0:router(config-rpl-if)# endif
RP/0/RSP0RP0/CPU0:router(config-rpl)#
```
med

To compare the Multi Exit Discriminator (MED) to an integer value or a parameterized value or compare the MED attribute of a BGP route to an integer value, use the `med` command in route-policy configuration mode.

```
med  {eq | is | ge | le}  {numberparameter}
```

**Syntax Description**

- `eq` | `is` | `ge` | `le`  Equal to; exact match; greater than or equal to; less than or equal to.
- `number`  Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.
- `parameter`  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release**  Modification
  - Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `med` command as a conditional expression within an `if` statement to compare the MED to an integer value or a parameterized value.

```
RP/0/RP0/CPU0:router(config-rpl)## if med eq 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
```

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

The MED is a 32-bit unsigned integer. The `eq` operation compares the MED to either a static value or a parameterized value passed to a parameterized policy for equality with that value. A greater than or equal to comparison can also be done with the `ge` operator, and a less than or equal to comparison can be performed using the `le` operator.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows that if the `med` commands match, the local preference is set to 100:

```
RP/0/RP0/CPU0:router(config-rpl)## if med eq 10 then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)##
```
To compare the next-hop associated with the route to data contained in either an inline or a named prefix set, use the **next-hop in** command in route-policy configuration mode.

```plaintext
next-hop in {prefix-set-name inline-prefix-set parameter}
```

**Syntax Description**

- **prefix-set-name**  
  Name of a prefix set.

- **inline-prefix-set**  
  Inline prefix set. The inline prefix set must be enclosed in parentheses.

- **parameter**  
  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **next-hop in** command as a conditional expression within an **if** statement to compare the next-hop associated with the route to data contained in either an inline or a named prefix set. The result is true if any value in the prefix set matches the next-hop of the route. A comparison that refers to a named prefix set that has no elements in it returns false.

**Note**

For a list of all conditional expressions available within an **if** statement, see the **if** command.

The next-hop is an IPv4 address entered as a dotted-decimal or an IPv6 address entered as a colon-separated hexadecimal.

**Examples**

The following example shows that if the **next-hop in** commands match, the local preference is set to 100

```
RP/0/RP0/CPU0:router(config-rpl)# if next-hop in some-prefix-set then
RP/0/RP0/CPU0:router(config-rpl-if)# if next-hop in (10.0.0.5, fe80::230/64) then
RP/0/RP0/CPU0:router(config-rpl-if)# set local-preference 0
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
orf prefix in

To configure an outbound route filter (ORF), use the `orf prefix in` command in route-policy configuration mode.

```
orf prefix in {prefix-set-name inline-prefix-set}
```

**Syntax Description**

- `prefix-set-name` Name of a prefix set.
- `inline-prefix-set` Inline prefix set. The inline prefix set must be enclosed in parentheses.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

Use the `orf prefix in` command to match a prefix in a prefix set or an inline prefix set.

This command takes either a named prefix set or an inline prefix set value as an argument. It returns true if the destination NLRI matches any entry in the prefix set. An attempt to match destination using a prefix set that is defined but contains no elements returns false.

This command is used in the context of the orf route-policy attach point in BGP. The destination of a route is also known in Border Gateway Protocol (BGP) as its network-layer reachability information (NLRI). It comprises a prefix value and a mask length. The routing policy language (RPL) provides one operation on prefixes, testing them for matching against a list of prefix-match specifications using the `in` operator.

**Examples**

In the following example, the prefix set orfpreset1 and the route policy named orfpolicy are defined. Next, the orfpolicy is applied to the neighbor orf attach point.

If the prefix of the route matches any of the prefixes specified in orfpreset1 (211.105.1.0/24, 211.105.5.0/24, 211.105.11.0/24), then the prefix is dropped. If the prefix matches in(211.105.3.0/24, 211.105.7.0/24, 211.105.13.0/24), then the prefix is accepted. In addition to this inbound filtering, BGP sends these prefix entries to the upstream neighbor indicating a permit or deny so that the neighbor can make the same filter updates.

```
RP/0/RP0/CPU0:router(config)# prefix-set orfpreset1
RP/0/RP0/CPU0:router(config-pfx)# 211.105.1.0/24
RP/0/RP0/CPU0:router(config-pfx)# 211.105.5.0/24
RP/0/RP0/CPU0:router(config-pfx)# 211.105.11.0/24
RP/0/RP0/CPU0:router(config-pfx)# end-set
!
RP/0/RP0/CPU0:router(config)# route-policy orfpolicy
RP/0/RP0/CPU0:router(config-rpl)# if orf prefix in orfpreset1 then
RP/0/RP0/CPU0:router(config-rpl-if)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# if orf prefix in (211.105.3.0/24, 211.105.7.0/24,
```
211.105.13.0/24) then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
!
RP/0/RP0/CPU0:router(config)# router bgp 2
RP/0/RP0/CPU0:router(config-bgp)# neighbor 1.1.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 3
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# orf route-policy orfpolicy
**origin is**

To match a specific origin type, use the `origin is` command in route-policy configuration mode.

```
origin is {igp | egp | incomplete parameter}
```

**Syntax Description**

- **igp**: Specifies Interior Gateway Protocol.
- **egp**: Specifies Exterior Gateway Protocol.
- **incomplete**: Specifies that Border Gateway Protocol (BGP) first learned the route by means other than BGP or Interior Gateway Protocol (IGP); for example, the route is learned through configuration.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `origin is` command as a conditional expression within an `if` statement to test the value of the origin attribute.

For a list of all conditional expressions available within an `if` statement, see the `if` command.

The origin of a BGP route is an enumeration; it is **igp**, **egp**, or **incomplete**.

This command can be parameterized.

**Examples**

In the following example, the origin is tested within an `if` statement to learn if it is either **igp** or **egp**:

```
RP/0/RP0/CPU0:router(config-rpl)# if origin is igp or origin is egp then
```

In the following example, a parameter is used to match a specific origin type:

```
RP/0/RP0/CPU0:router(config)# route-policy bar($origin)
RP/0/RP0/CPU0:router(config-rpl)# if origin is $origin then
```
RP/0/RP0/CPU0:router(config-rpl)# set med 20
RP/0/RP0/CPU0:router(config-rpl)# endif
RP/0/RP0/CPU0:router(config-rpl)#

origin is
## ospf-area

To match a specific ospf area, use the `ospf-area` command in route-policy configuration mode.

```
ospf-area [all-paths] {in | is}
```

### Syntax Description

- **is** Specify the explicit area-id.
- **in** Specify a list of area-id or area-set. Multiple areas can be specified separated by a comma (,).
- **all-paths** Used for routes with multiple paths. A match is made if area for every path of the route is configured in the route-policy.

### Command Default

None

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The route policy define by using `ospf-area` is useful in redistributing routes from a specific area of a routing domain into OSPF. After the route policy is created, use the `redistribute ospf route-policy` command for route redistribution.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Example

In the following example, an explicit area is specified as the matching criteria.

```
RP/0/RP0/CPU0:router(config-rpl)# if ospf-area is 10 then pass else drop endif
```

In the following example, a collection of areas is specified as the matching criteria.

```
RP/0/RP0/CPU0:router(config-rpl)# if ospf-area in (5,6,255.255.10.2) then pass else drop endif
```

In the following example, an area set is specified as the matching criteria. As a pre-requisite, the area set must be defined.

```
RP/0/RP0/CPU0:router(config)# ospf-area-set S1
RP/0/RP0/CPU0:router(config-ospf-area)# 1 , 2.2.2.2 end-set
RP/0/RP0/CPU0:router(config)# route-policy P1
```
RP/0/RP0/CPU0:router(config-rpl)# if ospf-area in S1 then pass else drop endif
pass

To pass a route for further processing, use the **pass** command in route-policy configuration mode.

### Syntax Description
This command has no arguments or keywords.

### Command Default
No default behavior or values

### Command Modes
Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
Use the **pass** command to signify that even though this route has not been modified, the user wants to continue executing in this policy block.

The **pass** command can be used as an action statement within an **if** statement. For a list of all action statements available within an **if** statement, see the **if** command.

When a policy block has finished executing, any route that has been modified in this policy block or has received a pass disposition in this policy block passes the policy and execution finishes for that policy. If this policy block is applied from within another policy block and the route is either passed or modified, then execution continues in the policy block that applied this policy block.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples
The following example shows how to accept the route unconditionally without modifying it:

```
RP/0/RP0/CPU0:router(config-rpl) # pass
```

This example accepts the route unconditionally, without modifying it, if the destination is in prefix-set permitted:

```
RP/0/RP0/CPU0:router(config-rpl) # if destination in permitted then
RP/0/RP0/CPU0:router(config-rpl-if) # pass
RP/0/RP0/CPU0:router(config-rpl-if) # endif
RP/0/RP0/CPU0:router(config-rpl) #
```
path-type is

To match path types, use the **path-type is** command in route-policy configuration mode.

\[
\text{path-type is } \{\text{ibgp} | \text{ebgp}\text{parameter}\}
\]

**Syntax Description**

- **ibgp** Specifies an internal BGP path.
- **ebgp** Specifies an external BGP path.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **path-type is** command as a conditional expression within an **if** statement to match path types.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, if the path is an external BGP path the route is accepted:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_A
RP/0/RP0/CPU0:router(config-rpl)# if path-type is ebgp then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# else
RP/0/RP0/CPU0:router(config-rpl-else)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
policy-global

To define global parameters and enter global parameter configuration mode, use the `policy-global` command in XR Config mode. To remove global parameters, use the `no` form of this command.

```
policy-global
no policy-global
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No default behavior or values

**Command Modes**
XR Config mode

**Command History**
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `policy-global` command to define global parameters and enter global parameter configuration mode.

RPL supports the definition of systemwide global parameters that can be used inside a policy definition. The global parameter values can be used directly inside a policy definition similar to the local parameters of parameterized policy. When a parameterized policy has a parameter name “collision” with a global parameter name, parameters local to policy definition take precedence, effectively ‘masking off’ global parameters. In addition, a validation mechanism is in place to prevent the deletion of a particular global parameter if it is referred by any policy. For more information on global parameters and parameterization, see the Implementing Routing Policy module of the Routing Configuration Guide for Cisco NCS 5500 Series Routers Routing Configuration Guide for Cisco NCS 540 Series Routers Routing Configuration Guide for Cisco NCS 560 Series Routers

**Task ID**
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure global parameters:

```
RP/0/RP0/CPU0:router (config) # policy-global
RP/0/RP0/CPU0:router (config-rp-gl) # glbpathtype 'ebgp'
RP/0/RP0/CPU0:router (config-rp-gl) # glbtag '100'
RP/0/RP0/CPU0:router (config-rp-gl) # end-global
```

In the following example, the `globalparam` argument makes use of the global parameters `gblpathtype` and `gbltag` defined above and is defined for a nonparameterized policy:

```
RP/0/RP0/CPU0:router (config) # route-policy globalparam
RP/0/RP0/CPU0:router (config-rpl) # if path-type is $gblpathtype then
RP/0/RP0/CPU0:router (config-rpl) # set tag $gbltag
RP/0/RP0/CPU0:router (config-rpl) # endif
```
policy-global

RP/0/RP0/CPU0:router(config-rpl)# end-policy
prefix-set

To enter prefix set configuration mode and define a prefix set for contiguous and non-contiguous set of bits, use the `prefix-set` command in XR Config mode. To remove a named prefix set, use the `no` form of this command.

```
prefix-set name
no prefix-set name
```

**Syntax Description**
- `name` Name of a prefix set.

**Command Default**
None

**Command Modes**
XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `prefix-set` command to enter prefix set configuration mode and define a prefix set.

A prefix set is a comma-separated list of prefix match specifications. It holds IPv4 or IPv6 prefix match specifications, each of which has four parts: an address, a mask length, a minimum matching length, and a maximum matching length. The address is required, but the other three parts are optional. The address is a standard four-part, dotted-decimal numeric IPv4 address or a colon-separated hexadecimal IPv6 address. The mask length, if present, is a nonnegative decimal integer in the range from 0 to 32 for IPv4 prefixes or 0 to 128 for IPv6 prefixes following the address and separated from it by a slash. The optional minimum matching length follows the address and optional mask length and is expressed as the keyword `ge` (mnemonic for greater than or equal to), followed by a nonnegative decimal integer in the range from 0 to 32 for IPv4 or 0 to 128 for IPv6. The optional maximum matching length follows the rest and is expressed by the keyword `le` (mnemonic for less than or equal to), followed by yet another nonnegative decimal integer in the range from 0 to 32 for IPv4 or 0 to 128 for IPv6. A syntactic shortcut for specifying an exact length for prefixes to match is the `eq` keyword, mnemonic for equal to.

If a prefix match specification has no mask length, then the default mask length is 32 for IPv4 or 128 for IPv6. The default minimum matching length is the mask length. If a minimum matching length is specified, then the default maximum matching length must be less than 32 for IPv4 prefixes or 128 for IPv6 prefixes. Otherwise, if neither a minimum nor maximum length is specified, the default maximum length is the mask length.

A prefix set is a list of prefix match specifications. It holds IPv4 or IPv6 prefix match specifications, each of which has two parts: an address and a mask. The address and mask is a standard dotted-decimal IPv4 or colon-separated hexadecimal IPv6 address. The prefix set allows the specifying of contiguous and non-contiguous set of bits that must be matched in any route. The set of bits to be matched are provided in the form of a mask in which a binary 0 means a mandatory match and a binary 1 means a 'do not match' condition.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows a prefix set named legal-ipv4-prefix-examples:

```
RP/0/RP0/CPU0:router(config)# prefix-set legal-ipv4-prefix-examples
RP/0/RP0/CPU0:router(config-pfx)# 10.0.1.1,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.2.0/24,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.3.0/24 ge 28,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.4.0/24 le 28,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.5.0/24 ge 26 le 30,
RP/0/RP0/CPU0:router(config-pfx)# 10.0.6.0/24 eq 28
RP/0/RP0/CPU0:router(config-pfx)# end-set
```

The first element of the prefix set matches only one possible value, 10.0.1.1/32 or the host address 10.0.1.1. The second element matches only one possible value, 10.0.2.0/24. The third element matches a range of prefix values, from 10.0.3.0/28 to 10.0.3.255/32. The fourth element matches a range of values, from 10.0.4.0/24 to 10.0.4.240/28. The fifth element matches prefixes in the range from 10.0.5.0/26 to 10.0.5.252/30. The sixth element matches any prefix of length 28 in the range from 10.0.6.0/28 through 10.0.6.240/28.

The following prefix set consists entirely of invalid prefix match specifications:

```
RP/0/RP0/CPU0:router(config)# prefix-set INVALID-PREFIX-EXAMPLES
RP/0/RP0/CPU0:router(config-pfx)# 10.1.1.1 ge 16,
RP/0/RP0/CPU0:router(config-pfx)# 10.1.2.1 le 16,
RP/0/RP0/CPU0:router(config-pfx)# 10.1.3.0/24 le 23,
RP/0/RP0/CPU0:router(config-pfx)# 10.1.4.0/24 ge 33,
RP/0/RP0/CPU0:router(config-pfx)# 10.1.5.0/25 ge 29 le 28
RP/0/RP0/CPU0:router(config-pfx)# end-set
```

Neither the minimum length nor the maximum length is legal without a mask length. The maximum length must be at least the mask length. The minimum length must be less than 32, the maximum length of an IPv4 prefix. The maximum length must be equal to or greater than the minimum length.

The following example shows a valid IPv6 prefix set named legal-ipv6-prefix-examples:

```
RP/0/RP0/CPU0:router(config)# prefix-set legal-ipv6-prefix-examples
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:1::/64,
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:2::/64,
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:3::/64,
RP/0/RP0/CPU0:router(config-pfx)# 2001:0:0:4::/64
RP/0/RP0/CPU0:router(config-pfx)# end-set
```

This example shows a prefix set named legal-ipv4-prefix:

```
RP/0/RP0/CPU0:router(config)# prefix-set legal-ipv4-prefix
RP/0/RP0/CPU0:router(config-pfx)# 10.1.1.1 0.255.0.255
RP/0/RP0/CPU0:router(config-pfx)# 10.2.2.2 0.0.0.0
RP/0/RP0/CPU0:router(config-pfx)# 10.3.3.3 255.255.255.254
RP/0/RP0/CPU0:router(config-pfx)# 10.4.4.4 255.255.255.255
```

In the above example, In the above example, the command defines the prefix-set named acl-prefix-set. The first element specifies to match all routes having 10 in first octet and 1 in third octet. The second element matches all routes having prefix as 10.2.2.2 (that is, matches all conditions). The third element matches all routes having odd numbers in the last octets and the fourth element matches all routes with any prefix.
prepend as-path

To prepend the AS path with additional autonomous system numbers, use the `prepend as-path` command in route-policy configuration mode.

```
prepend as-path {as-numberparameter | most-recent} [ {numberparameter} ]
```

**Syntax Description**

- `as-number` Autonomous system number to prepend to the path.
  - Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
  - Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
  - Range for 4-byte Autonomous system numbers (ASNs) as a dot format is 1.0 to 65535.65535.

- `parameter` Parameter name. The parameter name must be preceded with a “$.”
- `most-recent` Specifies that the most recent autonomous system number should be prepended.
- `number` (Optional) Number of times the autonomous system number should be prepended. Range is 1 to 63.

**Command Default**

The default `number` is 1.

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `prepend as-path` command to prepend the AS path with additional autonomous system numbers.

**Note**

The `prepend as-path` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command can take one or two arguments. The first argument (either a number or parameter) is the autonomous system number to prepend to the path. The optional second argument (either a number or parameter) is the number of times the autonomous system number should be prepended.

**Examples**

The following example shows how to prepend the autonomous system number 666.1 to the AS path three times:
The following examples show how to prepend the autonomous system number 666.0 to the AS path one time:

```
RP/0/RP0/CPU0:router(config-rpl)# prepend as-path 666.0 1
```
To check the protocol that installs the route, use the `protocol` command in route-policy configuration mode.

```
protocol {in(protocol-set) | is(protocol-name)}
```

### Syntax Description

| in (protocol-set) | Specifies a member of a set. The `protocol-set` argument accepts the following keywords within parentheses:
|                  | • bgp — Border Gateway Protocol (BGP)
|                  | • connected — Connected routes
|                  | • isis — ISO Intermediate System-to-Intermediate System (IS-IS)
|                  | • ospf — Open Shortest Path First (OSPF)
|                  | • ospfv3 — Open Shortest Path First version 3 (OSPFv3)
|                  | • rip — Routing Information Protocol (RIP)
|                  | • static — Static routes
| Keywords must be separated by a comma. |

| is protocol-name | Specifies a single protocol name, and accepted keywords are similar to the `protocol-set` argument. |

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `protocol` command as a conditional expression within an `if` statement to specify a protocol to install a route.

Use the `in` keyword to determine if a protocol listed in the `protocol-set` is the originator of the route being filtered.

Use the `is` keyword to determine if `protocol-name` is an exact match.

### Note

For a list of all conditional expressions available within an `if` statement, see the `if` command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to use the `protocol` command as a conditional expression within if statements:

```
RP/0/RP0/CPU0:router(config)# route-policy rip1
RP/0/RP0/CPU0:router(config-rpl)# if protocol in (connected, static) then
  RP/0/RP0/CPU0:router(config-rpl-if)# add rip-metric 2
  RP/0/RP0/CPU0:router(config-rpl-if)# elseif protocol is bgp 1 then
    RP/0/RP0/CPU0:router(config-rpl-elseif)# add rip-metric 3
  RP/0/RP0/CPU0:router(config-rpl-elseif)# elseif protocol is ospf 2 then
    RP/0/RP0/CPU0:router(config-rpl-elseif)# add rip-metric 4
  RP/0/RP0/CPU0:router(config-rpl-elseif)# else
    RP/0/RP0/CPU0:router(config-rpl-else)# add rip-metric 5
  RP/0/RP0/CPU0:router(config-rpl-else)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy

RP/0/RP0/CPU0:router(config)# router rip
RP/0/RP0/CPU0:router(config-rip)# interface HundredGigE 0/1/0/1
RP/0/RP0/CPU0:router(config-rip-if)# route-policy rip1 out
```
rd in

To compare the route distinguisher (RD) associated with the route to RDs contained in either a named or an inline RD set, use the `rd in` command in route-policy configuration mode.

```
rd in  {rd-set-name|inline-rd-set|parameter}
```

**Syntax Description**

- **rd-set-name**  Name of an RD set.
- **inline-rd-set**  Inline RD set. The inline RD set must be enclosed in parentheses.
- **parameter**  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

**Release 6.0**  This command was introduced.

**Usage Guidelines**

Use the `rd in` command as a conditional expression within an `if` statement to match a destination entry in a named prefix set or inline prefix set.

```
RP/0/RP0/CPU0:router(config)# route-policy
RP/0/RP0/CPU0:router(config-rpl)# if rd in (128.1.0.0/16:100) then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

For a list of all conditional expressions available within an `if` statement, see the `if` command.

This command takes either a named RD set or an inline RD set value as an argument. The condition returns true if the destination entry matches any entry in the RD set or inline RD set. An attempt to match an RD using an RD set that is defined but contains no elements returns false.
rd-set

To define a route distinguisher (RD) set and enter RD configuration mode, use the **rd-set** command in XR Config mode.

```
rd-set name
no rd-set name
```

**Syntax Description**

- `name` Name of an RD community set.

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **rd-set** command to create a set with RD elements and enter RD configuration mode. An RD set is a 64-bit value prepended to an IPv4 address to create a globally unique Border Gateway Protocol (BGP) VPN IPv4 address.

**Note**

For `m`, the mask length is supported.

You can define RD values with the following commands:

- `a.b.c.d/m:*`—BGP VPN RD in IPv4 format with a wildcard character. For example, `10.0.0.2/24.0:*`.
- `a.b.c.d/m:n`—BGP VPN RD in IPv4 format with a mask. For example, `10.0.0.2/24:666`.
- `a.b.c.d:*`—BGP VPN RD in IPv4 format with a wildcard character. For example, `10.0.0.2:*`.
- `a.b.c.d:n`—BGP VPN RD in IPv4 format. For example, `10.0.0.2:666`.
- `asn:*`—BGP VPN RD in ASN format with a wildcard character. For example, `10002:*`.
- `asn:n`—BGP VPN RD in ASN format. For example, `10002:666`.
- `x.y:*`—BGP VPN RD in 4-byte ASN format with a wildcard character. For example, `10002.101:*`.
- `x.y:n`—BGP VPN RD in 4-byte ASN format. For example, `10002.101:666`.

**Task ID**

- **Task ID**: route-policy
- **Operations**: read, write

**Examples**

The following example shows how to create an RD set called `my_rd_set`:

```
RP/0/RP0/CPU0:router(config)# rd-set my_rd_set
RP/0/RP0/CPU0:router(config-rd)# 172.16.0.0/16:*
RP/0/RP0/CPU0:router(config-rd)# 172.17.0.0/16:100
```
RP/0/RP0/CPU0:router(config-rd)# 192:*,
RP/0/RP0/CPU0:router(config-rd)# 192:100
RP/0/RP0/CPU0:router(config-rd)# end-set
replace as-path

To replace a sequence of AS numbers or private AS numbers in the AS path with the configured local AS number, use the **replace as-path** command in route-policy configuration mode.

```
replace as-path { [as-number-list parameter] | private-as }
```

**Syntax Description**

- `as-number-list` (Optional) Sequence of AS numbers to replace. The sequence must be enclosed in single quotes (‘ ’). You can use 2-byte or 4-byte AS numbers.
  - The 2-byte value is entered as a 16-bit unsigned decimal value. The range is 0 to 65535.
  - The 4-byte value is entered as two 16-bit unsigned decimal values separated by a period. The range is 1.0 to 65535.65535.

- `parameter` (Optional) Parameter name. The parameter name must be preceded with a “$.”

- `private-as` Matches within the BGP private AS range. Range is from 64512 to 65534.

**Command Default**

None.

**Command Modes**

Route-policy configuration

**Command History**

```
Release 6.0  This command was introduced.
```

**Usage Guidelines**

Use the **replace as-path** command to replace a sequence of AS numbers or private AS numbers in the AS path with the local AS numbers. For example, if the AS path is ‘67 65534 100 65533 5 78 89 90’ and the local AS number is 900, then:

```
replace as-path ‘5 78’
```

replaces ‘5 78’ in the AS path with 900 (from the local AS), and the new path would be ‘67 65534 100 65533 900 89 90’.

Consider following statement:

```
replace as-path private-as
```

Because 65534 and 65533 are within the private AS range, they are replaced with 900. The path is ‘67 900 100 900 5 78 89 90’. The length of the path remains the same.

The **replace as-path** command can be used as an action statement within an **if** statement. For a list of all action statements available within an **if** statement, see the **if** command.

⚠️ **Caution**

The **replace as-path** command changes the AS path content which can lead to routing loops.
### Examples

The following example shows how to use the `replace as-path` command to replace AS numbers in the AS path:

```
RP/0/RP0/CPU0:router(config)# route-policy drop-as-1234
RP/0/RP0/CPU0:router(config-rpl)# replace as-path '90 78 45 $asnum'
RP/0/RP0/CPU0:router(config-rpl)# replace as-path private-as
RP/0/RP0/CPU0:router(config-rpl)# replace as-path '9.9 7.89 14.15 $asnum'
RP/0/RP0/CPU0:router(config-rpl)# replace as-path '9 89 14.15 $asnum'
```
remove as-path private-as

To remove BGP private AS numbers from as-path structure used by BGP, use the `remove as-path private-as` command under route policy configuration mode.

```
remove as-path private-as  [ entire-aspath]
```

**Syntax Description**

- `entire-aspath` (Optional) Removes the entire private autonomous system numbers from an autonomous system path only if all the autonomous systems in the path are private.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

This example shows how to remove BGP private AS numbers from as-path structure:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# route-policy rm_private_as
RP/0/RP0/CPU0:router(config-rpl)# remove as-path private-as entire-aspath
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**rib-has-route**

To check if a route listed in the prefix set exists in the Routing Information Base (RIB), use the **rib-has-route** command in route-policy configuration mode.

```
rib-has-route in {prefix-set-nameinline-prefix-setparameter}
```

**Syntax Description**

- **prefix-set-name**  Name of a prefix set.
- **inline-prefix-set**  Inline prefix set. The inline prefix set must be enclosed in parentheses.
- **parameter**  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

**Release**  Modification

Release 6.0  This command was introduced.

**Usage Guidelines**

If routes are active, then they are advertised. Routes are considered active if they are already installed in the Routing Information Base (RIB).

The prefix sets used in the **rib-has-route** command contain two match specifications. The first is where an exact route match is requested (for example, 10.10.0.0/16 will match exactly one route) and the second is where a route match or any more-specific route match is allowed (for example, 10.10.0.0/16 ge 32 will match the 10.10.0.0/16 route and any longer prefix).

Use the **rib-has-route** command as a conditional expression within an **if** statement to check if there is an active route with a specific prefix contained in the RIB. If the statement reveals an active route that meets that criteria, additional actions are executed.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, an **if** statement is used to learn if a route contained in a prefix set 10.10.0.0/16 is in the RIB:

```
RP/0/RP0/CPU0:router(config-rpl)# if rib-has-route in (10.10.0.0/16 ge 16) then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
route-has-label

To check if there is a Multiprotocol Label Switching (MPLS) label in a route during redistribution, use the `route-has-label` command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `route-has-label` command as a conditional expression within an `if` statement to check if there is an MPLS label in a route during redistribution.

For a list of all conditional expressions available within an `if` statement, see the `if` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, an `if` statement learns if an MPLS label is present in a route:

```bash
RP/0/RP0/CPU0:router(config-rpl)# if route-has-label then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
```
route-policy (RPL)

To define a route policy and enter route-policy configuration mode, use the route-policy command in XR Config mode. To remove a policy definition, use the no form of this command.

route-policy name \[(\text{parameter1, parameter2, \ldots, parameterN})\]
no route-policy name
(\text{parameter1, parameter2, \ldots, parameterN})

Syntax Description

- **name**: Name of a route policy.
- **parameter**: (Optional) Parameter name. The parameter name must be preceded with a “$.” The parameters must be enclosed in parenthesis “()”.

Command Default

No default behavior or values

Command Modes

XR Config mode

Command History

- **Release 6.0**: This command was introduced.

Usage Guidelines

Use the route-policy command to define a route policy and enter route-policy configuration mode. Policy definitions create named bundles of policy statements. A policy definition consists of the route-policy command followed by a name, a group of policy statements, and the end-policy command. The policy name serves as a handle for binding the policy to protocols.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows a simple policy named drop-everything that drops any route it encounters:

RP/0/RP0/CPU0:router(config)# route-policy drop-everything
RP/0/RP0/CPU0:router(config-rpl)# drop
RP/0/RP0/CPU0:router(config-rpl)# end-policy

Policies may also refer to other policies such that common blocks of policy can be reused. This reference to other policies is accomplished by using the apply command. The following is a simple example:

RP/0/RP0/CPU0:router(config)# route-policy drop-as-1234
RP/0/RP0/CPU0:router(config-rpl)# if as-path passes-through '1234' then
RP/0/RP0/CPU0:router(config-rpl-if)# apply check-communities
The `apply` command indicates that the policy check-communities should be executed if the route under consideration passed through autonomous system 1234 before it was received. If so, the communities of the route are checked, and based on the findings the route may be accepted unmodified, accepted with changes, or dropped.
route-type is

To match route types when redistribution is being performed into Border Gateway Protocol (BGP), Open Shortest Path First (OSPF), or Integrated Intermediate System-to-Intermediate System (IS-IS), use the route-type is command in route-policy configuration mode.

route-type is {local | interarea | internal | type-1 | type-2 | level-1 | level-2 | parameter}

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local</td>
<td>Uses a local value to match locally generated BGP routes.</td>
</tr>
<tr>
<td>interarea</td>
<td>Uses an interarea value to match IS-IS interarea routes.</td>
</tr>
<tr>
<td>internal</td>
<td>Uses an internal value to match OSPF intra- and interarea routes.</td>
</tr>
<tr>
<td>type-1</td>
<td>Uses a Type 1 value to match Type 1 OSPF routes.</td>
</tr>
<tr>
<td>type-2</td>
<td>Uses a Type 2 value to match Type 2 OSPF routes.</td>
</tr>
<tr>
<td>level-1</td>
<td>Uses a Level 1 value to match Level 1 IS-IS routes.</td>
</tr>
<tr>
<td>level-2</td>
<td>Uses a Level 2 value to match Level 2 IS-IS routes.</td>
</tr>
</tbody>
</table>

| parameter          | Parameter name. The parameter name must be preceded with a “$.” |

Command Default
No default behavior or values

Command Modes
Route-policy configuration

Command History
Release 6.0 This command was introduced.

Usage Guidelines
Use the route-type is command as a conditional expression within an if statement to compare route types when redistribution is being performed into BGP, OSPF, or IS-IS.

For a list of all conditional expressions available within an if statement, see the if command.

Note
The valid keywords are local, internal, interarea, type-1, type-2, level-1, and level-2. A parameterized value that fills in one of these values may also be used. The local value is used to match locally generated BGP routes. The internal value is used to match OSPF intra- and interarea routes. The type-1 and type-2 values are used to match Type 1 and Type 2 OSPF external routes. The level-1, level-2, and interarea values are used to match IS-IS routes of those respective types.

Because the route type is a matching operator, it appears in conditional clauses of if and then statements.
**Examples**

In the following example, non-local routes are dropped:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_A
RP/0/RP0/CPU0:router(config-rpl)# if route-type is local then
RP/0/RP0/CPU0:router(config-rpl-if)# pass
RP/0/RP0/CPU0:router(config-rpl-if)# else
RP/0/RP0/CPU0:router(config-rpl-else)# drop
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**rpl editor**

To set the default routing policy language (RPL) editor, use the **rpl editor** command in XR Config mode.

```
rpl editor {nano | emacs | vim}
```

**Syntax Description**

- **nano** Sets the default RPL editor to GNU nano.
- **emacs** Sets the default RPL editor to EMACS.
- **vim** Sets the default RPL editor to VIM.

**Command Default**

The Nano editor is the default.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the default RPL editor is set to Nano:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl editor nano
```

In the following example, the default RPL editor is set to EMACS:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl editor emacs
```

In the following example, the default RPL editor is set to VIM:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl editor vim
```
rpl maximum

To configure system limits on the routing policy subsystem, use the `rpl maximum` command in XR Config mode.

```
rpl maximum {lines | policies} number
```

**Syntax Description**
- **lines number**: Configures the number of lines of configuration limit. Range is from 1 to 131072.
- **policies number**: Configures the number of policies limit. Range is from 1 to 5000.

**Command Default**
- **lines**: 65536
- **policies**: 3500

**Command Modes**
- XR Config mode

**Command History**
- **Release 6.0**: This command was introduced.

**Usage Guidelines**
Use the `rpl maximum` command to configure system limits on the routing policy subsystem. As such, `rpl maximum` configuration lines do not appear as statements within a routing policy. This command places resource limits on the routing policy subsystem. Use the `rpl maximum` command to configure the maximum number of lines of configuration and number of policies.

The number of lines of configuration includes the beginning and ending statements, for example, `route-policy` and `end-policy`. Each line of configuration for sets is also counted.

A line of configuration is counted only once; it is not counted each time it is used. Similarly, any multiple use of policy in an apply statement counts only as one policy.

A user can change the default values for lines and policies but cannot exceed the maximum value, nor can the value for lines and policies be configured lower than the number of lines or policies that are currently configured.

**Task ID**
- **Task ID**: `read, write`

**Examples**
In the following example, the maximum number of RPL system limits are modified:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl maximum lines 50
RP/0/RP0/CPU0:router(config)# rpl maximum policies 6
```
rpl set-exit-as-abort

To change the default exit behavior under RPL configuration mode to abort from the RPL configuration mode without saving the configuration, use the `rpl set-exit-as-abort` command in XR Config mode.

**Syntax Description**

This command has no keywords or arguments.

**Command Modes**

XR Config mode

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

The default `exit` command acts as end-policy, end-set, or end-if. If the `exit` command is executed under route policy configuration mode, the changes are applied and configuration is updated. This destructs the existing policy. The `rpl set-exit-as-abort` command allows to overwrite the default behavior of the `exit` command under the route policy configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how change the default exit behavior:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# rpl set-exit-as-abort
```
set administrative-distance

To set a route with lower administrative distance such that it is preferred to a route with higher administrative distance, use the set administrative-distance command in route policy configuration mode.

set administrative-distance [{number | parameter}]

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Value assigned to a 8-bit unsigned integer. Range is from 1 to 255.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a &quot;$&quot;.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set a route with an administrative value such that it is preferred to a route with higher administrative distance.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# route-policy sample
RP/0/RP0/CPU0:router(config-rpl)# set administrative-distance 34
RP/0/RP0/CPU0:router(config-rpl)# end-policy
RP/0/RP0/CPU0:router(config-rpl)# exit
RP/0/RP0/CPU0:router(config)# route bgp 100
RP/0/RP0/CPU0:router(config-bgp)# address family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# table-policy sample
RP/0/RP0/CPU0:router(config-bgp-af)# exit
RP/0/RP0/CPU0:router(config-bgp)# exit
RP/0/RP0/CPU0:router(config)# end
```
set community

To set the Border Gateway Protocol (BGP) community attributes in a route, use the `set community` command in route-policy configuration mode.

```
set community {community-set-name inline-community-set parameter} [additive]
```

**Syntax Description**

- `community-set-name`: Community set name.
- `inline-community-set`: Inline community set. The inline community set must be enclosed in parentheses.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”
- `additive`: (Optional) Adds communities to communities in the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release** 6.0: This command was introduced.

**Usage Guidelines**

- Use the `set community` command to set the BGP community attribute.

  - The `set community` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

**Note**

Communities are 32-bit values carried in BGP routes. Each route may have zero or more communities in an unordered list.

Use this command to replace the communities in a route or add to them using the optional `additive` keyword.

As with the other community forms that support inline sets, either or both 16-bit portions of the community can be parameterized. Likewise, the names of the well-known communities `internet` (0:0), `no-advertise` (65535:65281), `no-export` (65535:65282), and `local-AS` (65535:65283) can also be used. In an inline community set, each 16-bit portion can also be specified as the `peeras` to express the AS number of the neighbor from which the route was received. If the neighbor AS employs a 4-byte ASN, the IANA-assigned 16-bit value 23456 (AS_TRANS) is used as `peeras` instead.

Without the `additive` keyword, any existing communities (other than the well-known communities) are removed and replaced with the given communities. The `additive` keyword specifies that all communities already present in the route be maintained and the list of communities be added to them.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following are incomplete configuration examples using the `set community` command:

```
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24)
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, $as:24, $as:$tag)
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, internet) additive
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, $as:24) additive
RP/0/RP0/CPU0:router(config-rpl)# set community (10:24, peeras:24) additive
```
set core-tree

To set a Multicast Distribution Tree (MDT) type, use the set core-tree command in route-policy configuration mode.

```
set core-tree {gre-rosen | mldp-inband | mldp-partitioned-mp2mp | mldp-partitioned-p2mp | mldp-rosen | rsvp-te-partitioned-p2mp parameter}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gre-rosen</td>
<td>Specifies the IP GRE Rosen core MDT type</td>
</tr>
<tr>
<td>mldp-inband</td>
<td>Specifies the MLDP InBand core MDT type</td>
</tr>
<tr>
<td>mldp-partitioned-mp2mp</td>
<td>Specifies the MLDP Partitioned MP2MP core MDT type</td>
</tr>
<tr>
<td>mldp-partitioned-p2mp</td>
<td>Specifies the MLDP Partitioned P2MP core MDT type</td>
</tr>
<tr>
<td>mldp-rosen</td>
<td>Specifies the MLDP Rosen core MDT type</td>
</tr>
<tr>
<td>rsvp-te-partitioned-p2mp</td>
<td>Specifies the RSVP TE core core MDT type</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

No specific guidelines impact the use of this command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In this example, the Multicast Distribution Tree type is set to IP GRE Rosen core:

```
RP/0/RP0/CPU0:router(config)#route-policy policy_mdt_type
RP/0/RP0/CPU0:router(config))#set core-tree gre-rosen
```
set dampening

To configure Border Gateway Protocol (BGP) route dampening, use the `set dampening` command in route-policy configuration mode.

```
set dampening {halflife minutes} | max-suppress {minutesparameter} | reuse {secondsparameter} | suppress {penalty-unitsparameter} | others default
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>halflife minutes</code></td>
<td>Specifies the time (in minutes) after which a penalty is decreased. After the route has been assigned a penalty, the penalty is decreased by half after the half-life period. The process of reducing the penalty happens every 5 seconds. Range is 1 to 45 minutes.</td>
</tr>
<tr>
<td><code>max-suppress minutes</code></td>
<td>Specifies the maximum time (in minutes) a route can be suppressed. Range is 1 to 20000. If the half-life value is allowed to default, the maximum suppress time defaults to 60 minutes.</td>
</tr>
<tr>
<td><code>reuse seconds</code></td>
<td>Unsuppresses a route if the penalty for flapping the route decreases enough to fall below the configured value (in seconds). The process of unsuppressing routes occurs at 10-second increments. Range is 1 to 20000.</td>
</tr>
<tr>
<td><code>suppress penalty-units</code></td>
<td>Specifies a penalty of 1000 each time a route flaps. When a route penalty exceeds the configured limit, it is suppressed. Range is 1 to 20000.</td>
</tr>
<tr>
<td><code>others default</code></td>
<td>If all four keyword values are not specified in the command, then the command must end with <code>others default</code>. This designation indicates that any keyword not defined is set to its default.</td>
</tr>
</tbody>
</table>

**Command Default**

- `half-life`: 15 minutes
- `max-suppress`: 60 minutes (four times the half-life)
- `reuse`: 750 seconds
- `suppress`: 2000 penalty units

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

The BGP protocol supports route dampening using an exponential backoff algorithm. The algorithm is controlled by setting the four supported BGP values: half-life, max-suppress, reuse, and suppress. Use the `set dampening` command to configure BGP route dampening.
The `set dampening` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

A value for at least one of the four keywords must be set. If the `set dampening` command defines values for three or fewer of the supported keywords, then the configuration must end with the `others default`, which indicates that any keyword value not defined in the command is set to its default value.

The keywords may appear in the command in any order.

---

**Note**

A value for at least one of the four keywords must be set. If the `set dampening` command defines values for three or fewer of the supported keywords, then the configuration must end with the `others default`, which indicates that any keyword value not defined in the command is set to its default value.

---

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following examples, the half-life is set to 20 minutes and the maximum suppress time is set to 90 minutes. Each command must end with `others default` because three or fewer keywords are defined.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening halflife 20 others default
RP/0/RP0/CPU0:router(config-rpl)# set dampening max-suppress 90 others default
```

In this example, all four keywords are defined, which means the command does not use `others default`.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening halflife 15 max-suppress 60 reuse 750 suppress 2000
```

The following command is invalid because it is missing `others default`.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening reuse 700
```

In the following example, the parameters are used.

```
RP/0/RP0/CPU0:router(config-rpl)# set dampening halflife $p1 suppress $p4 reuse $p3 max-suppress $p2
```
set extcommunity cost

To set the Border Gateway Protocol (BGP) cost extended community attributes, use the `set extcommunity cost` command in route-policy configuration mode.

```
set extcommunity cost {cost-extcommunity-set-name cost-inline-extcommunity-set parameter} [additive]
```

**Syntax Description**

- `cost-extcommunity-set-name`: Cost extended community set name.
- `cost-inline-extcommunity-set`: Inline cost extended community set. The inline cost extended community set must be enclosed in parentheses.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”
- `additive`: (Optional) Adds extended communities for cost to extended communities in the route.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set extcommunity cost` command to either replace the extended communities on the route or add to them using the optional `additive` keyword. Cost community is an extended community used to tie break the best path selection process in BGP so as to have a localized custom decision for packet forwarding. The extended community format defines generic points of insertion (POI) that influence the decision at different points of the bestpath algorithm.

**Note**

The `set extcommunity cost` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

As with the other extended community forms that support inline sets, either or both portions of the community can be parameterized. Similarly to regular communities, the `additive` keyword can be used to signify adding these extended communities to those that are already present, as opposed to replacing them. Without the `additive` keyword, any existing extended communities for cost (other than the well-known communities) are removed and replaced with the given communities. The `additive` keyword specifies that all extended communities for cost already present in the route be maintained and the set of extended communities be added to them. Well-known communities include internet, local-AS, no-advertise, and no-export.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
Examples

The following are incomplete configuration examples using the `set extcommunity cost` command:

```
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity cost (IGP:10:20)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity cost (Pre-Bestpath:33:44)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity cost (IGP:11:21)
```
**set extcommunity rt**

To set the Border Gateway Protocol (BGP) route target (RT) extended community attributes, use the `set extcommunity rt` command in route-policy configuration mode.

```
set extcommunity rt {rt-extcommunity-set-name rt-inline-extcommunity-set} additive
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>rt-extcommunity-set-name</td>
<td>Route target extended community set name.</td>
</tr>
<tr>
<td>rt-inline-extcommunity-set</td>
<td>Inline route target extended community set. The inline route target extended community set must be enclosed in parentheses.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
<tr>
<td>additive</td>
<td>(Optional) Adds extended communities for an RT to extended communities in the route.</td>
</tr>
</tbody>
</table>

**Command Modes**

Route-policy configuration

**Command History**

```
Release 6.0  This command was introduced.
```

**Usage Guidelines**

Use the `set extcommunity rt` command to either replace the extended communities on the route or add to them using the optional `additive` keyword.

**Note**

The `set extcommunity rt` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

As with the other extended community forms that support inline sets, either or both portions of the community can be parameterized. Similarly to regular communities, the `additive` keyword can be used to signify adding these extended communities to those that are already present, as opposed to replacing them.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following are incomplete configuration examples using the `set extcommunity rt` command:

```
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity rt (10:24)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity rt (10:24, $as:24, $as:$tag)
RP/0/RP0/CPU0:router(config-rpl)# set extcommunity rt (10:24, internet) additive
```
Without the **additive** keyword, any existing extended communities for cost (other than the well-known communities) are removed and replaced with the given communities. The **additive** keyword specifies that all extended communities for cost already present in the route be maintained and the list of extended communities be added to them.
**set ip-precedence**

To set the IP precedence, use the `set ip-precedence` command in route-policy configuration mode.

```
set ip-precedence {number parameter}
```

**Syntax Description**

- `number` Value of the precedence. The precedence value can be a number from 0 to 7:
  - 7 — network (set packets with network control precedence)
  - 6 — internet (set packets with internetwork control precedence)
  - 5 — critical (set packets with critical precedence)
  - 4 — flash-override (set packets with flash override precedence)
  - 3 — flash (set packets with flash precedence)
  - 2 — immediate (set packets with immediate precedence)
  - 1 — priority (set packets with priority precedence)
  - 0 — routine (set packets with routine precedence)

- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set ip-precedence` command to set the IP precedence to classify packets. This command is supported at the BGP table-policy attach point. Prefixes are marked for subsequent processing in the forwarding plane. After QoS Policy Propagation through Border Gateway Protocol (BGP) (QPPB) is enabled on an interface, corresponding traffic shaping and policing is completed using packet classification based on the IP precedence or QoS group ID. See Modular QoS Configuration Guide for Cisco NCS 5500 Series Routers, Modular QoS Configuration Guide for Cisco NCS 540 Series Routers, and Modular QoS Configuration Guide for Cisco NCS 560 Series Routers for information on QPPB.

**Task ID**

```
route-policy read, write
```

**Examples**

This example shows how use `set ip-precedence` command:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set ip-precedence 3
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set isis-metric

To set the Intermediate System-to-Intermediate System (IS-IS) metric attribute value, use the **set isis metric** command in route-policy configuration mode.

```
set isis-metric {numberparameter}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>number</th>
<th>24-bit integer number. Range is from 0 to 16777215.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **set isis-metric** command to set the IS-IS metric attribute value for routes that are redistributed into IS-IS.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the IS-IS metric attribute value is set to 1000:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set isis-metric 1000
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
**set label**

To set the Border Gateway Protocol (BGP) label attribute value, use the `set label` command in route-policy configuration mode.

```
set label {explicit-null | implicit-null|parameter}
```

**Syntax Description**

- **explicit-null**  Sets the label to the well-known explicit value of 0.
- **implicit-null**  Sets the label to the well-known implicit value of 3.
- **parameter**  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set label` command in a route policy at the allocate label attachpoint to set the label to explicit-null or implicit-null based on deployment preference. During inter-AS operation, the ASBR sends some of its own loopbacks to other its peers and labels them either implicit null or explicit null.

**Examples**

The following example shows how to set the labels:

```
RP/0/RP0/CPU0:router(config)# route-policy labelpolicy
RP/0/RP0/CPU0:router(config-rpl)# if destination in (206.141.1.0/24) then
RP/0/RP0/CPU0:router(config-rpl)# set label explicit-null
RP/0/RP0/CPU0:router(config-rpl)# elseif destination in (206.141.3.0/24) then
RP/0/RP0/CPU0:router(config-rpl)# drop
RP/0/RP0/CPU0:router(config-rpl)# elseif destination in (206.141.4.0/24) then
RP/0/RP0/CPU0:router(config-rpl)# set label explicit-null
RP/0/RP0/CPU0:router(config-rpl)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set label-mode

To set the type of Border Gateway Protocol (BGP) label mode, use the `set label-mode` command in route-policy configuration mode. This command does not have a `no` form.

```
set label-mode {per-ce | per-vrf | per-prefix}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>per-ce</code></td>
<td>Specifies that the same label is used for all routes advertised from a unique customer edge (CE) peer or router.</td>
</tr>
<tr>
<td><code>per-vrf</code></td>
<td>Specifies that the same label is used for all routes advertised from a unique VRF.</td>
</tr>
<tr>
<td><code>per-prefix</code></td>
<td>Specifies that the same label is used for all routes advertised from a unique prefix.</td>
</tr>
</tbody>
</table>

**Command Default**

Per-prefix label mode.

If a policy attached at label-mode attachpoint evaluates to pass and a `label mode` is not explicitly set, `per-prefix` is used as a default label mode.

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set label-mode` command in a route policy at the label-mode attachpoint to set the type of label mode to per-ce or per-vrf or per-prefix, based on deployment preference.

Per-vrf label mode is not supported for Carrier Supporting Carrier (CSC) network with internal and external BGP multipath setup.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the type of label-mode to per-ce:

```
RP/0/RP0/CPU0:router(config)# route-policy set_label_mode
RP/0/RP0/CPU0:router(config-rpl)# set label-mode per-ce
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

This example shows how to set the type of label-mode to per-vrf:

```
RP/0/RP0/CPU0:router(config)# route-policy set_label_mode
RP/0/RP0/CPU0:router(config-rpl)# set label-mode per-vrf
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```

This example shows how to set the type of label-mode to per-prefix:
set label-mode

RP/0/RP0/CPU0:router(config)# route-policy set_label_mode
RP/0/RP0/CPU0:router(config-rpl)# set label-mode per-prefix
RP/0/RP0/CPU0:router(config-rpl)# end-policy
set level

To configure the Intermediate System-to-Intermediate System (IS-IS) link-state packet (LSP) level advertised to redistributed routes, use the `set level` command in route-policy configuration mode.

```
set level {level-1 | level-2 | level-1-2 parameter}
```

**Syntax Description**

- **level-1**: Specifies that redistributed routes are advertised in the Level 1 LSP of the router.
- **level-2**: Specifies that redistributed routes are advertised in the Level 2 LSP of the router.
- **level-1-2**: Specifies that redistributed routes are advertised in Level 1 and Level 2 LSPs of the router.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

**Release** Modification
Release 6.0  This command was introduced.

**Usage Guidelines**

Use the IS-IS `set level` command to configure the LSP level advertised to redistributed routes.

**Note**

The `set level` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command supports parameterization of the `level` keyword.

**Examples**

In the following example, the level is set to Level 2:

```
RP/0/RP0/CPU0:router(config)# route-policy bgp_isis_redist
RP/0/RP0/CPU0:router(config-rpl)# if destination in (172.2.0.0/16 ge 16) then
RP/0/RP0/CPU0:router(config-rpl)# set level level-2
RP/0/RP0/CPU0:router(config-rpl)# endif
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set local-preference

To set the Border Gateway Protocol (BGP) local preference attribute in a route, use the `set local-preference` command in route-policy configuration mode.

**Syntax Description**

```
set local-preference {number parameter}
```

- `number`: Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.
- `parameter`: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

Default value is 100.

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set local-preference` command to specify a preference value for the autonomous system path. Local preference is a nontransitive (does not cross autonomous system boundaries) attribute and is the second metric considered in the BGP best path calculation (the highest local preference is chosen). Weight is the first metric evaluated for best path, but it is local to the router and propagates only to iBGP peers. See the Implementing BGP module of the Routing Configuration Guide for Cisco NCS 5500 Series Routers, Routing Configuration Guide for Cisco NCS 540 Series Routers, Routing Configuration Guide for Cisco NCS 560 Series Routers for information on the BGP best path calculation.

**Note**

The `set local-preference` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

The local preference is a 32-bit unsigned integer.

**Examples**

In the following example, the local preference value is set to 10:

```
RP/0/RP0/CPU0:router(config-rpl)# set local-preference 10
```
set med

To set the Border Gateway Protocol (BGP) Multi Exit Discriminator (MED) attribute, use the `set med` command in route-policy configuration mode.

```
set med {numberparameter | igp-cost | {+ | {numberparameter} | - | {numberparameter}}} | max-reachable
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.</td>
</tr>
<tr>
<td><code>parameter</code></td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
<tr>
<td><code>igp-cost</code></td>
<td>Sets the MED value to the cost for the Interior Gateway Protocol (IGP) route to resolve the next-hop of the BGP route.</td>
</tr>
<tr>
<td><code>+</code></td>
<td>Sets the MED to the MED plus or minus a static offset. An integer or parameter must follow the plus or minus.</td>
</tr>
<tr>
<td><code>-</code></td>
<td>Sets the MED to the MED plus or minus a static offset. An integer or parameter must follow the plus or minus.</td>
</tr>
<tr>
<td><code>max-reachable</code></td>
<td>Sets the MED value to the maximum possible value of 4294967295.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

- **Release 6.0**: This command was introduced.

**Usage Guidelines**

Use the `set med` command to set the MED value, which is a 32-bit unsigned integer.

**Note**

The `set med` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command can take the following as argument values: an integer, a parameter, the `igp-cost` keyword, or a mathematical operator (either plus or minus) followed by an integer or a parameter. Setting the MED to the IGP cost is supported on outbound BGP policies only. The MED cannot be set to the IGP cost in policies applied to other BGP attach points.

The `max-reachable` keyword sets the MED to the maximum value while leaving the route reachable.

The plus or minus variants allow the user to set the MED to the MED plus or minus a static offset. The variants that allow a user to add or subtract offsets to the MED value are also range checked for underflow or overflow. If the value underflows as a result of subtraction, then the MED value is set to zero. If the value overflows, the value is set to 4294967295, which is the maximum value for MED. When MED is set to 4294967295, the route is unreachable.
Examples

The following two examples show how to set the MED to a value that is either specified directly (using the integer 156) or passed to the policy as a parameter:

RP/0/RP0/CPU0:router(config-rpl)# set med 156
RP/0/RP0/CPU0:router(config-rpl)# set med $med_param

The following example shows how to instruct BGP to automatically set the MED value to the cost of the IGP route that resolves the next-hop of the BGP route:

RP/0/RP0/CPU0:router(config-rpl)# set med igp-cost
set metric-type (IS-IS)

To configure the integrated Intermediate System-to-Intermediate System (IS-IS) metric type, use the `set metric-type` command in route-policy configuration mode.

```
set metric-type {internal | external | rib-metric-as-internal | rib-metric-as-external parameter}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>internal</code></td>
<td>Sets metric type to internal.</td>
</tr>
<tr>
<td><code>external</code></td>
<td>Sets the metric type to external.</td>
</tr>
<tr>
<td><code>rib-metric-as-internal</code></td>
<td>Uses RIB metric and sets IS-IS internal metric type.</td>
</tr>
<tr>
<td><code>rib-metric-as-external</code></td>
<td>Uses RIB metric and sets IS-IS external metric type.</td>
</tr>
<tr>
<td><code>parameter</code></td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

```
Release Modification
Release 6.0 This command was introduced.
```

### Usage Guidelines

Use the IS-IS `set metric-type` command to control whether IS-IS treats the metric as an internal or external metric.

Use the `rib-metric-as-external` and `rib-metric-as-internal` keywords to preserve RIB metrics when redistributing routes from another ISIS router instance or another protocol.

### Note

The `set metric-type` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

This command does not support parameterization.
In the following example, the IS-IS metric type is set to internal:

```
RP0/RP0/CPU0:router(config-rpl)# set metric-type internal
```
set metric-type (OSPF)

To control how Open Shortest Path First (OSPF) computes the cost for a route, use the `set metric-type` command in route-policy configuration mode.

```
set metric-type {type-1 | type-2 parameter}
```

**Syntax Description**

- **type-1** Uses the cost set on the route plus the topology-related costs in the calculation for Type 1 metrics.
- **type-2** Uses only the cost set on the route in the calculation for Type 2 metrics.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the OSPF `set metric-type` command to control whether OSPF treats the cost as a Type 1 or Type 2 metric.

**Note**

The `set metric-type` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

The value of Type 1 or Type 2 controls how OSPF computes the cost for this route. For Type 2 metrics, only the cost set on the route is used. For Type 1 metrics, the cost set on the route plus the topology-related costs are used in the calculation.

This command does not support parameterization.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the OSPF metric type is set to Type 1:

```
RP/0/RP0/CPU0:router(config-rpl)# set metric-type type-1
```
set next-hop

To replace the next-hop associated with a given route, use the set next-hop command in route-policy configuration mode.

```
set next-hop {ipv4-address [destination-vrf] ipv6-address [destination-vrf] | discard parameter | peer-address | self}
```

### Syntax Description

- **ipv4-address**: Valid IPv4 address.
- **ipv6-address**: Valid IPv6 address.
- **discard**: Sets next-hop as Null0 interface.
- **destination-vrf**: (Optional) Specifies that the next-hop of the route should be resolved in destination VRF context. This keyword is available when an IPv4 or IPv6 address or parameter is used.
- **peer-address**: Sets the next-hop to the IP address of the remote Border Gateway Protocol (BGP) peer.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”
- **self**: Sets itself as the next-hop.

### Command Default

No default behavior or values

### Command Modes

Route-policy configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the set next-hop command to replace the next-hop associated with a specific address.

The next hop destination is selected according to the address family. Example: for ipv4 address-family, the IPv4 address is used and for ipv6 address-family, the IPv6 address is used.

#### Note

The **set next-hop** command can be used as an action statement within an **if** statement. For a list of all action statements available within an **if** statement, see the **if** command.

Use the **set next-hop peer-address** command to set the next-hop to the address of the BGP neighbor, where this policy is attached.

The next-hop is a valid IPv4 address entered as a dotted decimal or an IPv6 address entered as a colon-separated hexadecimal.

It is not possible to use this command to set the BGP IPv6 link-local next-hop.

The **destination-vrf** keyword is used mainly in Layer 3 VPN networks when importing routes.
The below address families support the selective setting of 'next-hop-self' via the RPL statement 'set next-hop self' starting in 4.2.1. Previous to this the setting of next-hop-self via an RPL was for all prefixes in the address family or none of the prefixes.

- IPv4 unicast
- IPv4 labeled-unicast
- IPv4 multicast
- IPv6 unicast
- IPv6 multicast

The **set next-hop discard** configuration is used in the neighbor inbound policy. When this config is applied to a path, the primary next-hop is still be associated with the actual path but the RIB is updated with next-hop set to Null0. Even if the primary received nexthop is unreachable, the Remotely Triggered Blackhole (RTBH) path will be considered reachable and will be a candidate in the bestpath selection process. The RTBH path is readvertised to other peers with either the received next-hop or nexthop-self based on normal BGP advertisement rules.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the next-hop is set to a valid IPv4 address:

```
RP/0/RP0/CPU0:router(config-rpl)# set next-hop 10.0.0.5
```

In this example, the next-hop is set to a parameter value $nexthop:

```
RP/0/RP0/CPU0:router(config-rpl)# set next-hop $nexthop
```

In this example, the next-hop is set to a valid IPv4 address with a destination VRF context:

```
RP/0/RP0/CPU0:router(config-rpl)# set next-hop 10.0.0.5 destination-vrf
```
**set origin**

To change the Border Gateway Protocol (BGP) origin attribute, use the `set origin` command in route-policy configuration mode.

```
set origin {igp | incomplete | egp parameter}
```

**Syntax Description**

- **igp**: Sets the origin type to Interior Gateway Protocol (IGP).
- **incomplete**: Sets the origin type to incomplete.
- **egp**: Sets the origin type to Exterior Gateway Protocol (EGP).
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set origin` command to change the origin attribute.

**Note**

The `set origin` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

The origin of a Border Gateway Protocol (BGP) route is **igp**, **egp**, or **incomplete**.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the origin attribute is set to EGP:

```
RP/0/RP0/CPU0:router(config-rpl)# set origin egp
```
set ospf-metric

To set an Open Shortest Path First (OSPF) protocol metric attribute value, use the **set ospf-metric** command in route-policy configuration mode.

**set ospf-metric** {numberparameter}

**Syntax Description**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Value assigned to a 24-bit unsigned integer. Range is 0 to 4294967295.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **set ospf-metric** command to set the metric for routes that are redistributed into OSPF. The OSPF metric operator accepts either an integer value or a parameter.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the OSPF metric attribute value is set to 1000:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set ospf-metric 1000
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set path-selection

To set path selection criteria and install or advertise the path for the Border Gateway Protocol, use the set path-selection command in route-policy configuration mode.

```
set path-selection {backup number | group-best | all | best-path} [install] [multipath-protect] [advertise]
```

**Syntax Description**

- **backup** Specifies the BGP backup path.
- **number** Specifies the BGP backup path number. 3 bit decimal number. Range is 0-7.
- **group-best** Specifies the BGP group best path.
- **all** Specifies all BGP paths.
- **best-path** Specifies the BGP best path.
- **install** Installs the path.
- **multipath-protect** Installs and advertises the multipath protect.
- **advertise** Advertises the path.

**Command Default**

None

**Command Modes**

Route-policy configuration

**Command History**

- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the path selection as **advertise backup path 3** for route-policy **path_selection_plcy**:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# route-policy path_selection_plcy
RP/0/RP0/CPU0:router(config-rpl)# set path-selection backup 3 advertise
```
set qos-group (RPL)

To set the quality of service (QoS) group, use the `set qos-group` command in route-policy configuration mode:

```
set qos-group {numberparameter}
```

**Syntax Description**

- **number**  
  QoS group ID. Range is from 0 to 31.

- **parameter**  
  Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set qos-group` command to set the QoS group to classify packets.

This command is supported at the BGP table-policy attachpoint. Prefixes are marked for subsequent processing in the forwarding plane. After QoS Policy Propagation through Border Gateway Protocol (BGP) (QPPB) is enabled on an interface, corresponding traffic shaping and policing is completed using packet classification based on the IP precedence or QoS group ID. See the Modular QoS Configuration Guide for Cisco NCS 5500 Series Routers, Modular QoS Configuration Guide for Cisco NCS 540 Series Routers, Modular QoS Configuration Guide for Cisco NCS 560 Series Routers for information on QPPB.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to use `set qos-group` command:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set qos-group 12
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set rib-metric

To set the Routing Information Base (RIB) metric attribute value for a table policy, use the set rib-metric command in route-policy configuration mode:

```
set rib-metric {number parameter}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Value assigned to a 32-bit unsigned integer. Range is 0 to 4294967295.</td>
</tr>
<tr>
<td>parameter</td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set rib-metric` command to set the RIB metric attribute value for BGP routes.

Every route in the RIB has a metric associated with it, signifying the cost to reach a specific destination based on link characteristics. The `set rib-metric` command modifies the RIB metric while installing BGP routes into RIB, enabling the upgrading or downgrading of the BGP route installed in RIB.

**Examples**

In the following example, the RIB metric attribute is set to 1000:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set rib-metric 1000
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set rip-metric

To set Routing Information Protocol (RIP) metric attributes, use the `set rip-metric` command in route-policy configuration mode.

```
set rip-metric {numberparameter}
```

**Syntax Description**
- `number` Value assigned to a 4-bit unsigned integer. Range is from 0 to 16.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**
- **Release**   **Modification**
  - Release 6.0  This command was introduced.

**Usage Guidelines**
Use the `set rip-metric` command to set the cost attribute for routes that are redistributed into RIP. You can use the `add` command to increment the RIP metric value.

**Task ID**
- **Operations**
  - `route-policy` read,
  - write

**Examples**
In the following example, the RIP metric number is adjusted for route policy policy_1:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set rip-metric 10
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set rip-tag

To set a route tag attribute for Routing Information Protocol (RIP) routes, use the `set rip-tag` command in route-policy configuration mode.

```
set rip-tag {number parameter}
```

**Syntax Description**

- `number` Value assigned to a 16-bit unsigned integer. Range is from 0 to 65535.
- `parameter` Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set rip-tag` command to set the RIP tag attribute for routes that are redistributed into RIP. The RIP tag operator accepts either an integer value or a parameter.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the RIP tag is adjusted for route policy policy_1:

```
RP/0/RP0/CPU0:router(config)# route-policy policy_1
RP/0/RP0/CPU0:router(config-rpl)# set rip-tag 1000
RP/0/RP0/CPU0:router(config-rpl)# end-policy
```
set rpf-topology

To set reverse-path forwarding (RPF) to any default or nondefault tables for particular sources and groups, use the set rpf-topology command in routing policy configuration mode.

set rpf-topology [vrf vrf-name] {ipv4 | ipv6} {unicast | multicast} parameter topology table-name

Syntax Description
- **vrf vrf-name** [Optional] Specifies a VPN routing and forwarding (VRF) instance. Required when configuring extranet topologies.
- **ipv4** [Optional] Specifies IPv4 address prefixes.
- **ipv6** [Optional] Specifies IPv6 address prefixes.
- **unicast** Specifies unicast address prefixes.
- **multicast** Specifies multicast address prefixes.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”
- **topology** Specifies the default or non-default topology table for the source or group.
- **table-name** Alphanumeric name string.

Command Default
Default or current topology setting.

Command Modes
Routing policy configuration

Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 6.0     | This command was introduced.

Usage Guidelines
When using this command for MVPN extranet routing configuration, only the **vrf vrf-name** keyword and argument are required.

When using this command in the context of multitopology routing, all keywords and arguments with the exception of **vrf vrf-name** keyword and argument are required.

Task ID
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

Examples
The following example shows how to execute the set rpf-topology command:

RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# route-policy green
RP/0/RP0/CPU0:router(config-rpl)# set rpf-topology ipv6 multicast topology t12
The following example shows the use of `set rpf-topology` command in the context of creating an RPF for a topology table in multiple topologies:

```plaintext
route-policy mt4-p1
  if destination in (225.0.0.1, 225.0.0.11) then
    set rpf-topology ipv4 multicast topology t201
  elseif destination in (225.0.0.2, 225.0.0.12) then
    set rpf-topology ipv4 multicast topology t202
  elseif destination in (225.0.0.3, 225.0.0.13) then
    pass
  endif
end-policy
!
route-policy mt4-p3

!  
```
set spf-priority

To set OSPF Shortest Path First (SPF) priority, use the set spf-priority command in route-policy configuration mode.

```
set spf-priority {critical | high | medium}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>critical</td>
<td>Sets critical priority for SPF</td>
</tr>
<tr>
<td>high</td>
<td>Sets high priority for SPF</td>
</tr>
<tr>
<td>medium</td>
<td>Sets medium priority for SPF</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example sets SPF priority as critical:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#route-policy policy_spf_priority
RP/0/RP0/CPU0:router(config-rpl)#set spf-priority critical
```
set tag

To set the tag attribute, use the **set tag** command in route-policy configuration mode.

```
set tag {numberparameter}
```

**Syntax Description**

- **number**: Value assigned to a 32-bit unsigned integer. Range is from 0 to 4294967295.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **set tag** command to set the tag attribute.

**Note**

The **set tag** command can be used as an action statement within an **if** statement. For a list of all action statements available within an **if** statement, see the **if** command.

Tags are routing-protocol independent 32-bit integers that can be associated with a given route in the Routing Information Base (RIB).

For the Border Gateway Protocol (BGP), the tag attribute can be set only at the table-policy attach point.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the tag attribute is set to 10:

```
RP/0/RP0/CPU0:router(config-rpl)# set tag 10
```

In this example, the tag attribute is set to a parameter value $tag_param:

```
RP/0/RP0/CPU0:router(config-rpl)# set tag $tag_param
```
set traffic-index

To set the traffic index attribute, use the `set traffic-index` command in route-policy configuration mode.

```
set traffic-index {numberparameter | ignore}
```

**Syntax Description**

- **number** Integer value assigned to the traffic index attribute. Range is 1 to 63.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”
- **ignore** Specifies that Border Gateway Protocol (BGP) policy accounting is not done.

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

```
Release 6.0 This command was introduced.
```

**Usage Guidelines**

Use the `set traffic-index` command to set the traffic index attribute.

**Note**

The `set traffic-index` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

Traffic index is a special attribute for BGP. It is used as an index to a set of counters that are maintained by forwarding hardware. It is also used to track packet and byte counters that are forwarded using routes with specific attributes. These counters can be enabled and disabled on an individual interface basis.

The traffic index attribute can be set only at the table-policy attach point, and can take a value from 1 to 63, or a value of `ignore`. If the traffic index is set to `ignore`, then BGP policy accounting is not done. Parameterization of this value is also supported.

**Examples**

In the following example, a policy is created in which the traffic index is set to 10 for all routes that originated in autonomous system 1234:

```
RP/0/RSP0RP0/CPU0:router(config)# route-policy count-as-1234
RP/0/RSP0RP0/CPU0:router(config-rpl)# if as-path originates-from '1234' then
RP/0/RSP0RP0/CPU0:router(config-rpl-if)# set traffic-index 10
RP/0/RSP0RP0/CPU0:router(config-rpl-if)# else
RP/0/RSP0RP0/CPU0:router(config-rpl-if)# pass
RP/0/RSP0RP0/CPU0:router(config-rpl-if)# endif
```
RP/0/RSP0RP0/CP00:router(config-rpl)# **end-policy**

This policy could then be attached using the BGP **table-policy** command. The counters could then be enabled on various interfaces with the appropriate commands.
set vpn-distinguisher

To change the Border Gateway Protocol (BGP) VPN distinguisher attribute, use the **set vpn-distinguisher** command in route-policy configuration mode.

```
set vpn-distinguisher {numberparameter}
```

**Syntax Description**

- **number**: Value assigned to a 32-bit unsigned integer. Range is from 1 to 4294967295.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **set vpn-distinguisher** command to change the VPN distinguisher attribute.

**Note**

The **set origin** command can be used as an action statement within an **if** statement. For a list of all action statements available within an **if** statement, see the **if** command.

A VPN distinguisher is used in Layer 3 VPN networks for enhanced individual VPN control and to avoid route target mapping at AS boundaries in inter-AS VPN networks. Route target extended communities are removed at neighbor outbound, and the VPN distinguisher value is applied on the BGP route as an extended community. When the route is received on a neighboring router in another AS, the VPN distinguisher is removed and mapped to a route target extended community.

**Examples**

In the following example, the VPN distinguisher attribute is set to 456:

```
RP/0/RP0/CPU0:router(config-rpl)# set vpn-distinguisher 456
```
set weight

To set the weight value for Border Gateway Protocol (BGP) routes, use the `set weight` command in route-policy configuration mode.

```
set weight {number parameter}
```

**Syntax Description**
- **number** Number assigned to the weight value for BGP routes. Weight is 16 bits. Range is 0 to 65535.
- **parameter** Parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `set weight` command to set the weight value for BGP routes.

**Note**
The `set weight` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

- A weight is a value that can be applied to a route to override the BGP local preference. This is not a BGP attribute announced to BGP peer routers. RPL can be used to set the weight value.
- Given two BGP routes with the same network layer reachability information (NLRI), a route with a higher weight is selected, no matter what the values of other BGP attributes may be. However, weight only has significance on the local router. It is not sent from one BGP speaker to another, even within the same autonomous system.
- On Cisco routers, if a BGP route is sourced by the local router, its weight is automatically set to 32768; if the BGP route is learned from another router, its weight is automatically set to 0. Thus, by default, locally sourced routes are preferred over BGP learned routes.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
In the following example, the weight of the route is set to 10 and then to a parameter value:

```
RP/0/RP0/CPU0:router(config-rpl)# set weight 10
RP/0/RP0/CPU0:router(config-rpl)# set weight $weight_param
```
show rpl

To display system-wide RPL configuration, use the `show rpl` command in XR EXEC mode.

```
show [running-config] rpl [{maximum {lines configuration-limit | policies policies-limit} | editor {emacs | nano | vim}}]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>running-config</td>
</tr>
<tr>
<td>maximum</td>
</tr>
<tr>
<td>lines configuration-limit</td>
</tr>

No specific guidelines impact the use of this command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following shows the output of the `show running-config rpl` command:
RP/0/RP0/CPU0:router# show running-config rpl

extcommunity-set rt ext_comm_set_rt_ex1
   1.2.3.4:34
end-set
!
prefix-set prefix_set_ex1
   10.0.0.0/16 ge 16 le 32,
   0.0.0.0/0 ge 25 le 32,
   0.0.0.0/0
end-set
!
route-policy policy_2
  if destination in prefix_set_ex1 then
    if (community matches-any com_set_ex1) then
      set community (10:666) additive
    endif
    if (extcommunity rt matches-any ext_comm_set_rt_ex1) then
      set community (10:999) additive
    endif
  endif
end-policy
show rpl active as-path-set

To display the AS path sets that are referenced by at least one policy that is being used at an attach point, use the `show rpl active as-path-set` command in XR EXEC mode.

```
show rpl active as-path-set [detail]
```

**Syntax Description**

- `detail` (Optional) Displays the content of the object and all referenced objects for active AS path sets.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl active as-path-set` command to display all AS path sets that are in use in the system and referenced either directly or indirectly at a policy attach point.

**Examples**

This example shows the following sample configuration:

```
router bgp 2
    address-family ipv4 unicast
    !
    neighbor 10.0.101.2
        remote-as 100
        address-family ipv4 unicast
            route-policy policy_1 in
                !
    neighbor 10.0.101.3
        remote-as 12
        address-family ipv4 unicast
            route-policy policy_2 in
                !
    !
RP/0/R0/P0/CPU0:router# show rpl route-policy policy_2 detail
```

prefix-set prefix_set_ex1
    10.0.0.0/16 ge 16 le 32,
    0.0.0.0/0 ge 25 le 32,
    0.0.0.0/0
end-set
!
community-set comm_set_ex1
    65500:1,
```
show rpl active as-path-set

65500:2,
65500:3
end-set

extcommunity-set rt ext_comm_set_rt_ex1
1.2.3.4:34
end-set

route-policy policy_2
if destination in prefix_set_ex1 then
  if (community matches-any comm_set_ex1) then
    set community (10:666) additive
  endif
  if (extcommunity rt matches-any ext_comm_set_rt_ex1) then
    set community (10:999) additive
  endif
endif
end-policy

RP/0/RP0/CPU0:router# show rpl route-policy policy_1 detail

prefix-set prefix_set_ex1
  10.0.0.0/16 ge 16 le 32,
  0.0.0.0/0 ge 25 le 32,
  0.0.0.0/0
end-set

as-path-set as_path_set_ex1
  ios-regex '^_655--$'
  ios-regex '^_65501_$_'
end-set

route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
end-policy

Given this sample configuration, the show rpl active as-path-set command displays the following information:

RP/0/RP0/CPU0:router# show rpl active as-path-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following as-path-sets are ACTIVE
-------------------------------------
as_path_set_ex1
show rpl active community-set

To display the community sets that are referenced by at least one policy that is being used at an attach point, use the `show rpl active community-set` command in XR EXEC mode.

`show rpl active community-set [detail]`

**Syntax Description**
- `detail` (Optional) Displays the content of the object and all referenced objects for active community sets.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `show rpl active community-set` command to display all community sets that are in use in the system and referenced either directly or indirectly at a policy attach point.

**Task ID**
- Task ID: Operations
- Operations: read

**Examples**

This example shows the following sample configuration:

```bash
router bgp 2
    address-family ipv4 unicast
    !
    neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
    route-policy policy_1 in
    !
    neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
    route-policy policy_2 in
    !
    !
RP/0/RP0/CPU0:router# show rpl route-policy policy_2 detail
prefix-set prefix_set_ex1
    10.0.0.0/16 ge 16 le 32,
    0.0.0.0/0 ge 25 le 32,
    0.0.0.0/0
end-set
!
community-set comm_set_ex1
```
Given this sample configuration, the `show rpl active community-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl active community-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following community-sets are ACTIVE
---------------------------------------
comm_set_ex1
```
show rpl active extcommunity-set

To display the extended community sets for cost, route target (RT), and Site-of-Origin (SoO) that are referenced by at least one route policy used at an attach point, use the `show rpl active extcommunity-set` command in XR EXEC mode.

```
show rpl active extcommunity-set [cost | rt | soo] [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cost</td>
<td>(Optional) Displays all extended community cost sets.</td>
</tr>
<tr>
<td>rt</td>
<td>(Optional) Displays all extended community RT sets.</td>
</tr>
<tr>
<td>soo</td>
<td>(Optional) Displays all extended community SoO sets.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays the content of the object and all referenced objects for active extended community sets.</td>
</tr>
</tbody>
</table>

**Command Default**

All extended community sets are displayed.

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl active extcommunity-set` command to display all extended community sets that are in use in the system and referenced either directly or indirectly at a policy attach point.

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
      !
  !
neighbor 10.0.101.3
  remote-as 12
  address-family ipv4 unicast
  route-policy policy_2 in
  !
  !
```
Given this sample configuration, the `show rpl active extcommunity-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_2 detail
prefix-set prefix_set_ex1 10.0.0.0/16 ge 16 le 32,
end-set
community-set comm_set_ex1 65500:1,
end-set
extcommunity-set rt ext_comm_set_rt_ex1 1.2.3.4:34
end-set
route-policy policy_2 if destination in prefix_set_ex1 then
  if (community matches-any comm_set_ex1) then
    set community (10:666) additive
  endif
  if (extcommunity rt matches-any ext_comm_set_rt_ex1) then
    set community (10:999) additive
  endif
endif
end-policy
! RP/0/RP0/CPU0:router# show rpl route-policy policy_1 detail

| 6.0     | This command was introduced.

**Usage Guidelines**

Use the `show rpl active route-policy` command to display all policies that are in use in the system and that are referenced either directly or indirectly at a policy attach point.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
      !
  neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
      route-policy policy_2 in
      !
  !

RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
```
end-policy
!
RP/0/RP0/CPU0:router# show rpl route-policy policy_2

route-policy policy_2
  if destination in prefix_set_ex1 then
    if (community matches-any comm_set_ex1) then
      set community (10:666) additive
    endif
    if (extcommunity rt matches-any ext_comm_set_rt_ex1) then
      set community (10:999) additive
    endif
  endif
end-policy
!

Given this sample configuration, the `show rpl active route-policy` command displays the following information:

RP/0/RP0/CPU0:router# show rpl active route-policy

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following policies are (ACTIVE)
-----------------------------------
policy_1
policy_2
show rpl as-path-set

To display the contents of AS path sets, use the **show rpl as-path-set** command in XR EXEC mode.

```
show rpl as-path-set [{name | states | brief}]
```

**Syntax Description**

- **name**  (Optional) Name of the AS path set.
- **states**  (Optional) Displays all unused, inactive, and active states.
- **brief**  (Optional) Limits the display to a list of the names of all AS path sets without their configurations.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

**Release**  **Modification**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the optional **brief** keyword to limit the display to a list of the names of all AS path sets without their configurations.

**Examples**

This example shows the following sample configuration:

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
end-policy
```

Given this sample configuration, the **show rpl as-path-set as_path_set_ex1** command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl as-path-set as_path_set_ex1

as-path-set as_path_set_ex1
  ios-regex '^_65500_$',
  ios-regex '^_65501_$'
end-set
```
show rpl as-path-set attachpoints

To display all of the policies used at an attach point that reference the named AS path set, use the `show rpl as-path-set attachpoints` command in XR EXEC mode.

```
show rpl as-path-set {name} attachpoints
```

**Syntax Description**

- **name**: Name of an AS path set.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `show rpl as-path-set attachpoints` command to display all policies used at an attach point that reference the named set either directly or indirectly.

The AS path set name is required.

**Task ID**

**Task ID** | **Operations**
--- | ---
route-policy | read

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
    route-policy policy_1 in
    !
  !
  neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
    route-policy policy_2 in
    !
  !
RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
```

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
Given this sample configuration, the `show rpl as-path-set as_path_set_ex1 attachpoints` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl as-path-set as_path_set_ex1 attachpoints
```

<table>

show rpl as-path-set references

To list all of the policies that reference the named AS path set, use the `show rpl as-path-set references` command in XR EXEC mode.

```
show rpl as-path-set name references [brief]
```

**Syntax Description**
- `name` Name of the prefix set.
- `brief` (Optional) Limits the output to just the brief table and not the detailed information for the named AS path set.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**
- Release 6.0 This command was introduced.

**Usage Guidelines**
Use the `show rpl as-path-set references` command to display all policies that reference the named AS path set either directly or indirectly.

Use the optional `brief` keyword to limit the output to just a summary table and not the detailed information for the AS path set.

show rpl extcommunity-set

To display the configuration of extended community sets, use the `show rpl extcommunity-set` command in XR EXEC mode.

```
show rpl extcommunity-set [name [{attachpoints | references}]] [{cost | rt | soo}] [name] [brief]
[states]
```

### Syntax Description

- **name** *(Optional)* Name of the community set.
- **attachpoints** *(Optional)* Displays all attach points for this community set.
- **references** *(Optional)* Displays all policies that use this community set.
- **cost** *(Optional)* Displays all extended community cost sets.
- **rt** *(Optional)* Displays all extended community RT sets.
- **soo** *(Optional)* Displays all extended community SoO sets.
- **brief** *(Optional)* Limits the display to a list of the names of all extended community sets without their configurations.
- **states** *(Optional)* Displays all unused, inactive, and active states.

### Command Default

If an attachpoint or reference is not specified, all configured extended community sets are displayed.
If a cost, RT, or SoO sets is not specified, all configured extended community sets are displayed.

### Command Modes

XR EXEC mode

### Command History

**Release** Modification

- **Release 6.0** This command was introduced.

### Usage Guidelines

Use the optional `brief` keyword to limit the display to a list of the names of extended community sets without their configurations.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

### Examples

In the following example, the configuration of an extended community is displayed for the RT community set named `ext_comm_set_rt_ex1`:

```
RP/0/RP0/CP0:router# show rpl extcommunity-set rt ext_comm_set_rt_ex1

ext_comm_set_rt_ex1
1.2.3.4:34
```

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
In the following example, the configuration of an extended community is displayed with all RT set objects:

RP/0/RP0/CPU0:router# show rpl extcommunity-set rt
Listing for all Extended Community RT Set objects

extcommunity-set rt extrt1
  66:60001
end-set
!

extcommunity-set rt rtset1
  10:615,
  10:6150,
  15.15.15.15:15
end-set
!

extcommunity-set rt rtset3
  11:11,
  11.1.1.1:1:3
end-set
!

extcommunity-set rt extsoo1
  66:70001
end-set
!

extcommunity-set rt rtsetl1
  100:121,
  100:122,
  100:123,
  100:124,
  100:125,
  100:126,
  100:127,
  100:128,
  7.7.7.7:21
end-set
!

In the following example, the configuration of an extended community is displayed with all cost set objects:

RP/0/RP0/CPU0:router# show rpl extcommunity-set cost
Listing for all Extended Community COST Set objects

extcommunity-set cost costset1
  IGP:90:914,
  Pre-Bestpath:91:915
end-set
!

extcommunity-set cost costset2
  IGP:92:916,
  Pre-Bestpath:93:917,
  IGP:94:918,
  Pre-Bestpath:95:919
end-set
!
In the following example, the configuration of an extended community is displayed with all SoO set objects:

```
Extended Community SoO Set objects

extcommunity-set soo sooset1
  10:151,
  100.100.100.1:153
end-set
!
!
```

```
extcommunity-set soo sooset3
  11:11,
  11.1.1.1:3
end-set
!```
**show rpl inactive as-path-set**

To display the AS path sets that are referenced by a policy but not in any policy that is used at an attach point, use the `show rpl inactive as-path-set` command in XR EXEC mode.

```plaintext
show rpl inactive as-path-set [detail]
```

**Syntax Description**

- `detail` (Optional) Displays the content of the object and all referenced objects for inactive AS path sets.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Modification</th>
<th>Release</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>6.0</td>
</tr>
</tbody>
</table>

This command was introduced.

**Usage Guidelines**

Use the `show rpl inactive as-path-set` command to display all AS path sets that are not in use at an attach point either directly or indirectly but are referenced by at least one policy in the system.

**Task ID**

- `route-policy` read

**Examples**

This example shows the following sample configuration:

```plaintext
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
      !
  !
  neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
      route-policy policy_2 in
      !
  !
  route-policy sample
    if (destination in sample) then
      drop
    endif
  end-policy
!  !
  route-policy policy_1
    if (destination in prefix_set_ex1) then
      set local-preference 100
    endif
```
Given this sample configuration, the `show rpl inactive as-path-set` command displays the following information:

```
RP/0/RP0/CPU0# show rpl inactive as-path-set
ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following as-path-sets are INACTIVE
---------------------------------------
as_path_set_ex2
```
show rpl inactive community-set

To display the community sets that are referenced by a policy but not any policy that is used at an attach point, use the **show rpl inactive community-set** command in XR EXEC mode.

```plaintext
show rpl inactive community-set [detail]
```

### Syntax Description

- **detail** (Optional) Displays the content of the object and all referenced objects for inactive community sets.

### Command Default

No default behavior or values

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **show rpl inactive community-set** command to display all community sets that are not in use at an attach point either directly or indirectly but are referenced by at least one policy in the system.

### Examples

This example shows the following sample configuration:

```plaintext
router bgp 2
    address-family ipv4 unicast
    !
    neighbor 10.0.101.2
        remote-as 100
        address-family ipv4 unicast
        route-policy policy_1 in
            !
            neighbor 10.0.101.3
                remote-as 12

!

route-policy policy_5
    apply sample2
    apply policy_3
end-policy

Given this sample configuration, the `show rpl inactive community-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl inactive community-set
ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following community-sets are INACTIVE
------------------------------------------
comm_set_ex2
```
show rpl inactive extcommunity-set

To display the extended community sets that are referenced by a policy but not in any policy that is used at an attach point, use the `show rpl inactive extcommunity-set` command in XR EXEC mode.

```
show rpl inactive extcommunity-set [detail]
```

**Syntax Description**

- `detail` (Optional) Displays the content of the object and all referenced objects for inactive extended community sets.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release 6.0** This command was introduced.

**Usage Guidelines**

Use the `show rpl inactive extcommunity-set` command to display all extended community sets that are not in use at an attach point either directly or indirectly but are referenced by at least one policy in the system.

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
  remote-as 100
  address-family ipv4 unicast
  route-policy policy_1 in
  !
  neighbor 10.0.101.3
  remote-as 12
  address-family ipv4 unicast
  route-policy policy_2 in
  !
  !
  route-policy sample3
  if (destination in sample3) then
    drop
  endif
end-policy
!
route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
```
Given this sample configuration, the `show rpl inactive extcommunity-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl inactive extcommunity-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following extcommunity-sets are INACTIVE
--------------------------------------------
ext_comm_set_rt_ex2
```
show rpl inactive prefix-set

To display the prefix sets that are referenced by a policy but not in any policy that is used at an attach point, use the `show rpl inactive prefix-set` command in XR EXEC mode.

```
show rpl inactive prefix-set [detail]
```

**Syntax Description**

| detail  | (Optional) Displays the content of the object and all referenced objects for inactive prefix sets. |

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl inactive prefix-set` command to display all prefix sets that are not in use at an attach point either directly or indirectly but are referenced by at least one policy in the system.

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
      !
  neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
      route-policy policy_2 in
      !
  !
  route-policy sample4
    if (destination in sample4) then
      drop
    endif
  end-policy
  !
  route-policy policy_1
    if (destination in prefix_set_ex1) then
      set local-preference 100
    endif
```
Given this sample configuration, the `show rpl inactive prefix-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl inactive prefix-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following prefix-sets are INACTIVE
---------------------------------------------
sample4
prefix_set_ex2
```
show rpl inactive rd-set

To display the route distinguisher (RD) sets that are referenced by a policy but not in any policy that is used at an attach point, use the **show rpl inactive rd-set** command in XR EXEC mode.

**Syntax Description**

| Syntax Description | detail (Optional) Displays the content of the object and all referenced objects for inactive RD sets. |

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **show rpl inactive rd-set** command to display all RD sets that are not in use at an attach point either directly or indirectly but are referenced by at least one policy in the system.

**Examples**

This example shows the following sample configuration:

```
rd-set rdset1
  10:151,
  100.100.100.1:153,
  100.100.100.62/31:63
end-set
!
rd-set rdset2
  10:152,
  100.100.100.1:154,
  100.100.100.62/31:89
end-set
!
```

Given this sample configuration, the **show rpl inactive rd-set** command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl inactive rd-set

ACTIVE -- Referenced by at least one policy which is attached INACTIVE -- Only referenced by policies which are not attached UNUSED -- Not attached (directly or indirectly) and not referenced

The following rd-sets are INACTIVE
------------------------------------------
rdset1
```
show rpl inactive rd-set

rdset2
show rpl inactive route-policy

To display the route policies that are referenced by a policy but not in any policy that is used at an attach point, use the `show rpl inactive route-policy` command in XR EXEC mode.

```
show rpl inactive route-policy [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>detail</strong></td>
<td>(Optional) Displays the content of the object and all referenced objects for inactive route policies.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl inactive route-policy` command to display all policies that are not in use at an attach point either directly or indirectly but are referenced by at least one other policy in the system.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
        !
  neighbor 10.0.101.3
    remote-as 12
    address-family ipv4 unicast
      route-policy policy_2 in
        !
  !
  route-policy sample3
    if (destination in sample3) then
      drop
    endif
  end-policy
  !
  route-policy policy_1
    if (destination in prefix_set_ex1) then
      set local-preference 100
    endif
```
Given this sample configuration, the `show rpl inactive route-policy` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl inactive route-policy

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following policies are (INACTIVE)
-----------------------------
sample3
policy_3
```
**show rpl maximum**

To display the maximum limits for lines of configuration and number of policies, use the `show rpl maximum` command in XR EXEC mode.

```
show rpl maximum [lines | policies]
```

**Syntax Description**

- `lines` (Optional) Displays the number of lines of configuration limit.
- `policies` (Optional) Displays the number of policies limit.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl maximum` command to display the current total, current limit, and maximum limit for lines of configuration and policies.

Use the optional `lines` keyword to limit the display to the number of lines of configuration limits. Use the optional `policies` keyword to limit the display to the number of policies limits.

**Examples**

The following example shows sample output from the `show rpl maximum` command:

```
RP/0/RP0/CPU0:router# show rpl maximum

Current  Current  Max
        Total  Limit  Limit
--------------------------------------
Lines of configuration       3   65536   131072
Policies                 1     3500   5000
Compiled policies size (kB) 0
```

**Table 125: show rpl maximum Field Descriptions, on page 856** describes the significant fields shown in the display.

**Table 125: show rpl maximum Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lines of configuration</td>
<td>Displays the current total, current limit, and maximum limit of lines for the policy.</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Policies</td>
<td>Displays the current total, current limit, and maximum limit of policies.</td>
</tr>
<tr>
<td>Compiled policies size (kB)</td>
<td>Displays the current compiled total for policies in kilobytes.</td>
</tr>
</tbody>
</table>
show rpl policy-global references

To display policy-global definitions, use the `show rpl policy-global references` command in XR EXEC mode.

```
show rpl policy-global references [brief]
```

**Syntax Description**

| brief  | (Optional) Limits the display to a list of the policy names. |

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

This example shows the following sample configuration:

```
policy-global
  infinity '16'
end-global
!
route-policy set-rip-unreachable
  set rip-metric $infinity
end-policy
!
```

Given this sample configuration, the `show rpl policy-global references` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl policy-global references

Usage Direct -- Reference occurs in this policy Usage Indirect -- Reference occurs via an apply statement

Status UNUSED -- Policy is not in use at an attachpoint (unattached) Status ACTIVE -- Policy is actively used at an attachpoint Status INACTIVE -- Policy is applied by an unattached policy

Usage/Status       count
----------------------------------------------
Direct             1
Indirect           0
```
<table>
<thead>
<tr>
<th>Usage</th>
<th>Status</th>
<th>Route-policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct</td>
<td>UNUSED</td>
<td>set-rip-unreachable</td>
</tr>
</tbody>
</table>
show rpl prefix-set

To display the configuration of prefix sets, use the `show rpl prefix-set` command in XR EXEC mode.

```
show rpl prefix-set [name | states | brief]
```

**Syntax Description**
- `name` (Optional) Name of the prefix set.
- `states` (Optional) Shows all unused, inactive, and active states.
- `brief` (Optional) Limits the display to a list of the names of all extended community sets without their configurations.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Because sets cannot hierarchically reference other sets or policies, no `detail` keyword exists as with the `show rpl policy` command.

**Examples**
In the following example, the configuration of prefix set `pset1` is displayed:

```
RP/0/RP0/CPU0:router# show rpl prefix-set pset1
prefix-set pset1
10.0.0.0/16, 10.0.0.2/0 ge 25 le 32, 10.0.0.5/8 ge 8 le 32, 10.168.0.0/16 ge 16 le 32, 172.16.0.0/16 ge 20 le 32, 192.168.0.0/24 ge 20 le 32
end-set
```
show rpl prefix-set attachpoints

To display all the policies used at an attach point that reference the named prefix set, use the show rpl prefix-set attachpoints command in XR EXEC mode.

show rpl prefix-set name attachpoints

Syntax Description
name Name of a prefix set.

Command Default
No default behavior or values

Command Modes
XR EXEC mode

Command History
Release 6.0 This command was introduced.

Usage Guidelines
Use the show rpl prefix-set attachpoints command to display all the policies used at an attach point that reference the named prefix set either directly or indirectly.

The prefix set name is required.

Task ID
Task ID Operations
route-policy read

Examples
This example shows the following sample configuration:

router bgp 2
  address-family ipv4 unicast
  !
neighbor 10.0.101.2
  remote-as 100
  address-family ipv4 unicast
  route-policy policy_1 in
  !
neighbor 10.0.101.3
  remote-as 12
  address-family ipv4 unicast
  route-policy policy_2 in
  !
!
route-policy policy_1
  if (destination in prefix_set_ex1) then
    set local-preference 100
  endif
  if (as-path in as_path_set_ex1) then
    set community (10:333) additive
  endif
end-policy
route-policy policy_2
  if (destination in prefix_set_ex1) then
    if (community matches-any comm_set_ex1) then
      set community (10:666) additive
    endif
    if (extcommunity matches-any ext_comm_set_rt_ex1) then
      set community (10:999) additive
    endif
  endif
end-policy

Given this sample configuration, the `show rpl prefix-set prefix_set_ex1 attachpoints` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl prefix-set prefix_set_ex1 attachpoints
BGP Attachpoint:Neighbor
Neighbor/Group type afi/safi in/out referring policy attached policy
----------------------------------------------------------------------------
10.0.101.2 -- IPv4/uni in policy_1 policy_1
10.0.101.3 -- IPv4/uni in policy_2 policy_2
```

This table describes the significant fields shown in the display.

### Table 126: show rpl prefix-set attachpoints Field Descriptions

<table>
<thead>
<tr>

</tbody>
</table>
show rpl prefix-set references

To list all the policies that reference the named prefix set, use the `show rpl prefix-set references` command in XR EXEC mode.

```
show rpl prefix-set name references [brief]
```

**Syntax Description**

- `name` Name of the prefix set.
- `brief` (Optional) Limits the output to just a summary table and not the detailed information for the named prefix set.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- Release 6.0 This command was introduced.

**Usage Guidelines**

Use the `show rpl prefix-set references` command to list all the policies that reference the named prefix set. Use the optional `brief` keyword to limit the output to just a summary table and not the detailed information for the named prefix set.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
prefix-set ten-net
  10.0.0.0/16 le 32
end-set
prefix-set too-specific
  0.0.0.0/0 ge 25 le 32
end-set
route-policy example-one
  if destination in ten-net then
    drop
  else
    set local-preference 200
  apply set-comms
endif
end-policy
route-policy set-comms
  set community (10:1234) additive
end-policy

route-policy example-three
  if destination in too-specific then
```
drop
else
    apply example-one
    pass
endif
end-policy

The following example displays information showing the usage and status of each policy that references the prefix set ten-net. The `brief` keyword limits the display to just a summary table and not the detailed information for the prefix set.

RP/0/RP0/CPU0:router# show rpl prefix-set ten-net references brief

Usage Direct -- Reference occurs in this policy
Usage Indirect -- Reference occurs via an apply statement

Status UNUSED -- Policy is not in use at an attachpoint (unattached)
Status ACTIVE -- Policy is actively used at an attachpoint
Status INACTIVE -- Policy is applied by an unattached policy

<table>

</tbody>
</table>
show rpl rd-set

To display the configuration of route distinguisher (RD) sets, use the `show rpl rd-set` command in XR EXEC mode.

```
show rpl rd-set [ { name | states | brief } ]
```

**Syntax Description**

- **name** (Optional) Name of the RD set.
- **states** (Optional) Shows all unused, inactive, and active states.
- **brief** (Optional) Limits the display to a list of the names of all RD sets without their configurations.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Because sets cannot hierarchically reference other sets or policies, no `detail` keyword exists as with the `show rpl policy` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the configuration of RD set rdset1 is displayed:

```
RP/0/RP0/CPU0:router# show rpl rd-set rdset1
rd-set rdset1
  10:151,
  100.100.100.1:153,
  100.100.100.62/31:63
end-set
```
show rpl rd-set attachpoints

To display all the policies used at an attach point that reference the named route distinguisher (RD) set, use the `show rpl rd-set attachpoints` command in XR EXEC mode.

```
show rpl rd-set name attachpoints
```

### Syntax Description

- **name**: Name of an RD set.

### Command Default

No default behavior or values

### Command Modes

XR EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `show rpl rd-set attachpoints` command to display all the policies used at an attach point that reference the named RD set either directly or indirectly.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

### Examples

This example shows the following sample configuration:

```
route-policy rdsetmatch
  if rd in rdset1 then
    set community (10:112)
  elseif rd in rdset2 then
    set community (10:223)
  endif
end-policy

router bgp 10
  address-family vpnv4 unicast
  exit
neighbor 10.0.101.1
  remote-as 11
  address-family vpnv4 unicast
  route-policy rdsetmatch in
```

Given this sample configuration, the `show rpl rd-set rdset1 attachpoints` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl rd-set rdset attachpoints
BGP Attachpoint: Neighbor
Neighbor/Group type afi/safi in/out vrf name
```
This table describes the significant fields shown in the display.

### Table 128: show rpl rd-set attachpoints Field Descriptions

!
neighbor 10.0.101.1
  remote-as 11
  address-family vpnv4 unicast
  route-policy rdsetmatch in
!
```

Given this sample configuration, the **show rpl rd-set rdset1 references** command displays the following information:
show rpl rd-set rdset1 references

Usage Direct -- Reference occurs in this policy
Usage Indirect -- Reference occurs via an apply statement
Status UNUSED -- Policy is not in use at an attachpoint (unattached)
Status ACTIVE -- Policy is actively used at an attachpoint
Status INACTIVE -- Policy is applied by an unattached policy

</table>
show rpl route-policy

To display the configuration of route policies, use the `show rpl route-policy` command in XR EXEC mode.

```
show rpl route-policy [{name [detail] | states | brief}]
```

**Syntax Description**
- `name` (Optional) Name of a route policy.
- `detail` (Optional) Displays the configuration of all policies and sets that a policy uses.
- `states` (Optional) Shows all unused, inactive, and active states.
- `brief` (Optional) Limits the display to a list of the names of all extended community sets without their configurations.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the optional `brief` keyword to limit the display to a list of the names of policies without their configurations.

**Examples**
In the following example, the configuration of a route policy named `policy_1` is displayed.

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
  if destination in prefix_set_1 and not destination in sample1 then
    if as-path in aspath_set_1 then
      set local-preference 300
      set origin igp
    elseif as-path in as_allowed then
      set local-preference 400
      set origin igp
    else
      set origin igp
    endif
  else
    drop
  endif
  set med 120
  set community (8660:612) additive
  apply set_lpref_from_comm
```
If the optional **detail** keyword is used, all routing policy language (RPL) policies and sets that route policy `policy_1` uses are displayed, as shown in the following example.

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_1 detail
!
prefix-set sample

**show rpl route-policy attachpoints**

To display all the policies used at an attach point that reference the named policy, use the `show rpl route-policy attachpoints` command in XR EXEC mode.

```plaintext
show rpl route-policy name attachpoints
```

**Syntax Description**

- `name` Name of a policy.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl route-policy attachpoints` command to display all the policies used at an attach point that reference the named policy either directly or indirectly.

The policy name is required.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>route-policy read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
router bgp 2
    address-family ipv4 unicast
    neighbor 10.0.101.2
        remote-as 100
        address-family ipv4 unicast
            route-policy policy_1 in
            !
        neighbor 10.0.101.3
            remote-as 12
            address-family ipv4 unicast
                route-policy policy_2 in
                !
    !

RP/0/RP0/CPU0:router# show rpl route-policy policy_1

route-policy policy_1
    if (destination in prefix_set_ex1) then
        set local-preference 100
    endif
```
if (as-path in as_path_set_ex1) then
    set community (10:333) additive
endif
def-policy
!
RP/0/RP0/CPU0:router# show rpl route-policy policy_2

route-policy policy_2
    if (destination in prefix_set_ex1) then
        if (community matches-any comm_set_ex1) then
            set community (10:666) additive
        endif
        if (extcommunity matches-any ext_comm_set_rt_ex1) then
            set community (10:999) additive
        endif
    endif
end-policy
!

The following command displays the route policy attach points for policy_2:

RP/0/RP0/CPU0:router# show rpl route-policy policy_2 attachpoints

BGP Attachpoint: Neighbor

<table>
<thead>
<tr>
<th>Neighbor/Group</th>

<td>IP address of the attach point on the neighbor.</td>
</tr>
<tr>
<td>type</td>
<td>Displays the address family mode.</td>
</tr>
<tr>
<td>afi/safi</td>
<td>Address family identifier or subsequent address family identifier.</td>
</tr>
<tr>
<td>vrf name</td>
<td>Name of the VPN routing and forwarding (VRF) instance.</td>
</tr>
</tbody>
</table>
show rpl route-policy inline

To display all policies and sets that a policy uses expanded inline, use the `show rpl route-policy inline` command in XR EXEC mode.

```
show rpl route-policy name inline
```

**Syntax Description**

- `name`: Name of a policy.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

- **Release 6.0**: This command was introduced.

**Usage Guidelines**

Use the `show rpl route-policy inline` command to examine the configuration of a specified route policy. All policies and sets that a policy uses are gathered together and displayed expanded inline.

The policy name is required.

**Examples**

The following command displays the route policy `policy_1`:

```
RP/0/RP0/CPU0:router# show rpl route-policy policy_1
!
route-policy policy_1
  if destination in prefix_set_1 and not destination in martians then
    if as-path in aspath_set_1 then
      set local-preference 300
      set origin igp
    elseif as-path in as_allowed then
      set local-preference 400
      set origin igp
    else
      set origin igp
    endif
  else
    drop
  endif
set med 120
set community (8660:612) additive
apply set_lpref_from_comm
end-policy
```
The following command displays the route policy policy_1 and all the other sets or policies it refers too inline. Adding the inline keyword causes the configuration to be displayed inline for all RPL objects that the route-policy policy_1 uses.

```
RP/0/RP0/CPU0:router#show rpl policy policy_1 inline
```

```
route-policy policy_1
  if destination in (91.5.152.0/24 ge 24 le 32, 91.220.152.0/24 ge 24 le 32, 61.106.52.0/24 ge 24 le 32, 222.168.199.0/24 ge 24 le 32, 93.76.114.0/24 ge 24 le 32, 41.195.116.0/24 ge 24 le 32, 35.92.152.0/24 ge 24 le 32, 143.144.96.0/24 ge 24 le 32, 79.218.81.0/24 ge 24 le 32, 75.213.219.0/24 ge 24 le 32, 178.220.61.0/24 ge 24 le 32, 27.195.65.0/24 ge 24 le 32) and not destination in (0.0.0.0/0, 0.0.0.0 ge 25 le 32, 10.0.0.0/8 ge 8 le 32, 192.168.0.0/16 ge 16 le 32, 224.0.0.0/20 ge 20 le 32, 240.0.0.0/20 ge 20 le 32) then
    if as-path in (ios-regex '_9148_', ios-regex '_5870_', ios-regex '_2408_', ios-regex '_2531_', ios-regex '_137_', ios-regex '_2992_') then
      set local-preference 300
      set origin igp
      elseif as-path in (ios-regex '_1239_.*', ios-regex '_3561_.*', ios-regex '_701_.*', ios-regex '_666_.*', ios-regex '_1755_.*', ios-regex '_1756_.*') then
        set local-preference 400
        set origin igp
      else
        set origin igp
      endif
    else
      drop
    endif
  set med 120
  set community (8660:612) additive
  # apply set_lpref_from_comm
  if community matches-any (2:50) then
    set local-preference 50
  elseif community matches-any (2:60) then
    set local-preference 60
  elseif community matches-any (2:70) then
    set local-preference 70
  elseif community matches-any (2:80) then
    set local-preference 80
  elseif community matches-any (2:90) then
    set local-preference 90
  endif
  # end-apply set_lpref_from_comm
end-policy
```
show rpl route-policy references

To list all the policies that reference the named policy, use the `show rpl route-policy references` command in XR EXEC mode.

```
show rpl route-policy name references [brief]
```

**Syntax Description**

- `name` Name of a prefix set.
- `brief` (Optional) Limits the output to just a summary table and not the detailed information for the named policy.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show rpl route-policy references` command to list all the policies that reference the named policy.

Use the optional `brief` keyword to limit the output to just a summary table and not the detailed information for the policy.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```
prefix-set ten-net
  10.0.0.0/16 le 32
end-set
prefix-set too-specific
  0.0.0.0/0 ge 25 le 32
end-set
route-policy example-one
  if destination in ten-net then
    drop
  else
    set local-preference 200
    apply set-comms
  endif
end-policy
route-policy set-comms
  set community (10:1234) additive
end-policy
route-policy example-three
  if destination in too-specific then
    drop
```
else
    apply example-one
pass
endif
end-policy

The following command displays information about the policy set-comms and how it is referenced:

RP/0/RP0/CPU0:router# show rpl route-policy set-comms references

Usage Direct -- Reference occurs in this policy
Usage Indirect -- Reference occurs via an apply statement

Status UNUSED -- Policy is not in use at an attachpoint (unattached)
Status ACTIVE -- Policy is actively used at an attachpoint
Status INACTIVE -- Policy is applied by an unattached policy

<table>
<thead>
<tr>
<th>Usage/Status</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct</td>
<td>1</td>
</tr>
<tr>
<td>Indirect</td>
<td>1</td>
</tr>
<tr>
<td>ACTIVE</td>
<td>0</td>
</tr>
<tr>
<td>INACTIVE</td>
<td>1</td>
</tr>
<tr>
<td>UNUSED</td>
<td>1</td>
</tr>
</tbody>
</table>

route-policy usage policy status

<table>
<thead>
<tr>
<th>example-one</th>
<th>Direct</th>
<th>INACTIVE</th>
</tr>
</thead>
<tbody>
<tr>
<td>example-three</td>
<td>Indirect</td>
<td>UNUSED</td>
</tr>
</tbody>
</table>

The direct usage indicates that the route policy example-one directly applies the policy set-comms, that is, example-one has a line in the form apply set-comms. The usage Indirect indicates that the route policy example-three does not directly apply the route policy set-comms. However, the route policy example-three does apply the policy example-one, which in turn applies the policy set-comms, so there is an indirect reference from example-three to the route policy set-comms.

The status column indicates one of three states. A policy is active if it is in use at an attach point. In the example provided, neither example-one nor example-three is in use at an attach point, which leaves two possible states: UNUSED or INACTIVE. The route policy example-one is inactive because it has some other policy (example-three) that references it, but neither example-one nor any of the policies that reference it (example-one) are in use at an attach point. The route policy example-three has a status of unused because it is not used at an attach point and no other route policies in the system refer to it.

This table describes the significant fields shown in the display.

**Table 131: show rpl route-policy references Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>route-policy</td>
<td>One name for multiple policies that reference the specified policy.</td>
</tr>
<tr>
<td>usage</td>
<td>Type of usage for the policy.</td>
</tr>
<tr>
<td>policy status</td>
<td>Status of the policy.</td>
</tr>
</tbody>
</table>
show rpl route-policy uses

To display information about a specified named policy, use the `show rpl route-policy uses` command in XR EXEC mode.

`show rpl route-policy name uses {policies | sets | all} [direct]`

**Syntax Description**

- **name**: Name of a policy.
- **policies**: Generates a list of all policies that the named policy uses.
- **sets**: Lists all named sets that are used by the policy.
- **all**: Generates a list of both sets and policies that the named policy references.
- **direct**: (Optional) Lists only the policies or sets used directly in the named policy block. Set or policy references that occur as a result of an `apply` statement are not listed.

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

Release 6.0  This command was introduced.

**Usage Guidelines**

Use the `show rpl route-policy uses` command to display information about a specified named policy.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the following sample configuration:

```plaintext
prefix-set ten-net
  10.0.0.0/16 le 32
end-set
prefix-set too-specific
  0.0.0.0/0 ge 25 le 32
end-set
route-policy example-one
  if destination in ten-net then
    drop
  else
    set local-preference 200
  apply set-comms
endif
end-policy
route-policy set-comms
  set community (10:1234) additive
end-policy
```
route-policy example-three
if destination in too-specific then
dero
else
apply example-one
pass
endif
end-policy

The following command lists the policies one and set-comms. It also lists the prefix sets too-specific and ten-net.

RP/0/RP0/CPU0:router# show rpl route-policy example-three uses all

Policies directly and indirectly applied by this policy:
---------------------------------------------------------------------
example-one set-comms

Sets referenced directly and indirectly (via applied policies) in this policy:

type prefix-set:
  ten-net too-specific

The sets example-one and set-comms are listed as policies that are used by the policy example-three. The policy example-one is listed because route policy example-three uses it in an apply statement. The policy set-comms is also listed because example-one applies it. Similarly, the prefix-set too-specific is used directly in the if statement in the policy example-three, and the prefix-set ten-net is used in the policy example-one. The optional direct keyword can be used to limit the output to just those sets and policies that are used within the example-three block itself, as shown in the following example:

RP/0/RP0/CPU0:router# show rpl route-policy example-three uses all direct

Policies directly applied by this policy:
------------------------------------------
example-one

Sets used directly in this policy
-----------------------------------
type prefix-set:
  too-specific

As can be seen in the output, the route policy set-comms and the prefix set ten-net are no longer included in the output when the direct keyword is used. The direct form of the command considers only those sets or policies used in the specified route policy and any additional policies or sets that may be used if you follow the hierarchy of apply statements.
This table describes the significant fields shown in the display.

**Table 132: show rpl route-policy uses Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Displays the type used in the policy configuration.</td>
</tr>
<tr>
<td></td>
<td>Values for type are prefix-set, community-set, extcommunity-set, and as-path-set.</td>
</tr>
</tbody>
</table>
show rpl unused as-path-set

To display the AS path sets that are defined but not used by a policy at an attach point or referenced in a policy using an apply statement, use the show rpl unused as-path-set command in XR EXEC mode.

```plaintext
show rpl unused as-path-set [detail]
```

**Syntax Description**
- **detail** (Optional) Displays the content of the object and all referenced objects for unused AS path sets.

**Command Default**
- No default behavior or values

**Command Modes**
- XR EXEC mode

**Command History**
- **Release** 6.0  This command was introduced.

**Usage Guidelines**
- Use the show rpl unused as-path-set command to display all AS path sets that are not used in a policy at an attach point either directly or indirectly and are not referenced by any policies in the system.

**Examples**

This example shows the following sample configuration:

```plaintext
router bgp 2
  address-family ipv4 unicast
  !
  neighbor 10.0.101.2
    remote-as 100
    address-family ipv4 unicast
      route-policy policy_1 in
      !
      neighbor 10.0.101.3
        remote-as 12
        address-family ipv4 unicast
        route-policy policy_2 in

  end-set
  !
  as-path-set as_path_set_ex2
    ios-regex '^_65502_$',
    ios-regex '^_65503_$'
  end-set
```

Routing Command Reference for Cisco NCS 5500 Series, Cisco NCS 540 Series, and Cisco NCS 560 Series Routers
Given this sample configuration, the `show rpl unused as-path-set` command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl unused as-path-set
ACTIVE -- Referenced by at least one policy which is attached
```
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following as-path-sets are UNUSED
-------------------------------------
as_path_set_ex3
show rpl unused community-set

To display the community sets that are defined but not used by a policy at an attach point or referenced in a policy using an `apply` statement, use the `show rpl unused community-set` command in XR EXEC mode.

Syntax Description

```
show rpl unused community-set [detail]
```

- **detail** (Optional) Displays the content of the object and all referenced objects for unused community sets.

Command Default

No default behavior or values

Command Modes

XR EXEC mode

Command History

Given this sample configuration, the **show rpl unused community-set** command displays the following information:
show rpl unused community-set

RP/0/RP0/CPU0:router# show rpl unused community-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following community-sets are UNUSED
---------------------------------------
comm_set_ex3
show rpl unused extcommunity-set

To display the extended community sets that are defined but not used by a policy at an attach point or referenced in a policy using an apply statement, use the `show rpl unused extcommunity-set` command in XR EXEC mode.

```
show rpl unused extcommunity-set [{cost | detail | rt | soo}]
```

Syntax Description

<table>
<thead>

show rpl unused rd-set

To display the route distinguisher (RD) sets that are defined but not used by a policy at an attach point or referenced in a policy using an apply statement, use the show rpl unused rd-set command in XR EXEC mode.

```
show rpl unused rd-set [detail]
```

**Syntax Description**
- `detail` (Optional) Displays the content of the object and all referenced objects for unused RD sets.

**Command Default**
No default behavior or values

**Command Modes**
XR EXEC mode

**Command History**
- **Release** 6.0 This command was introduced.

**Usage Guidelines**
Use the show rpl unused rd-set command to display all of the RD sets that are not used in a policy at an attach point either directly or indirectly and are not referenced by any policies in the system.

**Examples**
The show rpl unused rd-set command displays the following information:

```
RP/0/RP0/CPU0:router# show rpl unused rd-set

ACTIVE -- Referenced by at least one policy which is attached
INACTIVE -- Only referenced by policies which are not attached
UNUSED -- Not attached (directly or indirectly) and not referenced

The following rd-sets are UNUSED
------------------------------------------
None found with this status.
```
show rpl unused route-policy

To display the route policies that are defined but not used at an attach point or referenced using an `apply` statement, use the `show rpl unused route-policy` command in XR EXEC mode.

```
show rpl unused route-policy [detail]
```

-------------------------------
policy_1
policy_2
policy_4
policy_5
source in

To test the source of a Border Gateway Protocol (BGP) route against the address contained in either a named or an inline prefix set, use the **source in** command in route-policy configuration mode.

**source in \{prefix-set-name\}inline-prefix-set\}parameter**

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix-set-name</td>
</tr>
<tr>
<td>inline-prefix-set</td>
</tr>
<tr>
<td>parameter</td>
</tr>
</tbody>
</table>

No default behavior or values

Route-policy configuration

**Release** Modification

Release 6.0  This command was introduced.

Use the **source in** command as a conditional expression within an **if** statement to test the source of the route against the data in either a named or an inline prefix set. A comparison that references a prefix set with zero elements in it returns false.

For a list of all conditional expressions available within an **if** statement, see the **if** command.

The source of a BGP route is the IP peering address of the neighboring router from which the route was received.

The prefix set can contain both IPv4 and IPv6 prefix specifications.

**Task ID**

**Task ID**  **Operations**

route-policy  read, write

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
</table>

In the following example, the source of a BGP route is tested against the data in the prefix set my-prefix-set:

```
RP/0/RP0/CPU0:router(config)# route-policy policy-A
RP/0/RP0/CPU0:router(config-rpl)# if source in my-prefix-set then
```

In this example, the source of a BGP route is tested against the data in an inline IPv4 prefix set:

```
RP/0/RP0/CPU0:router(config)# route-policy policy-B
```
In this example, the source of a route is tested against the data in an inline IPv6 prefix set:

```
RP/0/RP0/CPU0:router(config-rpl)# if source in (10.0.0.8, 10.0.0.20) then

RP/0/RP0/CPU0:router(config)# route-policy policy-C
RP/0/RP0/CPU0:router(config-rpl)# if source in (2001:0:0:1::/64, 2001:0:0:2::/64) then
```
suppress-route

To indicate that a given component of a BGP aggregate should be suppressed, use the suppress-route command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the suppress-route command to indicate that a given component of an aggregate should be suppressed, that is, not advertised by BGP. See the unsuppress-route, on page 904 command for information on overriding the suppress-route command for individual neighbors.

The suppress-route command can be used as an action statement within an if statement. For a list of all action statements available within an if statement, see the if command.

**Examples**

In the following example, if the destination is in 10.1.0.0/16, then the route is not advertised:

```
RP/0/RP0/CPU0:router(config)# route-policy check-aggregate
RP/0/RP0/CPU0:router(config-rpl)# if destination in (10.1.0.0/16) then
RP/0/RP0/CPU0:router(config-rpl-if)# suppress-route
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl-if)# end-policy
```
To match a specific tag value, use the `tag` command in route-policy configuration mode.

```
tag {eq | ge | le | is} {integerparameter}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>eq</td>
<td>Equal to</td>
<td><code>tag eq 10</code></td>
</tr>
<tr>
<td>ge</td>
<td>Greater than or equal to</td>
<td><code>tag ge 10</code></td>
</tr>
<tr>
<td>le</td>
<td>Less than or equal to</td>
<td><code>tag le 10</code></td>
</tr>
<tr>
<td>is</td>
<td>Is</td>
<td><code>tag is 10</code></td>
</tr>
</tbody>
</table>

*integerparameter* is an integer value. Range is 0 to 4294967295.

*parameter* is a parameter name. The parameter name must be preceded with a “$.”

**Command Default**
No default behavior or values

**Command Modes**
Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `tag` command as a conditional expression within an `if` statement to match a specific tag value.

For a list of all conditional expressions available within an `if` statement, see the `if` command.

A tag is a 32-bit integer that can be associated with a given route within the RIB.

The `eq` operator matches either a specific tag value or a parameter value. Its variants `ge` and `le` match a range of tag values that are either greater than or equal to or less than or equal to the supplied value or parameter.

**Examples**

In the following example, if the tag equals 10, then the condition returns true:

```
RP/0/RSP0RP0/CPU0:router(config-rpl)# if tag eq 10 then
```
tag in

To match a tag entry in a named tag set or inline tag set, use the tag in command in route-policy configuration mode.

tag in {tag-set-nameinline-tag-setparameter}

Syntax Description

- **tag-set-name**: Name of a tag set. The tag-set accepts 32-bit Integer value. Range is 0 to 4294967295.
- **inline-tag-set**: Inline tag set. The inline tag set must be enclosed in parentheses.
- **parameter**: Parameter name. The parameter name must be preceded with a “$.”

Command Default

No default behavior or values.

Command Modes

- Route-policy configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the tag in command as a conditional expression within an if statement to match a tag entry in a named tag set or inline tag set.

Note

For a list of all conditional expressions available within an if statement, see the if command.

This command takes either a named tag set or an inline tag set value as an argument. The condition returns true if the tag entry matches any entry in the tag set or inline tag set. An attempt to match a tag using a tag set that is defined but contains no elements returns false.

The routing policy language (RPL) provides the ability to test tags for a match to a list of tag match specifications using the in operator. The tag in command is protocol-independent.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

In the following example, a tag set named my-tag-set is defined and a route policy named use-tag-in is created. Within the use-tag-in route policy, the tag in command is used within an if statement to learn if the tag is in the tag-set named my-tag-set. If it is, then local preference is set to 100. If it is not in my-tag-set but does match the next tag specifications, then local preference is set to 200.

```
RP/0/RP0/CPU0:router(config)#tag-set my-tag-set
RP/0/RP0/CPU0:router(config-tag)#1000
```
RP/0/RP0/CPU0:router(config-tag)#3000
RP/0/RP0/CPU0:router(config-tag)#end-set

RP/0/RP0/CPU0:router(config)#route-policy use-tag-in
RP/0/RP0/CPU0:router(config-rpl)#if tag in my-tag-set then
RP/0/RP0/CPU0:router(config-rpl-if)#set local-preference 100
RP/0/RP0/CPU0:router(config-rpl-if)#elseif tag in (2000, 4000) then
RP/0/RP0/CPU0:router(config-rpl-elseif)#set local-preference 200
RP/0/RP0/CPU0:router(config-rpl-elseif)#endif
RP/0/RP0/CPU0:router(config-rpl)#end policy
tag-set

To enter tag set configuration mode and define a tag set, use the \texttt{tag-set} command in XR Config mode. To remove a named tag set, use the \texttt{no} form of this command.

\begin{verbatim}
tag-set name
no tag-set name
\end{verbatim}

\textbf{Syntax Description}

| name | Name of a tag set. |

\textbf{Command Default}

None

\textbf{Command Modes}

XR Config

\textbf{Command History}

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

\textbf{Usage Guidelines}

Use the \texttt{tag-set} command to enter tag set configuration mode and define a tag set. A tag-set is a 32-bit integer that can be associated with a given route within the RIB.

\textbf{Examples}

In the following example, a tag set named \texttt{my-tag-set} is defined and a route policy named \texttt{use-tag-in} is created. Within the \texttt{use-tag-in} route policy, the \texttt{tag in} command is used within an \texttt{if} statement to learn if the tag is in the tag-set named \texttt{my-tag-set}. If it is, then local preference is set to 100. If it is not in \texttt{my-tag-set} but does match the next tag specifications, then local preference is set to 200.

```
RP/0/RP0/CPU0:router (config)#tag-set my-tag-set
RP/0/RP0/CPU0:router (config-tag)#1000
RP/0/RP0/CPU0:router (config-tag)#3000
RP/0/RP0/CPU0:router (config-tag)#end-set

RP/0/RP0/CPU0:router (config)#route-policy use-tag-in
RP/0/RP0/CPU0:router (config-rpl)#if tag in my-tag-set then
  set local-preference 100
RP/0/RP0/CPU0:router (config-rpl-if)#elseif tag in (2000, 4000) then
  set local-preference 200
RP/0/RP0/CPU0:router (config-rpl-elseif)#endif
RP/0/RP0/CPU0:router (config-rpl)#end policy
```
unsuppress-route

To indicate that a given component of a BGP aggregate should be unsuppressed, use the `unsuppress-route` command in route-policy configuration mode.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>

</tbody>
</table>

**Usage Guidelines**

Use the `unsuppress-route` command to indicate that a given component of an aggregate should be unsuppressed, that is, allowed to be advertised by BGP again. This command affects routes that have been suppressed in the generation of BGP aggregates. If the request to unsuppress a route is encountered in a policy at a neighbor-out attach point, it guarantees that the routes that it affects are advertised to that neighbor even if that route was suppressed using the `suppress-route` command in a policy at the aggregation attach point.

The `unsuppress-route` command can be used as an action statement within an `if` statement. For a list of all action statements available within an `if` statement, see the `if` command.

**Examples**

In the following example, if the destination is in 10.1.0.0/16, then the route is not advertised:

```
RP/0/RP0/CPU0:router(config)## route-policy check-aggregate
RP/0/RP0/CPU0:router(config-rpl)## if destination in (10.1.0.0/16) then
RP/0/RP0/CPU0:router(config-rpl-if)## unsuppress-route

RP/0/RP0/CPU0:router(config-rpl-if)## endif
RP/0/RP0/CPU0:router(config-rpl)## end-policy
```

Assuming that the policy is attached at a neighbor-out attach point, if the route 10.1.0.0/16 was suppressed in a policy at an aggregation attach point, 10.1.0.0/16 is advertised to the neighbor. Routes continue to be suppressed in advertisements to other BGP neighbors unless a specific policy is attached to unsuppress the route.
**vpn-distinguisher is**

To match a specific Border Gateway Protocol (BGP) VPN distinguisher, use the `vpn-distinguisher is` command in route-policy configuration mode.

**vpn-distinguisher is** `{numberparameter}

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Value assigned to a 32-bit unsigned integer. Range is from 1 to 4294967295.</td>
</tr>
<tr>
<td><code>parameter</code></td>
<td>Parameter name. The parameter name must be preceded with a “$.”</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Route-policy configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `vpn-distinguisher is` command as a conditional expression within an `if` statement to test the value of the origin attribute.

A VPN distinguisher is used in Layer 3 VPN networks for enhanced individual VPN control and to avoid route target mapping at AS boundaries in inter-AS VPN networks. Route target extended communities are removed at neighbor outbound and the VPN distinguisher value is applied on the BGP route as an extended community. When the route is received on a neighboring router in another AS, the VPN distinguisher is removed and mapped to a route target extended community.

**Note**

For a list of all conditional expressions available within an `if` statement, see the `if` command.

This command can be parameterized.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-policy</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the origin is tested within an `if` statement to learn if it is either `igp` or `egp`:

```
RP/0/RP0/CPU0:router(config-rpl)# if origin is igp or origin is egp then
```

In the following example, a parameter is used to match a specific origin type:

```
RP/0/RP0/CPU0:router(config)# route-policy bar($origin)
```
VPN-distinguisher is

RP/0/RP0/CPU0:router(config-rpl)# if origin is $origin then
RP/0/RP0/CPU0:router(config-rpl-if)# set med 20
RP/0/RP0/CPU0:router(config-rpl-if)# endif
RP/0/RP0/CPU0:router(config-rpl)#
Static Routing Commands

All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note

• Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

• Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.

• References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.

• Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
  • N540-28Z4C-SYS-A
  • N540-28Z4C-SYS-D
  • N540X-16Z4G8Q2C-A
  • N540X-16Z4G8Q2C-D
  • N540-12Z20G-SYS-A
  • N540-12Z20G-SYS-D
  • N540X-12Z16G-SYS-A
  • N540X-12Z16G-SYS-D

This module describes the commands used to establish static routes on Cisco NCS 5500 Series Routers.
For detailed information about static routing concepts, configuration tasks, and examples, see the Implementing Static Routes on Cisco NCS 5000 Series Routers module in the *Routing Configuration Guide for Cisco NCS 5500 Series Routers*.

- address-family (static), on page 909
- maximum path (static), on page 910
- route (static), on page 911
- router static, on page 914
- vrf (static), on page 915
address-family (static)

To enter various address family configuration modes while configuring static routes, use the `address-family` command in the appropriate configuration mode. To disable support for an address family, use the `no` form of this command.

```
address-family {ipv4 | ipv6} {unicast | multicast}
no address-family {ipv4 | ipv6} {unicast | multicast}
```

**Syntax Description**

- **ipv4** Specifies IP Version 4 address prefixes.
- **ipv6** Specifies IP Version 6 address prefixes. This option is available only in static router configuration mode.
- **unicast** Specifies unicast address prefixes.
- **multicast** Specifies multicast address prefixes. This option is available only in static router configuration mode.

**Command Default**

All static routes belong to the default VRF if you enter address family configuration mode without entering VRF configuration mode.

**Command Modes**

- Router static configuration
- VRF router static configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `address-family` command to enter various address family configuration modes while configuring static routing sessions. From address family configuration mode, you can configure static routes using the `route` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enter IPv6 unicast address family mode:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)# address-family ipv6 unicast
RP/0/RP0/CPU0:router(config-static-afi)#
```
maximum path (static)

To change the maximum number of allowable static routes, use the `maximum path` command in static router configuration mode. To remove the `maximum path` command from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
maximum path {ipv4 | ipv6} value
no maximum path {ipv4 | ipv6} value
```

**Syntax Description**
- `ipv4` | `ipv6` Specifies IP Version 4 (IPv4) or IP Version 6 (IPv6) address prefixes.
- `value` Maximum number of static routes for the given AFI. The range is 1 to 140000.

**Command Default**
- `value`: 4000

**Command Modes**
- Static router configuration

**Command History**
- **Release** Modification
  - Release 6.0 This command was introduced.

**Usage Guidelines**
If you use the `maximum path` command to reduce the configured maximum allowed number of static routes for a given table below the number of static routes currently configured, the change is rejected. In addition, if you commit a batch of routes that would, when grouped, push the number of static routes configured above the maximum allowed, the first \( n \) routes in the batch and the number previously configured are accepted, and the remainder rejected. The \( n \) argument is the difference between the maximum number allowed and the number previously configured.

**Task ID**
- Task ID: read, write

**Examples**
The following example shows how to set the maximum number of static IPv4 routes to 100000:

```
RP/0/RP0/CPU0:router(config-static)# maximum path ipv4 100000
```

The following example shows how to remove the preceding configuration and set the maximum number of static IPv4 routes back to the default:

```
RP/0/RP0/CPU0:router(config-static)# no maximum path ipv4 100000
```
route (static)

To establish static routes, use the `route` command in address family configuration mode. To remove the `route` command from the configuration, use the `no` form of this command.

```
prefix/mask  [vrf  vrf-name]  {ip-address|type  interface-path-id  [{ip-address|type  interface-path-id}]}
[track  track-object-name]  [tunnel-id  tunnel-id]  [vrflabel  vrf-label]  [distance]  [description  text]
[tag  tag]  [permanent]}
no  prefix/mask  [vrf  vrf-name]  {ip-address|type  interface-path-id  [{ip-address|type  interface-path-id}]}
[track  track-object-name]  [tunnel-id  tunnel-id]  [vrflabel  vrf-label]  [distance]  [description  text]
[tag  tag]  [permanent]}
```

### Syntax Description

**prefix / mask**

IP route prefix and prefix mask for the destination.

The network mask can be specified in either of two ways:

- The network mask can be a four-part, dotted-decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit is a network address.
- The network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are 1s, and the corresponding bits of the address are the network address.

**vrf  vrf-name**

(Optional) Specifies a destination VRF. This option is available when IPv4 address families are specified.

The following names cannot be used: all, default, and global.

The following example shows how to configure IPv4 VRF:

```
router static
  address-family ipv4 unicast
  10.1.1.0/24 vrf  vrf_a 192.168.1.1

router static
  vrf  vrf_a
  address-family ipv4 unicast
  10.1.1.0/24 192.168.1.1
```

**ip-address**

IP address of the next hop that can be used to reach that network.

- For IPv4 address—the IP address is required, not optional, if the interface type and interface-path-id arguments are not specified. You can specify an IP address and an interface type and interface path.
- For IPv6 link-local address—the interface type and interface-path-id arguments are required. The route is not valid, if the interface type and interface-path-id arguments are not specified.

**Note**

A forwarding router's IP address or an interface or virtual interface path ID can be configured, in any order.

**type**

Interface type. For more information, use the question mark (?) online help function.
<table>
<thead>
<tr>
<th>Command</th>
<th>Default</th>
<th>Command Modes</th>
<th>Command History</th>
<th>Usage Guidelines</th>
</tr>
</thead>
</table>

**interface-path-id**  
Physical interface or virtual interface.

**Note**  
Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Note**  
A forwarding router’s IP address or an interface or virtual interface path ID can be configured, in any order.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>distance</strong></td>
<td>(Optional) Administrative distance. Range is 1 to 254.</td>
</tr>
<tr>
<td><strong>description</strong></td>
<td>text (Optional) Specifies a description of the static route.</td>
</tr>
<tr>
<td><strong>tag</strong></td>
<td>tag (Optional) Specifies a tag value that can be used as a match for controlling redistribution using route policies. Range is 1 to 4294967295.</td>
</tr>
<tr>
<td><strong>permanent</strong></td>
<td>(Optional) Specifies that the route is not removed from the routing table, even if the next-hop interface shuts down or next-hop IP address is not reachable.</td>
</tr>
<tr>
<td><strong>track</strong></td>
<td>track-object-name Enables object tracking for static route.</td>
</tr>
<tr>
<td><strong>tunnel-id</strong></td>
<td>tunnel-id Specifies a Tunnel ID.</td>
</tr>
<tr>
<td><strong>vrflabel</strong></td>
<td>vrf-label Specifies a VRF label.</td>
</tr>
</tbody>
</table>

**Command Default**

No static route is established.

**vrf vrf-name**: If no VRF is specified, the vrf where the configuration takes place is used.

**Command Modes**

Address family configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A static route is appropriate when the software cannot dynamically build a route to the destination.

Static routes have a default administrative distance of 1, in which a low number indicates a preferred route. By default, static routes are preferred to routes learned by routing protocols. You can configure an administrative distance with a static route if you want the static route to be overridden by dynamic routes. For example, you could have routes installed by the Open Shortest Path First (OSPF) protocol with an administrative distance of 120. To have a static route that would be overridden by an OSPF dynamic route, specify an administrative distance greater than 120.

The routing table considers the static routes that point to an interface as “directly connected.” Directly connected networks are advertised by IGP routing protocols if a corresponding `interface` command is contained under the router configuration stanza of that protocol.

A static route is always associated with a VPN routing and forwarding (VRF) instance. The VRF can be the default VRF or a specified VRF. Specifying a VRF allows you to enter VRF configuration mode where you can configure a static route. If you do not specify a VRF you can configure a default VRF static route.
Use the `router static` command to configure static routes. To configure a static route, you must enter router static configuration mode and then enter an address family configuration mode or VRF configuration mode. See the `vrf (static)` command for information on configuring a static route in VRF configuration mode. After you enter an address family mode, you can enter multiple static routes. The following example shows how to configure multiple static routes in IPv4 and IPv6 address family configuration modes:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)# address-family ipv6 unicast
```

Note

You cannot create a VRF named default, but you can reference the default VRF.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure IPv6 unicast address family static routes:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)# address-family ipv6 unicast
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 HundredGigE 0/2/0/7
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 HundredGigE 0/6/0/0
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4c
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4d
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4e
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:4f
RP/0/RP0/CPU0:router(config-static-afi)# 2b11::327a:7b00/120 2b11::2f01:50
```
router static

To enter static router configuration mode, use the `router static` command in XR Config mode. To remove all static route configurations and terminate the static routing process, use the `no` form of this command.

```
router static
no router static
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No static routing process is enabled.

**Command Modes**

XR Config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>read, write</td>
</tr>
<tr>
<td>bgp, ospf, isis, hsrp, vrrp, multicast, or network</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enter static router configuration mode:

```
RP/0/RP0/CPU0:router(config)# router static
RP/0/RP0/CPU0:router(config-static)#
```
vrf (static)

To configure a VPN routing and forwarding (VRF) instance and enter VRF configuration mode, use the `vrf` command in router configuration mode. To remove the VRF instance from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
vrf vrf-name
no vrf vrf-name
```

### Syntax Description

- **vrf-name**  
  Name of the VRF instance. The following names cannot be used: all, default, and global.

### Command Default

No default behavior or values

### Command Modes

Static router configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `vrf` command to configure a VRF instance. A VRF instance is a collection of VPN routing and forwarding tables maintained at the provider edge (PE) router.

A static route is always associated with a VRF, which is entirely user configurable. Static route is unique within a VRF. A static route can point to a next-hop interface, next-hop IP address, or both, which can be resided in the same VRF configured for the static route or in a different VRF. For example, routes 172.168.40.0/24 and 172.168.50.0/24 are configured as follows:

```
router static
vrf vrf_A
address ipv4 unicast
172.168.40.0/24 loopback 1
172.168.50.0/24 vrf vrf_B 192.168.1.2
```

Routes 172.168.40.0/24 and 172.168.50.0/24 belong to vrf_A. Route 172.168.50.0/24 is not installed in vrf_A until next-hop 192.168.1.2 (a vrf_B route) is reachable.

If you are configuring a default VRF route, you do not need to enter VRF configuration mode. For example, routes 192.168.1.0/24 and 192.168.2.0/24 are configured as follows:

```
router static
address ipv4 unicast
  192.168.1.0/24 loopback 5
  192.168.2.0/24 10.1.1.1
```

Routes 192.168.1.0/24 and 192.168.2.0/24 are default VRF routes.

### Note

You cannot create a VRF named default, but you can reference the default VRF.
You must remove IPv4/IPv6 addresses from an interface prior to assigning, removing, or changing a VRF on an IP interface. If this is not done in advance, any attempt to change the VRF on an IP interface is rejected.
