

Implementing Certification Authority Interoperability

CA interoperability permits devices and CAs to communicate so that your device can obtain and use digital certificates from the CA. Although IPsec can be implemented in your network without the use of a CA, using a CA provides manageability and scalability for IPsec.

Note IPsec will be supported in a future release.

Feature History for Implementing Certification Authority Interoperability

Release	Modification
Release 6.0	This feature was introduced.
Release 7.3.1	Added support for Ed25519 Public-Key Signature System.
Release 7.3.1	Added support for verifying authenticity of RPM packages using runtime and install time fingerprint.
Release 7.3.1	Added support to collect filesystem inventory.
Release 7.3.1	Added support for optimizations via IMA.

Information About Implementing Certification Authority

Supported Standards for Certification Authority Interoperability

Cisco supports the following standards:

- **IKE**—A hybrid protocol that implements Oakley and Skeme key exchanges inside the Internet Security Association Key Management Protocol (ISAKMP) framework. Although IKE can be used with other protocols, its initial implementation is with the IPSec protocol. IKE provides authentication of the IPSec peers, negotiates IPSec keys, and negotiates IPSec security associations (SAs).
- **Public-Key Cryptography Standard #7 (PKCS #7)**—A standard from RSA Data Security Inc. used to encrypt and sign certificate enrollment messages.
- **Public-Key Cryptography Standard #10 (PKCS #10)**—A standard syntax from RSA Data Security Inc. for certificate requests.
- **RSA keys**—RSA is the public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adelman. RSA keys come in pairs: one public key and one private key.
- **SSL**—Secure Socket Layer protocol.
- **X.509v3 certificates**—Certificate support that allows the IPSec-protected network to scale by providing the equivalent of a digital ID card to each device. When two devices want to communicate, they exchange digital certificates to prove their identity (thus removing the need to manually exchange public keys with each peer or specify a shared key at each peer). These certificates are obtained from a CA. X.509 as part of the X.500 standard of the ITU.

Certification Authorities

Purpose of CAs

CAs are responsible for managing certificate requests and issuing certificates to participating IPSec network devices. These services provide centralized key management for the participating devices.

CAs simplify the administration of IPSec network devices. You can use a CA with a network containing multiple IPSec-compliant devices, such as routers.

Digital signatures, enabled by public key cryptography, provide a means of digitally authenticating devices and individual users. In public key cryptography, such as the RSA encryption system, each user has a key pair containing both a public and a private key. The keys act as complements, and anything encrypted with

one of the keys can be decrypted with the other. In simple terms, a signature is formed when data is encrypted with a user's private key. The receiver verifies the signature by decrypting the message with the sender's public key. The fact that the message could be decrypted using the sender's public key indicates that the holder of the private key, the sender, must have created the message. This process relies on the receiver's having a copy of the sender's public key and knowing with a high degree of certainty that it does belong to the sender and not to someone pretending to be the sender.

Digital certificates provide the link. A digital certificate contains information to identify a user or device, such as the name, serial number, company, department, or IP address. It also contains a copy of the entity's public key. The certificate is itself signed by a CA, a third party that is explicitly trusted by the receiver to validate identities and to create digital certificates.

To validate the signature of the CA, the receiver must first know the CA's public key. Normally, this process is handled out-of-band or through an operation done at installation. For instance, most web browsers are configured with the public keys of several CAs by default. IKE, an essential component of IPSec, can use digital signatures to authenticate peer devices for scalability before setting up SAs.

Without digital signatures, a user must manually exchange either public keys or secrets between each pair of devices that use IPSec to protect communication between them. Without certificates, every new device added to the network requires a configuration change on every other device with which it communicates securely. With digital certificates, each device is enrolled with a CA. When two devices want to communicate, they exchange certificates and digitally sign data to authenticate each other. When a new device is added to the network, a user simply enrolls that device with a CA, and none of the other devices needs modification. When the new device attempts an IPSec connection, certificates are automatically exchanged and the device can be authenticated.

CA Registration Authorities

Some CAs have a registration authority (RA) as part of their implementation. An RA is essentially a server that acts as a proxy for the CA so that CA functions can continue when the CA is offline.

Prerequisites for Implementing Certification Authority

The following prerequisites are required to implement CA interoperability:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- You must install and activate the Package Installation Envelope (PIE) for the security software.

For detailed information about optional PIE installation, refer to the *System Management Guide*.

From Cisco IOS XR Software Release 7.0.1 and later, you need not install the PIE, because the functionality is available in the base image itself.

- You need to have a CA available to your network before you configure this interoperability feature. The CA must support Cisco Systems PKI protocol, the simple certificate enrollment protocol (SCEP) (formerly called certificate enrollment protocol [CEP]).

Restrictions for Implementing Certification Authority

- The software does not support CA server public keys greater than 2048 bits.
- Starting Cisco IOS XR Software Release 7.4.1, we mandate the below X509 certificate Subject Alternate Name (SAN) fields and domain name server configuration to validate SAN. TLS connection cannot be established if there is no domain name-server is configured.

Here are some key-points regarding SAN field:

- SAN must be a fully-qualified domain name. For example, DNS:smartreceiver.cisco.com
- SAN must be a critical extension in the absence of Common Name (CN).
- If the SAN cannot be represented as a FQDN, then it must be configured with GeneralName field as IP Address but not as DNS. For example, **IP address: 192.0.2.1**

To configure domain name-server use the **domain name-server** *ip-address*.

To configure domain name-server with VRF, use the following commands:

- **domain vrf name-server** *ip-address*
- Use the **crypto ca trustpoint-name vrf vrf-name** command when you are using VRF.
- Use the **crypto ca trustpoint Trustpool vrf vrf-name** command for smart-licensing.

For Static Domain Name Configuration, use the **domain ipv4 host** *host-name ip-address* command. and for configuring static domain name using VRF, use the **domain ipv4 vrf vrf-name host-name ip-address** command.

- Starting Cisco IOS XR Software Release 7.4.2, you can bypass FQDN and IP address check in SAN by configuring **crypto ca fqdn-check ip-address allow**.
- Starting Cisco IOS XR Software Release 7.10.1, in addition to SAN field, you must also set FQDN in the CN field. However, CN check can be bypassed by configuring **crypto ca fqdn ip-address allow**. For example, CN=root.cisco.com.

To ensure successful FQDN validations for **SAN & CN** fields, the device must have proper DNS configurations in place. If the DNS server becomes unreachable, it's mandatory to configure a static DNS entry. Failure to do so will result in certificate validation errors, leading to potential TLS authentication failures.

Note Cisco strongly recommends regenerating the existing certificates with valid FQDNs.

Configure Router Hostname and IP Domain Name

This task configures a router hostname and IP domain name.

You must configure the hostname and IP domain name of the router if they have not already been configured. The hostname and IP domain name are required because the router assigns a fully qualified domain name (FQDN) to the keys and certificates used by IPsec, and the FQDN is based on the hostname and IP domain name you assign to the router. For example, a certificate named `router20.example.com` is based on a router hostname of `router20` and a router IP domain name of `example.com`.

SUMMARY STEPS

1. **configure**
2. **hostname** *name*
3. **domain name** *domain-name*
4. Use the **commit** or **end** command.

DETAILED STEPS

Step 1 **configure**

Example:

```
RP/0/RP0/CPU0:router# configure
```

Enters global configuration mode.

Step 2 **hostname** *name*

Example:

```
RP/0/RP0/CPU0:router(config)# hostname myhost
```

Configures the hostname of the router.

Step 3 **domain name** *domain-name*

Example:

```
RP/0/RP0/CPU0:router(config)# domain name mydomain.com
```

Configures the IP domain name of the router.

Step 4 Use the **commit** or **end** command.

commit —Saves the configuration changes and remains within the configuration session.

end —Prompts user to take one of these actions:

- **Yes** — Saves configuration changes and exits the configuration session.
 - **No** —Exits the configuration session without committing the configuration changes.
 - **Cancel** —Remains in the configuration session, without committing the configuration changes.
-

Generate RSA Key Pair

This task generates an RSA key pair.

From Cisco IOS XR Software Release 7.0.1 and later, the crypto keys are auto-generated at the time of router boot up. Hence, step 1 is required to be configured only if the RSA host-key pair is not present in the router under some scenarios.

RSA key pairs are used to sign and encrypt IKE key management messages and are required before you can obtain a certificate for your router.

SUMMARY STEPS

1. **crypto key generate rsa [usage keys | general-keys] [keypair-label]**
2. **crypto key zeroize rsa [keypair-label]**
3. **show crypto key mypubkey rsa**

DETAILED STEPS

Step 1 **crypto key generate rsa [usage keys | general-keys] [keypair-label]**

Example:

```
RP/0/RP0/CPU0:router# crypto key generate rsa general-keys
```

Generates RSA key pairs.

- Use the **usage keys** keyword to specify special usage keys; use the **general-keys** keyword to specify general-purpose RSA keys.
- The *keypair-label* argument is the RSA key pair label that names the RSA key pairs.
- From Cisco IOS XR Release 7.3.2 onwards, you can configure this command from XR Config mode. For more details, see [Public Key-Pair Generation in XR Config Mode, on page 42](#).

Step 2 **crypto key zeroize rsa [keypair-label]**

Example:

```
RP/0/RP0/CPU0:router# crypto key zeroize rsa key1
```

(Optional) Deletes all RSAs from the router.

- Under certain circumstances, you may want to delete all RSA keys from your router. For example, if you believe the RSA keys were compromised in some way and should no longer be used, you should delete the keys.
- To remove a specific RSA key pair, use the *keypair-label* argument.
- From Cisco IOS XR Release 7.3.2 onwards, you can delete key-pairs with the **no** form of the command in [Step 1, on page 6](#) from XR Config mode. For more details, see [Public Key-Pair Generation in XR Config Mode, on page 42](#).

Step 3 **show crypto key mypubkey rsa**

Example:

```
RP/0/RP0/CPU0:router# show crypto key mypubkey rsa
```

(Optional) Displays the RSA public keys for your router.

Import Public Key to the Router

This task imports a public key to the router.

A public key is imported to the router to authenticate the user.

SUMMARY STEPS

1. `crypto key import authentication rsa [usage keys | general-keys] [keypair-label]`
2. `show crypto key mypubkey rsa`

DETAILED STEPS

Step 1 `crypto key import authentication rsa [usage keys | general-keys] [keypair-label]`**Example:**

```
RP/0/RP0/CPU0:router# crypto key import authentication rsa general-keys
```

Generates RSA key pairs.

- Use the **usage keys** keyword to specify special usage keys; use the **general-keys** keyword to specify general-purpose RSA keys.
- The *keypair-label* argument is the RSA key pair label that names the RSA key pairs.

Step 2 `show crypto key mypubkey rsa`**Example:**

```
RP/0/RP0/CPU0:router# show crypto key mypubkey rsa
```

(Optional) Displays the RSA public keys for your router.

Declare Certification Authority and Configure Trusted Point

This task declares a CA and configures a trusted point.

SUMMARY STEPS

1. `configure`

2. **crypto ca trustpoint ca-name**
3. **enrollment url CA-URL**
4. **query url LDAP-URL**
5. **enrollment retry period minutes**
6. **enrollment retry count number**
7. **rsa keypair keypair-label**
8. Use the **commit** or **end** command.

DETAILED STEPS

Step 1 **configure**

Example:

```
RP/0/RP0/CPU0:router# configure
```

Enters global configuration mode.

Step 2 **crypto ca trustpoint ca-name**

Example:

```
Router(config)# crypto ca trustpoint myca
```

Declares a CA.

- Configures a trusted point with a selected name so that your router can verify certificates issued to peers.
- Enters trustpoint configuration mode.

Note If you want to do certificate enrolment when the server or destination is in a VRF, use the following command after step 2 to configure the VRF:

```
Router(config-trustp)# vrf vrf-name
```

Step 3 **enrollment url CA-URL**

Example:

```
Router(config-trustp)# enrollment url http://ca.domain.com/certsrv/mscep/mscep.dll
```

Specifies the URL of the CA.

- The URL should include any nonstandard cgi-bin script location.

Note If you want to do certificate enrolment when the destination URL is in a VRF, use the following command instead:

```
Router(config-trustp)# enrollment url tftp-address;vrf-name/ca-name
```

Step 4 **query url LDAP-URL**

Example:

```
Router(config-trustp)# query url ldap://my-ldap.domain.com
```

(Optional) Specifies the location of the LDAP server if your CA system supports the LDAP protocol.

Step 5 **enrollment retry period minutes**

Example:

```
Router(config-trustp)# enrollment retry period 2
```

(Optional) Specifies a retry period.

- After requesting a certificate, the router waits to receive a certificate from the CA. If the router does not receive a certificate within a period of time (the retry period) the router will send another certificate request.
- Range is from 1 to 60 minutes. Default is 1 minute.

Step 6 **enrollment retry count number**

Example:

```
Router(config-trustp)# enrollment retry count 10
```

(Optional) Specifies how many times the router continues to send unsuccessful certificate requests before giving up.

- The range is from 1 to 100.

Step 7 **rsakeypair keypair-label**

Example:

```
Router(config-trustp)# rsakeypair mykey
```

(Optional) Specifies a named RSA key pair generated using the **crypto key generate rsa** command for this trustpoint.

- Not setting this key pair means that the trustpoint uses the default RSA key in the current configuration.

Step 8 Use the **commit** or **end** command.

commit —Saves the configuration changes and remains within the configuration session.

end —Prompts user to take one of these actions:

- **Yes** — Saves configuration changes and exits the configuration session.
- **No** —Exits the configuration session without committing the configuration changes.
- **Cancel** —Remains in the configuration session, without committing the configuration changes.

Authenticate CA

This task authenticates the CA to your router.

The router must authenticate the CA by obtaining the self-signed certificate of the CA, which contains the public key of the CA. Because the certificate of the CA is self-signed (the CA signs its own certificate), manually authenticate the public key of the CA by contacting the CA administrator to compare the fingerprint of the CA certificate.

SUMMARY STEPS

1. **crypto ca authenticate ca-name**
2. **show crypto ca certificates**

DETAILED STEPS

Step 1 **crypto ca authenticate ca-name**

Example:

```
RP/0/RP0/CPU0:router# crypto ca authenticate myca
```

Authenticates the CA to your router by obtaining a CA certificate, which contains the public key for the CA.

Step 2 **show crypto ca certificates**

Example:

```
RP/0/RP0/CPU0:router# show crypto ca certificates
```

(Optional) Displays information about the CA certificate.

Request Your Own Certificates

This task requests certificates from the CA.

You must obtain a signed certificate from the CA for each of your router's RSA key pairs. If you generated general-purpose RSA keys, your router has only one RSA key pair and needs only one certificate. If you previously generated special usage RSA keys, your router has two RSA key pairs and needs two certificates.

SUMMARY STEPS

1. **crypto ca enroll ca-name**
2. **show crypto ca certificates**

DETAILED STEPS

Step 1 **crypto ca enroll ca-name**

Example:

```
RP/0/RP0/CPU0:router# crypto ca enroll myca
```

Requests certificates for all of your RSA key pairs.

- This command causes your router to request as many certificates as there are RSA key pairs, so you need only perform this command once, even if you have special usage RSA key pairs.
- This command requires you to create a challenge password that is not saved with the configuration. This password is required if your certificate needs to be revoked, so you must remember this password.

- A certificate may be issued immediately or the router sends a certificate request every minute until the enrollment retry period is reached and a timeout occurs. If a timeout occurs, contact your system administrator to get your request approved, and then enter this command again.

Step 2 show crypto ca certificates**Example:**

```
RP/0/RP0/CPU0:router# show crypto ca certificates
```

(Optional) Displays information about the CA certificate.

Configure Certificate Enrollment Using Cut-and-Paste

This task declares the trustpoint certification authority (CA) that your router should use and configures that trustpoint CA for manual enrollment by using cut-and-paste.

SUMMARY STEPS

1. **configure**
2. **crypto ca trustpoint** *ca-name*
3. enrollment terminal
4. Use the **commit** or **end** command.
5. **crypto ca authenticate** *ca-name*
6. **crypto ca enroll** *ca-name*
7. **crypto ca import** *ca-name certificate*
8. show crypto ca certificates

DETAILED STEPS

Step 1 configure**Example:**

```
RP/0/RP0/CPU0:router# configure
```

Enters global configuration mode.

Step 2 crypto ca trustpoint *ca-name***Example:**

```
RP/0/RP0/CPU0:router(config)# crypto ca trustpoint myca RP/0//CPU0:router(config-trustp)#
```

Declares the CA that your router should use and enters trustpoint configuration mode.

- Use the *ca-name* argument to specify the name of the CA.

Step 3 enrollment terminal

Example:

```
RP/0/RP0/CPU0:router(config-trustp)# enrollment terminal
```

Specifies manual cut-and-paste certificate enrollment.

Step 4 Use the **commit** or **end** command.

commit —Saves the configuration changes and remains within the configuration session.

end —Prompts user to take one of these actions:

- **Yes** — Saves configuration changes and exits the configuration session.
- **No** —Exits the configuration session without committing the configuration changes.
- **Cancel** —Remains in the configuration session, without committing the configuration changes.

Step 5 **crypto ca authenticate** *ca-name*

Example:

```
RP/0/RP0/CPU0:router# crypto ca authenticate myca
```

Authenticates the CA by obtaining the certificate of the CA.

- Use the *ca-name* argument to specify the name of the CA. Use the same name that you entered in step 2.

Step 6 **crypto ca enroll** *ca-name*

Example:

```
RP/0/RP0/CPU0:router# crypto ca enroll myca
```

Obtains the certificates for your router from the CA.

- Use the *ca-name* argument to specify the name of the CA. Use the same name that you entered in Step 2.

Step 7 **crypto ca import** *ca-name* **certificate**

Example:

```
RP/0/RP0/CPU0:router# crypto ca import myca certificate
```

Imports a certificate manually at the terminal.

- Use the *ca-name* argument to specify the name of the CA. Use the same name that you entered in Step 2.

Note You must enter the **crypto ca import** command twice if usage keys (signature and encryption keys) are used. The first time the command is entered, one of the certificates is pasted into the router; the second time the command is entered, the other certificate is pasted into the router. (It does not matter which certificate is pasted first.)

Step 8 show crypto ca certificates

Example:

```
RP/0/RP0/CPU0:router# show crypto ca certificates
```

Displays information about your certificate and the CA certificate.

The following example shows how to configure CA interoperability.

Comments are included within the configuration to explain various commands.

```

configure
hostname myrouter
domain name mydomain.com
end

Accessing Certificate Enrollment URL Using HTTP Proxy via specified Source Interface

Table 1: Feature History Table

Feature Name	Release Information	Feature Description
Accessing Certificate Enrollment URL Using HTTP Proxy via specified Source Interface	Release 7.9.1	<p>With this feature, you can enable the router to use an HTTP proxy to access the certificate enrollment URL. The router uses the already available HTTP proxy configurations to fetch Certificate Revocation List (CRL) to access the certificate enrollment URL. In addition, you can specify a source interface through which the router places the enrollment requests.</p> <p>This feature reduces the enrollment URL access failures when the router fails to reach the enrollment URL directly or when the enrollment URL is only reachable via an HTTP proxy.</p>

The router uses enrollment URL to authenticate (i.e. fetch the CA certificate) and enroll the router/leaf certificate which is to be utilised by different applications like gRPC Protocol, System Logging over Transport Layer Security (TLS), MACsec Encryption, and so on. The enrollment URL is available in the trustpoint in the router that manages and tracks the CAs and certificates. When the router needs the CA for managing certificate requests and issuing certificates, it uses the enrollment URL to reach the CA. Sometimes, the router may not be able to reach the CA via an enrollment URL. It could be due to an enrollment URL not being directly reachable from the router or the enrollment URL being only accessible by an HTTP proxy. In such scenarios, the authentication or enrollment request processing fails.

With this feature, you can configure the router to route the enrollment URL requests through an HTTP proxy. Also, you can specify a source interface through which the enrollment requests are sent. Here the router checks for HTTP proxy and source interface configurations while requesting a connection to an enrollment URL. If both configs are present, the router makes the enrollment URL request from the source interface specified in the configurations through the HTTP proxy. When the CA configurations include the HTTP proxy with the source interface missing, the enrollment request will be sent through the HTTP proxy without being bound to any specific interface. When the configurations only include the source interface and the HTTP proxy is missing, such request is sent directly from the specified source interface.

Configuration

The following example shows the configuration for the http proxy server and source interface:

```
<!---Enabling the Router to use HTTP Proxy Server for accessing CA. For more information,
see crypto ca http-proxy.----!>
Router# config
```

```

Router(config)# crypto ca http-proxy 10.10.10.1 port 80
Router(config)# commit

<!--Enabling the Router to use specified Source Interface for accessing CA. For more
information, see crypto ca source interface.-->
Router# config
Router(config)# crypto ca source-interface ipv4 MgmtEth0/RP0/CPU0/0
Router(config)# commit

```

Certificate Authority Trust Pool Management

The trust pool feature is used to authenticate sessions, such as HTTPS, that occur between devices by using commonly recognized trusted agents called certificate authorities (CAs). This feature is enabled by default in the software to create a scheme to provision, store, and manage a pool of certificates from known CAs in a way similar to the services a browser provides for securing sessions. A special trusted point called a trust pool is designated, containing multiple known CA certificates from Cisco and possibly from other vendors. The trust pool consists of both built-in and downloaded CA certificates.

Implementing Certification Authority Interoperability provides details on Certificate Authority and trusted point.

CA Certificate Bundling in the Trust Pool

The router uses a built-in CA certificate bundle that is packaged into the asr9k-k9sec PIE. The bundle is contained in a special certificate store called a CA trust pool, which is updated automatically by Cisco. This trust pool is known by Cisco and other vendors. A CA certificate bundle can be in the following formats:

- Privilege Management Infrastructure (PMI) certificates in Distinguished Encoding Rules (DER) binary format enveloped within a public-key cryptographic message syntax standard 7 (pkcs7).
- A file containing concatenated X.509 certificates in Privacy Enhanced Mail (PEM) format with PEM headers.

Prerequisites for CA Trust Pool Management

Restrictions for CA trust pool management

- Device certificates that use CA certificates cannot be enrolled in a CA trust pool.
- Starting with Cisco IOS XR software version 7.3.4, the server certificates (leaf certificates) in the router must have a Fully Qualified Domain Name (FQDN) in the Common Name (CN) field.
- To add an IP address in the Subject Alternate Name (SAN) field of server certificates, add the extension type as IP address in the certificate. If the IP address extension type configuration isn't available, use the [crypto ca fqdn-check ip-address allow](#) command for the router to validate the IP address in the SAN field successfully.

Updating the CA Trustpool

The CA trustpool must be updated when the following conditions occur:

- A certificate in the trustpool is due to expire or has been reissued.
- The published CA certificate bundle contains additional trusted certificates that are needed by a given application.
- The configuration has been corrupted.

The CA trustpool is considered as a single entity, As such, any update you perform will replace the entire trustpool.

Note A built-in certificate in the trustpool cannot be physically replaced. However, a built-in certificate is rendered inactive after an update if its X.509 subject-name attribute matches the certificate in the CA certificate bundle.

Following are the methods available for updating the certificates in the trustpool:

- **Automatic update:** A timer is established for the trustpool that matches the CA certificate with the earliest expiration time. If the timer is running and a bundle location is not configured and not explicitly disabled, syslog warnings should be issued at reasonable intervals to alert the admin that this trustpool policy option is not set. Automatic trustpool updates use the configured URL. When the CA trustpool expires, the policy is read, the bundle is loaded, and the PKI trustpool is replaced. If the automatic CA trustpool update encounters problems when initiating, then the following schedule is used to initiate the update until the download is successful: 20 days, 15 days, 10 days, 5 days, 4 days, 3 days, 2 days, 1 day, and then once every hour.
- **Manual update:** [Manually Update Certificates in Trust Pool, on page 17](#) provides details.

Manually Update Certificates in Trust Pool

The CA trust pool feature is enabled by default and uses the built-in CA certificate bundle in the trust pool, which receives automatic updates from Cisco. Perform this task to manually update certificates in the trust pool if they are not current, are corrupt, or if certain certificates need to be updated.

SUMMARY STEPS

1. `crypto ca trustpool import url clean`
2. `crypto ca trustpool import url url`
3. `show crypto ca trustpool policy`

DETAILED STEPS

	Command or Action	Purpose
Step 1	crypto ca trustpool import url clean Example: RP/0/RSP0/CPU0:IMC0#crypto ca trustpool import url clean	(Optional) Manually removes all downloaded CA certificates. This command is run in the EXEC mode.

	Command or Action	Purpose
Step 2	crypto ca trustpool import url url Example: RP/0/RSP0/CPU0:IMC0#crypto ca trustpool import url http://www.cisco.com/security/pki/trs/ios.p7b	Specify the URL from which the CA trust pool certificate bundle must be downloaded. This manually imports (downloads) the CA certificate bundle into the CA trust pool to update or replace the existing CA certificate bundle.
Step 3	show crypto ca trustpool policy Example: RP/0/RSP0/CPU0:IMC0#show crypto ca trustpool Trustpool: Built-In ===== CA certificate Serial Number : 5F:F8:7B:28:2B:54:DC:8D:42:A3:15:B5:68:C9:AD:FF Subject: CN=Cisco Root CA 2048,O=Cisco Systems Issued By : CN=Cisco Root CA 2048,O=Cisco Systems Validity Start : 20:17:12 UTC Fri May 14 2004 Validity End : 20:25:42 UTC Mon May 14 2029 SHA1 Fingerprint: DE990CED99E0431F60EDC3937E7CD5BF0ED9E5FA Trustpool: Built-In ===== CA certificate Serial Number : 2E:D2:0E:73:47:D3:33:83:4B:4F:DD:0D:D7:B6:96:7E Subject: CN=Cisco Root CA M1,O=Cisco Issued By : CN=Cisco Root CA M1,O=Cisco Validity Start : 20:50:24 UTC Tue Nov 18 2008 Validity End : 21:59:46 UTC Fri Nov 18 2033 SHA1 Fingerprint: 45AD6BB499011BB4E84E84316A81C27D89EE5CE7	Displays the CA trust pool certificates of the router in a verbose format.

Retrieve CRL through the HTTP Proxy Server

CRL contains the serial numbers of the third-party certificates that are invalidated by the issuing Certificate Authority. In the event that the CRL Distribution point (CDP) is not directly reachable, you can fetch the CRL through the http proxy server using the newly introduced **crypto ca http-proxy** command.

The router receives a certificate from a peer and downloads a CRL from the CA as part of certificate validation. The router then checks the CRL to make sure the certificate of the peer has not been revoked. If the certificate appears on the CRL, the router will not accept the certificate and will not authenticate the peer.

A CRL can be reused with the same certificate multiple times until the CRL expires.

If the router receives the certificate of a peer after the applicable CRL has expired, the router downloads the new CRL.

If the CRL Distribution point (CDP) is not directly reachable, you can obtain the CRL through the http proxy server using this feature.

Configuration Example

This example shows how to retrieve CRL through the http proxy server using the **crypto ca http-proxy** command for smart licensing:

<!---Enabling the Router to use HTTP Proxy Server to Retrieve CRL----!>

```
Router# config
Router(config)# crypto ca http-proxy 10.10.10.1 port 1
Router(config)# commit
```

<!---Registering the Router with a Token on the Smart Licensing Server----!>

```
Router# license smart register idtoken NWRkMTJjZjYtMzJhNi00YzYxLWI3M$
Router# commit
```

Verification

Smart licensing registration is validated by fetching the CRL from the CDP, through the http proxy server. If the validation is successful, then the **show crypto ca crls** command displays the CRLs. If the validation has failed, then the **show crypto ca crls** command displays no output.

This example shows how to verify the retrieved CRL and the license status:

<!---Verifying the Retrieved CRLs----!>

```
Router#show crypto ca crls
Thu Jun  6 13:43:00.763 UTC
CRL Entry

Note If you want to fetch the latest CRL from a specific CDP, use the **crypto ca crl request** *<cdp-url>* [**http-proxy** *<ip-address>* **port** *<port-number>*] command.

Configuring Optional Trustpool Policy Parameters

SUMMARY STEPS

1. **configure**
2. **crypto ca trustpool policy**
3. **cabundle url URL**
4. **crl optional**
5. **description LINE**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|--|--|
| Step 1 | configure
Example:

RP/0/RP0/CPU0:router# configure | Enters global configuration mode. |
| Step 2 | crypto ca trustpool policy
Example:
RP/0/RSP0/CPU0:IMC0(config)#crypto ca trustpool policy
RP/0/RSP0/CPU0:IMC0(config-trustpool)# | Enters ca-trustpool configuration mode where commands can be accessed to configure CA trustpool policy parameters. |
| Step 3 | cabundle url URL
Example:
RP/0/RSP0/CPU0:IMC0(config-trustpool)#cabundle url http://www.cisco.com/security/pki/crl/crca2048.crl | Specifies the URL from which the CA trustpool certificate bundle is downloaded. |
| Step 4 | crl optional
Example:
RP/0/RSP0/CPU0:IMC0(config-trustpool)#crl optional | Disables revocation checking when the trustpool policy is being used. By default, the router enforces a check of the revocation status of the certificate by querying the certificate revocation list (CRL). |

| | Command or Action | Purpose |
|--------|--|---------|
| Step 5 | description LINE
Example:
<pre>RP/0/RSP0/CPU0:IMC0(config-trustpool)#description Trustpool for Test.</pre> | |

Handling of CA Certificates appearing both in Trust Pool and Trust Point

There may be cases where a CA resides in both the trust pool and a trust point; for example, a trust point is using a CA and a CA bundle is downloaded later with this same CA inside. In this scenario, the CA in the trust point and its policy is considered, before the CA in the trust pool or trust pool policy to ensure that any current behavior is not altered when the trust pool feature is implemented on the router.

The policy indicates how the security appliance obtains the CA certificate and the authentication policies for user certificates issued by the CA.

Expiry Notification for PKI Certificate

The section provides information about the notification mechanism using SNMP trap and syslog messages when a public key infrastructure (PKI) certificate is approaching its expiry date.

Learn About the PKI Alert Notification

Security is critical and availability of certificates for applications is vital for authenticating the router. If the certificate expires, they become invalid and impacts services like Crosswork Trust Insights, Internet Key Exchange version 2, dot1x, and so on.

What if there is a mechanism to alert the user about the expiry date of the certificate?

From Release 7.1.1, IOS -XR provides a mechanism by which a CA client sends a notification to a syslog server when certificates are on the verge of expiry. Alert notifications are sent either through the syslog server or Simple Network Management Protocol (SNMP) traps.

PKI traps retrieves the certificate information of the devices in the network. The device sends SNMP traps at regular intervals to the network management system (NMS) based on the threshold configured in the device.

An SNMP trap (certificate expiry notification) is sent to the SNMP server at regular intervals starting from 60 days to one week before the certificate end date. The notifications are sent at the following intervals:

The notifications are sent at the following intervals:

| Intervals | Description | Notification Mode |
|--------------------|--|---|
| First notification | The notification is sent 60 days before the expiry of the certificate. | The notification are in a warning mode. |

| Intervals | Description | Notification Mode |
|------------------------|---|--|
| Repeated notifications | The repeated notification is sent every week, until a week before the expiry of the certificate.

The notifications are in a warning mode when the certificate is valid for more than a week. | The notifications are in a warning mode when the certificate is valid for more than a week. |
| Last notification | The notifications are sent every day until the certificate expiry date. | The notifications are in an alert mode when the validity of a certificate is less than a week. |

The notifications include the following information:

- Certificate serial number
- Certificate issuer name
- Trustpoint name
- Certificate type
- Number of days remaining for the certificate to expire
- Certificate subject name

The following is a syslog message that is displayed on the device:

```
%SECURITY-CEPKI-1-CERT_EXPIRING_ALERT : Certificate expiring WITHIN A WEEK.
Trustpoint Name= check, Certificate Type= ID, Serial Number= 02:EC,
Issuer Name= CN=cacert,OU=SPBU,O=CSCO,L=BGL,ST=KA,C=IN, Subject name= CN=cisco.com,
Time Left= 1 days, 23 hours, 59 minutes, 41 seconds
```

Restrictions for PKI Credentials Expiry Alerts

Alerts are not sent for the following certificates:

- Secure Unique Device Identifier (SUDI) certificates
- Certificates that belong to a trustpool. Trustpools have their own expiry alerts mechanism
- Trustpoint clones
- CA certificates that do not have a router certificate associated with it.
- Certificates with key usage keys

Enable PKI Traps

This feature cannot be disabled and requires no additional configuration tasks.

To enable PKI traps, use the **snmp-server traps pki** command. If SNMP is configured, the SNMP trap is configured in the same PKI expiry timer.

```
Router(config)# snmp-server traps pki
Router(config)# commit
```

Verification

This example shows sample output from the show running-config command.

```
Router# show runn snmp-server traps
snmp-server traps pki
```

What's Next: See [Regenerate the Certificate](#).

Regenerate the Certificate

The certificate becomes invalid once expired. When you see the certificate expiry notification, we recommend you to regenerate the certificate, as soon as possible.

Perform the following steps, to regenerate the certificates:

1. Clear the existing certificate using the following command:

```
Router# clear crypto ca certificates [trustpoint-name]
```

For example,

```
Router# clear crypto ca certificates myca
```

2. We recommend you to regenerate a new keypair for the label configured under the trustpoint-name. The new keypair overwrites the old key pair.

```
Router# crypto key generate rsa [keypair-label]
```

For example,

```
Router# crypto key generate rsa mykey
```

```
The name for the keys will be: mykey
```

```
% You already have keys defined for mykey
```

```
Do you really want to replace them? [yes/no]: yes
```

```
Choose the size of the key modulus in the range of 512 to 4096 for your General Purpose Keypair. Choosing a key modulus greater than 512 may take a few minutes.
```

```
How many bits in the modulus [2048]:
```

```
Generating RSA keys ...
```

```
Done w/ crypto generate keypair
```

```
[OK]The name for the keys will be: mykey
```

```
% You already have keys defined for mykey
```

```
Do you really want to replace them? [yes/no]: yes
```

```
Choose the size of the key modulus in the range of 512 to 4096 for your General Purpose Keypair. Choosing a key modulus greater than 512 may take a few minutes.
```

```
How many bits in the modulus [2048]:
```

```
Generating RSA keys ...
```

```
Done w/ crypto generate keypair
```

```
[OK]
```

3. Reenroll the certificate using the following command. For more information, see [Request Your Own Certificates, on page 10](#).

```
Router# crypto ca authenticate [trustpoint-name]
```

```
Router# crypto ca enroll [trustpoint-name]
```

For example,

```
Router# crypto ca authenticate myca
```

```
Router# crypto ca enroll myca
```

Automatic renewal of PKI certificate

Table 2: Feature History Table

| Feature Name | Release Information | Feature Description |
|--|---------------------|---|
| Automatic renewal of Public Key Infrastructure (PKI) certificate | Release 7.5.3 | <p>You can now enable the router to renew the PKI certificate from the Certificate Authority (CA) by configuring the percentage of the certificate validity, after which the router requests a new certificate from the CA, and the CA authorizes it before certification expiration. This feature eliminates the previously needed manual efforts of certification renewal and avoids interruptions such as MACsec session flaps due to certificate expiry and so on.</p> <p>This feature introduces the following commands:</p> <ul style="list-style-type: none"> • auto-enroll • renewal-message-type |

The public key infrastructure (PKI) controls the digital certificates that protect the sensitive information flowing through a network to provide secure end-to-end communication. The PKI encrypts and decrypts data using a public key and a private key pair that it generates. A PKI (digital) certificate is a digital entity used to authenticate the identity of a router. These PKI certificates often have a short validity time and would need manual efforts from the network operators to replace them in time.

With automatic renewal of PKI certificate, the router has an ability to automatically renew the PKI certificate when it is approaching its expiry date. Here, you can configure a timeline for the PKI certificate renewal. You can specify the percentage of certificate validity, after which you would prefer the router to request a new certificate from the CA server. This timeline for auto-renewal of the PKI certificate is called auto-enroll. When a router with auto-enroll configured completes the said period, the router will generate a certificate signing request and sends the request to the CA using Simple Certificate Management Protocol (SCMP). The CA server will immediately create a newly signed certificate and ensures that it replaces the old certificate in the router. This way, automatic renewal of the PKI certificate before expiry avoids any interruptions to data flowing through the network.

Figure 1: Automatic renewal of PKI certificate

Pre-requisites

- Ensure that the CA has a valid certificate.
- Make sure that the CA possess certificate renewal capability.
- You must configure a trustpoint in the router. Configure the trustpoint using [crypto ca trustpoint](#) command.

Note A trustpoint should be authenticated before any enrolment. The trustpoint is authenticated when it has a CA certificate, and it is enrolled when it has a router certificate.

- The communication between the PKI Client and CA server should be over HTTP protocol. That is, the enrollment url for CA server should a HTTP url.

Configuration Guidelines

- The PKI certificates are signed using the RSA algorithm only.
- If you configure the auto-enroll option under trustpoint after the renew timer for a PKI certificate has started, then such configuration will only apply to the next renewal cycle and not the current one. The same condition applies while configuring the **no auto-enroll** option as well.
- The auto-enroll percentage may range between 1 and 99.
- The certificate renewal process requires the serial number and IP address values in the trustpoint. If these values are readily available under the trustpoint, the renewal process obtains it from there. If not, the router CLI requests you to configure these values during trustpoint enrollment.
- By default, the PKI uses PKCS requests for automatic certification renewal. You can also configure the router to use the Renewal request by executing the **renewal-message-type renewalreq** command.
- If the CA server is unable to address the certificate renewal requests, it requests the router to poll the renewal request. In such scenarios, by default, the router retries for 10 minutes with a gap of 1 minute between each request if a certificate renewal attempt fails. You can also configure these values using the **enrollment retry count** and **enrollment retry period** commands.

Configuration Example

Configuration

Configuring this feature using the CLI:

```
Router# configure
Router(config)# crypto ca trustpoint test
Router(config-trustp)# enrollment url http://frog.phoobin.com
Router(config-trustp)# subject-name OU=Spiral Dept., O=tiedye.com
Router(config-trustp)# auto-enroll 30
Router(config-trustp)# commit
```

To disable this feature, execute the following:

```
Router# configure
Router(config)# no auto-enroll
Router(config-trustp)# commit
```

Running configuration

```
Router# show running-config crypto ca trustpoint test
crypto ca trustpoint test
  enrollment url http://frog.phoobin.com
  auto-enroll 30
!
```

Integrating Cisco IOS XR and Crosswork Trust Insights

The Cisco IOS XR Software provides you the infrastructure to enroll and share the signed-data with Cisco Crosswork cloud infrastructure and applications. The [Cisco Crosswork Trust Insights](#) is a cloud-based Software as a service (SaaS) that provides signed and encrypted system integrity information to track the trust posture of network hardware and software components. For details, see [Cisco Crosswork Trust Insights Data Sheet](#).

Integrating IOS XR and Crosswork Trust Insights include these main processes:

- System enrollment – Enrolling a Cisco IOS XR platform into Crosswork cloud infrastructure.
- Signed-data sharing – Sharing the data for infrastructure trust analysis between the systems that run IOS XR and Crosswork. This involves collecting the signed-data dossier, that is, signed-data that is needed for infrastructure trust inspection service.

Workflow

The following steps depict the workflow of Cisco IOS XR and Crosswork Trust Insights integration:

1. As part of the enrollment process, the user generates new key pair and trust root within the IOS XR system by using the IOS XR commands.
2. The user logs into the Trust Inspector service, and enters the enrollment workflow in the enrollment dialog to create a new device ID. The user must provide the management IP address, login credentials and certificate root to the Trust Inspector service.
3. The Trust Inspector service configures the Crosswork collector to log in to the router, and to pull the data that is pushed down from the cloud to the collector.
4. The Crosswork collector begins a periodic polling cycle and executes a command to generate a signed-information dossier from each IOS XR instance that is being polled.
5. The collector forwards the signed-envelope data to the cloud service for validation.
6. The cloud service validates signed-envelope against the enrolled certificate or trust chain.

How to Integrate Cisco IOS XR and Crosswork Trust Insights

Integrating Cisco IOS XR and Crosswork Trust Insights involve these main tasks for system enrollment and data-signing:

- [Generate Key Pair, on page 29](#)
- [Generate System Trust Point for the Leaf and Root Certificate, on page 31](#)
- [Generate Root and Leaf Certificates, on page 32](#)
- [System Certificates Expiry, on page 33](#)
- [Collect Data Dossier, on page 34](#)

Prerequisites

Before you begin, you must check [here](#) for any available IOS XR Software Maintenance Updates (SMUs) specific to Crosswork Trust Insights. For information related to SMUs, see [Cisco IOS XR Release Notes](#).

You must ensure that the below configurations are present on the IOS XR device, before starting IOS XR and Crossworks Trust Insights integration.

- User authorization required to collect the signed-data dossier
- SSH server configuration
- Netconf server configuration
- Domain name configuration, which is required for certification enrollment

The sections given below lists the configuration example for the prerequisites.

Configuration Example for User Authorization

You must have the required user access privileges in order to collect the data dossier from the system. This is defined in terms of IOS XR Task IDs for each command.

For the respective Task ID applicable for each data dossier option and for the signed-envelope, see the Task ID section in the Command Reference page of **show platform security integrity dossier** command and **utility sign** command.

Note We recommend that you use the **task execute dossier** to configure a CTI (customer-define) user, who collects dossier from the system.

Listed below are the configurations to set up a user with sufficient authorization to collect all the signed-data dossier. You can configure customized task groups, then associate those task groups with user groups, and finally associate the user groups with the user.

```
Router#configure
Router(config)#taskgroup alltasks-dossier
Router(config-tg)#task read sysmgr
Router(config-tg)#task read system
Router(config-tg)#task read pkg-mgmt
Router(config-tg)#task read basic-services
Router(config-tg)#task read config-services
Router(config-tg)#task execute dossier
Router(config-tg)#task execute basic-services
Router(config-tg)#commit
```

```
Router#configure
Router(config)#usergroup dossier-group
Router(config-ug)#taskgroup alltasks-dossier
Router(config-ug)#commit
```

```
Router#configure
Router(config)#username dossier-user
Router(config-un)#group dossier-group
Router(config-un)#commit
```

Configuration Example for for SSH and Netconf

```
Router#configure
Router(config)#ssh server v2
Router(config)#ssh server vrf default
Router(config)#ssh server netconf vrf default
Router(config)#netconf-yang agent
Router(config-ncy-agent)#ssh
Router(config-ncy-agent)#exit
Router(config)#domain name example.com
Router(config)#commit
```

Running Configuration

```
ssh server v2
ssh server vrf default
ssh server netconf vrf default
!
netconf-yang agent
  ssh
!
domain name example.com
```

While the dossier is collected from a device through SSH, the SSH session might timeout. Also, multiple ssh sessions to a device can result in the denial of some SSH sessions. To avoid such occurrence, the following configuration is recommended on the device:

```
Router#configure
Router(config)#ssh server rate-limit 600
Router(config)#line default
Router(config-line)#exec-timeout 0 0
Router(config-line)#session-timeout 0
Router(config-line)#commit
```

Running Configuration

```
ssh server rate-limit 600
!
line default
  exec-timeout 0 0
  session-timeout 0
!
```

Generate Key Pair

To enroll a system running Cisco IOS XR Software, you must generate the key and the certificate for both the leaf and the root node. The system supports a two tier self-signed certificate chain for the enrollment key to support re-keying without re-enrollment of the certificate with the Crossworks service.

You can use the **system-root-key** and **system-enroll-key** options in the **crypto key generate** command to generate the root key and the enrollment key respectively, for all the hashing algorithms. You can do this for hashing algorithms such as RSA, DSA or ECDSA (including ECDSA nistp384 and ECDSA nistp521).

Example of Generating Key Pair

Key pair generation for root:

```
Router#crypto key generate rsa system-root-key
```

```
Sun Oct 20 13:05:26.657 UTC
The name for the keys will be: system-root-key
Choose the size of the key modulus in the range of 512 to 4096 for your General Purpose
Keypair. Choosing a key modulus greater than 512 may take a few minutes.
How many bits in the modulus [2048]:
Generating RSA keys ...
Done w/ crypto generate keypair
[OK]
```

Key pair generation for leaf:

```
Router#crypto key generate rsa system-enroll-key
```

```
Sun Oct 20 13:05:40.370 UTC
The name for the keys will be: system-enroll-key
Choose the size of the key modulus in the range of 512 to 4096 for your General Purpose
Keypair. Choosing a key modulus greater than 512 may take a few minutes.
How many bits in the modulus [2048]:
Generating RSA keys ...
Done w/ crypto generate keypair
[OK]
```

Verification

You can use the **show crypto key mypubkey rsa** command to verify the above key pair generation.

```
Router#show crypto key mypubkey rsa | begin system-
```

```
Fri Mar 27 14:00:20.954 IST

- crypto key generate rsa
- show crypto key mypubkey dsa
- show crypto key mypubkey ecDSA
- show crypto key mypubkey rsa

Generate System Trust Point for the Leaf and Root Certificate

You must configure these steps to generate the system trust point for the root and the leaf certificate:

Configuration Example

```
Router#config
Router(config)#domain name domain1
Router(config)#crypto ca trustpoint system-trustpoint
Router(config)#keypair rsa system-enroll-key
Router(config)#ca-keypair rsa system-root-key
Router(config)#subject-name CN=lab1-ads,C=US,ST=CA,L=San Jose,O=cisco systems,OU=ASR
Router(config)#subject-name ca-certificate CN=lab1-ca,C=US,ST=CA,L=San Jose,O=cisco
systems,OU=ASR
Router(config)#enrollment url self
Router(config)#key-usage certificate digitalsignature keyagreement dataencipherment
Router(config)#lifetime certificate 300
Router(config)#message-digest sha256
Router(config)#key-usage ca-certificate digitalsignature keycertsign crlsign
Router(config)#lifetime ca-certificate 367
Router(config)#commit
```

Running Configuration

```
config
domain name domain1
crypto ca trustpoint system-trustpoint
keypair rsa system-enroll-key
ca-keypair rsa system-root-key
subject-name CN=lab1-ads,C=US,ST=CA,L=San Jose,O=cisco systems,OU=ASR
subject-name ca-certificate CN=lab1-ca,C=US,ST=CA,L=San Jose,O=cisco systems,OU=ASR
enrollment url self
key-usage certificate digitalsignature keyagreement dataencipherment
lifetime certificate 300
message-digest sha256
key-usage ca-certificate digitalsignature keycertsign crlsign
lifetime ca-certificate 367
!
```

Associated Commands

- ca-keypair
- crypto ca trustpoint
- domain
- enrollment
- key-usage
- key-pair
- lifetime
- message-digest
- subject-name

Generate Root and Leaf Certificates

You must perform these steps to generate the root and the leaf certificates.

The root certificate is self-signed. The root certificate signs the leaf certificate.

Example of Generating Root Certificate

```
Router#crypto ca authenticate system-trustpoint

Sun Oct 20 13:07:24.136 UTC
% The subject name in the certificate will include: CN=lab1
ca,C=US,ST=CA,L=San Jose,O=cisco systems,OU=ASR
% The subject name in the certificate will include: ios.cisco.com
Serial Number : 0B:62
Subject:
serialNumber=c44a11fc,unstructuredName=ios.cisco.com,OU=ASR,O=cisco systems,L=San
Jose,ST=CA,C=US,CN=lab1-ca
Issued By :
serialNumber=c44a11fc,unstructuredName=ios.cisco.com,OU=ASR,O=cisco systems,L=San
Jose,ST=CA,C=US,CN=lab1-ca
Validity Start : 13:07:26 UTC Sun Oct 20 2019
Validity End : 13:07:26 UTC Wed Oct 21 2020
SHA1 Fingerprint:
9DD50A6B24FEBC1DDEE40CD2B4D99A829F260967
```

Example of Generating Leaf Certificate

```
Router#crypto ca enroll system-trustpoint

Sun Oct 20 13:07:45.593 UTC
% The subject name in the certificate will include: CN=lab1-ads,C=US,ST=CA,L=San Jose,O=cisco
systems,OU=ASR
% The subject name in the certificate will include: ios.cisco.com
% Include the router serial number in the subject name? [yes/no]: yes
% The serial number in the certificate will be: c44a11fc
% Include an IP address in the subject name? [yes/no]: no
Certificate keypair configured Type: 1, Label: system-enroll-key. Leaf cert key usage string:
critical,digitalSignature,keyEncipherment,keyAgreement. Serial Number : 0B:63
Subject:
serialNumber=c44a11fc,unstructuredName=ios.cisco.com,OU=ASR,O=cisco systems,L=San
Jose,ST=CA,C=US,CN=lab1-ads
Issued By :
```

```

        serialNumber=c44a11fc,unstructuredName=ios.cisco.com,OU=ASR,O=cisco systems,L=San
Jose,ST=CA,C=US,CN=lab1-ca
    Validity Start : 13:07:47 UTC Sun Oct 20 2019
    Validity End   : 13:07:47 UTC Sat Aug 15 2020
    SHA1 Fingerprint:
        19D4C40F9EFF8FF25B59DE0161BA6C0706DC9E3A

```

Verification

You can use the **show crypto ca certificates system-trustpoint [detail]** command to see the details of generated root and leaf certificates:

```

Router#show crypto ca certificates system-trustpoint
Fri Mar 27 14:00:51.037 IST

```

```

Trustpoint      : system-trustpoint

```

Associated Commands

- **crypto ca authenticate**
- **crypto ca enroll**
- **show crypto ca certificates system-trustpoint**

System Certificates Expiry

You need to regenerate the certificate, before it expires. From Release 7.1.1, IOS -XR provides a mechanism by which a CA client sends a notification to a syslog server when certificates are on the verge of expiry. For more information see [Learn About the PKI Alert Notification, on page 21](#).

When you see the certificate expiry notification, we recommend you to regenerate the certificate, see [Regenerate the Certificate, on page 23](#).

The following example shows how to regenerate the certificate.

```
Router# clear crypto ca certificates system-trustpoint
Router# crypto ca authenticate system-trustpoint
Router# crypto ca enroll system-trustpoint
```

Collect Data Dossier

Table 3: Feature History Table

| Feature Name | Release Information | Description |
|------------------------------|---------------------|--|
| Collect Filesystem Inventory | Release 7.3.1 | <p>With this feature, a snapshot of the filesystem metadata such as when the file was created, modified, or accessed is collected at each configured interval.</p> <p>In addition to displaying the changes that the file underwent as compared to the previous snapshot, the inventory helps in maintaining data integrity of all the files in the system.</p> |
| IMA Optimization | Release 7.3.1 | <p>Integrity Measurement Architecture (IMA) is a Linux-based utility that attests and appraises the integrity of a system security, at runtime. In this release, IMA introduces the following IMA optimization aspects:</p> <ul style="list-style-type: none"> • Incremental IMA that collects IMA events selectively and progressively instead of collecting all the IMA events at the same time. You can define the start of an IMA sequence, which consists of start event, start sequence number, and start time. • SUDI Signature - provides the hardware root of trust to the dossier that is collected by the system. |

| Feature Name | Release Information | Description |
|------------------------------------|---------------------|---|
| Support for Display Compact Option | Release 7.4.1 | <p>This release introduces:</p> <ul style="list-style-type: none"> • Display compact option in the dossier CLI, thereby allowing you to obtain IMA event logs in the protobuf format, which can be decoded at a client site. This provides flexibility to use any decoding mechanism <p>Use the <code>display compact</code> keyword with the existing <code>show platform security integrity dossier include system-integrity-snapshot</code> command.</p> |

The Cisco IOS XR Software provides a data dossier command, **show platform security integrity dossier**, that helps in collecting the data from various IOS XR components. The output is presented in JSON format.

You can choose various selectors for this command as given below :

```
Router#show platform security integrity dossier include packages reboot-history
rollback-history system-integrity-snapshot system-inventory nonce 1580 | utility sign nonce
1580 include-certificate
```

Create Signed-Envelope

To verify the data integrity and authenticity of the data dossier output, a signature is added to the output data. To enable this feature, you can use the **utility sign** command along with the **show platform security integrity dossier** command. The output is presented in JSON format.

This **utility sign** can also be used with any of the IOS XR commands.

Note The Secure Unique Device Identifier or SUDI signature provides the hardware root of trust to the dossier that is collected by the system.

Verification Example

```
Router#show platform security integrity dossier include reboot-history nonce 1580 |
utility sign nonce 1580 include-certificate
NCS5500
```

Collect Filesystem Inventory

The metadata of the filesystem can be collected using data dossier. The metadata of the file includes information about time the file was created, last accessed, last modified and so on. A snapshot is captured at each configured

interval. The initial snapshot shows a complete snapshot of all files in the filesystem. The files are scanned periodically and new inventory data is collected and stored as incremental snapshots.

Note Data about System admin, Host, and LC-specific files are not monitored.

To enable this feature, use the **filesystem-inventory** command.

```
Router(config)#filesystem-inventory
Router(config-filesystem-inventory)#snapshot-interval 2
Router(config-filesystem-inventory)#commit
```

The `snapshot-interval` is the time interval in 15-minute blocks. The interval ranges 1–96. For example, value of 2 indicates that a snapshot interval is collected every 30 minutes. The snapshots are stored in `in/misc/scratch/filesysinv`. The logs are stored in `/var/log/iosxr/filesysinv/*`.

To retrieve the filesystem inventory, use the following dossier command. Output is presented in JSON format.

```
show platform security integrity dossier include filesystem-inventory | file
<platform>-parent.json

{"collection-start-time":1610168028.380901,

"},
-----Output is snipped for brevity
-----
```

To limit the number of snapshots, use the following command:

```
show platform security integrity dossier include filesystem-inventory
filesystem-inventory-options '{"0/RP0/CPU0": {"block_start": 0, "count": 1}}'
```

To start from a new block, use the following command:

```
show platform security integrity dossier include filesystem-inventory
filesystem-inventory-options '{"0/RP0/CPU0": {"block_start": 5}}'
```

To collect data from a remote node, use the following command:

```
show platform security integrity dossier include filesystem-inventory
filesystem-inventory-options '{"0/RP1/CPU0": {"block_start": 0}}' | file
harddisk:PE1_remote.json
```

Following is the sample of the display compact container:

```
{"node-data":[{"node-location":"node0_RP0_CPU0","up-time":150311,"start-time":"Tue Jul 27 13:55:12 2021","ima-event-log-compact":["IlyIABoMCO+ggIgGEMxwZYBIkQIABAKGhTU2yPVDA5Rx+64ecp41qZQrLEWSCACKhSXl+34007Taz5JUeBYFHlr05F7jIOYm9vdF9hZ2dyZWdhdGVAAQ==" ]}]}
```

Incremental Integrity Measurement Architecture

With incremental Integrity Measurement Architecture (IMA), you can define the starting IMA sequence that you want to include in a response. The system then starts to report the subsequent events.

```
show platform security integrity dossier incremental-ima  
"{\"ima_start\": [{\"0/RP0/CPU0\": {\"start_event\": 1000, \"start_time\": \"Tue Feb 16 09:15:17 2021\"}}]}"
```

Associated Command

- show platform security integrity dossier
- utility sign

Procedure to Test Key Generation and Data-signing with Different Key Algorithm

You can follow these steps to test key generation and data-signing with a different key algorithm:

- Unconfigure the trustpoint (using the **no crypto ca trustpoint system-trustpoint** command)
- Clear the certificates that were generated earlier (using the **clear crypto ca certificates system-trustpoint** command)
- Generate new keys.
- Configure the system trustpoint again.
- Authenticate and enroll the system trustpoint to generate the certificates.

See [How to Integrate Cisco IOS XR and Crosswork Trust Insights, on page 27](#) section for configuration steps of each task.

Verify Authenticity of RPM Packages Using Fingerprint

Table 4: Feature History Table

| Feature Name | Release Information | Description |
|---|---------------------|---|
| Verify Authenticity of RPM Packages Using Fingerprint | Release 7.3.1 | <p>This feature helps in verifying the authenticity of an installable package using fingerprint values. The fingerprint value of the package is compared with a point of reference called Known Good Value (KGV). The KGV for an image or package is generated after it is built by Cisco.</p> <p>After installing the package, the associated install time and build time fingerprint values are compared using Yang RPC to determine whether the package is genuine. A match in the fingerprints indicates that the package published on CCO and that installed on router are the same.</p> |

Is there a simple way to determine the authenticity of a package that is installed on a router? Is there a mechanism to identify whether a package signature is checked at install time, or detect changes to the files after the package is installed at run time?

Cisco IOS XR, Release 7.3.1 introduces a fingerprint mechanism to verify the authenticity of a package that Cisco releases. This mechanism helps determine whether the installed package is genuine, where the installed and running software matches the software that is published by Cisco.

There are significant security measures for installing software using GPG and IMA signing. However, there is need to report more data for Cisco Crosswork application to monitor and flag potential issues for further investigation. Cisco Crosswork monitors the installed software over a period to help accomplish the following tasks:

- To determine whether there are any differences between the software that is published on Cisco.com and that downloaded to the router.
- To determine whether any files in a package have been altered, either accidentally or maliciously, from the time the package was installed.

A Known Good Value (KGV) is calculated and published for each package. This value is considered the right value for the package.

Two fingerprint (hex) values for each active or committed packages are monitored to ensure authenticity of the package:

- **Install time fingerprint:** Hex value that represents the software in the package at install time. An RPM is genuine if it is not modified before install, and it matches the KGV. Whereas a manipulated RPM shows a mismatch in the fingerprint that is published in the KGV.

- **Run time fingerprint:** Hex value that represents the running software of an installed package. The value matches the corresponding install time fingerprint if the RPM has not been modified since the install time. If there are changes to the files, the run time and install time fingerprints show a mismatch. Every time the files that are installed by an RPM are changed, the run time fingerprint also changes. A value of 0 (zero) is displayed if no run time fingerprint is available for a package. This is used to monitor changes to the running software over time.

Note These two values are displayed only in the Yang model output. No CLI commands are provided to view these values.

```

          <gpg-key-id>ddcead3dcb38048d</gpg-key-id>
          <rpm-fingerprint>

<rpm-fingerprint-install-time>3ddca55bc00a0ce2c2e52277919d398621616b28</rpm-fingerprint-install-time>

<rpm-fingerprint-run-time>3ddca55bc00a0ce2c2e52277919d398621616b28</rpm-fingerprint-run-time>

          </rpm-fingerprint>
        </package>
      </active>
    </packages>
  </install>
</data>
----- Truncated for brevity -----
```

In the example, both the install time and run time fingerprints are the same.

The fingerprint generation status is used to indicate how up-to-date the run time fingerprints are. This may indicate that generation is currently in progress and will complete shortly, or generation is awaiting the end of an atomic change.

Support for Ed25519 Public-Key Signature System

Table 5: Feature History Table

| Feature Name | Release Information | Feature Description |
|---|---------------------|---|
| Support for Ed25519 Public-Key Signature System | Release 7.3.1 | <p>This feature allows you to generate and securely store crypto key pair for the Ed25519 public-key signature algorithm on Cisco IOS XR 64-bit platforms. This signature system provides fast signing, fast key generation, fool proof session keys, collision resilience, and small signatures. The feature also facilitates integration of Cisco IOS XR with Cisco Crosswork Trust Insights.</p> <p>Commands introduced for this feature are:</p> <p>crypto key generate ed25519</p> <p>crypto key zeroize ed25519</p> <p>show crypto key mypubkey ed25519</p> <p>Commands modified for this feature are:</p> <p>ca-keypair</p> <p>keypair</p> |

The Cisco IOS XR Software Release 7.3.1 introduces the support for Ed25519 public-key signature algorithm on 64-bit platforms. Prior to this release, only DSA, ECDSA, and RSA signature algorithms were supported. The Ed25519 signature algorithm uses the elliptic curve cryptography that offers a better security with faster performance when compared to other signature algorithms.

You can generate the Ed25519 crypto keys either with an empty label or with two predefined labels: **system-root-key** and **system-enroll-key**. In the case of an empty label, the system generates the key pair against the default label. You can use the key pairs with the predefined labels to integrate Cisco IOS XR with Cisco Crosswork Trust Insights.

Generate Crypto Key for Ed25519 Signature Algorithm

Configuration Example

To generate the Ed25519 crypto key, use the **crypto key generate ed25519** command in XR EXEC mode.

```
Router#crypto key generate ed25519
```

To delete the Ed25519 crypto key with default label or any predefined label, use the **crypto key zeroize ed25519** command in XR EXEC mode.

Note From Cisco IOS XR Release 7.3.2 onwards, you can generate and delete key-pairs from XR Config mode, as well. For more details, see [Public Key-Pair Generation in XR Config Mode, on page 42](#).

Verification

Use the **show crypto key mypubkey ed25519** command to view all Ed25519 crypto keys generated on the system.

```
Router# show crypto key mypubkey ed25519

Mon Nov 30 07:05:06.532 UTC

Integrate Cisco IOS XR with Cisco Crosswork Trust Insights using Ed25519

Configuration Example

This section shows how to generate the system trustpoint, and the root and leaf certificates using the Ed25519 signature algorithm, as part of integrating Cisco IOS XR with Cisco Crosswork Trust Insights.

```
Router#configure
Router(config)#domain name domain1
Router(config)#crypto ca trustpoint system-trustpoint
Router(config-trustp)#keypair ed25519 system-enroll-key
Router(config-trustp)#ca-keypair ed25519 system-root-key
```

```
Router(config-trustp)#commit

/* Generate root and leaf certificates */
Router#crypto ca authenticate system-trustpoint
Router#crypto ca enroll system-trustpoint
```

Running Configuration

```
config
domain name domain1
crypto ca trustpoint system-trustpoint
  keypair ed25519 system-enroll-key
  ca-keypair ed25519 system-root-key
!
```

For the complete integration procedure, see, [Integrating Cisco IOS XR and Crosswork Trust Insights, on page 26](#).

Public Key-Pair Generation in XR Config Mode

Table 6: Feature History Table

| Feature Name | Release Information | Feature Description |
|--|---------------------|--|
| Public Key-Pair Generation in XR Config Mode | Release 7.3.2 | <p>This feature allows you to generate public-key pairs in the XR Config mode, which in turn lets you save configurations. You can then load these saved configurations across different routers to quickly deploy the key-pair configurations.</p> <p>You could generate public-key pairs in earlier releases only in the XR EXEC mode, which does not save configurations. So manually executing the key-pair generation commands on every router was time-consuming.</p> <p>The following commands are available in XR Config mode, in addition to XR EXEC mode:</p> <ul style="list-style-type: none"> • crypto key generate rsa • crypto key generate dsa • crypto key generate ecdsa • crypto key generate ed25519 |

Public Key-Pair Generation in XR Config mode supports the following key-types and key sizes in FIPS (Federal Information Processing Standard) and non-FIPS modes.

Table 7: Supported Key-Types for non-FIPS and FIPS mode

| Key-types | Non-FIPS mode | FIPS mode |
|-----------|---|---|
| RSA | Supported for all key sizes from 512 - 4096 | Supported for key sizes 2048, 3072, 4096 |
| DSA | Supported for key sizes 512, 768, 1024 | Supported for key size 2048 |
| ECDSA | Supported for key sizes nistp256, nistp384,nistp512 | Supported for key sizes nistp256, nistp384,nistp512 |
| ED25519 | Supported | Not Supported |

Guidelines and Restrictions:

The following guidelines and restrictions apply for generating crypto keys-pairs in XR Config mode:

- This feature doesn't support generation of generation of **system-root-key** and **system-enroll-key**.
- The key-pairs generated in XR Config mode overwrites any previously generated key-pairs in XR EXEC mode.
- The router doesn't support overwriting key-pairs generated in XR Config mode from XR EXEC mode.
- When you execute **no** form of the **crypto key generate** commands in XR Config Mode, it deletes only those keys generated in XR Config mode.
- The router doesn't support deleting key-pairs generated in XR Config mode from XR EXEC mode.
- When you execute the **crypto key generate** commands in XR EXEC mode, it doesn't overwrite or delete keys generated in XR Config mode.
- The show command **show crypto key mypubkey** displays the keys generated in XR EXEC mode first, followed by the keys generated in XR Config mode.

Configuration Examples:

The following examples show the creation of key-pairs in XR Config mode:

```
Router# conf t
Router(config)#crypto key generate dsa 512
Router(config)#crypto key generate rsa user1 general-keys 2048
Router(config)#crypto key generate rsa user2 usage-keys 2048
Router(config)#crypto key generate rsa 2048
Router(config)#crypto key generate ecdsa nistp256
Router(config)#crypto key generate ecdsa nistp384
Router(config)#crypto key generate ecdsa nistp521
Router(config)#crypto key generate ed25519
Router(config)#commit
```

Use **no** form of the command in XR Config mode to delete any of the key-pairs.

System Logs and Error Messages:

The router generates these system logs on successful creation of key-pairs:

```
cepki[287]: %SECURITY-CEPKI-6-KEY_INFO : crypto key DSA generated, label:the_default,
modBits:1024
cepki[287]: %SECURITY-CEPKI-6-KEY_INFO : crypto key ECDSA_NISTP256 generated,
label:the_default, modBits:256
```

The router generates these system logs on deletion of key-pairs:

```
cepki[287]: %SECURITY-CEPKI-6-KEY_INFO : crypto key RSA zeroized, label:user1
cepki[287]: %SECURITY-CEPKI-6-KEY_INFO : crypto key DSA zeroized, label:the_default
```

The router generates these error messages if you try to overwrite the key-pairs generated in XR Config Mode from XR EXEC mode:

```
Router#conf t
Router(config)#crypto key generate ed25519
Router(config)#commit
Router#crypto key generate ed25519
Cannot execute the command : Operation not permitted
ce_cmd[68727]: %SECURITY-CEPKI-6-ERR_2 : Cannot execute the command : Operation not
permitted
ce_cmd[68736]: %SECURITY-CEPKI-6-ERR : Key is added as part of config mode, key deletion
is not allowed , delete key from config mode
```

The router generates these error messages if you try to delete key-pairs generated in XR Config Mode from XR EXEC mode:

```
Router#conf t
Router(config)#crypto key generate ed25519
Router(config)#commit
Router#crypto key zeroize ed25519
Cannot execute the command : Operation not permitted
ce_cmd[68736]: %SECURITY-CEPKI-6-ERR_2 : Cannot execute the command : Operation not
permitted
```

To View the Generated Key-Pairs:

You can view the key-pairs generated in XR Config mode, listed under **Public keys from config sysdb** in the following command output:

```
Router#show crypto key mypubkey ecdsa
