

Implementing Type 6 Password Encryption

You can use Type 6 password encryption to securely store plain text key strings for authenticating BGP, IP SLA, IS-IS, MACsec, OSPF, and RSVP sessions.

Feature History for Implementing Type 6 Password Encryption

Release	Modification
Release 7.0.1	This feature was introduced.

[•] How to Implement Type 6 Password Encryption, on page 1

How to Implement Type 6 Password Encryption

Scenario - The following 3-step process explains the Type 6 password encryption process for authenticating BGP sessions between two routers, R1 and R2.

Note

Follow the first two steps for all Type 6 password encryption scenarios. The third step, *Creating BGP Sessions*, is specific to BGP. To enable Type 6 password encryption for OSPF, IS-IS, or other protocol sessions (the final step), refer the respective configuration guide. For MACsec authentication, refer the *Configure MACsec* chapter.

Enabling Type6 Feature and Creating a Primary Key (Type 6 Server)

The primary key is the password or key that encrypts all plain text key strings in the router configuration. An Advance Encryption Standard (AES) symmetric cipher does the encryption. The router configuration does not store the primary key. You cannot see or access the primary key when you connect to the router.

Configuration

```
/* Enter the primary key details */
R1 & R2 # key config-key password-encryption
Fri Jul 19 12:22:45.519 UTC
New password Requirements: Min-length 6, Max-length 64
Characters restricted to [A-Z][a-z][0-9]
Enter new key:
```

```
Enter confirm key :
Master key operation is started in background
/* Enable Type 6 password encryption */
R1 & R2 (config) # password6 encryption aes
R1 & R2 (config) # commit
Fri Jul 19 12:22:45.519 UTC
```

Modifying the Primary Key

Note

The Type 6 primary key update results in configuration change of the key chain and the other clients using Type 6. Hence, it is recommended to perform the primary key update operation during a maintenance window, and not while the live session is active. Else, you might experience session flaps due to these configuration changes.

The primary key is not saved to the running configuration, but the changes are persistent across reloads. Please note that the primary key update cannot be rolled back.

Enter the key config-key password-encryption command, and the old key and new key information.

R1 & R2# key config-key password-encryption

```
New password Requirements: Min-length 6, Max-length 64 Characters restricted to [A-Z][a-z][0-9] Enter old key:
Enter new key:
Enter confirm key:
Master key operation is started in background
```

Deleting the Primary Key

```
R1 & R2# configure
R1 & R2 (config)# no password6 encryption aes
R1 & R2 (config)# commit
R1 & R2 (config)# exit
R1 & R2# key config-key password-encryption delete
WARNING: All type 6 encrypted keys will become unusable
Continue with master key deletion ? [yes/no]:yes
Master key operation is started in background
```

Verification

Verify that the primary key configuration and Type 6 feature configuration state are in the *Enabled* state. The **Master key Inprogress** field displays **No**. It indicates that the primary key activity is complete (created, modified, or deleted). When you disable a primary key, **Disabled** is displayed for all the three states.

R1 & R2#show type6 server

Verify Type 6 trace server details.

R1 & R2#show type6 trace server all

```

to (NOT INPROGRESS)
```

From Cisco IOS XR Software Release 7.0.2 and later, you can use the **show type6 masterkey update status** command to display the update status of the primary key. Prior to this release, you could use the **show type6 clients** command for the same purpose.

Clear Type 6 Client State

You can use the **clear type6 client** command in XR EXEC mode to clear the Type 6 client state.

If the primary key update operation is stuck at any stage, then you can use this **clear** command to clear that state. You can track the primary key update operation using the **show type6 server** command output. If the *Master key Inprogress* field in that output displays as *YES*, then you can use **show type6 masterkey update status** command (or, **show type6 clients** command, prior to Release 7.0.2) to check which client has not completed the operation. Accordingly, you can clear that particular client using the **clear** command.

Associated Commands

- clear type6 client
- key config-key password-encryption
- password6 encryption aes
- show type6

Implementing Key Chain for BGP Sessions (Type 6 Client)

For detailed information about key chains, refer the Implementing Keychain Management chapter.

If you enable Type 6 password encryption, plain-text keys are encrypted using Type 6 encryption. Enter plain-text key-string input in alphanumeric form. If you enable MACsec with Type 6 password encryption, the key-string input is in hexadecimal format.

Configuration

```
/* Enter the key chain details */
R1 & R2# configure
R1 & R2 (config) # key chain type6_password
R1 & R2 (config-type6 password) # key 1
```

Enter the Type 6 encrypted format using the **key-string password6** command.

Note

Using the **key-string** command, you can enter the password in clear text format or Type 6 encrypted (already encrypted password) format, as used in this scenario.

Note

Enable the same key string for all the routers.

```
R1 & R2 (config-type6_password-1)# key-string password6 606745575e6565$
R1 & R2 (config-type6_password-1)# cryptographic-algorithm MD5
R1 & R2 (config-type6_password-1)# accept-lifetime 1:00:00 october 24 2005 infinite
R1 & R2 (config-type6_password-1)# send-lifetime 1:00:00 october 24 2005 infinite
R1 & R2 (config-type6_password-1)# commit
```

Verification

Verify key chain trace server information.

```
R1 & R2# show key chain trace server both
```

```

- · show key chain trace server both

Creating a BGP Session (Type 6 Password Encryption Use Case)

This example provides iBGP session creation configuration. To know how to configure the complete iBGP network, refer the *BGP Configuration Guide* for the platform.

Configuration

```
/* Create BGP session on Router1 */
R1# configure
R1(config)# router bgp 65537
```

Ensure that you use the same key chain name for the BGP session and the Type 6 encryption (for example, *type6_password* in this scenario).

Ensure that you use the same session and keychain for all routers (R1 and R2 in this case).

```
R1 (config-bgp) # session-group bgp-type6-session keychain type6_password
R1 (config-bgp) # neighbor 10.1.1.11 remote-as 65537
R1 (config-bgp) # commit

/* Create BGP session on Router2 */
R2 (config) # router bgp 65537
R2 (config-bgp) # session-group bgp-type6-session keychain type6_password
R2 (config-bgp) # neighbor 10.1.1.1 remote-as 65537
R2 (config-bgp) # commit
```

Verification

Verify that the BGP NBR state is in the *Established* state, on R1 and R2.

```
R1\# show bgp sessions
Neighbor VRF Spk AS
                             InQ OutQ NBRState NSRState
10.1.1.11 default 0
                      65537 0
                                 0 Established None
R2# show bgp sessions
Neighbor
         VRF
                 Spk
                      AS
                            InQ OutQ NBRState
                                               NSRState
                      65537 0
          default 0
10.1.1.1
                               0
                                    Established None
```

Associated Commands

- session-group
- · show BGP sessions
