Secure Shell Commands

This module describes the Cisco IOS XR software commands used to configure Secure Shell (SSH).

Note All commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router that is introduced from Cisco IOS XR Release 6.3.2. References to earlier releases in Command History tables apply to only the Cisco NCS 5500 Series Router.

Note
- Starting with Cisco IOS XR Release 6.6.25, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 560 Series Routers.

- Starting with Cisco IOS XR Release 6.3.2, all commands applicable for the Cisco NCS 5500 Series Router are also supported on the Cisco NCS 540 Series Router.

- References to releases before Cisco IOS XR Release 6.3.2 apply to only the Cisco NCS 5500 Series Router.

- Cisco IOS XR Software Release 7.0.1 specific updates are not applicable for the following variants of Cisco NCS 540 Series Routers:
    - N540-28Z4C-SYS-A
    - N540-28Z4C-SYS-D
    - N540X-16Z4G8Q2C-A
    - N540X-16Z4G8Q2C-D
    - N540X-16Z8Q2C-D
    - N540-12Z20G-SYS-A
    - N540-12Z20G-SYS-D
    - N540X-12Z16G-SYS-A
    - N540X-12Z16G-SYS-D

For detailed information about SSH concepts, configuration tasks, and examples, see the Implementing Secure Shell chapter in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

> **Note** Currently, only default VRF is supported. VPNv4, VPNv6 and VPN routing and forwarding (VRF) address families will be supported in a future release.

clear ssh

To terminate an incoming or outgoing Secure Shell (SSH) connection, use the **clear ssh** command.

clear ssh {*session-id* | **outgoing** *session-id*}

Syntax Description	*session-id*	Session ID number of an incoming connection as displayed in the **show ssh** command output. Range is from 0 to 1024.
	outgoing *session-id*	Specifies the session ID number of an outgoing connection as displayed in the **show ssh** command output. Range is from 1 to 10.

Command Default None

Command Modes XR EXEC mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines Use the **clear ssh** command to disconnect incoming or outgoing SSH connections. Incoming connections are managed by the SSH server running on the local networking device. Outgoing connections are initiated from the local networking device.

To display the session ID for a connection, use the **show ssh** command.

Task ID

Task ID	Operations
crypto	execute

Examples In the following example, the **show ssh** command is used to display all incoming and outgoing connections to the router. The **clear ssh** command is then used to terminate the incoming session with the ID number 0.

```
RP/0/RP0/CPU0:router# show ssh

SSH version: Cisco-2.0
session     pty location    state        userid    host        ver
----------------------------------------------------------------
Incoming sessions
0         vty0 0/33/1   SESSION_OPEN   cisco    172.19.72.182   v2
1         vty1 0/33/1   SESSION_OPEN   cisco    172.18.0.5      v2
2         vty2 0/33/1   SESSION_OPEN   cisco    172.20.10.3     v1
3         vty3 0/33/1   SESSION_OPEN   cisco    3333::50        v2

Outgoing sessions
1              0/33/1   SESSION_OPEN   cisco    172.19.72.182   v2
2              0/33/1   SESSION_OPEN   cisco    3333::50        v2
```

```
RP/0/RP0/CPU0:router# clear ssh 0
```

The following output is applicable for the **clear ssh** command starting release 6.0 and later.

```
RP/0/RP0/CPU0:router# show ssh

SSH version : Cisco-2.0

id  chan pty     location        state           userid   host                    ver
authentication connection type
-----------------------------------------------------------------------------------------------
Incoming sessions
0   1    vty0   0/33/1         SESSION_OPEN      cisco      123.100.100.18         v2
password    Command-Line-Interface

Outgoing sessions
1              0/33/1         SESSION_OPEN      cisco      172.19.72.182          v2
2              0/33/1         SESSION_OPEN      cisco      3333::50               v2

RP/0/RP0/CPU0:router# clear ssh 0
```

disable auth-methods

To selectively disable the authentication methods for the SSH server, use the **disable auth-methods** command in ssh server configuration mode. To remove the configuration, use the **no** form of this command.

disable   auth-methods   { keyboard-interactive | password | public-key }

Syntax Description		
	keyboard-interactive	Disables keyboard-interactive authentication method for the SSH server
	password	Disables password authentication method for the SSH server
	public-key	Disables publick-key authentication method for the SSH server

Command Default

Allows all the authentication methods, by default.

Command Modes

ssh server

Command History

Release	Modification
Release 7.8.1	This command was introduced.

Usage Guidelines

If this configuration is not present, you can consider that the SSH server on the router allows all the authentication methods.

The public-key authentication method includes certificate-based authentication as well.

Task ID

Task ID	Operation
crypto	read, write

This example shows how to disable the public-key authentication method for the SSH server on the router.

```
Router#configure
Router(config)# ssh server
Router(config-ssh)# disable auth-methods public-key
Router(config-ssh)# commit
```

netconf-yang agent ssh

To enable netconf agent over SSH (Secure Shell) , use the **netconf-yang agent ssh** command in the global configuration mode. To disable netconf, use the **no** form of the command.

netconf-yang agent ssh
no netconf-yang agent ssh

Syntax Description   This command has no keywords or arguments.

Command Default   None

Command Modes   Global Configuration

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines   SSH is currently the supported transport method for Netconf.

Task ID

Task ID	Operation
config-services	read, write

Example

This example shows how to use the **netconf-yang agent ssh** command:

```
RP/0/RP0/CPU0:router (config) #  netconf-yang agent ssh
```

sftp

To start the secure FTP (SFTP) client, use the **sftp** command.

sftp [*username* @ *host* **:** *remote-filenam* **e**] *source-filename* *dest-filename* [**port** *port-num*] [**source-interface** *type* *interface-path-id*] [**vrf** *vrf-name*]

Syntax Description		
username	(Optional) Name of the user performing the file transfer. The at symbol (@) following the username is required.	
hostname:remote-filename	(Optional) Name of the Secure Shell File Transfer Protocol (SFTP) server. The colon (:) following the hostname is required.	
source-filename	SFTP source, including the path.	
dest-filename	SFTP destination, including the path.	
port *port-num*	Specifies the non-default port number of the server to which the SFTP client on the router attempts a connection.	
	The port number ranges from 1025 - 65535.	
source-interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.	
type	Interface type. For more information, use the question mark (**?**) online help function.	
interface-path-id	Physical interface or virtual interface.	
	Note Use the **show interfaces** command in XR EXEC mode to see a list of all interfaces currently configured on the router.	
	For more information about the syntax for the router, use the question mark (**?**) online help function.	
vrf *vrf-name*	Specifies the name of the VRF associated with the source interface.	

Command Default

If no *username* argument is provided, the login name on the router is used. If no *hostname* argument is provided, the file is considered local.

Command Modes

XR EXEC mode

Command History

Release	Modification
Release 7.7.1	Modified the command to include the **port** option that specifies the non-default port for outbound connections.
Release 6.0	This command was introduced.

Usage Guidelines

SFTP provides for the secure (and authenticated) copying of files between a router and a remote host. Like the **copy** command, the **sftp** command can be invoked only in XR EXEC mode.

If a username is not provided, the login name on the router is used as the default. If a host name is not provided, the file is considered local.

If the source interface is specified in the **sftp** command, the **sftp** interface takes precedence over the interface specified in the **ssh client source-interface** command.

When the file destination is a local path, all of the source files should be on remote hosts, and vice versa.

When multiple source files exist, the destination should be a preexisting directory. Otherwise, the destination can be either a directory name or destination filename. The file source cannot be a directory name.

If you download files from different remote hosts, that is, the source points to different remote hosts, the SFTP client spawns SSH instances for each host, which may result in multiple prompts for user authentication.

If you have configured a non-default SSH server port on the router, then the SCP and SFTP services also use that SSH port for their connections. The **port** option to specify the non-default port number is available for the **ssh** command also.

The non-default SSH port number is supported only for SSHv2 and only on Cisco IOS XR SSH; not on CiscoSSH, the Open-SSH-based implementation of SSH. For more details, see *Non-default SSH Port* section in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

From Cisco IOS XR Software Release 7.10.1 and later, you can use public-key based user authentication for Cisco IOS XR routers configured as SSH clients as well. This feature thereby allows you to use password-less authentication for secure file transfer and copy operations using SFTP and SCP protocols.

Task ID

Task ID	Operations
crypto	execute
basic-services	execute

Examples

In the following example, user *abc* is downloading the file *ssh.diff* from the SFTP server *ena-view1* to *disk0:*

```
RP/0/RP0/CPU0:router#sftp abc@ena-view1:ssh.diff disk0
```

In the following example, user *abc* is uploading multiple files from disk 0:/sam_* to /users/abc/ on a remote SFTP server called ena-view1:

```
RP/0/RP0/CPU0:router# sftp disk0:/sam_* abc@ena-view1:/users/abc/
```

In the following example, user *admin* is downloading the file *run* from *disk0a:* to *disk0:/v6copy* on a local SFTP server using an IPv6 address:

```
RP/0/RP0/CPU0:router#sftp admin@[2:2:2::2]:disk0a:/run disk0:/V6copy
Connecting to 2:2:2::2...
Password:

disk0a:/run
  Transferred 308413 Bytes
  308413 bytes copied in 0 sec (338172)bytes/sec
```

```
RP/0/RP0/CPU0:router#dir disk0:/V6copy

Directory of disk0:

70144       -rwx  308413      Sun Oct 16 23:06:52 2011  V6copy

2102657024 bytes total (1537638400 bytes free)
```

In the following example, user *admin* is uploading the file *v6copy* from *disk0:* to *disk0a:/v6back* on a local SFTP server using an IPv6 address:

```
RP/0/RP0/CPU0:router#sftp disk0:/V6copy admin@[2:2:2::2]:disk0a:/v6back
Connecting to 2:2:2::2...
Password:

/disk0:/V6copy
  Transferred 308413 Bytes
  308413 bytes copied in 0 sec (421329)bytes/sec

RP/0/RP0/CPU0:router#dir disk0a:/v6back

Directory of disk0a:

66016       -rwx  308413      Sun Oct 16 23:07:28 2011  v6back

2102788096 bytes total (2098987008 bytes free)
```

In the following example, user *admin* is downloading the file *sampfile* from *disk0:* to *disk0a:/sampfile_v4* on a local SFTP server using an IPv4 address:

```
RP/0/RP0/CPU0:router#sftp admin@2.2.2.2:disk0:/sampfile disk0a:/sampfile_v4
Connecting to 2.2.2.2...
Password:

disk0:/sampfile
  Transferred 986 Bytes
  986 bytes copied in 0 sec (493000)bytes/sec

RP/0/RP0/CPU0:router#dir disk0a:/sampfile_v4

Directory of disk0a:

131520      -rwx  986         Tue Oct 18 05:37:00 2011  sampfile_v4

502710272 bytes total (502001664 bytes free)
```

In the following example, user *admin* is uploading the file *sampfile_v4* from *disk0a:* to *disk0:/sampfile_back* on a local SFTP server using an IPv4 address:

```
RP/0/RP0/CPU0:router#sftp disk0a:/sampfile_v4 admin@2.2.2.2:disk0:/sampfile_back
Connecting to 2.2.2.2...
Password:

disk0a:/sampfile_v4
  Transferred 986 Bytes
  986 bytes copied in 0 sec (564000)bytes/sec

RP/0/RP0/CPU0:router#dir disk0:/sampfile_back

Directory of disk0:
```

```
121765      -rwx  986         Tue Oct 18 05:39:00 2011  sampfile_back

524501272 bytes total (512507614 bytes free)
```

This example shows how to connect to the non-default port of a remote SFTP server and download a file to the local *disk0:* on the router.

```
RP/0/RP0/CPU0:router#sftp user1@198.51.100.1:disk0:/test-file port 5525 disk0
```

sftp (Interactive Mode)

To enable users to start the secure FTP (SFTP) client, use the **sftp** command.

sftp [*username* @ *host* **:** *remote-filenam* **e**] [**port** *port-num*] [**source-interface** *type* *interface-path-id*] [**vrf** *vrf-name*]

Syntax Description		
username	(Optional) Name of the user performing the file transfer. The at symbol (@) following the username is required.
hostname:remote-filename	(Optional) Name of the Secure Shell File Transfer Protocol (SFTP) server. The colon (:) following the hostname is required.
port *port-num*	Specifies the non-default port number of the server to which the SFTP client on the router attempts a connection. The port number ranges from 1025 - 65535.
source-interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.
type	Interface type. For more information, use the question mark (**?**) online help function.
interface-path-id	Physical interface or virtual interface. **Note** Use the **show interfaces** command in XR EXEC mode to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (**?**) online help function.
vrf *vrf-name*	Specifies the name of the VRF associated with the source interface.

Command Default

If no *username* argument is provided, the login name on the router is used. If no *hostname* argument is provided, the file is considered local.

Command Modes

XR EXEC mode

Command History

Release	Modification
Release 7.7.1	Modified the command to include the **port** option that specifies the non-default port for outbound connections.
Release 6.0	This command was introduced.

Usage Guidelines

The SFTP client, in the interactive mode, creates a secure SSH channel where the user can enter any supported command. When a user starts the SFTP client in an interactive mode, the SFTP client process creates a secure SSH channel and opens an editor where user can enter any supported command.

More than one request can be sent to the SFTP server to execute the commands. While there is no limit on the number of 'non-acknowledged' or outstanding requests to the server, the server might buffer or queue these requests for convenience. Therefore, there might be a logical sequence to the order of requests.

The following unix based commands are supported in the interactive mode:

- bye

- **cd** *<path>*

- **chmod** *<mode> <path>*

- exit

- **get** *<remote-path> [local-path]*

- help

- **ls** *[-alt] [path]*

- **mkdir <path>**

- **put** *<local-path> [remote-path]*

- pwd

- quit

- **rename <old-path> <new-path>**

- **rmdir <path>**

- **rm <path>**

The following commands are not supported:

- lcd, lls, lpwd, lumask, lmkdir

- ln, symlink

- chgrp, chown

- !, !command

- ?

- mget, mput

If you have configured a non-default SSH server port on the router, then the SCP and SFTP services also use that SSH port for their connections. The **port** option to specify the non-default port number is available for the **ssh** command also.

The non-default SSH port number is supported only for SSHv2 and only on Cisco IOS XR SSH; not on CiscoSSH, the Open-SSH-based implementation of SSH. For more details, see *Non-default SSH Port* section in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

From Cisco IOS XR Software Release 7.10.1 and later, you can use public-key based user authentication for Cisco IOS XR routers configured as SSH clients as well. This feature thereby allows you to use password-less authentication for secure file transfer and copy operations using SFTP and SCP protocols.

Task ID

Task ID	Operations
crypto	execute
basic-services	execute

Examples

In the following example, user *admin* is downloading and uploading a file from/to an external SFTP server using an IPv6 address:

```
RP/0/RP0/CPU0:router#sftp admin@[2:2:2::2]

Connecting to 2:2:2::2...
Password:
sftp> pwd
Remote working directory: /
sftp> cd /auto/tftp-server1-users5/admin
sftp> get frmRouter /disk0:/frmRouterdownoad

/auto/tftp-server1-users5/admin/frmRouter
  Transferred 1578 Bytes
  1578 bytes copied in 0 sec (27684)bytes/sec
sftp> put /disk0:/frmRouterdownoad againtoServer

/disk0:/frmRouterdownoad
  Transferred 1578 Bytes
  1578 bytes copied in 0 sec (14747)bytes/sec
sftp>
```

In the following example, user *abc* is downloading and uploading a file from/to an external SFTP server using an IPv4 address:

```
RP/0/RP0/CPU0:router#sftp abc@2.2.2.2
Connecting to 2.2.2.2...
Password:
sftp> pwd
Remote working directory: /
sftp> cd /auto/tftp-server1-users5/abc
sftp> get frmRouter /disk0:/frmRouterdownoad

/auto/tftp-server1-users5/abc/frmRouter
  Transferred 1578 Bytes
  1578 bytes copied in 0 sec (27684)bytes/sec
sftp> put /disk0:/frmRouterdownoad againtoServer

/disk0:/frmRouterdownoad
  Transferred 1578 Bytes
  1578 bytes copied in 0 sec (14747)bytes/sec
sftp>
```

show ssh

To display all incoming and outgoing connections to the router, use the **show ssh** command.

show ssh

Syntax Description

This command has no keywords or arguments.

Command Default

None

Command Modes

XR EXEC mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines

Use the **show ssh** command to display all incoming and outgoing Secure Shell (SSH) Version 1 (SSHv1) and SSH Version 2 (SSHv2) connections.

The connection type field in the command output of **show ssh** command shows as **port-forwarded local** for SSH port-forwarded sessions.

Use the **show ssh server** command to see the details of the SSH server. The **Port Forwarding** column shows as **local** for the port-forwarded session. Whereas, for a regular SSH session, the field displays as **disabled**.

Task ID

Task ID	Operations
crypto	read

Examples

The following output is applicable for the **show ssh** command starting release 6.0 and later.

```
RP/0/RP0/CPU0:router# show ssh

SSH version : Cisco-2.0

id  chan pty    location       state         userid   host              ver
authentication connection type
-------------------------------------------------------------------------------------------------
Incoming sessions
0   1    vty0   0/33/1    SESSION_OPEN       cisco      123.100.100.18      v2
password     Command-Line-Interface

Outgoing sessions
1             0/33/1    SESSION_OPEN       cisco      172.19.72.182       v2
2             0/33/1    SESSION_OPEN       cisco      3333::50            v2
```

This table describes significant fields shown in the display.

Table 1: show ssh Field Descriptions

Field	Description
session	Session identifier for the incoming and outgoing SSH connections.
chan	Channel identifier for incoming (v2) SSH connections. NULL for SSH v1 sessions.
pty	pty-id allocated for the incoming session. Null for outgoing SSH connection.
location	Specifies the location of the SSH server for an incoming connection. For an outgoing connection, location specifies from which route processor the SSH session is initiated.
state	The SSH state that the connection is currently in.
userid	Authentication, authorization and accounting (AAA) username used to connect to or from the router.
host	IP address of the remote peer.
ver	Specifies if the connection type is SSHv1 or SSHv2.
authentication	Specifies the type of authentication method chosen by the user.
connection type	Specifies which application is performed over this connection (Command-Line-Interface, Remote-Command, Scp, Sftp-Subsystem, or Netconf-Subsystem)

The following is a sample output of SSH port-forwarded session:

```
Router#show ssh

Wed Oct 14 11:22:05.575 UTC
SSH version : Cisco-2.0

id chan pty location    state         userid host          ver authentication connection type
--------------------------------------------------------------------------------------------
Incoming sessions
15 1    XXX 0/RP0/CPU0 SESSION_OPEN admin  192.168.122.1 v2  password
port-forwarded-local

Outgoing sessions

Router#
```

The following is a sample output of **show ssh server** command with SSH port forwarding enabled:

```
Router#show ssh server
Tue Sep  7 17:43:22.483 IST
--------------------

This table describes the significant fields shown in the display.

Table 2: Field Descriptions

Field	Description
session	Session identifier for the incoming and outgoing SSH connections.
key-exchange	Key exchange algorithm chosen by both peers to authenticate each other.
pubkey	Public key algorithm chosen for key exchange.
incipher	Encryption cipher chosen for the receiver traffic.
outcipher	Encryption cipher chosen for the transmitter traffic.
inmac	Authentication (message digest) algorithm chosen for the receiver traffic.
outmac	Authentication (message digest) algorithm chosen for the transmitter traffic.
start_time	Start time of the session.
end_time	End time of the session.

show ssh session details

To display the details for all incoming and outgoing Secure Shell Version 2 (SSHv2) connections, use the **show ssh session details** command.

show ssh session details

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes XR EXEC mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines Use the **show ssh session details** command to display a detailed report of the SSHv2 connections to or from the router, including the cipher chosen for the specific session.

Task ID

Task ID	Operations
crypto	read

Examples The following is sample output from the **show ssh session details** command to display the details for all the incoming and outgoing SSHv2 connections:

```
RP/0/RP0/CPU0:router# show ssh session details

SSH version: Cisco-2.0
session    key-exchange    pubkey   incipher   outcipher    inmac     outmac
---------------------------------------------------------------------------
Incoming Session

0          diffie-hellman ssh-dss  3des-cbc   3des-cbc     hmac-md5  hmac-md5

Outgoing connection

1          diffie-hellman ssh-dss  3des-cbc   3des-cbc     hmac-md5  hmac-md5
```

This table describes the significant fields shown in the display.

Table 3: show ssh session details Field Descriptions

Field	Description
session	Session identifier for the incoming and outgoing SSH connections.
key-exchange	Key exchange algorithm chosen by both peers to authenticate each other.

Field	Description
pubkey	Public key algorithm chosen for key exchange.
incipher	Encryption cipher chosen for the Rx traffic.
outcipher	Encryption cipher chosen for the Tx traffic.
inmac	Authentication (message digest) algorithm chosen for the Rx traffic.
outmac	Authentication (message digest) algorithm chosen for the Tx traffic.

show tech-support ssh

To automatically run show commands that display system information, use the show tech-support command, use the **show tech-support ssh** command in XR EXEC mode.

show tech-support ssh

Syntax Description

This command has no keywords or arguments.

Command Default

None

Command Modes

XR EXEC mode

Command History

Release	Modification
Release 6.4.1	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

++ Show tech end time: 2018-Feb-20.123236.IST ++
RP/0/RP0/CPU0:turin-sec1#
```

The **show tech-support ssh** command collects the output of these CLI:

Command	Description
show logging	Displays the contents of the logging buffer.
show context location all	
show running-config	Displays the contents of the currently running configuration or a subset of that configuration.
show ip int brief	Displays brief information about each interface.

Command	Description
show ssh	Displays all incoming and outgoing connections to the router.
show ssh session details	Displays the details for all the incoming and outgoing SSHv2 connections, to the router.
show ssh rekey	Displays session rekey details such as session id, session rekey count, time to rekey, data to rekey.
show ssh history	Displays the last hundred SSH connections that were terminated.
show tty trace info all all	
show tty trace error all all	

ssh

To start the Secure Shell (SSH) client connection and enable an outbound connection to an SSH server, use the **ssh** command.

ssh [**vrf** *vrf-name*] { *ipv4-address* [**port** *port-num*] | *ipv6-address* [**port** *port-num*] | *hostname* [**port** *port-num*] } [**username** *user-id*] [**cipher aes** { **128-cbc** | **192-cbc** | **256-cbc** }] [**source-interface** *type* *interface-path-id*] [**command** *command-name*]

Syntax Description

vrf *vrf-name*	Specifies the name of the VRF associated with this connection.
ipv4-address	IPv4 address in A:B:C:D format.
ipv6-address	IPv6 address in X:X::X format.
hostname	Hostname of the remote node. If the hostname has both IPv4 and IPv6 addresses, the IPv6 address is used.
port *port-num*	Specifies the non-default SSH port number of the remote SSH server to which the SSH client on the router attempts a connection. The port number ranges from 1025 - 65535.
username *user-id*	(Optional) Specifies the username to use when logging in on the remote networking device running the SSH server. If no user ID is specified, the default is the current user ID.
cipheraes	(Optional) Specifies Advanced Encryption Standard (AES) as the cipher for the SSH client connection. **Note** If there is no specification of a particular cipher by the administrator, the client proposes 3DES as the default to ensure compatibility.
128-CBC	128-bit keys in CBC mode.
192-CBC	192-bit keys in CBC mode.
256-CBC	256-bit keys in CBC mode.
source interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.
type	Interface type. For more information, use the question mark (**?**)online help function.
interface-path-id	Physical interface or virtual interface. **Note** Use the**showinterfaces** command in XR EXEC mode to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark(**?**)online help function.

command	(Optional) Specifies a remote command. Adding this keyword prompts the SSHv2 server to parse and execute the**ssh**command in non-interactive mode instead of initiating the interactive session.

Command Default   3DES cipher

Command Modes   XR EXEC mode

Command History

Release	Modification
Release 7.7.1	Modified the command to include the **port** option that specifies the non-default port for outbound SSH connections.
Release 6.0	This command was introduced.

Usage Guidelines   Use the **ssh** command to make an outbound client connection. The SSH client tries to make an SSHv2 connection to the remote peer. If the remote peer supports only the SSHv1 server, it internally spawns an SSHv1 connection to the remote server. The process of the remote peer version detection and spawning the appropriate client connection is transparent to the user.

If a VRF is specified in the **ssh** command, the **ssh** interface takes precedence over the interface specified in the ssh client source-interface, on page 34 command.

When you configure the **cipher aes** keyword, an SSH client makes a proposal, including one or more of the key sizes you specified, as part of its request to the SSH server. The SSH server chooses the best possible cipher, based both on which ciphers that server supports and on the client proposal.

Note   AES encryption algorithm is not supported on the SSHv1 server and client. Any requests for an AES cipher sent by an SSHv2 client to an SSHv1 server are ignored, with the server using 3DES instead.

A VRF is required to run SSH, although this may be either the default VRF or a VRF specified by the user. If no VRF is specified while configuring the ssh client source-interface, on page 34 or   ssh client knownhost, on page 33 commands, the default VRF is assumed.

Use the **command** keyword to enable the SSHv2 server to parse and execute the **ssh** command in non-interactive mode instead of initiating an interactive session.

The non-default SSH port number is supported only for SSHv2 and only on Cisco IOS XR SSH; not on CiscoSSH, the Open-SSH-based implementation of SSH. For more details, see *Non-default SSH Port* section in the *System Security Configuration Guide for Cisco NCS 5500 Series Routers*.

If you have configured a non-default SSH server port on the router, then the SCP and SFTP services also use that SSH port for their connections. The **port** option to specify the non-default port number is available for the **scp** and **sftp** commands also.

Among the NCS540 router variants, the non-default **port** option is applicable only for the following variants:

- N540-ACC-SYS

- N540X-ACC-SYS

- N540-24Z8Q2C-SYS

Task ID

Task ID	Operations
crypto	execute
basic-services	execute

Examples

The following sample output is from the **ssh** command to enable an outbound SSH client connection:

```
Router# ssh vrf green  username userabc

Password:
Remote-host>
```

This examples shows how to initiate an outbound SSH client connection to an SSH server which uses a port number other than the standard default port, 22. Here, the SSH server listens on port 5525 for client connections:

```
Router#ssh 198.51.100.1 port 5525 username user1
```

ssh algorithms cipher

To configure the list of supported SSH algorithms on the client or on the server, use the **ssh client algorithms cipher** command or **ssh server algorithms cipher** command in XR Config mode. To remove the configuration, use the **no** form of this command.

ssh {**client** | **server**} **algorithms cipher** {**aes256-cbc** | **aes256-ctr** | **aes192-ctr** | **aes192-cbc** | **aes128-ctr** | **aes128-cbc** | **aes128-gcm@openssh.com** | **aes256-gcm@openssh.com** | **3des-cbc**}

Syntax Description

client	Configures the list of supported SSH algorithms on the client.
server	Configures the list of supported SSH algorithms on the server.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 7.0.1	This command was introduced.

Usage Guidelines   No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
crypto	read, write

This example shows how to enable CTR cipher on the client and CBC cipher on the server:

```
Router1#ssh client algorithms cipher aes128-ctr aes192-ctr aes256-ctr
```

```
Router1#ssh server algorithms cipher aes128-cbc aes192-cbc aes256-cbc 3des-cbc
```

Related Commands

Command	Description
ssh client enable cipher , on page 31	Enables CBC mode ciphers on the SSH client.
ssh server enable cipher, on page 42	Enables CBC mode ciphers on the SSH server.

ssh client auth-method

To set the preferred order of SSH client authentication methods to be negotiated with the SSH server while establishing SSH sessions, use the **ssh client auth-method** command in the XR Config mode. To revert to the default order of SSH client authentication methods, use the **no** form of this command.

ssh client auth-method *list-of-auth-method*

Syntax Description	*list-of-auth-method* Specifies the list of SSH client authentication methods in the respective order. The available options are: • **keyboard-interactive** • **password** • **public-key**

Command Default	None

Command Modes	Global ConfigurationXR Config

Command History

Release	Modification
Release 7.9.2/Release 7.10.1	This command was introduced.

Usage Guidelines

The default order of SSH client authentication methods on Cisco IOS XR routers is as follows:

• On routers running Cisco IOS XR SSH:

  • **public-key**, **password** and **keyboard-interactive** (prior to Cisco IOS XR Software Release 24.1.1)

  • **public-key**, **keyboard-interactive** and **password** (from Cisco IOS XR Software Release 24.1.1 and later)

• On routers running CiscoSSH (open source-based SSH):

  • **public-key**, **keyboard-interactive** and **password**

Task ID

Task ID	Operation
crypto	read, write

This example shows how to set the order of SSH client authentication methods in such a way that public key authentication is negotiated first, followed by keyboard-interactive, and then password-based authentication.

```
Router#configure
Router(config)#ssh client auth-method public-key keyboard-interactive password
Router(config-ssh)#commit
```

ssh client enable cipher

To enable the CBC mode ciphers 3DES-CBC and/or AES-CBC for an SSH client connection, use the **ssh client enable cipher** command in XR Config mode. To disable the ciphers, use the **no** form of this command.

ssh client enable cipher {**aes-cbc** | **3des-cbc**}

Syntax Description	**3des-cbc** Specifies that the 3DES-CBC cipher be enabled for the SSH client connection.
	aes-cbc Specifies that the AES-CBC cipher be enabled for the SSH client connection.

Command Default   CBC mode ciphers are disabled.

Command Modes   Global Configuration

Command History

Release	Modification
Release 6.3.1	This command was introduced.

Usage Guidelines   The support for CBC ciphers were disabled by default, from Cisco IOS XR Software Release 6.1.2. Hence, **ssh client enable cipher** and **ssh server enable cipher** commands were introduced to explicitly enable CBC ciphers in required scenarios.

If a client tries to reach the router which acts as a server with CBC cipher, and if the CBC cipher is not explicitly enabled on that router, then the system displays an error message:

```
ssh root@x.x.x. -c aes128-cbc
Unable to negotiate with x.x.x.x port 22: no matching cipher found.
Their offer: aes128-ctr,aes192-ctr,aes256-ctr,aes128-gcm@openssh.com,aes256-gcm@openssh.com
```

You must configure **ssh server enable cipher aes-cbc** command in this case, to connect to the router using the CBC cipher.

Task ID

Task ID	Operation
crypto	read, write

Examples   The following example shows how to enable the 3DES-CBC and AES-CBC ciphers for an SSH client connection:

```
Router# configure
```

```
Router(config)# ssh client enable cipher aes-cbc 3des-cbc
Router(config)# commit
```

Related Commands	Command	Description
	ssh algorithms cipher, on page 28	Configures the list of supported SSH algorithms on the client or on the server.
	ssh server enable cipher, on page 42	Enables CBC mode ciphers on the SSH server.

ssh client knownhost

To authenticate a server public key (pubkey), use the **ssh client knownhost** command. To disable authentication of a server pubkey, use the **no** form of this command.

ssh client knownhost device : /filename
no ssh client knownhost device : /filename

Syntax Description	*device*: / *filename* Complete path of the filename (for example, slot0:/server_pubkey). The colon (:) and slash (/) are required.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines   The *server pubkey* is a cryptographic system that uses two keys at the client end—a public key known to everyone and a private, or secret, key known only to the owner of the keys. In the absence of certificates, the server pubkey is transported to the client through an out-of-band secure channel. The client stores this pubkey in its local database and compares this key against the key supplied by the server during the early stage of key negotiation for a session-building handshake. If the key is not matched or no key is found in the local database of the client, users are prompted to either accept or reject the session.

The operative assumption is that the first time the server pubkey is retrieved through an out-of-band secure channel, it is stored in the local database. This process is identical to the current model adapted by Secure Shell (SSH) implementations in the UNIX environment.

Task ID

Task ID	Operations
crypto	read, write

Examples   The following sample output is from the **ssh client knownhost** command:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh client knownhost disk0:/ssh.knownhost
RP/0/RP0/CPU0:router(config)# commit
RP/0/RP0/CPU0:router# ssh host1 username user1234
Host key not found from the list of known hosts.
Are you sure you want to continue connecting (yes/no)? yes
Password:
RP/0/RP0/CPU0:host1# exit
RP/0/RP0/CPU0:router# ssh host1 username user1234
```

ssh client source-interface

To specify the source IP address of a selected interface for all outgoing Secure Shell (SSH) connections, use the **ssh client source-interface** command. To disable use of the specified interface IP address, use the **no** form of this command.

ssh client source-interface *type interface-path-id*
no ssh client source-interface *type interface-path-id*

Syntax Description

type	Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface.

	Note	Use the **show interfaces** command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (**?**) online help function.

Command Default

No source interface is used.

Command Modes

XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines

Use the **ssh client source-interface** command to set the IP address of the specified interface for all outgoing SSH connections. If this command is not configured, TCP chooses the source IP address when the socket is connected, based on the outgoing interface used—which in turn is based on the route required to reach the server. This command applies to outbound shell over SSH as well as Secure Shell File Transfer Protocol (SFTP) sessions, which use the ssh client as a transport.

The source-interface configuration affects connections only to the remote host in the same address family. The system database (Sysdb) verifies that the interface specified in the command has a corresponding IP address (in the same family) configured.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to set the IP address of the Management Ethernet interface for all outgoing SSH connections:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh client source-interface MgmtEth 0/RP0/CPU0/0
```

ssh client vrf

To configure a new VRF for use by the SSH client, use the **ssh client vrf** command. To remove the specified VRF, use the **no** form of this command.

ssh client vrf *vrf-name*
no ssh client vrf *vrf-name*

Syntax Description	*vrf-name*	Specifies the name of the VRF to be used by the SSH client.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines   An SSH client can have only one VRF.

If a specific VRF is not configured for the SSH client, the default VRF is assumed when applying other SSH client-related commands, such as ssh client knownhost, on page 33 or ssh client source-interface, on page 34.

Task ID

Task ID	Operations
crypto	read, write

Examples   The following example shows the SSH client being configured to start with the specified VRF:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh client vrf green
```

ssh server

To bring up the Secure Shell (SSH) server, use the **ssh server** command. To stop the SSH server, use the **no** form of this command.

ssh server
no ssh server

This command has no keywords or arguments.

Command Default

The default SSH server version is 2 (SSHv2), which falls back to 1 (SSHv1) if the incoming SSH client connection is set to SSHv1.

Command Modes

XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines

The SSH server listens for an incoming client connection on port 22. This server handles both Secure Shell Version 1 (SSHv1) and SSHv2 incoming client connections for both IPv4 and IPv6 address families. To accept only Secure Shell Version 2 connections, use the ssh server v2, on page 51 command.

To verify that the SSH server is up and running, use the **show process sshd** command.

Task ID

Task ID	Operations
crypto	read, write

Examples

In the following example, how to bring up the the SSH server:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server
```

ssh server algorithms host-key

To configure the allowed SSH host-key pair algorithms from the list of auto-generated host-key pairs on the SSH server, use the **ssh server algorithms host-key** command in XR Config mode. To remove the configuration, use the **no** form of this command.

ssh server algorithms host-key { **dsa** | **ecdsa-nistp256** | **ecdsa-nistp384** | **ecdsa-nistp521** | **ed25519** | **rsa** | **x509v3-ssh-rsa** }

Syntax Description		
	• **dsa** • **ecdsa-nistp256** • **ecdsa-nistp384** • **ecdsa-nistp521** • **ed25519** • **rsa** • **x509v3-ssh-rsa**	Selects the specified host keys to be offered to the SSH client. While configuring this, you can specify the algorithms in any order.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 7.0.1	This command was introduced.
Release 7.3.1	The support for **ed25519** and **x509v3-ssh-rsa** algorithms was introduced.

Usage Guidelines   This configuration is optional. If this configuration is not present, it is assumed that all the SSH host-key pairs are configured. In that case, the SSH client is allowed to connect to the SSH sever with any of the host-key pairs.

You can also use the **crypto key zeroize** command to remove the SSH algorithms that are not required.

With the introduction of the automatic generation of SSH host-key pairs, the **show crypto key mypubkey** command output displays key information of all the keys that are auto-generated. Before its introduction, the output of this command displayed key information of only those host-key pairs that were explicitly configured using the **crypto key generate** command.

Task ID

Task ID	Operation
crypto	read, write

This example shows how to select the **ecdsa** algorithm from the list of auto-generated host-key pairs on the SSH server:

```
Router#ssh server algorithms host-key ecdsa-nistp521
```

Similarly, this example shows how to select the **ed25519** algorithm:

```
Router(config)#ssh server algorithms host-key ed25519
```

Similarly, this example shows how to select the **x509v3-ssh-rsa** algorithm:

```
Router(config)#ssh server algorithms host-key x509v3-ssh-rsa
```

ssh server certificate

To configure the certificate-related parameters of SSH server, use the **ssh server certificate** command in XR Config mode. To remove the configuration, use the **no** form of this command.

ssh   server   certificate   username   { common-name | user-principle-name }

Syntax Description		
username	Specifies which field in the certificate to be used as the username.
common-name	Configures the user common name (CN) from the subject name field.
user-principle-name	Configures the user principle name (UPN) from subject alternate name.

Command Default In the absence of this configuration, the SSH server considers common name (CN) as the username.

Command Modes XR Config mode

Command History

Release	Modification
Release 7.3.1	This command was introduced.

Usage Guidelines The user name must match the user name provided in the CLI.

Task ID

Task ID	Operation
crypto	read, write

This example shows how to specify which field in the certificate is to be used as the username. Here, it specifies the user common name to be picked up from the subject name field.

```
Router#configure
Router(config)#ssh server certificate username common-name
Router(config)#commit
```

Here, it specifies the user principle name to be picked up from the subject alternate name field.

```
Router#configure
Router(config)#ssh server certificate username user-principle-name
Router(config)#commit
```

ssh server disable hmac

To disable HMAC cryptographic algorithm on the SSH server, use the **ssh server disable hmac** command, and to disable HMAC cryptographic algorithm on the SSH client, use the **ssh client disable hmac** command in XR Config mode. To disable this feature, use the **no** form of this command.

ssh {**client** | **server**} **disable** **hmac** {**hmac-sha1** | **hmac-sha2-512**}

Syntax Description	hmac-sha1	Disables the SHA-1 HMAC cryptographic algorithm.
	hmac-sha2-512	Disables the SHA-2 HMAC cryptographic algorithm.
		Note This option is available only for the **server**.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 7.0.1	This command was introduced.

Usage Guidelines   No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
crypto	read, write

This example shows how to disable SHA1 HMAC cryptographic algorithm on the SSH client:

```
Router#ssh client disable hmac hmac-sha1
```

This example shows how to disable SHA-2 HMAC cryptographic algorithm on the SSH server:

```
Router#ssh server disable hmac hmac-sha2-512
```

ssh server enable cipher

To enable CBC mode ciphers 3DES-CBC and/or AES-CBC for an SSH server connection, use the **ssh server enable cipher** command in XR Config mode. To disable the ciphers, use the **no** form of this command.

ssh server enable cipher {**aes-cbc** | **3des-cbc**}

Syntax Description		
3des-cbc	Specifies that the 3DES-CBC cipher be enabled for the SSH server connection.
aes-cbc	Specifies that the AES-CBC cipher be enabled for the SSH server connection.

Command Default CBC mode ciphers are disabled.

Command Modes Global Configuration

Command History

Release	Modification
Release 6.3.1	This command was introduced.

Usage Guidelines The support for CBC ciphers were disabled by default, from Cisco IOS XR Software Release 6.1.2. Hence, **ssh client enable cipher** and **ssh server enable cipher** commands were introduced to explicitly enable CBC ciphers in required scenarios.

Task ID

Task ID	Operation
crypto	read, write

Examples The following example shows how to enable the 3DES-CBC and AES-CBC ciphers for an SSH server connection:

```
Router# configure
Router(config)# ssh server enable cipher aes-cbc 3des-cbc
Router(config)# commit
```

Related Commands

Command	Description
ssh algorithms cipher, on page 28	Configures the list of supported SSH algorithms on the client or on the server.
ssh client enable cipher , on page 31	Enables CBC mode ciphers on the SSH client.

ssh server logging

To enable SSH server logging, use the **ssh server logging** command. To discontinue SSH server logging, use the **no** form of this command.

ssh server logging
no ssh server logging

Syntax Description   This command has no keywords or arguments.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines   Only SSHv2 client connections are allowed.

Once you configure the logging, the following messages are displayed:

- Warning: The requested term-type is not supported

- SSH v2 connection from %s succeeded (*user:%s, cipher:%s, mac:%s, pty:%s*)

The warning message appears if you try to connect using an unsupported terminal type. Routers running the Cisco IOS XR software support only the vt100 terminal type.

The second message confirms a successful login.

Task ID

Task ID	Operations
crypto	read, write

Examples   The following example shows the initiation of an SSH server logging:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server logging
```

ssh server max-auth-limit

To configure the maximum number of authentication attempts allowed for SSH connection, use the **ssh server max-auth-limit** command in XR Config mode. To remove the configuration, use the **no** form of this command.

ssh   server   max-auth-limit   *limit*

Syntax Description

limit	Specifies the maximum authentication attempts allowed for SSH connection.
	The limit ranges from 3 to 20; default being 20 (prior to Cisco IOS XR Software Release 7.3.2, the limit range was from 4 to 20).

Command Default

The default authentication limit is 20.

Command Modes

XR Config mode

Command History

Release	Modification
Release 7.3.2	The command was modified to change the minimum value of limit range from 4 to 3.
Release 7.3.1	This command was introduced

Usage Guidelines

The SSH server limits the number of authentication attempts using the password authentication method to a maximum of 3 due to security reasons. You cannot change this particular limit of 3 by configuring the maximum authentication attempts limit for SSH.

For example, even if you configure the maximum authentication attempts limit as 5, the number of authentication attempts allowed using the password authentication method still remain as 3.

Task ID

Task ID	Operations
crypto	read, write

Examples

This example shows how to configure the maximum number of authentication attempts allowed for SSH connection:

```
Router# configure
Router(config)# ssh server max-auth-limit 5
Router(config)# commit
```

ssh server port

To configure a non-default port for the SSH server, use the **ssh server port** command in XR Config mode. To remove the configuration and to change the SSH port number to the default port (22), use the **no** form of this command.

ssh   server   port   *port-number*

Syntax Description	*port-number* Specifies the non-default SSH port number.
	The limit ranges from 5520 to 5529.

Command Default Disabled, by default.

Command Modes XR Config mode

Command History

Release	Modification
Release 7.7.1	This command was introduced

Usage Guidelines If this command is not configured, then the SSH server uses the default port number, 22, for all SSH, SCP and SFTP services.

Among the NCS540 router variants, this command is applicable only for the following variants:

- N540-ACC-SYS
- N540X-ACC-SYS
- N540-24Z8Q2C-SYS

Task ID

Task ID	Operations
crypto	read, write

Examples This example shows how to configure a non-default SSH port for the SSH server on your router:

```
Router# configure
Router(config)# ssh server port 5520
Router(config)# commit
```

ssh server port-forwarding local

To enable SSH port forwarding feature on SSH server, use the **ssh server port-forwarding local** command in XR Config mode. To disable the feature, use the **no** form of this command.

ssh   server   port-forwarding   local

Syntax Description   This command has no keywords or arguments.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 7.3.2	This command was introduced.

Usage Guidelines   The Cisco IOS XR software supports SSH port forwarding only on SSH server; not on SSH client. Hence, to utilize this feature, the SSH client running at the end host must already have the support for SSH port forwarding or tunneling.

Task ID

Task ID	Operations
crypto	read, write

Examples   This example shows how to enable SSH port forwarding feature on SSH server:

```
Router#configure
Router(config)#ssh server port-forwarding local
Router(config)#commit
```

Related Commands

Command	Description
show ssh, on page 14	Displays all incoming and outgoing SSH connections on the router.

ssh server rate-limit

To limit the number of incoming Secure Shell (SSH) connection requests allowed per minute, use the **ssh server rate-limit** command. To return to the default value, use the **no** form of this command.

ssh server rate-limit *rate-limit*
no ssh server rate-limit

Syntax Description

rate-limit	Number of incoming SSH connection requests allowed per minute. Range is from 1 to 120.
	When setting it to 60 attempts per minute, it basically means that we can only allow 1 per second. If you set up 2 sessions at the same time from 2 different consoles, one of them will get rate limited. This is connection attempts to the ssh server, not bound per interface/username or anything like that. So value of 30 means 1 session per 2 seconds and so forth.

Command Default

rate-limit: 60 connection requests per minute

Command Modes

XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines

Use the **ssh server rate-limit** command to limit the incoming SSH connection requests to the configured rate. Any connection request beyond the rate limit is rejected by the SSH server. Changing the rate limit does not affect established SSH sessions.

If, for example, the *rate-limit* argument is set to 30, then 30 requests are allowed per minute, or more precisely, a two-second interval between connections is enforced.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to set the limit of incoming SSH connection requests to 20 per minute:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server rate-limit 20
```

ssh server session-limit

To configure the number of allowable concurrent incoming Secure Shell (SSH) sessions, use the **ssh server session-limit** command. To return to the default value, use the **no** form of this command.

ssh server session-limit *sessions*

Syntax Description	*sessions*	Number of incoming SSH sessions allowed across the router. The range is from 1 to 100110.

Note	Although CLI output option has 1024, you are recommended to configure session-limit not more than 100. High session count may cause resource exhaustion .

Note	From Cisco IOS XR release 6.4.1 and later, the session-limit is increased from 100 to 110.

Command Default   *sessions*: 64 per router

Command Modes   XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.
Release 6.4.1	The session-limit is increased from 100 to 110.

Usage Guidelines   Use the **ssh server session-limit** command to configure the limit of allowable concurrent incoming SSH connections. Outgoing connections are not part of the limit.

Task ID

Task ID	Operations
crypto	read, write

Examples   The following example shows how to set the limit of incoming SSH connections to 50:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server session-limit 50
```

ssh server set-dscp-connection-phase

To set the DSCP marking from TCP connection phase itself for SSH packets originating from Cisco IOS XR routers that function as SSH servers, use the **ssh server set-dscp-connection-phase** command in XR Config mode. To remove the configuration and to continue marking the SSH packets from the authentication phase, use the **no** form of this command.

ssh   server   set-dscp-connection-phase

Syntax Description	This command has no keywords or arguments.
Command Default	None
Command Modes	XR Config mode

Command History

Release	Modification
Release 24.1.1	This command was introduced.

Usage Guidelines

- By default, the DSCP marking for the SSH packets originating from Cisco IOS XR routers with CiscoSSH that function as SSH servers is done from the authentication phase. Whereas, for routers with Cisco IOS XR SSH, the DSCP marking for the SSH packets is done from TCP connection phase itself.

- Although the **ssh server set-dscp-connection-phase** command is available on routers with CiscoSSH and routers with Cisco IOS XR SSH, this configuration is relevant only on routers with CiscoSSH due to the above mentioned reason.

Task ID

Task ID	Operations
crypto	read, write

Examples

This example shows how to set the DSCP marking from TCP connection phase itself for SSH server packets originating from Cisco IOS XR routers with CiscoSSH:

```
Router#configure
Router(config)#ssh server set-dscp-connection-phase
Router(config-ssh)#commit
```

ssh server trustpoint

To configure the trustpoint for SSH certificates, use the **ssh server trustpoint** command in XR Config mode. To disable this feature, use the **no** form of this command.

ssh   server   trustpoint   { **host** | **user** }   *trustpoint-name*

Syntax Description		
host	Configures the trustpoint from where server takes its certificate.	
user	Configures the trustpoints used for user certificate validation.	
trustpoint-name	Specifies the name of the trustpoint.	

Command Default None

Command Modes XR Config mode

Command History

Release	Modification
Release 7.3.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
crypto	read, write

This example shows how to configure the trustpoint from where SSH server takes its certificate:

```
Router#configure
Router(config)#ssh server trustpoint host test-host-tp
Router(config)#commit
```

This example shows how to configure the trustpoint used for user certificate validation:

```
Router#configure
Router(config)#ssh server trustpoint user test-user-tp
Router(config)#commit
```

ssh server v2

To force the SSH server version to be only 2 (SSHv2), use the **ssh server v2** command. To bring down an SSH server for SSHv2, use the **no** form of this command.

ssh server v2
no ssh server v2

Syntax Description   This command has no keywords or arguments.

Command Default   None

Command Modes   XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines   Only SSHv2 client connections are allowed.

Task ID

Task ID	Operations
crypto	read, write

Examples   The following example shows how to initiate the SSH server version to be only SSHv2:

```
 RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)# ssh server v2
```

ssh server vrf

To bring up the Secure Shell (SSH) server and to configure one or more VRFs for its use, use the **ssh server vrf** command. To stop the SSH server from receiving any further connections for the specified VRF, use the **no** form of this command. Optionally ACLs for IPv4 and IPv6 can be used to restrict access to the server before the port is opened.

ssh server vrf *vrf-name* [**ipv4 access-list** *access-list name*] [**ipv6 access-list** *access-list name*]
no ssh server vrf *vrf-name* [**ipv4 access-list** *access-list name*] [**ipv6 access-list** *access-list name*]

Syntax Description		
vrf *vrf-name*	Specifies the name of the VRF to be used by the SSH server. The maximum VRF length is 32 characters.	
	Note If no VRF is specified, the default VRF is assumed.	
ipv4 access-list *access-list name*	Configures an IPv4 access-list for access restrictions to the ssh server. The maximum length of the access-list name length is 32 characters.	
ipv6 access-list *access-list name*	Configures an IPv6 access-list for access restrictions to the ssh server. The maximum length of the access-list name length is 32 characters.	

Command Default The default SSH server version is 2 (SSHv2), which falls back to 1 (SSHv1) if the incoming SSH client connection is set to SSHv1.

Command Modes XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines An SSH server must be configured at minimum for one VRF. If you delete all configured VRFs, including the default, the SSH server process stops. If you do not configure a specific VRF for the SSH client when applying other commands, such as **ssh client knownhost** or **ssh client source-interface** the default VRF is assumed.

To verify that the SSH server is up and running, use the **show process sshd** command.

Task ID

Task ID	Operations
crypto	read, write

Examples In the following example, the SSH server is brought up to receive connections for VRF "green":

```
RP/0/RP0/CPU0:router# configure
```

```
RP/0/RP0/CPU0:router(config)# ssh server vrf green
```

In the following example, the SSH server is brought up to receive connections for VRF "green" and a standard access list ipv4 access list named Internetfilter is configured:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh server vrf green ipv4 access-list Internetfilter
```

ssh server netconf

To configure a port for the netconf SSH server, use the **ssh server netconf port** in the XR Config mode. To disable netconf for the configured port, use the **no** form of the command.

ssh server netconf [**port** *port-number*]
no ssh server netconf [**port** *port-number*]

Syntax Description

port-number	(Optional) Port number for the netconf SSH server (default port number is 830).

Command Default   Default port number is 830.

Command Modes   XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines   No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
crypto	read, write

Example

This example shows how to use the **ssh server netconf port** command:

```
RP/0/RP0/CPU0:router (config) #  ssh server netconf port 830
```

ssh timeout

To configure the timeout value for authentication, authorization, and accounting (AAA) user authentication, use the **ssh timeout** command. To set the timeout value to the default time, use the **no** form of this command.

ssh timeout *seconds*
no ssh timeout *seconds*

Syntax Description

seconds	Time period (in seconds) for user authentication. The range is from 5 to 120.

Command Default

seconds: 30

Command Modes

XR Config mode

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines

Use the **ssh timeout** command to configure the timeout value for user authentication to AAA. If the user fails to authenticate itself within the configured time to AAA, the connection is terminated. If no value is configured, the default value of 30 seconds is used.

Task ID

Task ID	Operations
crypto	read, write

Examples

In the following example, the timeout value for AAA user authentication is set to 60 seconds:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ssh timeout 60
```
