

Configure Segment Routing Path Computation Element

The Segment Routing Path Computation Element (SR-PCE) provides stateful PCE functionality by extending the existing IOS-XR PCEP functionality with additional capabilities. SR-PCE is supported on the MPLS data plane and IPv4 control plane.

- About SR-PCE, on page 1

- PCE-Initiated SR Policies, on page 6
- ACL Support for PCEP Connection, on page 7
- Anycast SID-Aware Path Computation, on page 8
- PCE Support for MPLS-TE LSPs, on page 11
- Configuring the North-Bound API on SR-PCE, on page 14

About SR-PCE

The path computation element protocol (PCEP) describes a set of procedures by which a path computation client (PCC) can report and delegate control of head-end label switched paths (LSPs) sourced from the PCC to a PCE peer. The PCE can request the PCC to update and modify parameters of LSPs it controls. The stateful model also enables a PCC to allow the PCE to initiate computations allowing the PCE to perform network-wide orchestration.

SR-PCE learns topology information by way of IGP (OSPF or IS-IS) or through BGP Link-State (BGP-LS). SR-PCE is capable of computing paths using the following methods:

- TE metric—SR-PCE uses the TE metric in its path calculations to optimize cumulative TE metric.
- IGP metric—SR-PCE uses the IGP metric in its path calculations to optimize reachability.
- LSP Disjointness—SR-PCE uses the path computation algorithms to compute a pair of disjoint LSPs. The disjoint paths can originate from the same head-end or different head-ends. Disjoint level refers to the type of resources that should not be shared by the two computed paths. SR-PCE supports the following disjoint path computations:
 - Link Specifies that links are not shared on the computed paths.
 - Node Specifies that nodes are not shared on the computed paths.

- SRLG Specifies that links with the same SRLG value are not shared on the computed paths.
- SRLG-node Specifies that SRLG and nodes are not shared on the computed paths.

When the first request is received with a given disjoint-group ID, the first LSP is computed, encoding the shortest path from the first source to the first destination. When the second LSP request is received with the same disjoint-group ID, information received in both requests is used to compute two disjoint paths: one path from the first source to the first destination, and another path from the second source to the second destination. Both paths are computed at the same time.

Configure SR-PCE

This task explains how to configure SR-PCE.

SUMMARY STEPS

- 1. configure
- 2. pce
- 3. address ipv4 address
- 4. state-sync ipv4 address
- 5. tcp-buffer size size
- **6.** password {clear | encrypted} password
- **7.** segment-routing {strict-sid-only | te-latency}
- 8. timers
- 9. keepalive time
- 10. minimum-peer-keepalive time
- 11. reoptimization time
- **12**. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	pce	Enables PCE and enters PCE configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# pce	
Step 3	address ipv4 address	Configures a PCE IPv4 address.
	Example:	
	RP/0/RP0/CPU0:router(config-pce)# address ipv4	

Command or Action	Purpose
192.168.0.1	
state-sync ipv4 address	Configures the remote peer for state synchronization.
RP/0/RP0/CPU0:router(config-pce)# state-sync ipv4 192.168.0.3	
tcp-buffer size size Example:	Configures the transmit and receive TCP buffer size for each PCEP session, in bytes. The default buffer size is 256000. The valid range is from 204800 to 1024000.
RP/0/RP0/CPU0:router(config-pce)# tcp-buffer size 1024000	
password {clear encrypted} password Example:	Enables TCP MD5 authentication for all PCEP peers. Any TCP segment coming from the PCC that does not contain a MAC matching the configured password will be rejected. Specify if the password is encrypted or clear text.
<pre>RP/0/RP0/CPU0:router(config-pce)# password encrypted pwd1</pre>	especial in the passengue is closely product to the
segment-routing {strict-sid-only te-latency} Example:	Configures the segment routing algorithm to use strict SID or TE latency.
<pre>RP/0/RP0/CPU0:router(config-pce)# segment-routing strict-sid-only</pre>	Note This setting is global and applies to all LSPs that request a path from this controller.
timers	Enters timer configuration mode.
Example: RP/0/RP0/CPU0:router(config-pce)# timers	
keepalive time Example:	Configures the timer value for locally generated keep-alive messages. The default time is 30 seconds.
<pre>RP/0/RP0/CPU0:router(config-pce-timers)# keepalive 60</pre>	
<pre>minimum-peer-keepalive time Example: RP/0/RP0/CPU0:router(config-pce-timers)#</pre>	Configures the minimum acceptable keep-alive timer that the remote peer may propose in the PCEP OPEN message during session establishment. The default time is 20 seconds.
	state-sync ipv4 address Example: RP/0/RP0/CPU0:router(config-pce)# state-sync ipv4 192.168.0.3 tcp-buffer size size Example: RP/0/RP0/CPU0:router(config-pce)# tcp-buffer size 1024000 password {clear encrypted} password Example: RP/0/RP0/CPU0:router(config-pce)# password encrypted pwd1 segment-routing {strict-sid-only te-latency} Example: RP/0/RP0/CPU0:router(config-pce)# segment-routing strict-sid-only timers Example: RP/0/RP0/CPU0:router(config-pce)# timers keepalive time Example: RP/0/RP0/CPU0:router(config-pce)# keepalive 60 minimum-peer-keepalive time

	Command or Action	Purpose	
Step 11	reoptimization time	Configures the re-optimization timer. The default timer is	
	Example:	1800 seconds.	
	<pre>RP/0/RP0/CPU0:router(config-pce-timers)# reoptimization 600</pre>		
Step 12	exit	Exits timer configuration mode and returns to PCE	
	Example:	configuration mode.	
	RP/0/RP0/CPU0:router(config-pce-timers)# exit		

Configure the Disjoint Policy (Optional)

This task explains how to configure the SR-PCE to compute disjointness for a pair of LSPs signaled by PCCs that do not include the PCEP association group-ID object in their PCEP request. This can be beneficial for deployments where PCCs do not support this PCEP object or when the network operator prefers to manage the LSP disjoint configuration centrally.

SUMMARY STEPS

- 1. disjoint-path
- **2.** group-id value type {link | node | srlg | srlg-node} [sub-id value]
- 3 strict
- **4.** lsp {1 | 2} pcc ipv4 address lsp-name lsp_name [shortest-path]

DETAILED STEPS

	Command or Action	Purpose
Step 1	disjoint-path	Enters disjoint configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config-pce)# disjoint-path	
Step 2	<pre>group-id value type {link node srlg srlg-node} [sub-id value] Example: RP/0/RP0/CPU0:router(config-pce-disjoint)# group-id 1 type node sub-id 1</pre>	Configures the disjoint group ID and defines the preferred level of disjointness (the type of resources that should not be shared by the two paths): • link—Specifies that links are not shared on the computed paths. • node—Specifies that nodes are not shared on the computed paths. • srlg—Specifies that links with the same SRLG value are not shared on the computed paths.

	Command or Action	Purpose	
		• srlg-node—Specifies that SRLG and nodes are not shared on the computed paths.	
		If a pair of paths that meet the requested disjointness level cannot be found, then the paths will automatically fallback to a lower level:	
		If the requested disjointness level is SRLG or node, then link-disjoint paths will be computed.	
		If the requested disjointness level was link, or if the first fallback from SRLG or node disjointness failed, then the lists of segments encoding two shortest paths, without any disjointness constraint, will be computed.	
Step 3	strict	(Optional) Prevents the automatic fallback behavior of the preferred level of disjointness. If a pair of paths that meet	
	Example:	the requested disjointness level cannot be found, the disjoint	
	RP/0/RP0/CPU0:router(config-pce-disjoint)# strict	calculation terminates and no new path is provided. T	
Step 4	lsp {1 2} pcc ipv4 address lsp-name lsp_name	Adds LSPs to the disjoint group.	
-	[shortest-path]	The shortest-path keyword forces one of the disjoint paths	
		to follow the shortest path from the source to the destination. This option can only be applied to the the first LSP	
	RP/0/RP0/CPU0:router(config-pce-disjoint)# lsp 1	specified.	
	<pre>pcc ipv4 192.168.0.1 lsp-name rtrA_t1 shortest-path RP/0/RP0/CPU0:router(config-pce-disjoint) # lsp 2 pcc ipv4 192.168.0.5 lsp-name rtrE_t2</pre>		

Global Maximum-delay Constraint

This feature allows a PCE to compare the cumulative latency of a computed path against a global maximum-delay constraint value. If the latency of the computed path exceeds this global constraint, the path is not considered valid. This ensures that all latency-based paths computed by the PCE and signaled to the PCCs in the network do not exceed this maximum-delay constraint.

```
pce
constraints
bounds
cumulative
type
latency <1-4294967295> Bound metric value in microseconds
```

Configuration

To configure a PCE for specifying maximum cumulative latency metric, you must complete the following configurations:

```
RP/0/RSP0/CPU0:ios(config) # pce
RP/0/RSP0/CPU0:ios(config-pce) # constraints
RP/0/RSP0/CPU0:ios(config-pce-constr) # bounds
RP/0/RSP0/CPU0:ios(config-pce-constr-bounds) # cumulative
RP/0/RSP0/CPU0:ios(config-pce-constr-bounds-type) # type latency 1000000
RP/0/RSP0/CPU0:ios(config-pce-constr-bounds-type) #
```

Verification

Verify using the **show** command:

```
RP/0/RSP0/CPU0:ios(config-pce-constr-bounds-type)# show
Wed Oct 12 22:18:22.962 UTC
pce
  constraints
  bounds
   cumulative
    type latency 1000000
  !
  !
  !
  !
  !
}
```

PCE-Initiated SR Policies

Use cases based on centralized optimization, such as congestion mitigation solutions, rely on the ability of the PCE to signal and instantiate SR-TE policies in the network. We refer to this as PCE-initiated SR-TE policies.

PCE-initiated SR-TE policies can be triggered via Crossworks Network Controller (recommended approach) or via CLI at the PCE.

For more information on configuring SR-TE policies, see the SR-TE Policy Overview.

The PCE deploys the SR-TE policy using PCC-PCE communication protocol (PCEP).

- 1. PCE sends a PCInitiate message to the PCC.
- 2. If the PCInitiate message is valid, the PCC sends a PCRpt message; otherwise, it sends PCErr message.
- 3. If the PCInitiate message is accepted, the PCE updates the SR-TE policy by sending PCUpd message.

You can achieve high-availability by configuring multiple PCEs with SR-TE policies. If the head-end (PCC) loses connectivity with one PCE, another PCE can assume control of the SR-TE policy.

Configuration Example: PCE-Initiated SR Policy with Explicit SID List

To configure a PCE-initiated SR-TE policy, you must complete the following configurations:

- **1.** Enter PCE configuration mode.
- 2. Create the segment list.

Note

When configuring an explicit path using IP addresses of intermediate links, the SR-TE process prefers the protected Adj-SID of the link, if one is available.

3. Create the policy.

```
/* Enter PCE configuration mode and create the SR-TE segment lists */
Router# configure
Router(config) # pce
/* Create the SR-TE segment lists */
Router(config-pce)# segment-routing
Router(config-pce-sr)# traffic-eng
Router(config-pce-sr-te)# segment-list name addr2a
Router(config-pce-sr-te-sl)# index 10 address ipv4 10.1.1.2
Router(config-pce-sr-te-sl)# index 20 address ipv4 10.2.3.2
Router(config-pce-sr-te-sl)# index 30 address ipv4 10.1.1.4
Router(config-pce-sr-te-sl)# exit
/* Create the SR-TE policy */
Router(config-pce-sr-te)# peer ipv4 10.1.1.1
Router(config-pce-sr-te) # policy P1
Router(config-pce-sr-te-policy) # color 2 end-point ipv4 2.2.2.2
Router(config-pce-sr-te-policy) # candidate-paths
Router(config-pce-sr-te-policy-path) # preference 50
Router(config-pce-sr-te-policy-path-preference)# explicit segment-list addr2a
Router(config-pce-sr-te-pp-info) # commit
Router(config-pce-sr-te-pp-info)# end
Router(config)#
```

Running Config

```
pce
segment-routing
traffic-eng
segment-list name addr2a
  index 10 address ipv4 10.1.1.2
  index 20 address ipv4 10.2.3.2
  index 30 address ipv4 10.1.1.4
!
  peer ipv4 10.1.1.1
  policy P1
    color 2 end-point ipv4 2.2.2.2
  candidate-paths
    preference 50
        explicit segment-list addr2a
    !
    !
```

ACL Support for PCEP Connection

PCE protocol (PCEP) (RFC5440) is a client-server model running over TCP/IP, where the server (PCE) opens a port and the clients (PCC) initiate connections. After the peers establish a TCP connection, they create a PCE session on top of it.

The ACL Support for PCEP Connection feature provides a way to protect a PCE server using an Access Control List (ACL) to restrict IPv4 PCC peers at the time the TCP connection is created based on the source address of a client. When a client initiates the TCP connection, the ACL is referenced, and the client source

address is compared. The ACL can either permit or deny the address and the TCP connection will proceed or not.

Refer to the Implementing Access Lists and Prefix Lists chapter in the *IP Addresses and Services Configuration Guide for Cisco NCS 5500 Series Routers* for detailed ACL configuration information.

To apply an ACL to the PCE, use the **pce peer-filter ipv4 access-list** acl_name command.

The following example shows how to configure an ACL and apply it to the PCE:

```
pce
address ipv4 10.1.1.5
peer-filter ipv4 access-list sample-peer-filter
!
ipv4 access-list sample-peer-filter
10 permit ipv4 host 10.1.1.6 any
20 permit ipv4 host 10.1.1.7 any
30 deny ipv4 any any
```

Anycast SID-Aware Path Computation

This feature allows the SR-TE head-end or SR-PCE to compute a path that is encoded using Anycast prefix SIDs of nodes along the path.

An Anycast SID is a type of prefix SID that identifies a set of nodes and is configured with n-flag clear. The set of nodes (Anycast group) is configured to advertise a shared prefix address and prefix SID. Anycast routing enables the steering of traffic toward multiple advertising nodes, providing load-balancing and redundancy. Packets addressed to an Anycast address are forwarded to the topologically nearest nodes.

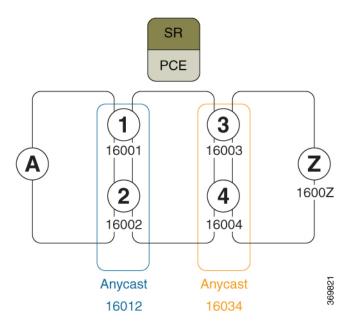

Note

For information on configuring Anycast SID, see Configuring a Prefix-SID on the IS-IS Enabled Loopback Interface and Configuring a Prefix-SID on the OSPF-Enabled Loopback Interface.

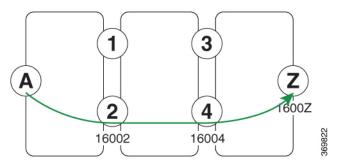

This example shows how Anycast SIDs are inserted into a computed SID list.

The following figure shows 3 isolated IGP domains without redistribution and without BGP 3107. Each Area Border Router (ABR) 1 through 4 is configured with a node SID. ABRs 1 and 2 share Anycast SID 16012 and ABRs 3 and 4 share Anycast SID 16034.

Consider the case where nodes A and Z are provider edge (PE) routers in the same VPN. Node A receives a VPN route with BGP next-hop to node Z. Node A resolves the SR path to node Z based on ODN behaviors with delegation of path computation to SR-PCE.

Before considering Anycast SIDs, the head-end router or SR-PCE computes the SID list.

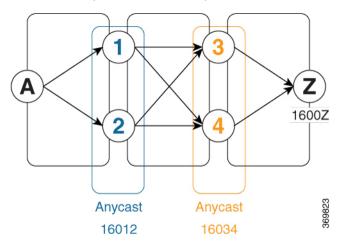

Assume that the computed path from node A to node Z traverses node 2 and node 4. This translates to SID list {16002, 16004, 1600Z} when node SIDs are leveraged to encode the path.

When an Anycast SID-aware path is requested, the path computation algorithm performs the following:

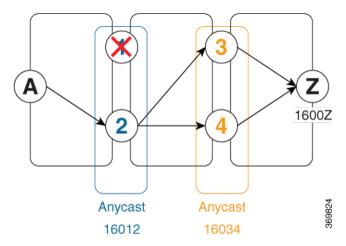

- Path Computation—Computes the path according to optimization objectives and constraints
- Path Encoding—Encodes the path in a SID list leveraging node-SIDs and adj-SIDs as applicable
- **Anycast SID Replacement**—Reiterates the original SID list by replacing node SIDs with Anycast SIDs present on the nodes along the computed path.
- Optimality Validation—The new paths are validated against the original optimization objectives and constraints (maintain same cumulative metric as original SID list and do not violate path constraints).
- **Anycast SID Promotion**—If the optimality validation is successful, then the Anycast-encoded SID list is signaled and instantiated in the forwarding.

The following figure depicts cumulative metrics between nodes in the network.

Under these conditions, the optimality check is met, and therefore, the Anycast-encoded SID list from node A to node Z is {16012,16034,1600Z}.

The Anycast SID aware path computation also provides resiliency. For example, if one of the ABRs (in this case, ABR 1) becomes unavailable or unreachable, the path from node A to node Z $\{16012,16034,1600Z\}$ will still be valid and usable.

Configuration Examples

- 1. Configure Prefix SIDs on the ABR nodes.
 - **a.** Configure each node with a node SID.
 - **b.** Configure each group of nodes with a shared Anycast SID.

See Configuring a Prefix-SID on the IS-IS Enabled Loopback Interface and Configuring a Prefix-SID on the OSPF-Enabled Loopback Interface.

2. Configure SR policies to include Anycast SIDs for path computation using the **anycast-sid-inclusion** command.

This example shows how to configure a local SR policy to include Anycast SIDs for PCC-initiated path computation at the head-end router:

```
Router(config) # segment-routing traffic-eng
Router(config-sr-te) # policy FOO
Router(config-sr-te-policy) # color 10 end-point ipv4 10.1.1.10
Router(config-sr-te-policy) # candidate-paths
Router(config-sr-te-policy-path) # preference 100
Router(config-sr-te-policy-path-pref) # dynamic
Router(config-sr-te-pp-info) # anycast-sid-inclusion
```

Running Configuration

Use the **anycast-sid-inclusion** command to request Anycast SID-aware path computation for the following SR policy types:

• Local SR policy with PCC-initiated path computation at the head-end router:

```
segment-routing
traffic-eng
policy FOO
    color 10 end-point ipv4 10.1.1.10
    candidate-paths
    preference 100
        dynamic
        anvcast-sid-inclusion
```

• Local SR policy with PCC-initiated/PCE-delegated path computation at the SR-PCE:

```
segment-routing
traffic-eng
policy BAR
color 20 end-point ipv4 10.1.1.20
candidate-paths
preference 100
dynamic
pcep
anycast-sid-inclusion
```

 On-demand SR policies with a locally computed dynamic path at the head-end, or centrally computed dynamic path at the SR-PCE:

```
segment-routing
traffic-eng
on-demand color 10
dynamic
anycast-sid-inclusion
```

• On-demand SR policies with centrally computed dynamic path at the SR-PCE:

```
segment-routing
traffic-eng
on-demand color 20
dynamic
pcep
anycast-sid-inclusion
```

PCE Support for MPLS-TE LSPs

This feature allows Cisco's SR-PCE to act as a Path Computation Element (PCE) for MPLS Traffic Engineering Label Switched Paths (MPLS-TE LSPs).

Note

For more information about MPLS-TE, refer to the "Implementing MPLS Traffic Engineering" chapter in the MPLS Configuration Guide for Cisco NCS 5500 Series Routers.

The supported functionality is summarized below:

- PCE type: Active Stateful PCE
- MPLS-TE LSP initiation methods:
 - PCE Initiated—An active stateful PCE initiates an LSP and maintains the responsibility of updating the LSP.
 - PCC Initiated—A PCC initiates the LSP and may delegate the control later to the Active stateful PCE.
- MPLS-TE LSP metric—Metric optimized by the path computation algorithm:
 - IGP metric
 - TE metric
 - Latency metric
- MPLS-TE LSP constraints—TE LSP attributes to be taken into account by the PCE during path computation:
 - · Resource Affinities
 - Path Disjointness
- MPLS-TE LSP parameters:
 - Setup priority—The priority of the TE LSP with respect to taking resources
 - Hold priority—The priority of the TE LSP with respect to holding resources
 - FRR L flag—The "Local Protection Desired" bit. Can be set from an application instantiating an MPLS-TE LSP via SR-PCE. SR-PCE passes this flag to the PCC, and the PCC will enable FRR for that LSP.
 - Signaled Bandwidth—This value can be set from an application instantiating an MPLS-TE LSP via SR-PCE. SR-PCE passes this value to the PCC.
 - Binding SID—A segment identifier (SID) that a headend binds to an MPLS-TE LSP. When the
 headend receives a packet with active segment (top MPLS label) matching the BSID of a local
 MPLS-TE LSP, the headend steers the packet into the associated MPLS-TE LSP.

Cisco Crosswork Optimization Engine is an application that leverages the SR-PCE in order to visualize and instantiate MPLS-TE LSPs. For more information, refer to the Visualize SR Policies and RSVP-TE Tunnels chapter in the Cisco Crosswork Optimization Engine 1.2.1 User Guide.

Note

No extra configuration is required to enable MPLS-TE support at SR-PCE.

Example: Configuring a PCEP Session (Stateful Mode) on MPLS-TE PCC

The following example shows the configuration for an MPLS-TE PCC to establish a PCEP session with a PCE (IPv4 address 10.1.1.100).

Note

MPLS-TE PCC must operate in the stateful PCEP mode when connecting to SR-PCE.

The **instantiation** keyword enables the PCC to support MPLS-TE LSP instantiation by PCE (PCE-initiated).

The **report** keyword enables the PCC to report all the MPLS-TE LSPs configured on that node.

Note

PCE-initiated LSPs are automatically reported to all configured PCEs.

The **autoroute-announce** keyword enables autoroute-announce globally for all PCE-initiated LSPs on the PCC.

The **redundancy pcc-centric** keywords enable PCC-centric high-availability model for PCE-initiated LSPs. The PCC-centric model changes the default PCC delegation behavior to the following:

- After LSP creation, LSP is automatically delegated to the PCE that computed it.
- If this PCE is disconnected, then the LSP is redelegated to another PCE.
- If the original PCE is reconnected, then the delegation fallback timer is started. When the timer expires, the LSP is redelegated back to the original PCE, even if it has worse preference than the current PCE.

```
mpls traffic-eng
pce
  peer ipv4 10.1.1.100
!
  stateful-client
   instantiation
  report
  autoroute-announce
  redundancy pcc-centric
!
!
end
```

Example: Configuring Multiple PCEP Sessions from a PCC Acting as MPLS-TE and SR-TE Headend Toward a Common PCE

The following example shows the configuration for a PCC (IPv4 addresses 10.1.1.1 and 10.1.1.2) to establish two PCEP sessions with a common PCE (IPv4 address 10.1.1.100). One session is configured under MPLS-TE, and the other under SR-TE.

Note

The two PCEP sessions must use a different source address on the PCC when connecting to the same PCE.

For more information regarding PCEP configuration at SR-TE PCC, see the *Configure the Head-End Router* as PCEP PCC topic.

```
mpls traffic-eng
pce
  peer source ipv4 10.1.1.1
  peer ipv4 10.1.1.100
!
!
!
end

segment-routing
  traffic-eng
  pcc
  source-address ipv4 10.1.1.2
  pce address ipv4 10.1.1.100
!
!
!
!
end
```

Configuring the North-Bound API on SR-PCE

The SR-PCE provides a north-bound HTTP-based API to allow communication between SR-PCE and external clients and applications.

Over this API, an external application can leverage the SR-PCE for topology discovery, SR policy discovery, and SR policy instantiation.

The Cisco Crosswork Optimization Engine is an application that leverages the SR-PCE. For more information, refer to the Cisco Crosswork Optimization Engine User Guides.

Use the following commands under PCE configuration mode to configure the API to allow communication between SR-PCE and external clients or applications.

Note

The API server is enabled by default when SR-PCE is configured.

Command	Description	
rest authentication basic	(Optional) Specify basic (plaintext) authentication. By default, authentication is disabled.	
rest username password {clear encrypted}	Add credentials when connecting to API.	
password	Note This command is used only if authentication is configured.	

Command	Description	
rest sibling ipv4 address	1 2	rchronization channel to another PCE in igh availability (HA) pair. For more information regarding SR-PCE HA pairs, refer to the Multiple Cisco SR-PCE HA Pairs chapter of the Cisco Crossweet Optimization Family 1.2.1
		Crosswork Optimization Engine 1.2.1 User Guide.

Example: Configuring API on SR-PCE

```
pce
address ipv4 10.1.1.100
rest
  user admin
  password encrypted 1304131F0202
!
  authentication basic
  sibling ipv4 10.1.1.200
!
!
end
```

The following example shows the current active connections:

```
RP/0/0/CPU0:pce1# show tcp brief | i 8080
Thu Aug 6 00:40:15.408 PDT
0xe9806fb8 0x60000000 0
                                0 :::8080
                                                         :::0
                                                                               LISTEN
0xe94023b8 0x60000000
                        0
                              0 10.1.1.100:50487
                                                       10.1.1.200:8080
                                                                              ESTAB
0xe94023b8 0x60000000 0
0xeb20bb40 0x60000000 0
