

Graceful Handling of Out of Resource Situations

Out of Resource Situation is an alarm or notification indicating that the resources of the router are used extensively and the resources are reaching their threshold limits. These situations can occur due to various reasons such as high number of routes, MAC addresses, interfaces, and Access Control List (ACEs). To exemplify, if the router fails to program high number of routes in its Network Processing Unit (NPU), OOR alarm can be triggered. The OOR situations ultimately leads to traffic loss. By handling the OOR situation gracefully, you can avoid the traffic loss in the router.

NPU is an integrated circuit which has a feature set targeted at a networking application domain. The role of NPU is similar to the role of CPU (Central Processing Unit) in the computer. Integrated circuits in NPU handle data packets transmission in the routers. To enable the transmission of data packets, NPU uses several internal resources such as Forwarding Information Base (FIB), Input Logical Interface (INLIF), INLIF1, INLIF2, and Router Interface (RIF).

To ensure optimum traffic forwarding without any loss, it is crucial to monitor and ensure that the NPU tables are not out of resources. The router maintains default OOR threshold levels to alert you of the NPU resource usage.

The default values for OOR threshold levels are as follows:

- The **Red** state occurs when 95% or more of the router's hardware resources are in-use.
- The **Yellow** state occurs when 80% or more of the router's hardware resources are in-use.
- The **Green** state indicates that less than 80% of the router's hardware resources are in-use and there's favorable utilization of hardware resources.
- [Out of Resource Handling of FIB Resources, on page 1](#)

Out of Resource Handling of FIB Resources

The main function of the FIB within routers/line-cards is to map destination IP prefixes/labels to potential egress interfaces. In order to achieve this, the FIB maintains multiple databases or hardware tables, such as:

- Forward Equivalence Class (FEC) and the Equal Cost Multi-Path Forward Equivalence Class (ECMP FEC): This database mainly stores information related to the IPv4 and IPv6 prefixes that the router has learnt. When a traffic packet reaches the router, it performs a FIB lookup on the destination prefix of the incoming packet. This lookup results in the FEC or ECMP FEC object for that particular prefix and it provides information about the egress interface on the router through which the packet can reach its destination.

- Egress Encapsulation Data Base (EEDB): This database stores adjacency details such as the link-local details from Address Resolution Protocol (ARP) or Neighbor Discovery (ND) Protocol, Multiprotocol Label Switching (MPLS) labels, Generic Routing Encapsulation (GRE) headers and so on.

OOR Protection Mode

When the FIB resource usage exceeds the red threshold, the system enters OOR protection mode.

In FEC OOR protection mode, the router doesn't allocate any FEC objects when it learns a new prefix, but assigns a pre-created drop FEC instead. The router drops incoming packets with destination IP addresses that were assigned the drop FEC.

In ECMP FEC OOR protection mode, the router chooses only the first path among multiple paths to forward traffic. When FEC or ECMP FEC usage drops below yellow threshold, the router reprograms the affected prefixes to normal FEC or ECMP FEC. Thereafter, the router resumes traffic flow.

In EEDB OOR protection mode, the router will not program any more egress encapsulation information. This in turn results in traffic drop. When EEDB usage drops below yellow threshold, the router resumes programming new egress encapsulation data as well as traffic flow.

Configuration Steps to Change OOR Threshold Levels

The following section shows how to change the default threshold levels for OOR handling.

```
Router# conf t
Router(config)# oor hw threshold red 90
Router(config)# oor hw threshold yellow 75
Router(config)# commit
```

Release Stale FEC Resources

To release the stale FEC resources, execute the following command:

```
Router# clear cef
```

Verification of FEC Resources

Table 1: Feature History Table

Feature Name	Release Information	Feature Description
Hierarchical Forward Equivalence Class (HFEC) Out of Resource (OOR) Enhancements	Release 7.5.1	With this enhancement, you can view the details of the utilization of Forwarding Information Base (FIB) hardware resources, such as hierarchical FEC and hierarchical Equal Cost Multi-Path (ECMP) FEC, in the output of the command show controllers npu resources . This feature also enables the router to display system logs on the console that alert you when FEC resources have crossed the OOR threshold levels. These logs help you to take corrective action and free up FEC resources, to minimize traffic loss. .

Use the **show controllers npu resources** command to verify FIB resources.

The **OOR State** in the output of the **show controllers npu resources** command changes when the router reaches an OOR situation. The **OOR State** changes from **Green** to **Yellow**, and finally to **Red** depending on the utilization of FEC or ECMP FEC resources.

```
Router# show controllers npu resources fec location 0/0/CPU0

FIB has three FEC hierarchies and 3 ECMP FEC hierarchies. From Cisco IOS XR Release 7.5.1 onwards, you can view these hierarchies in the output of the commands show controllers npu resources fec and show controllers npu resources ecmpfec. The router records the OOR State of each of these hierarchies in the command outputs.

System Log Alerts for HFEC OOR

When utilization of any of the FEC or ECMP FEC hierarchies transition from the current OOR state to another state, the router generates system logs to alert the user. You can then take corrective action if the router is approaching OOR state to ensure that FEC resources get freed up before traffic loss takes place.

```

Verification of EEDB Resources

Table 2: Feature History Table

Feature Name	Release Information	Feature Description
EEDB Resource Segregation for Encapsulation Types	Release 7.8.1	<p>We have now segregated the Egress Encapsulation Database (EEDB) resources based on different egress encapsulation types, such as attachment circuits (AC), pseudowires, tunnels, and Address Resolution Protocol (ARP). This allows you to examine encapsulation-specific resource details using show commands.</p> <p>When resource usage exceeds the Out of Resource (OOR) threshold levels, the router also alerts you with system log messages.</p> <p>When resource usage exceeds the OOR thresholds, you can avoid traffic loss by taking corrective action to free up resources, such as reducing the scale of interfaces with the related encapsulation.</p> <p>The show controllers npu resources command is now modified to include the following optional keywords:</p> <ul style="list-style-type: none"> • encapAC • encapPWE • encaptunnels • encapARP <p>This feature is supported on Cisco 5700 Series Routers and on routers that have the NC57 line cards installed and operating in either native or compatibility mode</p>

Feature Name	Release Information	Feature Description
Verification of EEDB OOR	Release 7.6.1	<p>If the Egress Encapsulation Database (EEDB) resources exceed the Out of Resource (OOR) threshold levels, the router generates system logs that indicate the resource utilization of EEDB hardware. With these details, you can take corrective action by freeing up EEDB resources, thereby minimizing traffic loss.</p> <p>This feature also updates the show output of the following command to display utilization of EEDB hardware resources:</p> <p style="color: blue;">show controllers npu resources</p>

The router processes several entries and often stores these entries in the form of tables. These tables are further divided into smaller tables. These smaller tables are called as banks. The banks are often named as bank_0, bank_1, bank_2, and so on. Router segregates the entries through these banks.

Use **show controllers npu resources encaps** command to verify the usage of EEDB resources.

The **OOR State** in the output of the **show controllers npu resources encaps** command changes when the router reaches an OOR situation. The **OOR State** changes from **Green** to **Yellow**, and finally to **Red** depending on the utilization of the EEDB resources.

EEDB Resource Segregation for Encapsulation Types

Starting from Cisco IOS XR Release 7.8.1, we have segregated EEDB resources based on different egress encapsulation types. Cisco IOS XR software now provides encapsulation specific EEDB resource usage for the following egress encapsulation types:

- Attachment Circuits (AC)
- Pseudowires
- ARP packets
- Tunnels

To view the EEDB resource details for AC, use the command **show controllers npu resources encapAC**.

```
Router# show controllers npu resources encapAC location 0/RP0/CPU0

System Log Alerts for EEDB OOR

When utilization of EEDB resources transition from the current OOR state to another state, the router generates system logs to alert the user. You can then take corrective action if the router is approaching OOR state to ensure that EEDB resources get freed up before traffic loss takes place.

The router logs the following log messages to inform you of the OOR state of the encapsulation resource when it exceeds thresholds. The syslog also indicates the Network Processing Unit (NPU) of the affected encapsulation, which is NPU0, in this case.

```

LC/0/0/CPU0: fia_driver[164]: %PLATFORM-OFA-4-OOR_YELLOW : NPU 0, Table mplsnh, Resource
encap
LC/0/0/CPU0: fia_driver[164]: %PLATFORM-OFA-1-OOR_RED : NPU 0, Table mplsnh, Resource encaps

```

Starting from Cisco IOS XR Release 7.8.1, the router logs the following GRID alarm log message and NPU OOR alarm log message when the encapsulation specific EEDB resource exceeds thresholds.

```

LC/0/0/CPU0: grid_svr[450]: %L2-GRID-4-BANK_ALARM_STATE_YELLOW : GRID POOL: GLIF (id:2),
BANK 0 has state changed from Green to Yellow.
LC/0/0/CPU0: fia_driver[228]: %PLATFORM-OFA-4-OOR_YELLOW : NPU 0, Table ipnh, Resource
encap_ARP

```

Out of Resource Handling of Input Logical Interface and Router Interface Resources

Table 3: Feature History Table

Feature Name	Release Information	Feature Description
Out of Resource Handling of Input Logical Interface and Router Interface Resources	Release 7.7.1	<p>You can now reconfigure the threshold level for NPU resources - Input Logical Interface (INLIF) and Router Interface (RIF) by changing the predefined threshold level at which Out of Resource (OOR) situation is triggered. Graceful handling of OOR helps you to minimize traffic loss.</p> <p>You get notified via systemlogs, when the utilization of resources reaches their OOR limit. Also, you can view the utilization of resources by using the following commands:</p> <ul style="list-style-type: none"> • show controllers npu resources • show grid pool

INLIF: This resource is part of Logical Interface (LIF) and mainly stores several IP-related attributes. INLIF stores information about the following:

- Layer 2 ports
- Layer 2 interface
- IP virtual routing and forwarding
- Layer 2 bridge
- Layer 2 cross connect
- MPLS
- MPLS Multicast Distribution Tree (MDT) bud
- IP tunnel decapsulation
- Policy-based routing IPv4
- Redirect virtual routing and forwarding

RIF: This resource stores information about routing interfaces and Virtual Switching Interfaces (VSI). Routing interface consists of a port at which a router connects to the given network. RIF stores information about the following:

- Layer 3 interface

- IP virtual routing and forwarding
- IP tunnel decapsulation
- Layer 2 bridge
- Policy-based routing IPv4
- Policy-based routing IPv6
- Layer 2 bridge
- Redirect virtual routing and forwarding
- MPLS Multicast Distribution Tree (MDT) bud

Cisco IOS XR Software Release 7.7.1 introduces the graceful handling of INLIF and RIF resources under NPU. You can redefine the threshold levels of OOR to change the triggering of OOR notification.

To change OOR threshold levels for INLIF and RIF, refer section *Configuration Steps to Change OOR Threshold Levels* in this chapter.

Verification

The **OOR State** in the output of the **show controllers npu resources** and **show grid pool** command changes when the router reaches an OOR situation. The **OOR State** changes from **Green** to **Yellow**, and finally to **Red** depending on the utilization of INLIF and RIF resources.

Use the following commands to check the utilization of NPU resources:

- **show controllers npu resources**
- **show grid pool**

```
Router#show controllers npu resources INLIF1 location 0/3/CPU0

You can also check the utilization of resources within a bank by using the **show grid pool** command. This command gives you detailed information about the current state of banks in each resource.

Note Yang data model support is not available for **show grid pool**.

```

Router#show grid pool 1 bank all
Tue Jul 26 11:44:24.960 UTC

System Log Alerts for INLIF and RIF OOR

When utilization of resources in NPU transition from the current OOR state to another state, the router generates system logs to alert you to free up the resources before traffic loss occurs.

```
