

EVPN Features

This chapter describes how to configure Layer 2 Ethernet VPN (EVPN) features on the router.

Table 1: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Infrastructure	Release 7.3.1	This feature is now supported on routers that have Cisco NC57 line cards installed and operate in native and compatibility modes.

EVPN Overview

Ethernet VPN (EVPN) is a solution that provides Ethernet multipoint services over MPLS networks. EVPN operates in contrast to the existing Virtual Private LAN Service (VPLS) by enabling control-plane based MAC learning in the core. In EVPN, PEs participating in the EVPN instances learn customer MAC routes in control-plane using MP-BGP protocol. Control-plane MAC learning brings a number of benefits that allow EVPN to address the VPLS shortcomings, including support for multihoming with per-flow load balancing.

EVPN provides the solution for network operators for the following emerging needs in their network:

- Data center interconnect operation (DCI)
- Cloud and services virtualization
- Remove protocols and network simplification
- Integration of L2 and L3 services over the same VPN
- Flexible service and workload placement
- Multi-tenancy with L2 and L3 VPN
- Optimal forwarding and workload mobility
- Fast convergence
- Efficient bandwidth utilization

EVPN Benefits

The EVPN provides the following benefits:

- Integrated Services: Integrated L2 and L3 VPN services, L3VPN-like principles and operational experience for scalability and control, all-active multihoming and PE load-balancing using ECMP, and enables load balancing of traffic to and from CEs that are multihomed to multiple PEs.
- Network Efficiency: Eliminates flood and learn mechanism, fast-reroute, resiliency, and faster reconvergence when the link to dual-homed server fails, optimized Broadcast, Unknown-unicast, Multicast (BUM) traffic delivery.
- Service Flexibility: MPLS data plane encapsulation, support existing and new services types (E-LAN, E-Line), peer PE auto-discovery, and redundancy group auto-sensing.

EVPN Modes

The following EVPN modes are supported:

- Single-homing - Enables you to connect a customer edge (CE) device to one provider edge (PE) device.
- Multihoming - Enables you to connect a customer edge (CE) device to more than one provider edge (PE) device. Multihoming ensures redundant connectivity. The redundant PE device ensures that there is no traffic disruption when there is a network failure. Following are the types of multihoming:
 - Single-Active - In single-active mode only a single PE among a group of PEs attached to the particular Ethernet-Segment is allowed to forward traffic to and from that Ethernet Segment.

- All-Active - In all-active mode all the PEs attached to the particular Ethernet-Segment is allowed to forward traffic to and from that Ethernet Segment.

EVPN Restrictions

When paths of different technologies are resolved over ECMP, it results in *heterogeneous* ECMP, leading to severe network traffic issues. Don't use ECMP for any combination of the following technologies:

- LDP.
- BGP-LU, including services over BGP-LU loopback peering or recursive services at Level-3
- VPNv4.
- 6PE and 6VPE.
- EVPN.
- Recursive static routing.

EVPN Concepts

To implement EVPN features, you need to understand the following concepts:

- Ethernet Segment (ES): An Ethernet segment is a set of Ethernet links that connects a multihomed device. If a multi-homed device or network is connected to two or more PEs through a set of Ethernet links, then that set of links is referred to as an Ethernet segment. The Ethernet segment route is also referred to as Route Type 4. This route is used for designated forwarder (DF) election for BUM traffic.
- Ethernet Segment Identifier (ESI): Ethernet segments are assigned a unique non-zero identifier, which is called an Ethernet Segment Identifier (ESI). ESI represents each Ethernet segment uniquely across the network.
- EVI: The EVPN instance (EVI) is represented by the virtual network identifier (VNI). An EVI represents a VPN on a PE router. It serves the same role of an IP VPN Routing and Forwarding (VRF), and EVIs are assigned import/export Route Targets (RTs). Depending on the service multiplexing behaviors at the User to Network Interface (UNI), all traffic on a port (all-to-one bundling), or traffic on a VLAN (one-to-one mapping), or traffic on a list/range of VLANs (selective bundling) can be mapped to a Bridge Domain (BD). This BD is then associated to an EVI for forwarding towards the MPLS core.

Before Release 25.2.1, the EVPN EVI range was from 1 to 65534.

From Release 25.2.1, the EVPN EVI range is from 1 to 16777215.

- EAD/ES: Ethernet Auto Discovery Route per ES is also referred to as Route Type 1. This route is used to converge the traffic faster during access failure scenarios. This route has Ethernet Tag of 0xFFFFFFFF.
- EAD/EVI: Ethernet Auto Discovery Route per EVI is also referred to as Route Type 1. This route is used for aliasing and load balancing when the traffic only hashes to one of the switches. This route cannot have Ethernet tag value of 0xFFFFFFFF to differentiate it from the EAD/ES route.
- Aliasing: It is used for load balancing the traffic to all the connected switches for a given Ethernet segment using the Route Type 1 EAD/EVI route. This is done irrespective of the switch where the hosts are actually learned.

- **Mass Withdrawal:** It is used for fast convergence during the access failure scenarios using the Route Type 1 EAD/ES route.
- **DF Election:** It is used to prevent forwarding of the loops. Only a single router is allowed to decapsulate and forward the traffic for a given Ethernet Segment.

EVPN Operation

At startup, PEs exchange EVPN routes in order to advertise the following:

- **VPN membership:** The PE discovers all remote PE members of a given EVI. In the case of a multicast ingress replication model, this information is used to build the PEs flood list associated with an EVI. BUM labels and unicast labels are exchanged when MAC addresses are learned.
- **Ethernet segment reachability:** In multihoming scenarios, the PE auto-discovers remote PE and their corresponding redundancy mode (all-active or single-active). In case of segment failures, PEs withdraw the routes used at this stage in order to trigger fast convergence by signaling a MAC mass withdrawal on remote PEs.
- **Redundancy Group membership:** PEs connected to the same Ethernet segment (multihoming) automatically discover each other and elect a Designated Forwarder (DF) that is responsible for forwarding Broadcast, Unknown unicast and Multicast (BUM) traffic for a given EVI.

Figure 1: EVPN Operation

EVPN can operate in single-homing or dual-homing mode. Consider single-homing scenario, when EVPN is enabled on PE, Route Type 3 is advertised where each PE discovers all other member PEs for a given EVPN instance. When an unknown unicast (or BUM) MAC is received on the PE, it is advertised as EVPN Route Type 2 to other PEs. MAC routes are advertised to the other PEs using EVPN Route Type 2. In multihoming scenarios, Route Types 1, 3, and 4 are advertised to discover other PEs and their redundancy modes (single-active or all-active). Use of Route Type 1 is to auto-discover other PE which hosts the same CE. The other use of this route type is to fast route unicast traffic away from a broken link between CE and PE. Route Type 4 is used for electing designated forwarder. For instance, consider the topology when customer traffic arrives at the PE, EVPN MAC advertisement routes distribute reachability information over the core for each customer MAC address learned on local Ethernet segments. Each EVPN MAC route announces the customer MAC address and the Ethernet segment associated with the port where the MAC was learned from and its

associated MPLS label. This EVPN MPLS label is used later by remote PEs when sending traffic destined to the advertised MAC address.

Behavior Change due to ESI Label Assignment

To adhere to RFC 7432 recommendations, the encoding or decoding of MPLS label is modified for extended community. Earlier, the lower 20 bits of extended community were used to encode the split-horizon group (SHG) label. Now, the SHG label encoding uses from higher 20 bits of extended community.

According to this change, routers in same ethernet-segment running old and new software release versions decodes extended community differently. This change causes inconsistent SHG labels on peering EVPN PE routers. Almost always, the router drops BUM packets with incorrect SHG label. However, in certain conditions, it may cause remote PE to accept such packets and forward to CE potentially causing a loop. One such instance is when label incorrectly read as NULL.

To overcome this problem, Cisco recommends you to:

- Minimize the time both PEs are running different software release versions.
- Before upgrading to a new release, isolate the upgraded node and shutdown the corresponding AC bundle.
- After upgrading both the PEs to the same release, you can bring both into service.

Similar recommendations are applicable to peering PEs with different vendors with SHG label assignment that does not adhere to RFC 7432.

EVPN Route Types

The EVPN network layer reachability information (NLRI) provides different route types.

Table 2: EVPN Route Types

Route Type	Name	Usage
1	Ethernet Auto-Discovery (AD) Route	Few routes are sent per ES, carries the list of EVIs that belong to ES
2	MAC/IP Advertisement Route	Advertise MAC, address reachability, advertise IP/MAC binding
3	Inclusive Multicast Ethernet Tag Route	Multicast Tunnel End point discovery
4	Ethernet Segment Route	Redundancy group discovery, DF election
5	IP Prefix Route	Advertise IP prefixes.

Route Type 1: Ethernet Auto-Discovery (AD) Route

The Ethernet Auto-Discovery (AD) routes are advertised on per EVI and per ESI basis. These routes are sent per ES. They carry the list of EVIs that belong to the ES. The ESI field is set to zero when a CE is single-homed. This route type is used for mass withdrawal of MAC addresses and aliasing for load balancing.

Route Type 2: MAC/IP Advertisement Route

These routes are per-VLAN routes, so only PE that are part of a VNI require these routes. The host's IP and MAC addresses are advertised to the peers within NRLI. The control plane learning of MAC addresses reduces unknown unicast flooding.

Route Type 3: Inclusive Multicast Ethernet Tag Route

This route establishes the connection for broadcast, unknown unicast, and multicast (BUM) traffic from a source PE to a remote PE. This route is advertised on per VLAN and per ESI basis.

Route Type 4: Ethernet Segment Route

Ethernet segment routes enable to connect a CE device to two or PE devices. ES route enables the discovery of connected PE devices that are connected to the same Ethernet segment.

Route Type 5: IP Prefix Route

The IP prefixes are advertised independently of the MAC-advertised routes. With EVPN IRB, host route /32 is advertised using RT-2 and subnet /24 is advertised using RT-5.

Note With EVPN IRB, host route /32 are advertised using RT-2 and subnet /24 are advertised using RT-5.

EVPN Timers

The following table shows various EVPN timers:

Table 3: EVPN Timers

Timer	Range	Default Value	Trigger	Applicability	Action	Sequence
startup-cost-in	30-86400s	disabled	node recovered*	Single-Homed, All-Active, Single-Active	Postpone EVPN startup procedure and Hold AC link(s) down to prevent CE to PE forwarding. Startup-cost-in timer allows PE to set core protocols first.	1

Timer	Range	Default Value	Trigger	Applicability	Action	Sequence
peering	0-3600s	3s	node recovered, interface recovered	All-Active, Single-Active	Starts after sending EVPN RT4 to postpone rest of EVPN startup procedure. Peering timer allows remote PE (multihoming AC with same ESI) to process RT4 before DF election will happen.	3
global mac evpn timer	0-300s	300s	when BGP is fired	Single-Flow-Active and Multi homed all active	Delay the time and effort required to delete the remote portion to save programming cycles working for forwarding path first.	4

**Note**

- The timers are available in EVPN global configuration mode and in EVPN interface sub-configuration mode.
- Startup-cost-in is available in EVPN global configuration mode only.
- Timers are triggered in sequence (if applicable).
- Cost-out in EVPN global configuration mode brings down AC link(s) to prepare node for reload or software upgrade.

* indicates all required software components are loaded.

** indicates link status is up.

*** you can change the recovery timer on Single-Homed AC if you do not expect any STP protocol convergence on connected CE.

Global MAC EVPN Timer

Global mac evpn timer is configurable under **evpn timers mac-postpone** timer. Global MAC EVPN timer is relevant for SYNC routes only in the following scenarios:

- FRR (fast re-route) is configured: MAC and MAC+IP deletes are postponed to help with convergence.
- All-active: MAC+IPs deletes are postponed to allow time for ARP to converge.
- Single-flow-active: MAC+IP deletes are postponed to allow speculative (Address Resolution Protocol) ARP to point to local adjacency.

Typically, a route that is deleted is always quickly learned locally. Using this knowledge, we can delay the time and effort required to delete the remote portion to save programming cycles working for forwarding path first.

Note The timer of 5-minutes start when EVPN receives a delete from BGP. The timer doesn't start at the exact time of AC shut or mass-withdraw.

The benefit of this speculative behavior is that we can reduce MAC-IP delete/re-create churn in forwarding and BGP.

Triggers of Global Mac EVPN Timer:

- Shut / No shut on IRB/BVI Interfaces.
- Removing and adding AC Interface Configuration.
- Removing and adding BVI Interface Configuration.
- Removing and adding BVI Interface from Bridge Domains.
- Shut / No shut on AC/Main-port Interface Configuration.

Configure EVPN L2 Bridging Service

Perform the following steps to configure EVPN L2 bridging service.

Note Always ensure to change the label mode from per-prefix to per-VRF label mode. Since L2FIB and VPNv4 route (labels) shares the same resource, BVI ping fails when you exhaust the resources.

Note Traffic to directly connected neighbor on EVPN or VPLS bridge won't work in the following scenarios:

- If neighbor doesn't advertise MPLS explicit null.
- If imposition node has a mix of implicit-null and labeled paths in ECMP or LFA deployment.

Note A device can contain up to 128K MAC address entries. A bridge domain on a device can contain up to 64K MAC address entries.

Note Flooding disable isn't supported on EVPN bridge domains.

```
/* Configure address family session in BGP */
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router# (config)# router bgp 200
RP/0/RSP0/CPU0:router# (config-bgp)# bgp router-id 209.165.200.227
RP/0/RSP0/CPU0:router# (config-bgp)# address-family l2vpn evpn
RP/0/RSP0/CPU0:router# (config-bgp)# neighbor 10.10.10.10
RP/0/RSP0/CPU0:router# (config-bgp-nbr)# remote-as 200
RP/0/RSP0/CPU0:router# (config-bgp-nbr)# description MPLSFACING-PEER
RP/0/RSP0/CPU0:router# (config-bgp-nbr)# update-source Loopback 0
RP/0/RSP0/CPU0:router# (config-bgp-nbr)# address-family l2vpn evpn

/* Configure EVI and define the corresponding BGP route targets */
```

Note EVI route target used for multicast EVPN supports only extcomm type sub-type 0xA for EVI route target, the two-octet Autonomous System (AS) specific Extended Community. This means that when using a 4-byte AS number for BGP, you must additionally configure BGP import and export route targets under the EVPN configuration.

```

EVPN Modes

The following EVPN modes are supported:

- **Single-homing** - Enables you to connect a customer edge (CE) device to one provider edge (PE) device.
- **Multihoming** - Enables you to connect a customer edge (CE) device to more than one provider edge (PE) device. Multihoming ensures redundant connectivity. The redundant PE device ensures that there is no traffic disruption when there is a network failure. Following are the types of multihoming:
 - **Single-Active** - In this mode, only a single PE among a group of PEs attached to the particular Ethernet-Segment is allowed to forward traffic to and from that Ethernet Segment.
 - **All-Active** - In this mode, all PEs attached to the particular Ethernet-Segment is allowed to forward traffic to and from that Ethernet Segment.
 - **Port-Active** - In this mode, only the PE which is in the active mode sends and receives the traffic. This mode supports single-active redundancy load balancing at the port-level or the interface-level.
 - **Single-Flow-Active** - In this mode, only the PE that first advertises the host MAC address in a VLAN forwards the traffic in a specific flow.

EVPN Single-Active Multi-Homing Mode

In single-active multihoming mode, only a single edge (PE) Router among a group of PE Routers attached to a host is allowed to send and receive traffic on a given VLAN.

The single-active mode offers redundant connectivity for a VLAN on a single link at a time with failover to the second link in case the active link fails. The single-active mode directs the traffic to a single uplink. This mode is useful for network scenarios where policing, metering, and billing are required.

In Single-Active mode, Cisco IOS XR sends a topology change notification on the Ethernet segment links when a service carving update occurs, so that CEs flush their MAC tables and redirect traffic to the new DF-Elected PE.

Starting from Cisco IOS XR Release 7.11.2, the MAC flush message can be disabled for an Ethernet segment if it causes undesired behaviour at the CE, like triggering BPDU guard. Use the **mac-flush-message disable** command to disable the MAC flush messages.

Topology

Let's understand how the single-active mode works with this sample topology.

In this topology,

- The CE Router is multihomed to PE1 and PE2. Only one active uplink is allowed to send and receive traffic at any given time.
- In this mode, each link towards PE is in a unique ethernet bundle interface. In this example, BE1 is the ethernet bundle interface connecting CE1 and PE1. BE2 is the ethernet bundle interface connecting CE1 and PE2.
- As both the links are in a separate ethernet bundle interface, CE1 floods traffic at first to both the PE devices, but only the PE that is the Designated Forwarder (DF) forwards the traffic.
- In this mode, the uplinks to PE1 and PE2 are individual links and by default, the host chooses the DF uplink for forwarding for a given VLAN.

Configure EVPN Single-Active Multi-Homing

Perform the following tasks to configure EVPN single-active multi-homing:

- Configure Ethernet bundles on CE1 for multi-homing.
- Configure EVPN based single-active multi-homing.

Note Sub-interface shutdown is not supported in Single-Active load-balancing mode

Configure Ethernet bundles on CE1 for Multihoming:

```
Router#configure
Router(config)#interface Bundle-Ether1
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface Bundle-Ether2
Router(config-if)# no shutdown
Router(config)#exit
Router(config)#interface HundredGigE0/0/0/0
Router(config-if)#bundle id 1 mode active
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface HundredGigE0/0/0/1
Router(config-if)#bundle id 2 mode active
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface HundredGigE0/0/0/2
Router(config-if)#exit
Router(config)#interface HundredGigE0/0/0/3
Router(config-if)#no shutdown
Router(config-if)#commit
Router(config-if)#exit

Verification

The following output shows that the EVPN single-active mode is enabled:

Router#**show evpn ethernet-segment detail**

Legend:

B - No Forwarders EVPN-enabled,
 C - Backbone Source MAC missing (PBB-EVPN),
 RT - ES-Import Route Target missing,
 E - ESI missing,
 H - Interface handle missing,
 I - Name (Interface or Virtual Access) missing,
 M - Interface in Down state,
 O - BGP End of Download missing,
 P - Interface already Access Protected,
 Pf - Interface forced single-homed,
 R - BGP RID not received,
 S - Interface in redundancy standby state,
 X - ESI-extracted MAC Conflict
 SHG - No local split-horizon-group label allocated

Disable MAC Flush Messages for EVPN Single-Active Multi-Homing

To disable the MAC flush messages on an Ethernet segment, use the [mac-flush-message disable](#) while configuring EVPN single-active multi-homing on PE Routers.

```

Router(config)#evpn
Router(config-evpn)#evi 100
Router(config-evpn-instance)#advertise-mac
Router(config-evpn-instance-mac)#exit
Router(config-evpn-instance)#exit
Router(config-evpn)#interface Bundle-Ether1
Router(config-evpn-ac)#ethernet-segment
Router(config-evpn-ac-es)#identifier type 0 36.37.00.00.00.00.11.00
Router(config-evpn-ac-es)#load-balancing-mode single-active
Router(config-evpn-ac-es)#exit
Router(config-evpn-ac)# mac-flush-message disable
Router(config-evpn-ac)# root

Router(config)#l2vpn
Router(config-l2vpn)#bridge group 100
Router(config-l2vpn-bg)#bridge-domain 100

EVPN Port-Active Multihoming

The EVPN Port-Active Multihoming feature supports single-active redundancy load balancing at the port-level or the interface-level. You can use this feature when you want to forward the traffic to a specific interface, rather than have a per-flow load balancing across multiple PE routers. This feature provides a faster convergence during a link failure. This feature enables protocol simplification as only one of the physical ports is active at a given time. You can enable this feature only on bundle interfaces.

EVPN port-active provides protocol simplification compared to Inter-Chassis Communication Protocol (ICCP), which runs on top of Label Distribution Protocol (LDP). You can use this feature as an alternative to multi-chassis link aggregation group (MC-LAG) with ICCP.

Also, you can use this feature when you want certain QoS features to work.

This feature allows one of the PEs to be in active mode and another in the standby mode at the port-level. Only the PE which is in the active mode sends and receives the traffic. The other PE remains in the standby mode. The PEs use the Designated Forwarder (DF) election mechanism to determine which PE must be in the active mode and which must be in the standby mode. You can use either modulo or Highest Random Weight (HRW) algorithm for per port DF election. By default, the modulo algorithm is used for per port DF election.

Figure 2: EVPN Port-Active Multihoming

Consider a topology where the customer edge device (CE) is multihomed to provider edge devices, PE1 and PE2. Use single link aggregation at the CE. Only one of the two interfaces is in the forwarding state, and the other interface is in the standby state. In this topology, PE2 is in the active mode and PE1 is in the standby mode. Hence, PE2 carries traffic from the CE. All services on the PE2 interface operate in the active mode. All services on the PE1 operate in the standby mode.

If you remove the port-active configuration on both PE1 and PE2 and then add back the port-active configuration on both the PEs, PE2 is chosen as an active interface again.

EVPN port-active is compatible with the following services:

- L2 bridging
- L3 gateway
- L2VPN VPLS
- EVPN ELAN
- EVPN IRB
- L2VPN VPWS
- EVPN VPWS

- FXC

Note MC-LAG in EVPN Multihoming-ELAN is not supported and alternative EVPN port-active should be used.

This feature supports both L2 and L3 port-active functionality. L2 and L3 port-active can coexist on the same bundle. For example, if you configure port-active on a bundle, the bundle can have a mix of both L3 subinterfaces and L2 subinterfaces participating in the services mentioned above.

Configure EVPN Port-Active Multihoming

Perform this task to configure EVPN port-active multihoming.

Configure the same ESI on both the routers. Configure Ethernet-Segment in port-active load-balancing mode on peering PEs for a specific interface.

Note Sub-interface shutdown is not supported in Port-Active load-balancing mode

Configuration Example

```
/* PE1 and PE2 Configuration */

Router#configure
Router(config)#interface Bundle-Ether11
Router(config-if)#lcp system mac 3637.3637.3637
Router(config-if)#exit

Router(config)#evpn
Router(config-evpn)#interface Bundle-Ether11
Router(config-evpn-ac)#ethernet-segment
Router(config-evpn-ac-es)#identifier type 0 11.11.11.11.11.00.11.11.11
Router(config-evpn-ac-es)#load-balancing-mode port-active
Router(config-evpn-ac-es)#commit

/* If you want enable L3 port-active, configure the IP address */
Router#configure
Router(config)#interface Bundle-Ether11
Router(config-if)#ipv4 address 10.0.0.1 255.0.0.0
Router(config-if)#ipv6 address 10::1/64
Router(config-if)#commit
```

Running Configuration

EVPN Port-Active Hot Standby on Bundle Interfaces

Table 4: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Port-Active Hot Standby on Bundle Interfaces	Release 7.10.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5700 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards; NCS 5700 line cards [Mode: Compatibility; Native])</p> <p>The EVPN port-active mode configuration is now modified to support hot standby. In a hot standby bundle interface, the main and subinterfaces remain up. This functionality ensures fast convergence of standby to active transition.</p> <p>Previously, the interfaces in a standby node would be down. During the failure and recovery of active node, the standby node transitions through the Out-of-Service (OOS) state to the Up state.</p> <p>If you still want the nodes to transition through the OOS state, use the access-signal out-of-service command to revert to the previous behavior.</p> <p>The feature introduces these changes:</p> <p>CLI:</p> <ul style="list-style-type: none"> • access-signal out-of-service <p>YANG Data Model:</p> <ul style="list-style-type: none"> • New XPaths for <code>Cisco-IOS-XR-l2vpn-cfg.yang</code> (see GitHub, YANG Data Models Navigator)

In earlier releases, when you configure EVPN port-active mode, one of the PEs is in active mode and other PEs are in standby mode at the port level. Only the PE, which is in active mode, sends and receives the traffic. The other PE remains in the standby mode. The PEs use the Designated Forwarder (DF) election mechanism using BGP Route-Type 4 (Ethernet-Segment route) exchange, to determine which PE must be in the active mode and which must be in the standby mode.

In a normal network, the PEs remain in the following state:

- The DF is in active mode, with the Bundle-Ethernet interface in Up state.

- The non-Designated Forwarder (NDF) is in standby mode, with the Bundle-Ethernet interface in OOS or Down state.

During the failure and recovery, the transitions happen as follows:

- When failure occurs on DF, Ethernet Segment (ES) route is withdrawn and the NDF becomes DF. The Bundle-Ethernet interface on NDF transitions from OOS/Down to Up state.
- During the recovery, ES route is signalled and DF transitions to NDF. The Bundle-Ethernet interface on peer node transitions from Up to OOS or Down state.

For more information, see the following references:

- [EVPN Port-Active Multihoming, on page 18](#)
- [EVPN Access-Driven DF Election, on page 134](#)

Implement EVPN Port-Active Hot Standby on Bundle Interfaces

Starting from Cisco IOS XR Release 7.10.1, EVPN port-active configuration is modified to support hot standby where the interfaces in the standby node are Up.

During the failure and recovery, the transitions happen as follows:

- When a standby node becomes active during failure, the node transitions from Up-Standby to Up-Active state .
- When an active node recovers, the node transitions from Up-Standby to Up-Active state.

The following table depicts the difference between states of DF and NDF for the previous and current releases:

PE State	Previous Releases	Current Release (Cisco IOS XR Release 7.10.1)
Bundle interfaces in DF	Up	Up
Bundle interfaces in NDF	Down or OOS	Hot Standby
Failure and Recovery	Standby node transitions from Down or OOS to Up state	Standby node transitions from Hot Standby to Up state

Consider a topology with EVPN port-active multihoming, where the customer edge device (CE) is multihomed to PEs.

Figure 3: EVPN Port-Active Multihoming

In this image, CE is multihomed to PE1 and PE2.

- PE1 and PE2 exchange ES routes (route-type 4) and perform DF election.
- DF node makes a Bundle-Ethernet interface as Up-Active.
- NDF nodes makes a Bundle-Ethernet interface as hot standby with the main and subinterfaces in the bundle Up.

Using port-active hot standby driven by ES route exchange, the transitions happen as follows:

- When failure occurs on DF, ES route is withdrawn and NDF bundle transitions from Up-Standby to Up-Active state.
- During the recovery of DF, the bundle transitions from Down to Up-Standby. When the recovery and peering is complete, the bundle transitions from Up-Standby to Up-Active state.

Revert to Previous Behavior

If you want to revert to the previous behavior of transitioning through the OOS state, use the **access-signal out-of-service** command.

When you configure EVPN port-active with the **access-signal out-of-service** command, the OOS state from EVPN is interpreted as Up-Standby.

- DF node makes a Bundle-Ethernet interface as Up-Active.
- NDF nodes makes a Bundle-Ethernet interface as Down, which sets the main port as Up-Standby.

In the standby node, the transitions happen as follows:

- When failure occurs on DF, ES route is withdrawn and NDF bundle transitions from Up-Standby to Up-Active state.
- During the recovery of DF, the bundle transitions from Down to OOS state to Up-Active state.

Note It is recommended to use the hot standby method for fast convergence.

Restrictions for EVPN Port-Active Hot Standby on Bundle Interfaces

- Link Aggregation Control Protocol (LACP) mode must be active for the hot standby to be enabled. Configure the bundle attached to the Ethernet Segment (ES) using the **lACP mode active** command. If the CE device does not support LACP, use the **access-signal down** command.

Configure EVPN Port-Active Hot Standby on Bundle Interfaces

To achieve EVPN port-active mode with hot standby mode, configure Ethernet-Segment (ES) in port-active load-balancing mode on peering PEs for a specific interface.

```
/* PE1 and PE2 Configuration */

Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 01.00.01.00.01.09.01.00.09
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# commit
```

Verification

The following examples show output from the active and standby nodes.

As PE1 is the DF in active mode, the status is UP with active links.

The following example shows ES state as UP.

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 private
...
Ethernet Segment Id      Interface      Nexthops

```

The following output shows that the bundle interface is in **Hot-Standby** mode with local member in standby mode.

```

Router# show bundle bundle-ether 1
...
Bundle-Ether1
  Status:                      EVPN Hot-Standby
  Local links <active/standby/configured>: 0 / 1 / 1
...
  Port      Device      State      Port ID      B/W, kbps
  -----
  Gi0/3/0/2 Local      Standby    0x8006, 0xa001 1000000
  Link is in standby due to bundle out of service state

```

Configure to Revert to Previous Behavior

To revert to the previous behavior of transitioning through OOS state, configure the PE2 bundle member to be in the OOS state, by using the **access-signal out-of-service** command.

```

/* PE1 and PE2 Configuration */

Router# configure
Router (config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router (config-evpn-ac)# ethernet-segment

```

```

Router(config-evpn-ac-es)# identifier type 0 01.00.01.00.01.09.01.00.09
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# exit
Router (config-evpn-ac)# access-signal out-of-service
Router (config-evpn-ac)# commit

```

Verification

As PE1 is the DF in active mode, the status is UP with active link.

The following example shows ES state as UP.

```

Router# show evpn ethernet-segment interface Bundle-Ether 1 detail
...

```

Ethernet Segment Id	Interface	Nexthops
0001.0001.0001.0901.0009	BE1	192.168.0.1 192.168.0.3

EVPN Single-Flow-Active Multihoming Load-Balancing Mode

Table 5: Feature History Table

Feature Name	Release Information	Feature Description
Single-Flow Active (for Access Rings) - VPNv4 Hosts	Release 7.4.1	<p>This feature is now supported on routers that have Cisco NC57 line cards installed and are operating in compatibility mode.</p> <p>This feature extends the current implementation of EVPN Single-Flow-Active Multihoming Load-Balancing Mode, on NC57 line cards with VPNv4 routes.</p>

Feature Name	Release Information	Feature Description
EVPN Single-Flow-Active Multihoming Load-Balancing Mode	Release 7.3.1	This feature introduces EVPN Single-Flow-Active multihoming mode to connect PE devices in an access network that run Layer 2 access gateway protocols. In this mode, only the PE that first advertises the host MAC address in a VLAN forwards the traffic in a specific flow. When the primary link fails, the traffic quickly switches to the standby PE that learns the MAC address from the originated path, thereby providing fast convergence. A keyword, single-flow-active is added to the load-balancing-mode command.

In a ring topology, only one of the PEs, which is the active PE, sends and receives the traffic to prevent a traffic loop. When the link to the active PE fails, the traffic switches over to the standby PE. Traffic switchover takes a while because the standby PE has to learn the MAC addresses of the connected hosts. There's a traffic loss until the traffic switch over happens.

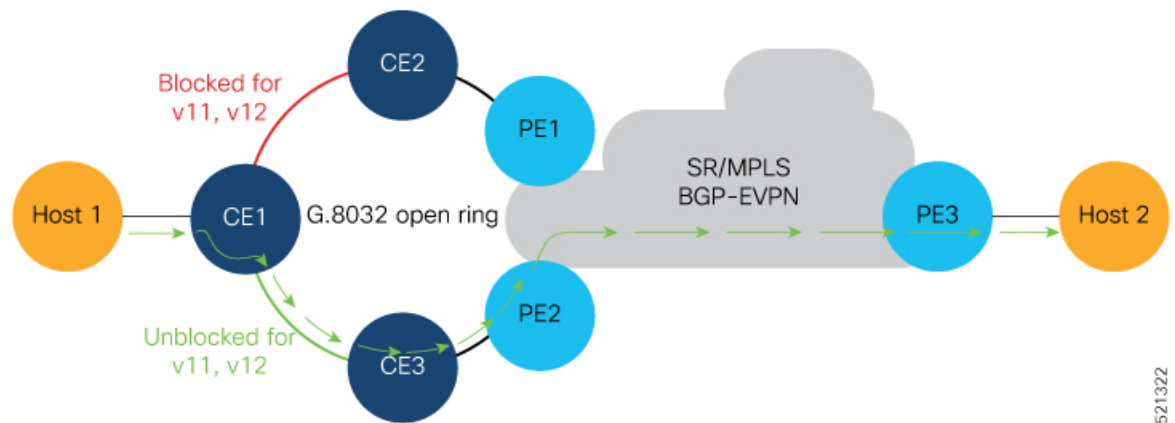

The EVPN Single-Flow-Active multihoming mode connects PE devices in an access network, and in the event of active link failure the switchover happens immediately and reduces the traffic loss.

Both active and standby PEs learn the MAC addresses of the connected host. The PE that learns the MAC address of the host directly is called the Primary (active) PE. The primary PE advertises the learnt MAC addresses to the peer PE, which is referred as standby PE. As the standby PE learns the MAC address of the host through the active PE, this learnt path is referred to as the reoriginated path.

When the primary link fails, the convergence happens fast and the traffic is sent through the standby PE (reoriginated path).

Let us understand how EVPN single flow-active mode helps in fast convergence:

- In this topology, the access network devices are connected through a ring topology. The access network uses Layer-2 gateway protocols such as G.8032, MPLS-TP, STP, REP-AG or MSTP-AG to prevent traffic loop due to continuous flooding. The access protocols are not supported on Cisco NC57 line cards, but only xconnect is supported in access network.

521322

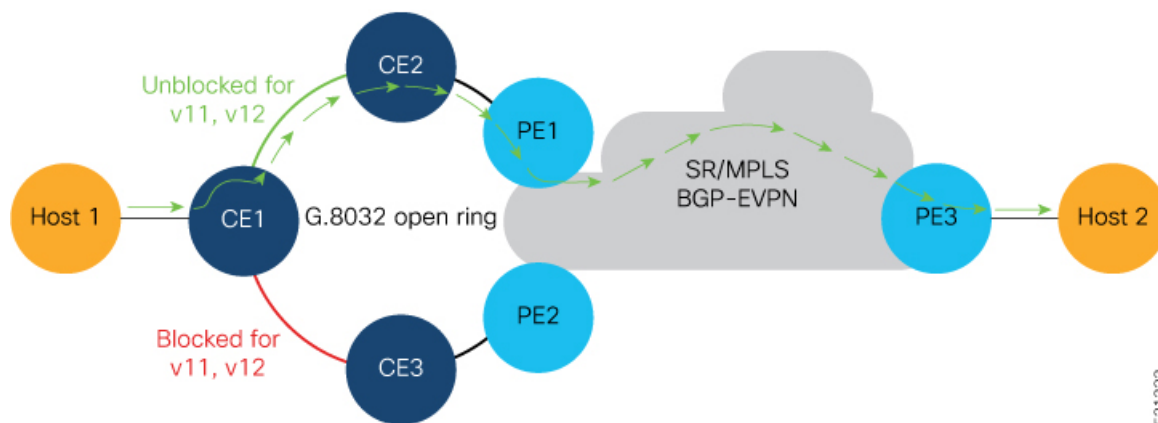

- Host 1 is connected to CE1.
- CE1 is connected to both PE1 and PE2, thus is multihomed.
- PE1 and PE2 are Multihoming devices.
- Both PE1 and PE2 is configured with the same non-zero Ethernet Segment ID (ESI) number 036.37.00.00.00.00.00.11.00 for the bundle interface to enable multihoming of the host (CE1).
- PE1 and PE2 belongs to te same VLAN and hence configured with the same EVPN instance (EVI) 100.

Traffic Flow

- Consider a traffic flow from Host 1 to Host 2. The traffic is sent from Host 1 to CE1.
- In this ring topology, the link between CE1 to CE2 is in the blocked state; the link between CE1 to CE3 is in the forwarding state. Hence, CE1 sends the traffic to PE2 through CE3.
- PE2 first learns the MAC address of Host1 through CE1. PE2 advertises the learnt MAC address to the peering PE1.
- As PE2 has learnt the MAC address directly from Host 1, and acts as an active PE.
- The PE which originates the MAC route due to access learning sets the default BGP local preference attribute value to 100.
- PE1 learns the MAC address from PE2 and acts as a stand-by PE. As PE1 gets the reoriginated MAC route from PE2, PE1 sets the BGP local preference attribute value to 80.
- The PE that has the higher local preference always sends and receives the traffic. Thus PE1 sends the traffic to PE3. PE3 sends the traffic to Host 2.

Failure Scenario

When the link between CE1 and CE3 is down or when the link between CE3 and PE2 is down, traffic is sent through PE1.

521323

- When the link fails, the link CE1-CE2 changes to the forwarding state.
- PE1 learns the MAC address of Host 1 directly and advertises the learnt MAC address to PE2.
- PE1 sends the traffic to Host 2 through the remote PE3 with a BGP local preference value of 100.
- PE3 sends and receives the traffic from PE1 until the access link between CE1 and CE2 changes to the blocked state.

Restrictions

Single-Flow Active is not supported for EVPN VPWS.

Configuration Example

- Configure both PE1 and PE2 with the same EVI of 100.
- Configure both PE1 and PE2 with the same ESI 0 36.37.00.00.00.00.11.01.

Perform these tasks on both PE1 and PE2.

```

Verification

Verify the Ethernet Segment Status:

- Verify that the Ethernet Segment Id is the same as that you have configured: In this example, you notice that the ESI on PE1 is 0 36.37.00.00.00.00.11.01.
- Verify that the Single-flow-active mode is enabled in the Topology section.

```

Router#show evpn ethernet-segment interface be 1 detail
Legend:
B   - No Forwarders EVPN-enabled,
C   - MAC missing (Backbone S-MAC PBB-EVPN / Grouping ES-MAC vES),
RT  - ES-Import Route Target missing,

Improved scalability and convergence for EVPN single-flow active using ARP pacing

The improved scalability and convergence for EVPN single-flow active using ARP pacing is a network capability that

- supports large-scale deployments
- improves traffic patterns and convergence speed, and
- leverages all L2 protocols such as, Resilient Ethernet Protocol Access Gateway (REP-AG), Spanning Tree Protocol (STP), G.8032 ring to converge hosts with bidirectional traffic in less than one second.

Table 6: Feature History Table

Feature Name	Release Information	Feature Description
Improved scalability and convergence for EVPN single-flow active using ARP pacing	Release 25.2.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5700 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards; NCS 5700 line cards [Mode: Compatibility; Native])</p> <p>You now have the ability to converge hosts in less than a second, with bidirectional traffic. This feature enables the network to recover quickly from failures or changes in topology, ensuring continuous service and balanced data transmission.</p> <p>This capability is achieved by optimizing the management of MAC and IP routes through ARP pacing.</p> <p>This feature introduces the arp probe pace command.</p>

Traffic convergence challenges in ring failures

In the event of a ring failure, redirecting traffic from the active Provider Edge (PE) router to the standby PE router may take some time. This delay occurs because the standby PE router transitions to an active state and learns new MAC addresses. The new active PE router sends Address Resolution Protocol (ARP) requests to the hosts, but the Local Packet Transport Services (LPTS) limits the ARP replies, which leads to queue overflows, dropped responses, and repeated retries, further delaying the convergence.

Optimized solution for traffic convergence

By optimizing the management of MAC and IP routes through ARP pacing, this solution resolves scalability and convergence challenges. This capability ensures efficient handling of ARP probing and reduces convergence time to less than one second, enabling faster network recovery and improved service continuity.

ARP pacing

ARP pacing is a network mechanism that controls the rate at which ARP probes are sent. This control helps manage network traffic and prevents overload from sending too many ARP requests simultaneously. ARP pacing enhances network convergence and reliability by pacing these requests, which are essential for optimal performance.

ARP probes are sent out at a configured rate to prevent the LPTS from dropping the replies. To further improve efficiency, devices avoid redundant requests; they do not send ARP requests if an entry is already being probed.

Benefits of ARP pacing

ARP pacing offers these benefits:

- Scalability—controls the rate of ARP requests to prevent network congestion and maintain scalability, even with numerous devices.
- Convergence—improves network convergence by performing ARP learning in a controlled manner.
- Stability—becomes more resilient to sudden surges in ARP activity, reducing the likelihood of service disruptions caused by excessive ARP processing.

How does the provider edge router learn the MAC address after a link or ring failure

Summary

After a link or ring failure, PE2 learns the MAC address of Host1 through a combination of events. The actors or components:

- PE1: The PE that initially forwards traffic.
- PE2: The peering PE that takes over forwarding traffic after a failure.
- SW1 and SW2: An intermediary element.
- Host1 and Host2: A target host.
- EVPN control plane: Uses BGP to distribute MAC address reachability information between PEs.
- L2 protocol such as, STP, MSTP, RSTP, REP, G.8032 ring: Protocol responsible for detecting and reacting to link failures, and unblocking the alternate path.

Workflow

Prior to the link failure, PE2 learns Host1's MAC address through EVPN synchronization from PE1.

The process by which the PE2 learns the MAC address after a link or ring failure involves these steps:

1. **Link failure detection:** The PE1 and SW1 detect a failure in the link between them. The REP mechanism in the ring identifies and responds to such failures. Subsequently, REP unblocks the previously blocked link between SW1 and SW2, establishing an alternate traffic path
2. **PE2 forwards traffic for Host1:** Due to the link failure between PE1 and SW1, and the subsequent unblocking of the SW1-SW2 link, PE2 now becomes the designated forwarder for traffic destined to Host1. This is due to the change in the network topology and the L2 protocol's convergence.
3. **MAC address withdrawal:** PE1, upon detecting the failure, withdraws the MAC address advertisements it had previously sent for the hosts reachable through SW1 (including Host1). This withdrawal is signaled through EVPN control plane messages to PE2.
4. **ARP pacing and new ARP requests:** PE2, now needing to forward traffic to Host1 (which was previously reachable through PE1), initiates its own ARP requests to learn the MAC address to IP mapping for Host1. The ARP pacing mechanism controls the rate at which PE2 sends these requests.

When a large number of hosts are present in the Ethernet segment, the responses to ARP requests generated by PE2 can arrive in bursts, potentially overwhelming the Local Packet Transport Services (LPTS) and leading to dropped responses. ARP pacing mitigates this issue by controlling and slowing down the rate at which PE2 generates ARP requests, ensuring a more stable and reliable convergence process.

5. **MAC advertisement:** Host1 responds to the ARP request from PE2. PE2 then learns the MAC address of Host1 and forwards traffic accordingly. PE2 then advertises the MAC address to other PEs.
6. **EVPN control plane:** The EVPN control plane is crucial for distributing MAC address reachability information between the PEs. The remote PE learns the new location of the MAC address through EVPN updates.

Configure ARP pacing for improved scalability and convergence

Follow these steps to configure EVPN single-flow active and ARP pacing on PE1 and PE2:

Procedure

-
- Step 1** Configure advertisement of MAC routes.

Example:

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-instance)# advertise-mac
Router(config-evpn-instance-mac)# root
```

Step 2 Configure single-flow-active load-balancing mode.

Example:

```
Router(config)# evpn
Router(config-evpn)# interface bundle-ether 1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 36.37.00.00.00.00.11.01
Router(config-evpn-ac-es)# load-balancing-mode single-flow-active
Router(config-evpn-ac-es)# convergence
Router(config-evpn-ac-es-conv)# mac-mobility
Router(config-evpn-ac-es-conv)# exit
```

Step 3 Configure bridge domain and associate the EVI to the bridge domain.

Example:

```
Router(config)# l2vpn
Router(config-l2vpn)# bridge group 100
Router(config-l2vpn-bg)# bridge-domain 100
Router(config-l2vpn-bg-bd)# interface Bundle-Ether1.2
Router(config-l2vpn-bg-bd-ac)# exit
Router(config-l2vpn-bg-bd)# evi 100
Router(config-l2vpn-bg-bd-evi)# root
Router(config)# interface Bundle-Ether1.2 l2transport
Router(config-l2vpn-subif)# encapsulation dot1q 2
Router(config-l2vpn-subif)# commit
```

Step 4 Setup the ring topology using REP, MST, or G.8032.

This example shows REP access gateway configuration.

Example:

```
Router(config)# spanning-tree repag REPAG
Router(config-repag)# interface Bundle-Ether1.2
Router(config-repag-subif)# commit
```

Step 5 Configure ARP pacing to set the rate at which ARP probes are sent.

Set the ARP pacing rate between 1 and 1000 packets per second (PPS). If you don't specify a rate, the router defaults to 500 PPS.

Example:

```
Router(config)# arp probe pace rate 1000
Router(config)# commit
```

Step 6 Verify the configured ARP pace rate using the **show arp trace** command.

Example:

```
Router# show arp trace location all | inc PACE
Apr 1 09:33:50.985684 ipv4_ar/slow 0/0/CPU0 118# t6183 [ARPTP_340] PROBE-PACE: Starting

Pacing timer 999883404ns
Apr  1 09:33:13.471679 ipv4_arp/slow 0/0/CPU0 t6183 [ARPTP_364] PROBE-PACE: Sent a burst
of 1000 packets, Remaining 6500, Rate 500, Time elapsed 162890ns
```

EVPN MPLS Seamless Integration with VPLS

Table 7: Feature History Table

Feature Name	Release Information	Feature Description
EVPN MPLS Seamless Integration with VPLS	Release 7.4.2	<p>This feature enables the co-existence of PE nodes running EVPN and VPLS for the same VPN instance. VPLS or legacy network can be upgraded to the next generation EVPN network without service disruption. You can introduce EVPN service on all the selected VPLS provider edge (PE) nodes simultaneously. However, to avoid traffic disruption, provision EVPN service on existing VPLS-enabled PEs one by one.</p> <p>This feature is now supported on routers that have Cisco NC57 line cards installed and operate in native and compatibility modes.</p>

VPLS is a widely-deployed L2VPN technology. As service providers are looking to adopt EVPN on their existing VPLS networks, it is required to provide a mechanism by which EVPN can be introduced without a software upgrade. The EVPN MPLS Seamless Integration with VPLS feature allows EVPN service introduced gradually in the network on a few PE nodes at a time. It eliminates the need to network wide software upgrade at the same time. This feature allows a VPLS service migrated to EVPN service. This feature allows for staged migration where new EVPN sites can be provisioned on existing VPLS enabled PEs. This feature also allows for the co-existence of PE nodes running EVPN and VPLS for the same VPN instance. This allows VPLS or legacy network to be upgraded to the next generation EVPN network without service disruption.

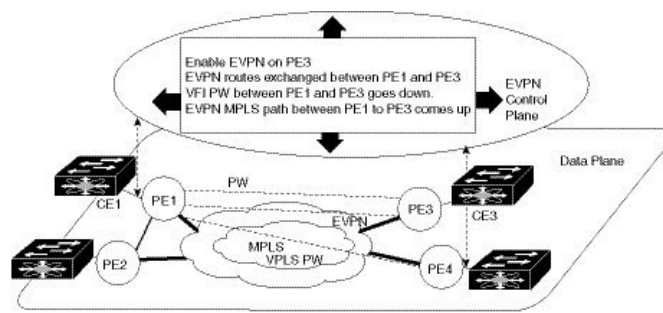

Migrate VPLS Network to EVPN Network through Seamless Integration

In EVPN network, VPN instances are identified by EVPN instance ID (EVI-ID). Similar to other L2VPN technologies, EVPN instances are also associated with route-targets and route-distinguisher. EVPN uses control plane for learning and propagating MAC unlike traditional VPLS, where MAC is learnt in the data plane (learns using "flood and learn technique"). In EVPN, MAC routes are carried by MP-BGP protocol. In EVPN enabled PEs, PEs import the MAC route along with the label to their respective EVPN forwarding table only if their route targets (RTs) match. An EVPN PE router is capable of performing VPLS and EVPN L2 bridging in the same VPN instance. When both EVPN and BGP-AD PW are configured in a VPN instance, the EVPN PEs advertise the BGP VPLS auto-discovery (AD) route as well as the BGP EVPN Inclusive Multicast route (type-3) for a given VPN Instance. Route type-3 referred to as ingress replication multicast

route, is used to send broadcast, unknown unicast, and multicast (BUM) traffic. Other remote PEs import type-3 routes for the same VPN instance only if the sending PE RTs match with their configured RT. Thus, at the end of these route-exchanges, EVPN capable PEs discover all other PEs in the VPN instance and their associated capabilities. The type-3 routes used by PE to send its BUM traffic to other PEs ensure that PEs with the same RTs receive the BUM traffic. EVPN advertises the customer MAC address using type-2 route.

EVPN MPLS Seamless Integration with VPLS allows you to upgrade the VPLS PE routers to EVPN one by one without any network service disruption. Consider the following topology where PE1, PE2, PE3, and PE4 are interconnected in a full-meshed network using VPLS PW.

Figure 4: EVPN MPLS Seamless Integration with VPLS

The EVPN service can be introduced in the network one PE node at a time. The VPLS to EVPN migration starts on PE1 by enabling EVPN in a VPN instance of VPLS service. As soon as EVPN is enabled, PE1 starts advertising EVPN inclusive multicast route to other PE nodes. Since PE1 does not receive any inclusive multicast routes from other PE nodes, VPLS pseudo wires between PE1 and other PE nodes remain active. PE1 keeps forwarding traffic using VPLS pseudo wires. At the same time, PE1 advertises all MAC address learned from CE1 using EVPN route type-2. In the second step, EVPN is enabled in PE3. PE3 starts advertising inclusive multicast route to other PE nodes. Both PE1 and PE3 discover each other through EVPN routes. As a result, PE1 and PE3 shut down the pseudo wires between them. EVPN service replaces VPLS service between PE1 and PE3. At this stage, PE1 keeps running VPLS service with PE2 and PE4. It starts EVPN service with PE3 in the same VPN instance. This is called EVPN seamless integration with VPLS. The VPLS to EVPN migration then continues to remaining PE nodes. In the end, all four PE nodes are enabled with EVPN service. VPLS service is completely replaced with EVPN service in the network. All VPLS pseudo wires are shut down.

Configure EVPN on the Existing VPLS Network

Perform the following tasks to configure EVPN on the existing VPLS network.

- Configure L2VPN EVPN address-family
- Configure EVI and corresponding BGP route-targets under EVPN configuration mode
- Configure EVI under a bridge-domain

See [EVI Configuration Under L2VPN Bridge-Domain, on page 43](#) section for how to migrate various VPLS-based network to EVPN.

Configure L2 EVPN Address-Family

Perform this task to enable EVPN address family under both BGP and participating neighbor.

Configuration Example

```
Router# configure
Router(config)#router bgp 65530
Router(config-bgp)#nsr
Router(config-bgp)#bgp graceful-restart
Router(config-bgp)#bgp router-id 200.0.1.1
Router(config-bgp)#address-family l2vpn evpn
Router(config-bgp-af)#exit
Router(config-bgp)#neighbor 200.0.4.1
Router(config-bgp-nbr)#remote-as 65530
Router(config-bgp-nbr)#update-source Loopback0
Router(config-bgp-nbr)#address-family l2vpn evpn
Router(config-bgp-nbr-af)#commit
```

Running Configuration

```
configure
router bgp 65530
  nsr
  bgp graceful-restart
  bgp router-id 200.0.1.1
  address-family l2vpn evpn
  !
  neighbor 200.0.4.1
    remote-as 65530
    update-source Loopback0
    address-family l2vpn evpn
  !
!
```

Configure EVI and Corresponding BGP Route Target under EVPN Configuration Mode

Perform this task to configure EVI and define the corresponding BGP route targets. Also, configure advertise-mac, else the MAC routes (type-2) are not advertised.

Configuration Example

```
Router# configure
Router(config)#evpn
Router(config-evpn)#evi 1
Router(config-evpn-evi-bgp)#bgp
Router(config-evpn-evi-bgp)#table-policy spp-basic-6
Router(config-evpn-evi-bgp)#route-target import 100:6005
Router(config-evpn-evi-bgp)#route-target export 100:6005
Router(config-evpn-evi-bgp)#exit
Router(config-evpn-evi)#advertise-mac
Router(config-evpn-evi)#commit
```

Running Configuration

```

configure
 evpn
  evi
    bgp
      table-policy spp-basic-6
      route-target import 100:6005
      route-target export 100:6005
    !
  advertise-mac
  !
!
!
!

```

Configure EVI under a Bridge Domain

Perform this task to configure EVI under the corresponding L2VPN bridge domain.

Configuration Example

```

Router# configure
Router(config)#l2vpn
Router(config-l2vpn)#bridge group bg1
Router(config-l2vpn-bg)#bridge-domain bd1
Router(config-l2vpn-bg-bd)#interface GigabitEthernet0/2/0/0.1
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)#evi 1
Router(config-l2vpn-bg-bd-evi)#exit
Router(config-l2vpn-bg-bd)#vfi v1
Router(config-l2vpn-bg-bd-vfi)#neighbor 10.1.1.2 pw-id 1000
Router(config-l2vpn-bg-bd-vfi-pw)#mpls static label local 20001 remote 10001
Router(config-l2vpn-bg-bd-vfi-pw)#commit

```

Running Configuration

```

configure
 l2vpn
  bridge group bg1
  bridge-domain bd1
    interface GigabitEthernet0/2/0/0.1
    !
    evi 1
    !
  vfi v1
    neighbor 10.1.1.2 pw-id 1000
    mpls static label local 20001 remote 10001
    !
    !
  evi 1
!
!

```

EVI Configuration Under L2VPN Bridge-Domain

The following examples show EVI configuration under L2VPN bridge-domain for various VPLS-based networks:

MPLS Static Labels Based VPLS

```
l2vpn
bridge group bg1
bridge-domain bd-1-1
interface GigabitEthernet0/2/0/0.1
!
vfi vfi-1-1
neighbor 200.0.2.1 pw-id 1200001
mpls static label local 20001 remote 10001
!
neighbor 200.0.3.1 pw-id 1300001
mpls static label local 30001 remote 10001
!
neighbor 200.0.4.1 pw-id 1400001
mpls static label local 40001 remote 10001
!
!
evi 1
!
```

AutoDiscovery BGP and BGP Signalling Based VPLS

```
l2vpn
bridge group bg1
bridge-domain bd-1-2
interface GigabitEthernet0/2/0/0.2
!
vfi vfi-1-2
vpn-id 2
autodiscovery bgp
rd 101:2
route-target 65530:200
signaling-protocol bgp
ve-id 11
ve-range 16
!
!
evi 2
!
```

Targeted LDP-Based VPLS

```
bridge-domain bd-1-4
interface GigabitEthernet0/2/0/0.4
!
vfi vfi-1-4
neighbor 200.0.2.1 pw-id 1200004
!
neighbor 200.0.3.1 pw-id 1300004
!
neighbor 200.0.4.1 pw-id 1400004
!
```

```
evi 3
!
```

Verify EVPN Configuration

Use the following commands to verify EVPN configuration and MAC advertisement. Verify EVPN status, AC status, and VFI status.

- show l2vpn bridge-domain
- show evpn summary
- show bgp rt l2vpn evpn
- show evpn evi
- show l2route evpn mac all

Verify the state of the bridge domain, number of ACs, and VFIs.

```
Router#show l2vpn bridge-domain bd-name bd-1-1
Mon Feb 20 21:03:40.244 EST
Legend: pp = Partially Programmed.
Bridge group: bg1, bridge-domain: bd-1-1, id: 0, state: up, ShgId: 0, MSTi: 0

Clear Forwarding Table

To clear an L2VPN forwarding table at a specified location, you can use the **clear l2vpn forwarding table** command. When BVI is present in the bridge domain, you might experience traffic loss during the command execution. Refer the following work-around to resolve such issues.

When you encounter such issues, delete the BVI and roll back the action. As a result, the traffic on the BVI returns to normal state. The following example shows how to delete the BVI and perform roll back action:

```

Router#clear l2vpn forwarding table location 0/0/CPU0
Fri Mar 24 09:34:02.083 UTC
Router(config)#no int BVI100
Router(config)#commit
Router#roll configuration las 1
Wed Dec 16 18:26:52.869 UTC
Loading Rollback Changes.
Loaded Rollback Changes in 1 sec
Committing

```

Note We can also clear the forwarding table by shutting and unshutting the interface.

EVPN Seamless Integration with VPWS

Table 8: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Seamless Integration with VPWS	Release 7.4.2	<p>This feature enables you to seamlessly migrate the PE nodes from VPWS to EVPN-VPWS service without disruption in traffic. Such a migration offers your service providers the option to use VPWS or EVPN-VPWS services on PE nodes</p> <p>This feature introduces the vpws-seamless-integration command.</p>

Although VPWS is a widely deployed Layer 2 VPN technology, some service providers prefer to migrate to EVPN service in their existing VPWS networks to leverage the benefits of EVPN services.

With EVPN-VPWS Seamless Integration feature, you can migrate the PE nodes from legacy VPWS service to EVPN-VPWS gradually and incrementally without any service disruption.

You can migrate an Attachment Circuit (AC) connected to a legacy VPWS pseudowire (PW) to an EVPN-VPWS PW either by using targeted-LDP signaling or BGP-AD signaling.

Instead of performing network-wide software upgrade at the same time on all PEs, this feature provides the flexibility to migrate one PE at a time. Thus allows the coexistence of legacy VPWS and EVPN-VPWS dual-stack in the core for a given L2 Attachment Circuit (AC) over the same MPLS network. You can enable this feature using the **vpws-seamless-integration** command.

In an EVPN-VPWS network, VPN instances are grouped by EVPN Instance VPN ID (EVI) and identified by an ethernet tag or attachment circuit ID (AC-ID). EVI is also associated with route-targets and route-distinguisher.

During migration, an EVPN-VPWS PE router performs either VPWS or EVPN-VPWS L2 cross-connect for a given AC. When both EVPN-VPWS and BGP-AD PWs are configured for the same AC, the EVPN-VPWS PE during migration advertises the BGP VPWS Auto-Discovery (AD) route as well as the BGP EVPN Auto-Discovery (EVI/EAD) route and gives preference to EVPN-VPWS Pseudowire (PW) over the BGP-AD VPWS PW.

How to migrate a legacy VPWS network to EVPN-VPWS seamlessly

Let's understand how a legacy VPWS network can be migrated seamlessly to EVPN-VPWS with the following scenario:

Consider that a service provider plans to migrate VPWS node to an EVPN node one at a time. The service provider expects the migration to span over multiple years.

Figure 5:

In this topology, PE1, PE2, PE3 are provider edge devices in the MPLS network and the legacy VPWS cross-connects are up and running between PE1, PE2, and PE3.

- PE1 and PE2 have a legacy PW established between them. (pw1)
- PE1 and PE3 have a legacy PW established between them. (pw2)

Service provider wants to replace PE1 with a new hardware. So after replacing the equipment, service provider enables EVPN-VPWS on PE1 first.

Let's understand what happens when only PE1 is migrating to EVPN-VPWS:

- When EVPN-VPWS is enabled, PE1 starts advertising EVPN EVI or Ethernet-AD route to other PE nodes.
- PE1 advertises BGP VPWS Auto-Discovery route and the BGP EVPN Ethernet-AD per EVI route for a given PW.
- As PE2 and PE3 aren't yet migrated, PE1 does not receive any EVI/EAD routes from these PE nodes. Therefore, legacy VPWS runs between PE1, PE2, and PE3.
- PE1 keeps forwarding traffic using legacy VPWS.

After one year, service provider decides to upgrade PE2 and wants to migrate from VPWS to EVPN-VPWS.

- When the upgrade is completed, PE2 starts advertising EVI/EAD route to other PE nodes.
- Both PE1 and PE2 discover each other through EVPN routes.
- As a result, EVPN-VPWS service replaces legacy VPWS service between PE1 and PE2. This is called EVPN-VPWS MPLS Seamless Integration with VPWS.
- EVPN-VPWS service takes high-precedence over legacy VPWS network.
- PE1 and PE2 shuts down the legacy VPWS between them to prevent ongoing duplicate packets from remote CE.

Service provider plans not to migrate PE3 device as of now:

- At this stage, PE1 keeps running legacy VPWS service with PE3.
- The legacy VPWS to EVPN-VPWS migration then continues to remaining PE nodes. The legacy VPWS and EVPN-VPWS dual-stack coexist in the core for a given L2 Attachment Circuit (AC).

After another year, service provider plans to upgrade the PE3 device.

- PE3 is now enabled with EVPN-VPWS service.
- All the PE devices are replaced with EVPN-VPWS services in the network.
- Service provider plans to retain both legacy and an EVPN-VPWS related configuration on PE1 and PE2 nodes.
- During any uncertainties, service provider can roll back the migration. If you rollback the migration to VPWS at node PE2, then PE1 and PE2 will revert to the legacy VPWS between them.

Restriction

- Supported only in single-homing or EVPN port-active multi-homing.
- PWHE is not supported.

Configuration Example

To enable the feature, use the **vpws-seamless-integration** command.

In this example, let's see how to migrate each PE at a time.

When you migrate only PE1, here is the configuration example for PE1, PE2, and PE3:

```

/* Here is the configuration for PE1: */
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# mp2mp 2
Router(config-l2vpn-xc-mp2mp)# autodiscovery bgp
Router(config-l2vpn-xc-mp2mp-ad)# signaling-protocol bgp
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 3

/* Migrate VPWS to EVPN-VPWS*/
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# vpws-seamless-integration
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.1
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# root
Router(config)# l2vpn xconnect group 2
Router(config-l2vpn-xc)# p2p 3
Router(config-l2vpn-xc-p2p)# interface Bundle-Ether 1.1
Router(config-l2vpn-xc-p2p)# neighbor evpn evi 4 service 5
Router(config-l2vpn-xc-p2p-pw)# commit

/* Here is the configuration for PE2: */
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# mp2mp 2
Router(config-l2vpn-xc-mp2mp)# autodiscovery bgp

Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# exit
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 5
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.2
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit

/* Here is the configuration for PE3:*/
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# mp2mp 2
Router(config-l2vpn-xc-mp2mp)# autodiscovery bgp
Router(config-l2vpn-xc-mp2mp-ad)# signaling-protocol bgp
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 3
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.1
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# exit
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 5
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.2
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit

```

The following show output indicates that only VPWS is up and EVPN is down:

```

Router# show l2vpn xconnect
Tue Jun  8 12:36:20.253 EDT
Legend: ST = State, UP = Up, DN = Down, AD = Admin Down, UR = Unresolved,
        SB = Standby, SR = Standby Ready, (PP) = Partially Programmed,
        LU = Local Up, RU = Remote Up, CO = Connected, (SI) = Seamless Inactive

```

XConnect Group	Name	ST	Segment 1 Description	ST	Segment 2 Description	ST
service-8	evpn-vpws-8	DN	BE1.1	UP	EVPN 8,8,192.168.0.4	DN

```

service-8  mp2mp-8.8:10008
                UP    BE1.1                UP    192.168.0.4    534296 UP
-----

```

When you migrate both PE1 and PE2, here is the configuration example for PE1, PE2, and PE3:

```

/* Here is the configuration for PE1: */
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# mp2mp 2
Router(config-l2vpn-xc-mp2mp)# autodiscovery bgp

Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit

```

Verification

The following example shows that VPWS is inactive and indicates the status as SB(SI).

```

Router# show l2vpn xconnect
Thu Feb 25 11:57:27.622 EST

```

Legend: ST = State, UP = Up, DN = Down, AD = Admin Down, UR = Unresolved,
 SB = Standby, SR = Standby Ready, (PP) = Partially Programmed,
 LU = Local Up, RU = Remote Up, CO = Connected, **(SI) = Seamless Inactive**

XConnect			Segment 1		Segment 2		
Group	Name	ST	Description	ST	Description		ST
evpn-vpws	test11-1	UP	BE11	UP	EVPN 11,11,24048		UP
legacy-tldp	test11	DN	BE11	SB(SI)	192.168.12.110	11	UP

The following example shows whether EVPN-VPWS or VPWS is used for forwarding the traffic. In this example, **evi: 1** indicates that EVPN is used for forwarding the traffic.

```
Router# show l2vpn forwarding interface gigabitEthernet 0/2/0/8.1 detail location 0/2/CPU0
Wed Apr 28 09:08:37.512 EDT
Local interface: GigabitEthernet0/2/0/8.1, Xconnect id: 0x800001, Status: up
  Segment 1
    AC, GigabitEthernet0/2/0/8.1, status: Bound
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
  Segment 2
    MPLS, Destination address: 192.168.0.4, evi: 1,
    ac-id: 1, status: Bound
    Pseudowire label: 24004
    Control word enabled
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
```

In the following example, **pw-id: 1** indicates that VPWS is used for forwarding the traffic:

```
Router# show l2vpn forwarding interface gigabitEthernet 0/2/0/8.1 detail location 0/2/CPU0
Wed Apr 28 09:09:45.204 EDT
Local interface: GigabitEthernet0/2/0/8.1, Xconnect id: 0x800001, Status: up
  Segment 1
    AC, GigabitEthernet0/2/0/8.1, status: Bound
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
  Segment 2
    MPLS, Destination address: 192.168.0.4, pw-id: 1, status: Bound
    Pseudowire label: 24000
    Control word disabled
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
```

Use the **l2vpn logging pseudowire** command to track the migration of AC from one PW to another.

For example,

```
Router(config)# l2vpn logging pseudowire
RP/0/0/CPU0:Jan 18 15:35:15.607 EST:
l2vpn_mgr[1234]: %L2-EVPN-5-VPWS_SEAMLESS_INTEGRATION_STATE_CHANGE :
GigabitEthernet0/2/0/8.1 - Active XC is now service-1:evpn-vpws-1, standby XC is
service-1:tldp-1
```

TLDP PW to EVPN-VPWS Migration

Similar to migrating VPWS to EVPN, we can migrate TLDP PW to EVPN-VPWS on all the PE routers incrementally.

You can perform this task on all the PE router incrementally. The following configuration example shows the TLDP PW to EVPN-VPWS migration on PE1:

```
/*Here is an example using TLDP*/
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# p2p p1
Router(config-l2vpn-xc-p2p)# interface BE1.1
Router(config-l2vpn-xc-p2p)# neighbor 10.0.0.1 pw-id 1
Router(config-l2vpn-xc-p2p)# vpws-seamless-integration
```

EVPN Features

This section lists the supported EVPN features and how to configure them:

Configure EVPN MAC Address Limit

To configure EVPN MAC address limit, the following restrictions are applicable:

- Remote MAC addresses are programmed in the hardware irrespective of whether the MAC address limit is configured or not.
- MAC address limit can be modified correctly only when the device is not actively learning any MAC addresses. This is an expected behavior.
- When the MAC learning is enabled, you can configure the MAC address limit up to a maximum of six. However, when the MAC learning is disabled, you can configure the MAC address limit up to a maximum of five.
- The **clear l2vpn mac address table** command is not supported. The MAC address table is cleared when **shut** or **no shutdown** is performed on an attachment circuit interface or sub interface, or when the MAC aging timer expires.
- You can configure both MAC limit Action and MAC notification. However, the configuration does not take into effect as the functionality is not supported.

Configuration Example

Perform this task to configure EVPN MAC address limit.

This table lists the MAC address limit parameters and values that are configured:

Parameter	Value
MAC address limit	50
MAC limit threshold	80%

```

Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group EVPN-BG-SH
Router(config-l2vpn-bg)# bridge-domain EVPN_2701
Router(config-l2vpn-bg-bd)# mac
Router(config-l2vpn-bg-bd-mac)# limit
Router(config-l2vpn-bg-bd-mac-limit)# maximum 50
Router(config-l2vpn-bg-bd-mac-limit)# exit
Router(config-l2vpn-bg-bd)# exit
Router(config-l2vpn-bg)# exit
Router(config-l2vpn)# mac limit threshold 80
Router(config-l2vpn)# commit

```

Running Configuration

```

l2vpn
bridge group EVPN-BG-SH
  bridge-domain EVPN_2701
    mac
      limit
        maximum 50
    !
  !
!
mac limit threshold 80
commit

```

Verification

Verify the EVPN MAC address limit parameters are set as described in above table:

```

Router# show l2vpn bridge-domain bd-name EVPN_2701 detail
Legend: pp = Partially Programmed.

EVPN Software MAC Learning

The MAC addresses learned on one device needs to be learned or distributed on the other devices in a VLAN. EVPN Software MAC Learning feature enables the distribution of the MAC addresses learned on one device

to the other devices connected to a network. The MAC addresses are learnt from the remote devices using BGP.

Note A device can contain up to 128K MAC address entries. A bridge domain on a device can contain up to 64K MAC address entries.

Figure 6: EVPN Software MAC Learning

The above figure illustrates the process of software MAC learning. The following are the steps involved in the process:

1. Traffic comes in on one port in the bridge domain.
2. The source MAC address (AA) is learnt on the PE and is stored as a dynamic MAC entry.
3. The MAC address (AA) is converted into a type-2 BGP route and is sent over BGP to all the remote PEs in the same EVI.
4. The MAC address (AA) is updated on the PE as a remote MAC address.

Configure EVPN Software MAC Learning

The following section describes how you can configure EVPN Software MAC Learning:

Note From Release 7.4.1 Control word is enabled by default. If the **control-word-disable** command is not configured, ensure to configure it under EVPN or EVI configuration mode before an upgrade to avoid inconsistent behaviour with routers running before Release 7.4.2.

If you want to enable **control-word** command for EVPN Bridging feature, then you must configure it only when both the endpoints run Release 7.4.1 or later.

Note The router does not support flow-aware transport (FAT) pseudowire.

```
/* Configure bridge domain. */
```

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group EVPN_SH
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain EVPN_2001
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface TenGigE0/4/0/10.2001
```

```

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# exit
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface BundleEther 20.2001
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# storm-control broadcast pps 10000 ← Enabling
storm-control is optional
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# exit
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# evi 2001
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-evi)# commit

/* Configure address family session in BGP. */

RP/0/RSP0/CPU0:router(config-bgp-nbr)# update-source Loopback 0
RP/0/RSP0/CPU0:router(config-bgp-nbr)# address-family l2vpn evpn

```

Supported Modes for EVPN Software MAC Learning

The following are the modes in which EVPN Software MAC Learning is supported:

- Single Home Device (SHD) or Single Home Network (SHN)
- Dual Home Device (DHD)—All Active Load Balancing

Single Home Device or Single Home Network Mode

The following section describes how you can configure EVPN Software MAC Learning feature in single home device or single home network (SHD/SHN) mode:

Figure 7: Single Home Device or Single Home Network Mode

In the above figure, the PE (PE1) is attached to Ethernet Segment using bundle or physical interfaces. Null Ethernet Segment Identifier (ESI) is used for SHD/SHN.

Configure EVPN in Single Home Device or Single Home Network Mode

This section describes how you can configure EVPN Software MAC Learning feature in single home device or single home network mode.

```

/* Configure bridge domain. */

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group EVPN_ALL_ACTIVE
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain EVPN_2001
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface Bundle-Ether1.2001

```

```

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# evi 2001

/* Configure advertisement of MAC routes. */

RP/0/RSP0/CPU0:router(config)# evpn
RP/0/RSP0/CPU0:router(config-evpn)# evi 2001
RP/0/RSP0/CPU0:router(config-evpn-evi)# advertise-mac

/* Configure address family session in BGP. */

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router#(config)# router bgp 200
RP/0/RSP0/CPU0:router#(config-bgp)# bgp router-id 09.165.200.227
RP/0/RSP0/CPU0:router#(config-bgp)# address-family l2vpn evpn
RP/0/RSP0/CPU0:router#(config-bgp)# neighbor 10.10.10.10
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# remote-as 200
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# description MPLSFACING-PEER
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# update-source Loopback 0
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# address-family l2vpn evpn

```

Running Configuration

```

l2vpn
bridge group EVPN_ALL_ACTIVE
  bridge-domain EVPN_2001
    interface BundleEther1.2001
      evi 2001
!
evpn
  evi 2001
    advertise-mac
!
router bgp 200 bgp
  router-id 40.40.40.40
  address-family l2vpn evpn
  neighbor 10.10.10.10
    remote-as 200 description MPLS-FACING-PEER
  updatesource Loopback0
  addressfamily l2vpn evpn

```

Verification

Verify EVPN in single home devices.

```
RP/0/RSP0/CPU0:router# show evpn ethernet-segment interface Te0/4/0/10 detail
```

```

Ethernet Segment Id      Interface      Nexthops
-----
N/A                      Te0/4/0/10    20.20.20.20
.....
Topology :
Operational : SH
Configured : Single-active (AApS) (default)

```

Dual Home Device—All-Active Load Balancing Mode

The following section describes how you can configure EVPN Software MAC Learning feature in dual home device (DHD) in all-active load balancing mode:

Figure 8: Dual Home Device —All-Active Load Balancing Mode

All-active load-balancing is known as Active/Active per Flow (AApF). In the above figure, identical Ethernet Segment Identifier is used on both EVPN PEs. PEs are attached to Ethernet Segment using bundle interfaces. In the CE, single bundles are configured towards two EVPN PEs. In this mode, the MAC address that is learnt is stored on both PE1 and PE2. Both PE1 and PE2 can forward the traffic within the same EVI.

Configure EVPN Software MAC Learning in Dual Home Device—All-Active Mode

This section describes how you can configure EVPN Software MAC Learning feature in dual home device—all-active mode:

```
/* Configure bridge domain. */

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group EVPN_ALL_ACTIVE
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain EVPN_2001
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface Bundle-Ether1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# evi 2001

/* Configure advertisement of MAC routes. */

RP/0/RSP0/CPU0:router(config)# evpn
RP/0/RSP0/CPU0:router(config-evpn)# evi 2001
RP/0/RSP0/CPU0:router(config-evpn-evi)# advertise-mac
RP/0/RSP0/CPU0:router(config-evpn-evi)# exit
RP/0/RSP0/CPU0:router(config-evpn)# interface Bundle-Ether1
RP/0/RSP0/CPU0:router(config-evpn-ac)# ethernet-segment
RP/0/RSP0/CPU0:router(config-evpn-ac-es)# identifier type 0 01.11.00.00.00.00.00.01

/* Configure address family session in BGP. */

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router#(config)# router bgp 200
RP/0/RSP0/CPU0:router#(config-bgp)# bgp router-id 209.165.200.227
RP/0/RSP0/CPU0:router#(config-bgp)# address-family l2vpn evpn
RP/0/RSP0/CPU0:router#(config-bgp)# neighbor 10.10.10.10
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# remote-as 200
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# description MPLS-FACING-PEER
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# update-source Loopback 0
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# address-family l2vpn evpn
```

```

/* Configure Link Aggregation Control Protocol (LACP) bundle. */

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether1
RP/0/RSP0/CPU0:router(config-if)# lacp switchover suppress-flaps 300
RP/0/RSP0/CPU0:router(config-if)# exit

/* Configure VLAN Header Rewrite.*/

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether1 l2transport

EVPN Out of Service

The EVPN Out of Service feature enables you to control the state of bundle interfaces that are part of an Ethernet segment that have Link Aggregation Control protocol (LACP) configured. This feature enables you to put a node out of service (OOS) without having to manually shutdown all the bundles on their provider edge (PE).

Use the **cost-out** command to bring down all the bundle interfaces belonging to an Ethernet VPN (EVPN) Ethernet segment on a node. The Ethernet A-D Ethernet Segment (ES-EAD) routes are withdrawn before shutting down the bundles. The PE signals to the connected customer edge (CE) device to bring down the corresponding bundle member. This steers away traffic from this PE node without traffic disruption. The

traffic that is bound for the Ethernet segment from the CE is directed to the peer PE in a multi-homing environment.

Note EVPN cost-out is supported only on manually configured ESIs.

In the following topology, the CE is connected to PE1 and PE2. When you configure the **cost-out** command on PE1, all the bundle interfaces on the Ethernet segment are brought down. Also, the corresponding bundle member is brought down on the CE. Hence, the traffic for this Ethernet segment is now sent to PE2 from the CE.

Figure 9: EVPN Out of Service

To bring up the node into service, use **no cost-out** command. This brings up all the bundle interfaces belonging to EVPN Ethernet segment on the PE and the corresponding bundle members on the CE.

When the node is in cost-out state, adding a new bundle Ethernet segment brings that bundle down. Similarly, removing the bundle Ethernet segment brings that bundle up.

Use **startup-cost-in** command to bring up the node into service after the specified time on reload. The node will cost-out when EVPN is initialized and remain cost-out until the set time. If you execute **evpn no startup-cost-in** command while timer is running, the timer stops and node is cost-in.

The 'cost-out' configuration always takes precedence over the 'startup-cost-in' timer. So, if you reload with both the configurations, cost-out state is controlled by the 'cost-out' configuration and the timer is not relevant. Similarly, if you reload with the startup timer, and configure 'cost-out' while timer is running, the timer is stopped and OOS state is controlled only by the 'cost-out' configuration.

If you do a proc restart while the startup-cost-in timer is running, the node remains in cost-out state and the timer restarts.

Configure EVPN Out of Service

This section describes how you can configure EVPN Out of Service.

```
/* Configuring node cost-out on a PE */

Router# configure
Router(config)# evpn
Router(config-evpn)# cost-out
Router(config-evpn)# commit

/* Bringing up the node into service */

Router# configure
```

```

Router(config)# evpn
Router(config-evpn)# no cost-out
Router(config-evpn)commit

/* Configuring the timer to bring up the node into service after the specified time on
reload */

Router# configure
Router(config)# evpn
Router(config-evpn)# startup-cost-in 6000
Router(config-evpn)commit

```

Running Configuration

```

configure
evpn
cost-out
!

configure
evpn
startup-cost-in 6000
!

```

Verification

Verify the EVPN Out of Service configuration.

```

/* Verify the node cost-out configuration */

Control Word Support for ELAN

Table 9: Feature History Table

Feature Name	Release Information	Feature Description
Control-word support for EVPN Bridge-Mode (E-LAN)	Release 7.4.1	<p>Control word is now supported and enabled by default in ELAN mode on routers that have Cisco NC57 line cards installed and are operating in compatibility mode. If the control-word-disable command is not configured, ensure to configure it under EVPN or EVI configuration mode before an upgrade to avoid inconsistent behaviour with routers before this release.</p> <pre> Router# configure Router(config)# evpn Router(config-evpn)# evi 1 Router(config-evpn-instance)# control-word-disable // Apply to interop with older releases EVPN ELAN </pre> <p>If you want to enable control-word command for EVPN Bridging feature, then you must configure it only when both the endpoints run Release 7.4.1 or later.</p>

Note Control word is enabled by default in ELAN mode as well. If the **control-word-disable** command is not configured, ensure to configure it under EVPN or EVI configuration mode before an upgrade to avoid inconsistent behaviour with routers before Release 7.4.1.

If you want to enable **control-word** command for EVPN Bridging feature, then you must configure it only when both the endpoints run Release 7.4.1 or later.

EVPN Multiple Services per Ethernet Segment

Table 10: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Multiple Services per Ethernet Segment	Release 7.3.1	This feature is now supported on Cisco NCS 5700 series fixed port routers and the Cisco NCS 5500 series routers that have the Cisco NC57 line cards installed and operating in the native and compatible modes.

EVPN Multiple Services per Ethernet Segment feature allows you to configure multiple services over single Ethernet Segment (ES). Instead of configuring multiple services over multiple ES, you can configure multiple services over a single ES.

You can configure the following services on a single Ethernet Bundle; you can configure one service on each sub-interface.

- Flexible cross-connect (FXC) service. It supports VLAN Unaware, VLAN Aware, and Local Switching modes.

For more information, see *Configure Point-to-Point Layer 2 Services* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS 5500 Series Routers*.

- EVPN-VPWS Xconnect service

For more information, see *EVPN Virtual Private Wire Service (VPWS)* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS 5500 Series Routers*.

- EVPN Integrated Routing and Bridging (IRB)

For more information, see *Configure EVPN IRB* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS 5500 Series Routers*.

- Native EVPN

For more information see, *EVPN Features* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS 5500 Series Routers*.

All these services are supported only on all-active multihoming scenario.

Configure EVPN Multiple Services per Ethernet Segment

Consider a customer edge (CE) device connected to two provider edge (PE) devices through Ethernet Bundle interface 22001. Configure multiple services on Bundle Ethernet sub-interfaces.

Configuration Example

Consider Bundle-Ether22001 ES, and configure multiple services on sub-interface.

```
/* Configure attachment circuits */
Router# configure

EVPN Convergence Using NTP Synchronization

Table 11: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Convergence Using NTP Synchronization	Release 7.3.1	This feature leverages the NTP clock synchronization mechanism to handle the transfer of DF role from one edge device to another. In this mechanism, the newly added or recovered PE advertises the Service Carving Timestamp along with the current time to peering PEs. This improves convergence by reducing the time for DF election from three seconds to a few tens of milliseconds. The show evpn ethernet-segment command is modified to display the Service-Carving wall clock Timestamp (SCT).

In Ethernet VPN, depending on the load-balancing mode, the Designated Forwarder (DF) is responsible for forwarding Unicast, Broadcast, Unknown Unicast, and Multicast (BUM) traffic to a multihomed Customer Edge (CE) device on a given VLAN on a particular Ethernet Segment (ES).

The DF is selected from the set of multihomed edge devices attached to a given ES. When a new edge router joins the peering group either through failure recovery or booting up of a new device, the DF election process is triggered.

By default, the process of transferring the DF role from one edge device to another takes 3 seconds. The traffic may be lost during this period.

The NTP synchronization mechanism for fast DF election upon recovery leverages the NTP clock synchronization to better align DF events between peering PEs.

If all edge devices attached to a given Ethernet Segment are clock-synchronized with each other using NTP, the default DF election time reduces from 3 seconds to few tens of milliseconds, thereby reducing traffic loss.

Note If the NTP is not synchronized with the NTP server when the EVPN Ethernet Segment interface is coming up, EVPN performs normal DF election.

Let's understand how NTP synchronization works:

Figure 10: EVPN Convergence Using NTP Synchronization

In this topology, CE1 is multihomed to PE1 and PE2.

- PE1 joins the peering group after failure recovery at time (t) = 99 seconds.
- When PE1 joins the peering group, PE1 advertises Route-Type 4 at t = 100 seconds with target Service Carving Time (SCT) value t = 103 seconds to PE2.
- PE2 receives peering Route-Type 4 and learns the DF election time of PE1 to be t=103 seconds.
- If all the peers support NTP, PE2 starts a timer based on the SCT received from PE1 along with a skew value in the Service Carving Time. The skew values are used to eliminate any potential duplicate traffic or loops. Both PE1 and PE2 carves at time t = 103 seconds.

Benefits

- Helps in fast convergence during a primary link recovery
- Supports all the existing load-balancing modes:
 - All-active multihoming
 - Single-active multihoming
 - Port-active multihoming
 - Single-Flow-Active multihoming

Limitations

- All devices attached to a given Ethernet Segment must be configured with NTP. If one of the devices doesn't support NTP clock, the mechanism falls back to default timers.

Verification

Use the **show evpn ethernet-segment** command to view the **Service Carving Time** of the edge device.

For example,

```
Router# show evpn ethernet-segment interface Bundle-Ether200 carving detail
```

```

Hierarchical EVPN Access Pseudowire

Table 12: Feature History Table

Feature Name	Release Information	Feature Description
--------------	---------------------	---------------------

Hierarchical EVPN Access Pseudowire	Release 7.6.1	<p>You can configure EVPN VPWS in the access node under the same bridge domain as EVPN in the core to build a PW to the nearest high-end PE that stitches those access circuits using EVPN. This allows the access nodes to leverage the benefits of EVPN.</p> <p>This feature also allows you to reduce the number of pseudowires (PWs) between the network provider edge (N-PE) devices by replacing PE devices with user provider edge (U-PE) and network provider edge (N-PE) devices. This feature prevents signaling overhead and packet replication.</p>
-------------------------------------	---------------	---

A standard VPN configuration comprises of CE devices and PE devices. With this feature, each PE device is replaced with a user provider edge (U-PE) and network provider edge (N-PE) devices. U-PE devices communicate with the CE devices and N-PE devices on the access side, and N-PE devices communicate with other N-PE devices on the core.

The Hierarchical EVPN Access Pseudowire feature allows you to reduce the number of pseudowires (PWs) between the network provider edge (N-PE) devices. The user provider edge (U-PE) device connects to the N-PE device using EVPN access pseudowire (PW) for each VPN instance. Each CE device is connected to a U-PE device through an attachment circuit.

Hierarchical EVPN Access Pseudowire Topology

In this topology, a user provider edge (U-PE1) device is connected to the CE1 through an attachment circuit. The U-PE1 device transports the CE1 traffic over an EVPN access PW to a network provider edge (N-PE1) device. The N-PE1 is connected with other N-PE2 in an EVPN core. On the N-PE1, the access PW coming from the U-PE1 is much like an AC. The U-PE is not part of the core with the other N-PEs. The N-PE forwards traffic from that access PW to the core PWs that are part of the EVPN core.

Restriction

- EVPN-VPWS is not supported on Cisco NCS 5508 modular chassis and the Cisco NCS 5516 modular chassis variants.

Configure Hierarchical EVPN Access Pseudowire

Perform the following task to configure Hierarchical EVPN Access Pseudowire feature on U-PEs and N-PEs.

Configuration Example

```
/* Configure U-PE1 */
Router# configure
Router(config)# 12vpn
Router(config-12vpn)# xconnect group XG1
```

```

Router(config-l2vpn-xc) # p2p P1
Router(config-l2vpn-xc-p2p) # interface TenGigE0/0/0/31
Router(config-l2vpn-xc-p2p) # neighbor evpn evi 4 target 33 source 33
Router(config-l2vpn-xc-p2p-pw) # commit

/* Configure N-PE1 */
Router# configure
Router(config) # l2vpn
Router(config-l2vpn) # bridge group evpn
Router(config-l2vpn-bg) # bridge-domain evpn1
Router(config-l2vpn-bg-bd) # neighbor evpn evi 4 target 33
Router(config-l2vpn-bg-bd) # evi 1
Router(config-l2vpn-bg-bd-evi) # commit

```

Running Configuration

This section shows the Hierarchical EVPN Access Pseudowire running configuration.

```

/* U-PE1 Configuration */
l2vpn
  xconnect group XG1
  p2p P1
    interface TenGigE0/0/0/31 l2transport
    neighbor evpn evi 4 target 33 source 33
  !
!
/* N-PE1 Configuration */
l2vpn
  bridge group evpn
    bridge-domain evpn1
      neighbor evpn evi 4 target 33
      evi 1
    !
  !
!
!
!

```

Verification

Verify the EVPN state, and the list of access PWs. The following is the sample output on N-PE1:

```

Router:N-PE1# show l2vpn bridge-domain bd-name evpn1
Wed Jun 16 09:22:30.328 EDT
Legend: pp = Partially Programmed.

  List of Access PWs:
    EVPN 4,33,192.168.0.4, state: up, Static MAC addresses: 0
  List of VFIs:
  List of Access VFIs:

```

EVPN Core Isolation Protection

The EVPN Core Isolation Protection feature enables you to monitor and detect the link failure in the core. When a core link failure is detected in the provider edge (PE) device, EVPN brings down the PE's Ethernet Segment (ES), which is associated with access interface attached to the customer edge (CE) device.

EVPN replaces ICCP in detecting the core isolation. This new feature eliminates the use of ICCP in the EVPN environment.

Consider a topology where CE is connected to PE1 and PE2. PE1, PE2, and PE3 are running EVPN over the MPLS core network. The core interfaces can be Gigabit Ethernet or bundle interface.

Figure 11: EVPN Core Isolation Protection

When the core links of PE1 go down, the EVPN detects the link failure and isolates PE1 node from the core network by bringing down the access network. This prevents CE from sending any traffic to PE1. Since BGP session also goes down, the BGP invalidates all the routes that were advertised by the failed PE. This causes the remote PE2 and PE3 to update their next-hop path-list and the MAC routes in the L2FIB. PE2 becomes the forwarder for all the traffic, thus isolating PE1 from the core network.

When all the core interfaces and BGP sessions come up, PE1 advertises Ethernet A-D Ethernet Segment (ES-EAD) routes again, triggers the service carving and becomes part of the core network.

Configure EVPN Core Isolation Protection

Configure core interfaces under EVPN group and associate that group to the Ethernet Segment which is an attachment circuit (AC) attached to the CE. When all the core interfaces go down, EVPN brings down the associated access interfaces which prevents the CE device from using those links within their bundles. All interfaces that are part of a group go down, EVPN brings down the bundle and withdraws the ES-EAD route.

Starting from Cisco IOS-XR software version 7.1.2, you can configure a sub-interface as an EVPN Core. With this enhancement, when using IOS-XR software versions 7.1.2 and above, EVPN core facing interfaces can be physical, bundle main, or sub-interfaces. For all Cisco IOS-XR software versions lower than 7.1.2, EVPN core facing interfaces must be physical or bundle main. Sub-interfaces are not supported.

EVPN core facing interfaces can be physical main interface or subinterface, or bundle main interface or subinterface.

Restrictions

- A maximum of 24 groups can be created under the EVPN.
- A maximum of 12 core interfaces can be added under the group.
- The core interfaces can be reused among the groups. The core interface can be a bundle interface.
- EVPN group must only contain core interfaces, do not add access interfaces under the EVPN group.
- The access interface can only be a bundle interface.
- EVPN core facing interfaces must be physical or bundle main interfaces only. Sub-interfaces are not supported.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# group 42001
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/1
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/3
Router(config-evpn-group)# exit
!
Router(config-evpn)# group 43001
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/2
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/4
Router(config-evpn-group)# exit
!
Router# configure
Router(config)# evpn
Router(config-evpn)# interface bundle-Ether 42001
Router(config-evpn-ac)# core-isolation-group 42001
Router(config-evpn-ac)# exit
!
Router(config-evpn)# interface bundle-Ether 43001
Router(config-evpn-ac)# core-isolation-group 43001
Router(config-evpn-ac)# commit
```

Running Configuration

```
configure
evpn
group 42001
core interface GigabitEthernet0/2/0/1
core interface GigabitEthernet0/2/0/3
!
group 43001
core interface GigabitEthernet0/2/0/2
core interface GigabitEthernet0/2/0/4
!
!
configure
evpn
interface bundle-Ether 42001
core-isolation-group 42001
!
interface bundle-Ether 43001
core-isolation-group 43001
!
!
```

Verification

The **show evpn group** command displays the complete list of evpn groups, their associated core interfaces and access interfaces. The status, up or down, of each interface is displayed. For the access interface to be up, at least one of the core interfaces must be up.

```
Router# show evpn group /* Lists specific group with core-interfaces and access interface
status */
EVPN Group: 42001
  State: Ready
  Core Interfaces:
    Bundle-Ethernet110: down
    Bundle-Ethernet111: down
    GigabethEthernet0/2/0/1: up
    GigabethEthernet0/2/0/3: up
    GigabethEthernet0/4/0/8: up
    GigabethEthernet0/4/0/9: up
    GigabethEthernet0/4/0/10: up
  Access Interfaces:
    Bundle-Ether42001: up

EVPN Group: 43001
  State: Ready
  Core Interfaces:
    Bundle-Ethernet110: down
    GigabethEthernet0/2/0/2: up
    GigabethEthernet0/2/0/4: up
    GigabethEthernet0/4/0/9: up

  Access Interfaces:
    Bundle-Ether43001: up
```

Configurable Recovery Time for EVPN Core Isolation Group

Table 13: Feature History Table

Feature Name	Release Information	Feature Description
Configurable Recovery Time for EVPN Core Isolation Group	Release 7.6.1	<p>You can now configure the recovery time for the EVPN core isolation group after the core interfaces recover from a network failure. This functionality is important because post-failure recovery, you can provide sufficient time for the EVPN PE nodes to relearn the MAC addresses and BGP routes received from the remote PEs. There's also time to handle delays in exchanging EVPN routes after recovery.</p> <p>This feature introduces the core-de-isolation command under the EVPN Timers configuration mode.</p>

When the core link failure is detected on the PE device, the PE device is isolated from the network and brings down the access interfaces connected to this PE till the core interfaces recover. When the core links recover, the default recovery delay timer begins. The access interfaces become active after the default recover delay timer of 60 seconds expire. The core isolation group recovery delay timer was not user-configurable.

Under scale situations where a network has high MAC addresses, it is observed that the 60 seconds is too short to bring up the access bundle interface as there can be multiple reasons which can delay the exchange of EVPN routes even after the core interfaces have come up.

This feature allows you to configure the core isolation group recovery time to handle delays coming from the core and provides enough time for the EVPN PE nodes to relearn the MAC addresses. You can configure the core isolation group recovery time using the **core-de-isolation** command.

Topology

Consider a topology where CE1 is connected to PE1 and PE2. PE1 and PE2 are running EVPN over the MPLS core network. The core interfaces on PE1 are configured with BE11 and BE22. When the core links of PE1 go down, the EVPN detects the link failure and isolates the PE1 node from the core network, and brings down the access interfaces connected to PE1. This prevents CE1 from sending any traffic to PE1.

When all the core interfaces and BGP sessions come up, PE1 advertises Ethernet A-D Ethernet Segment (ES-EAD) routes again, triggers the service carving, and becomes part of the core network. The access interfaces connected to PE1 from CE1 also come up after the *core-de-isolation* timer value expires.

Configurable Recovery Time for EVPN Core Isolation Group

To enable this feature, configure core interfaces under the EVPN group and associate that group to the Ethernet Segment which is an attachment circuit (AC) attached to the CE.

Perform the following tasks to configure recovery time for EVPN core isolation group:

- Configure EVPN core interfaces on PE1

- Configure *core-de-isolation* timer on PE1
- Configure attachment circuits on CE1

Configuration Example

Configure EVPN core interfaces on PE1.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# group 100
Router(config-evpn-group)# core interface BE11
Router(config-evpn-group)# core interface BE21
Router(config-evpn-group)# commit
```

Configure core-de-isolation timer on PE1.

```
Router# configure
Router(config)# evpn timers
Router(config-evpn-timers)# core-de-isolation 120
Router(config-evpn-timers)# commit
```

Configure attachment circuits on CE1.

```
/* Configure interface Bundle-Ether200 and associate it to core isolation group 100 */
Router # configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether200
Router(config-evpn-ac)# ethernet-segment identifier type 0 11.11.11.11.11.11.11.11
Router(config-evpn-ac-es)# bgp route-target 1111.1111.1111
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# core-isolation-group 100

/* Configure interface Bundle-Ether201 and associate it to core isolation group 100 */
Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether201
Router(config-evpn-ac)# ethernet-segment identifier type 0 11.22.22.22.22.22.22.22
Router(config-evpn-ac-es)# bgp route-target 1111.2222.2222
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# core-isolation-group 100
```

Running Configuration

This section shows the EVPN core isolation group recovery delay timer running configuration.

```
/* Configure EVPN core interfaces on PE1 */
evpn
group 100
core interface Bundle-Ether11
core interface Bundle-Ether21
!
!
/* Configure core-de-isolation timer on PE1 */
evpn timers
core-de-isolation 120
!
!
/* Configure attachment circuits on CE1 */
```

```

evpn
 interface Bundle-Ether200
   ethernet-segment
     identifier type 0 11.11.11.11.11.11.11.11
     bgp route-target 1111.1111.1111
   !
   core-isolation-group 100
 !
 !
evpn
 interface Bundle-Ether201
   ethernet-segment
     identifier type 0 11.22.22.22.22.22.22.22
     bgp route-target 1111.2222.2222
   !
   core-isolation-group 100
 !
 !

```

Verification

The following output shows that all core interfaces and access interfaces are UP. The *core de-isolation* timer value is configured as 120 seconds, but not running as the core interfaces are UP.

```

Router# show evpn group
EVPN Group: 100

```

```

state: Ready

```

```

Core Interfaces:

```

```

  Bundle-Ether11: up
  Bundle-Ether21: up

```

```

Access Interfaces:

```

```

  Bundle-Ether200: up
  Bundle-Ether201: up

```

```

Router# show evpn summary

```

```

    Startup-cost-in timer      : Not configured
    EVPN manual cost-out      : No
    EVPN Bundle Convergence   : No

```

Failure Scenario

The following example shows the failure scenario and how the *core de-isolation* timer works.

Let's bring down the core interfaces:

```

Router# configure
Router(config)# interface Bundle-Ether11
Router(config-if)# shutdown
Router(config-if)# exit
Router(config)# interface Bundle-Ether21
Router(config-if)# shutdown
Router(config-if)# commit

```

This example shows when the core interfaces are shutdown even the access interfaces are down and the core is isolated.

```

Router# show evpn group

EVPN Group: 100

    state: Isolated

Core Interfaces:
    Bundle-Ether11: shutdown
    Bundle-Ether21: shutdown

Access Interfaces:
    Bundle-Ether200: down
    Bundle-Ether201: down

```

This example shows that the *core de-isolation timer* is not yet running because the core interfaces are still down.

```

Configuration successfully rolled back 1 commits.

```

In this example, you can see that the *core de-isolation* timer starts running after the core interfaces come up. When the core interfaces are UP, the state of core changes to Deisolating. In the following output you can see the state as Deisolating and core interfaces are up and the *core de-isolation* timer has started.

The access interfaces come up only after the *core de-isolation* timer value expires. In the following output you can see the access interfaces are still down.

```
Router# show evpn group
```

```

EVPN Group: 100

state: Deisolating

Core Interfaces:
  Bundle-Ether11: up
  Bundle-Ether21: up

Access Interfaces:
  Bundle-Ether200: down
  Bundle-Ether201: down

```

```

Highest Random Weight Mode for EVPN DF Election

Table 14: Feature History Table

Feature Name	Release Information	Feature Description
Highest Random Weight Mode for EVPN DF Election	Release 7.3.1	This feature is now supported on Cisco NCS 5700 series fixed port routers and the Cisco NCS 5500 series routers that have the Cisco NC57 line cards installed and operating in the native and compatible modes.

The Highest Random Weight (HRW) Mode for EVPN DF Election feature provides optimal load distribution of Designated Forwarder (DF) election, redundancy, and fast access. It ensures a nondisruptive service for an ES irrespective of the state of a peer DF.

The DF election is calculated based on the weight. The highest weight becomes the DF and the subsequent weight becomes a backup DF (BDF). The weight is determined by the mathematical function of EVI, ESI, and the IP address of the server.

DF weight calculation is based on the weight vector:

```

Wrand(v, Si) = (1103515245((1103515245.Si+12345) XOR
    D(v))+12345) (mod 2^31)
                where:
                Si: IP Address of the server i
                v: EVI
                D(v): 31 bit digest [CRC-32 of v]

```

The existing DF election algorithm is based on ordinal value of a modulus calculation, and it comprises of number of peers and EVI. The DF is determined by the mathematical function of ESI and EVI, which is called “service carving”. This mode of DF election is described in RFC 7432.

In modulus calculation mode, the algorithm does not perform well when the Ethernet tags are all even or all odd. When the Ethernet Segment (ES) is multihomed to two PEs, all the VLANs pick only one of the PEs as the DF; one of the PEs does not get elected at all as the DF. The DF election is not optimal in this mode of operation.

The HRW mode of DF election has the following advantages over modulus mode of DF election:

- The DF election for the respective VLANs is equally distributed among the PEs.
- When a PE which is neither a DF nor a BDF hosts some VLANs on a given ES, and if the PE goes down, or its connection to the ES goes down, it does not result in a DF and BDF reassignment to the other PEs. This eliminates computation during the connection flaps.
- It avoids the service disruption that are inherent in the existing modulus based algorithm.
- The BDF provides redundant connectivity. The BDF ensures that there is no traffic disruption when a DF fails. When a DF fails, the BDF becomes the DF.

Configure Highest Random Weight Mode for EVPN DF Election

Perform this task to configure Highest Random Weight Mode for EVPN DF Election feature.

Configuration Example

```
Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether 23
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# service-carving hrw
Router(config-evpn-ac-es)# commit
```

Running Configuration

```
configure
evpn
  interface Bundle-Ether 23
  ethernet-segment
    service-carving hrw
  !
!
```

Verification

Verify that you have configured HRW mode of DF election.

```

Network Convergence using Core Isolation Protection

The Network Convergence using Core Isolation Protection feature allows the router to converge fast when remote links and local interfaces fail. This feature reduces the duration of traffic drop by rapidly rerouting traffic to alternate paths. This feature uses Object Tracking (OT) to detect remote link failure and failure of connected interfaces.

Tracking interfaces can only detect failure of connected interfaces and not failure of a remote router interfaces that provides connectivity to the core. Tracking one or more BGP neighbor sessions along with one or more of the neighbor's address-families enables you to detect remote link failure.

Object Tracking

Object tracking (OT) is a mechanism for tracking an object to take any client action on another object as configured by the client. The object on which the client action is performed may not have any relationship to the tracked objects. The client actions are performed based on changes to the properties of the object being tracked.

You can identify each tracked object by a unique name that is specified by the track command in the configuration mode.

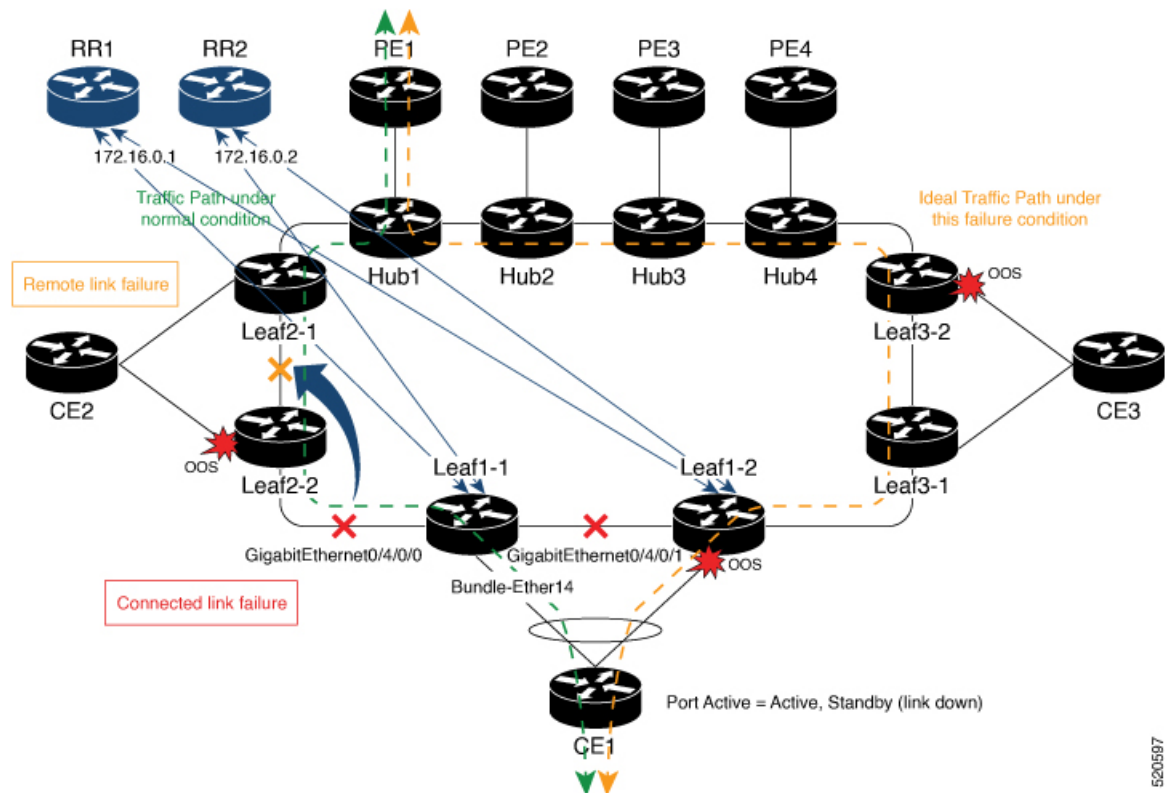

The tracking process receives the notification when the tracked object changes its state. The state of the tracked objects can be up or down.

You can also track multiple objects by a list. You can use a flexible method for combining objects with Boolean logic. This functionality includes:

- Boolean AND function—When a tracked list has been assigned a Boolean AND function, each object defined within a subset must be in an up state, so that the tracked object can also be in the up state.
- Boolean OR function—When the tracked list has been assigned a Boolean OR function, it means that at least one object defined within a subset must also be in an up state, so that the tracked object can also be in the up state.

For more information on OT, see the *Configuring Object Tracking* chapter in the *System Management Configuration Guide for Cisco NCS 5500 Series Routers*.

Figure 12: EVPN Convergence Using Core Isolation Protection

Consider a traffic flow from CE1 to PE1. The CE1 can send the traffic either from Leaf1-1 or Leaf1-2. When Leaf1-1 loses the connectivity to both the local links and remote link, BGP sessions to both route reflectors (RRs) are down; the Leaf1-1 brings down the Bundle-Ether14 connected to CE1. The CE1 redirects the traffic from Leaf1-2 to PE1.

You can track the connected interfaces to identify the connected link failures. However, if there is a remote link failure, tracking connected interfaces does not identify the remote link failures. You must track BGP sessions to identify the remote link failure.

Note When you configure the **bgp graceful-restart** command, unconfiguring a neighbor is considered as a non-gr event. This generates a BGP notification to the neighbor before the neighbor is unconfigured.

On the remote router, if the track is configured for this neighbor, the track state is brought down immediately.

However, certain configurations are treated as graceful reset reason and when unconfigured they suppress the BGP notification to the neighbor. The route-reflector-client configuration under the neighbor or neighbor address-family is one of the examples.

On the remote router, if the track is configured for this neighbor, the track state is not brought down immediately because a notification is not received.

To overcome this situation, shutdown the neighbor before unconfiguring the neighbor. This generates a BGP notification to the neighbor, and any track configured for the neighbor is brought down immediately.

Configure EVPN Convergence using Core Isolation Protection

A tracked list contains one or more objects. The Boolean expression enables tracking objects using either AND or OR operators. For example, when tracking two interfaces, using the AND operator, up means that *both* interfaces are up, and down means that *either* interface is down.

Note An object must exist before it can be added to a tracked list.

The NOT operator is specified for one or more objects and negates the state of the object.

After configuring the tracked object, you must associate the neighbor or interface whose state must be tracked.

Perform the following tasks to configure EVPN convergence using core isolation protection:

- Configure BGP
- Track the Line Protocol State of an Interface
- Track neighbor address-family state
- Track objects for both interfaces and neighbors

Configuration Example

In this example, Leaf1-1 brings the down the AC connected to CE1 when:

Both local interfaces GigabitEthernet0/4/0/0 and GigabitEthernet0/4/0/1 of Leaf1-1 are down.

OR

Leaf1-1 BGP sessions to both RRs are down.

CE1 re-directs the traffic it was sending to Leaf1-1 to Leaf1-2.

Perform the following tasks on Leaf1-1:

```
/* Configure BGP */
Router# configure
Router(config)# router bgp 100
```

```

Router(config-bgp)# address-family l2vpn evpn
Router(config-bgp-af)# exit

Conditional Advertisement of Default-Originate

The router advertises the default-originate (0.0.0.0/0) towards the network fabric only upon receiving all the core routes. The router withdraws the advertisement of default-originate when the core is isolated. To avoid traffic drop, install the routes in the hardware. To accommodate an additional delay for the routes to be installed in the hardware, you can configure a timeout for the installed routes.

Figure 13: Advertisement of default-originate

In this topology, PE3 advertises the default-originate to CE only when the PE3 session to RR is established and all the routes are received from the RR.

Configure Conditional Advertisement of Default-Originate

Perform the following tasks to configure conditional advertisement of default-originate.

- Configure BGP
- Configure RPL
- Track BGP neighbor address-family state

Configuration Example

Perform the following task on PE3:

```
/* Configure BGP */
Router# configure
Router(config)# router bgp 100
Router(config-bgp)# bgp router-id 192.0.2.1
Router(config-bgp)# address-family vpnv4 unicast
Router(config-bgp-af)# exit
```

```

Router(config-bgp)# neighbor 172.16.0.5
Router(config-bgp-nbr)# remote-as 200
Router(config-bgp-nbr)# address-family vpnv4 unicast
Router(config-bgp-nbr-af)# exit
Router(config-bgp-nbr)# exit
Router(config-bgp)# vrf cust1
Router(config-bgp-vrf)# rd auto
Router(config-bgp-vrf)# address-family ipv4 unicast
Router(config-bgp-vrf-af)# redistribute connected
Router(config-bgp-vrf-af)# redistribute static
Router(config-bgp-vrf-af)# exit
Router(config-bgp-vrf)# neighbor 172.16.0.5
Router(config-bgp-vrf-nbr)# remote-as 200
Router(config-bgp-vrf-nbr)# address-family ipv4 unicast
Router(config-bgp-vrf-nbr-af)# default-originate route-policy track-bgp-core-policy
Router(config-bgp-vrf-nbr-af)# route-policy pass in
Router(config-bgp-vrf-nbr-af)# route-policy pass out
Router(config-bgp-vrf-nbr-af)# commit

/* Configure RPL */
Router# configure
Router(config)# route-policy track-bgp-core-policy
Router(config-rpl)# if track core-group-1 is up then
Router(config-rpl-if)# pass
Router(config-rpl-if)# endif
Router(config-rpl)# end-policy
Router(config)# commit

/* Track BGP neighbor address-family state */
Router# configure
Router(config)# track core-group-1
Router(config-track)# type bgp neighbor address-family state
Router(config-track-bgp-nbr-af)# address-family vpnv4 unicast
Router(config-track-bgp-neighbor)# neighbor 172.16.0.5
Router(config-track-bgp-neighbor)# commit

```

Running Configuration

This section shows conditional advertisement of default-originate running configuration.

```

configure
router bgp 100

EVPN Bridging and VPWS Services over BGP-LU Underlay

Table 15: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Bridging and VPWS Services over BGP-LU Underlay	Release 7.4.1	This feature is now supported on routers that have Cisco NC57 line cards installed and operate in native mode.

The EVPN Bridging and VPWS Services over BGP-LU Underlay feature allows you to configure end-to-end EVPN services between data centers (DCs). This feature allows you to perform ECMP at three-levels: transport, BGP- LU, and service level.

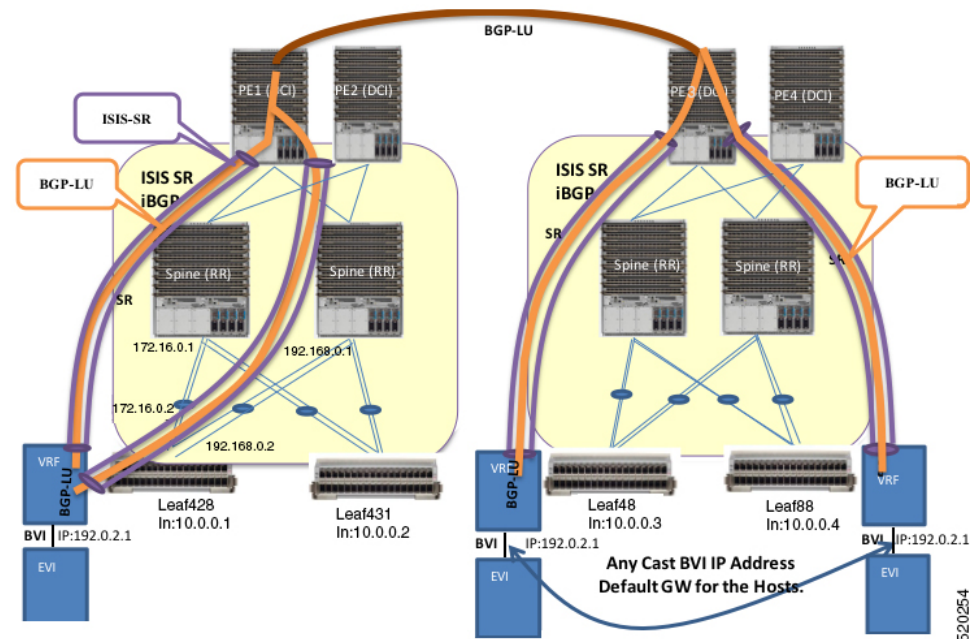

This feature supports the following services:

- IRB VRF over BGP-LU using IGP (SR or non-SR (LDP or IGP))
- EVPN Aliasing over BGP-LU using IGP (SR or non-SR (LDP or IGP))
- VPWS over BGP-LU using IGP

Note EVPN IRB with default-vrf over BGP-LU over IGP is not supported on the Cisco NCS 5500 series routers and NCS57 line cards.

Figure 14: EVPN Bridging and VPWS Services over BGP-LU Underlay

This section explains the topology of EVPN Bridging and VPWS Services over BGP-LU Underlay feature:

- Consider two data centers that are connected through DCI. Configure EVPN with bridging and inter-subnet routing on the leaf nodes.
- Configure EVPN instance with BVI attachment circuit to interface with L3-VRF.
- Configure BVI interface with anycast IP address with the same MAC address. This is the default gateway for all the hosts across the same EVPN bridged domain.
- The leaf acts as default gateway for its local hosts.
- Connect hosts to leaf nodes. Leaf nodes are routed across the spines. For DC interconnectivity, the spines are connected through provider edge (PE) device and Data Center Interconnect (DCI).
- IS-IS labelled IGP and I-BGP are enabled internally across the leaf nodes, spine and DCI. The spine acts as a Route Reflector (RR).
- Configure IS-IS SR policy across the leaf node, spine and DCI.
- Configure BGP-LU between the DCs.
- Labelled Unicast BGP routers are learnt across the leaf nodes and tunnelled through IGP labelled paths (IS-IS SR).

For example, at Leaf428, BGP-LU routes are learnt for remote loopback 10.0.0.3 and 10.0.0.4.

- IRB (BVI) interface routes are learnt across the EVPN instances and programmed as labelled routes tunnelled through BGP-LU.

For example, at Leaf428, 192.0.2.1 can be reached with two BGP-LU paths 10.0.0.3 and 10.0.0.4.

After establishing the BGP-LU services, you can configure either EVPN instance or EVPN VPWS to support BGP-LU.

Limitations for EVPN Bridging and VPWS Services over BGP-LU Underlay

The following EVPN services are not supported over BGP-LU over IGP with L2 unicast and BUM traffic on the Cisco NCS 5500 series routers and NCS57 line cards:

- EVPN-ELAN and ELINE for EVPN Multi-Homing Single-Active
- EVPN IRB with VRF (intra-subnet)

Configure EVPN Bridging and VPWS Services over BGP-LU Underlay

Perform these tasks to configure the EVPN Bridging and VPWS Services over BGP-LU Underlay feature.

- Configure IGP
- Configure BGP
- Configure EVPN instance and ESI
- Configure BVI (IRB) Interface
- Configure VRF
- Configure BVI with VRF
- Configure VRF under BGP

- Configure bridge domain and associate with attachment circuits and EVPN instance
- Configure bridge domain and associate with attachment circuits, EVPN instance and BVI
- Configure EVPN VPWS

Configuration Example

```

/* Configure IGP */
IGP configuration is a pre-requisite to configure EVPN. IGP can be OSPF or ISIS.
Router# configure
Router(config)#router ospf 1
Router(config-ospf)#router-id 209.165.201.1
Router(config-ospf)#area 10
Router(config-ospf-ar)#interface loopback0\
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface TenGigE0/0/0/1\
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface TenGigE0/0/0/17\
Router(config-ospf-ar-if)#commit

/* Configure BGP enable BGP-LU, and configure iBGP peering */
Router# configure
Router(config)#router bgp 100
Router(config-bgp)#router-id 209.165.201.1
Router(config-bgp)#bgp graceful-restart
Router(config-bgp)#address-family ipv4 unicast
Router(config-bgp-af)#redistribute connected
Router(config-bgp-af)#network 209.165.200.225/27
Router(config-bgp-af)#allocate-label all
Router(config-bgp-af)#exit
Router(config-bgp)#address-family ipv6 unicast
Router(config-bgp-af)#allocate-label all
Router(config-bgp-af)#exit
Router(config-bgp)#neighbor-group spines
Router(config-bgp-nbrgrp)#remote-as 100
Router(config-bgp-nbrgrp)#update-source loopback0
Router(config-bgp-nbrgrp)#address-family ipv4 labeled-unicast multipath
Router(config-bgp-nbrgrp-af)#exit
Router(config-bgp-nbrgrp)#address-family ipv6 labeled-unicast multipath
Router(config-bgp-nbrgrp-af)#exit
Router(config-bgp-nbrgrp)#address-family l2vpn evpn
Router(config-bgp-nbrgrp-af)#advertise vpnv4 unicast re-originated
Router(config-bgp-nbrgrp-af)#advertise vpnv6 unicast re-originated
Router(config-bgp-nbrgrp-af)#exit
Router(config-bgp-nbrgrp)#exit
Router(config-bgp)#neighbor 209.165.200.225
Router(config-bgp-nbr)#use neighbor-group spines
Router(config-bgp-nbr)#commit

/* Configure VPN4 address-family to enforce iBGP policy. */
Router(config)#router bgp 100
Router(config-bgp)#router-id 209.165.201.1
Router(config-bgp)#ibgp policy out enforce-modifications
Router(config-bgp)#address-family vpnv4 unicast
Router(config-bgp-af)#commit

The above steps establish BGP-LU. You can configure either EVPN VPLS or EVPN VPWS on the
PE routers to support BGP-LU.
/* Configure EVPN instance and ESI */

```

```

Support for DHCPv4 and DHCPv6 Client over BVI

Table 16: Feature History Table

Feature Name	Release Information	Description
Support for DHCPv6 Client over BVI	Release 7.5.1	This feature is now supported on Cisco NCS 5700 Series Fixed Port Routers and the Cisco NCS 5500 Series Routers that have the Cisco NC57 line cards installed and operating in the native mode.

The Support for DHCPv4 and DHCPv6 Client over the BVI feature allows you to configure DHCPv4 and DHCPv6 client on the Bridged Virtual Interface (BVI). You can configure a BVI, and request DHCP IPv4 or IPv6 address on the BVI. This allows your customer's device to have initial connectivity to your network without user intervention in the field. After the device is connected to your network, the customer devices can push a node-specific configuration with static IP addresses on a different BVI for customer deployment.

Configure DHCPv4 and DHCPv6 Client over BVI

Perform the following tasks to configure DHCPv4 and DHCPv6 client over BVI:

- Configure AC interface
- Configure L2VPN
- Configure BVI

Configuration Example

```
/* Configure AC interface */
Router# configure
Router(config)# interface tenGigE 0/5/0/1/1
Router(config-if)# bundle id 1 mode on
Router(config-if)# exit
Router(config)# interface Bundle-Ether1
Router(config-if)# no shut
Router(config-if)# exit
Router(config)# interface bundle-ether 1.100 l2transport
Router(config-l2vpn-subif)# encapsulation dot1q 100
Router(config-l2vpn-subif)# rewrite ingress tag pop 1 symmetric
Router(config-l2vpn-subif)# commit

/* Configure L2VPN */
Router # configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group BVI
Router(config-l2vpn-bg)# bridge-domain bvi
Router(config-l2vpn-bg-bd)# interface Bundle-Ether1.100
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)# routed interface BVI1
Router(config-l2vpn-bg-bd-bvi)# commit

/* Configure BVI */
Router# configure
Router(config)# interface BVI1
Router(config-if)# ipv4 address dhcp
Router(config-if)# ipv6 address dhcp
Router(config-if)# commit
```

Running Configuration

This section shows the DHCPv4 and DHCPv6 client over BVI running configuration.

```
interface TenGigE0/5/0/1/1
bundle id 1 mode on
!
interface Bundle-Ether1
!
interface Bundle-Ether1.100 l2transport
encapsulation dot1q 100
rewrite ingress tag pop 1 symmetric
!
l2vpn
bridge group BVI
    bridge-domain bvi
        interface Bundle-Ether1.100
    !
```

```

    routed interface BVI1
    !
  !
!
interface BVI1
ipv4 address dhcp
ipv6 address dhcp
!

```

Verification

The show output given in the following section display the details of DHCPv4 and DHCPv6 client over BVI configuration.

```

Configure DHCPv6 Client Options

You can configure different DHCPv6 client options to differentiate between clients as required. Configure different DHCPv6 client options to differentiate how a DHCPv6 client communicates with a DHCPv6 server. The different DHCPv6 client options that you can configure are:

- **DUID:** If the DUID DHCPv6 client option is configured on an interface, DHCPv6 client communicates with the DHCPv6 server through the link layer address.
- **Rapid Commit:** If the Rapid Commit DHCPv6 client option is configured on an interface, DHCPv6 client can obtain configuration parameters from the DHCPv6 server through a rapid two-step exchange (solicit and reply) instead of the default four-step exchange (solicit, advertise, request, and reply).
- **DHCP Options:** The various other DHCPv6 options that can be configured on a DHCPv6 client are:
 - **Option 15:** Option 15 is also known as the User Class option and it is used by a DHCPv6 client to identify the type or category of users or applications it represents.
 - **Option 16:** Option 16 is also known as the Vendor ID option and it is used by a DHCPv6 a client to identify the vendor that manufactured the hardware on which the client is running.

- **Option 23:** Option 23 is also known as the Domain name Server (DNS) option provides a list of one or more IPv6 addresses of DNS recursive name servers to which a client's DNS resolver can send DNS queries.
- **Option 24:** Option 24 is also known as the Domain List option and it specifies the domain search list that the client uses to resolve hostnames with the DNS.
- **DHCP Timers:** This option is used to set different timer value for DHCP client configurations. The various DHCP timer options are:
 - **Release-timeout:** It is used to set retransmission timeout value for the initial release message.
 - **Req-max-rt:** It is used to set the maximum retransmission timeout value for the request message.
 - **Req-timeout:** It is used to set the initial request timeout value of the request message.
 - **Sol-max-delay:** It is used to set the maximum delay time of the first solicit message.
 - **Sol-max-rt:** It is used to set the maximum solicit retransmission time.
 - **Sol-time-out:** It is used to set the initial timeout value of the solicit message.

Configuration Example

Perform this task to configure DHCPv6 client options on a BVI interface.

```
Router# configure
Router(config)# interface BVI 10
Router(config-if)# ipv6 address dhcp-client-options
Router(config-dhcpv6-client)# duid linked-layer-address
Router(config-dhcpv6-client)# rapid-commit
Router(config-dhcpv6-client)# timers release-timeout 3
Router(config-dhcpv6-client)# timers sol-max-delay 1
Router(config-dhcpv6-client)# timers sol-time-out 1
Router(config-dhcpv6-client)# timers sol-max-rt 120
Router(config-dhcpv6-client)# timers req-max-rt 30
Router(config-dhcpv6-client)# timers req-timeout 1
Router(config-dhcpv6-client)# commit
```

Verification

To verify the DHCPv6 client options, use the **show dhcp ipv6 client BVI10 detail** command.

```
Router# show dhcp ipv6 client BVI10 detail

MSTI Flush and Flood

Table 17: Feature History Table

Feature Name	Release Information	Feature Description
--------------	---------------------	---------------------

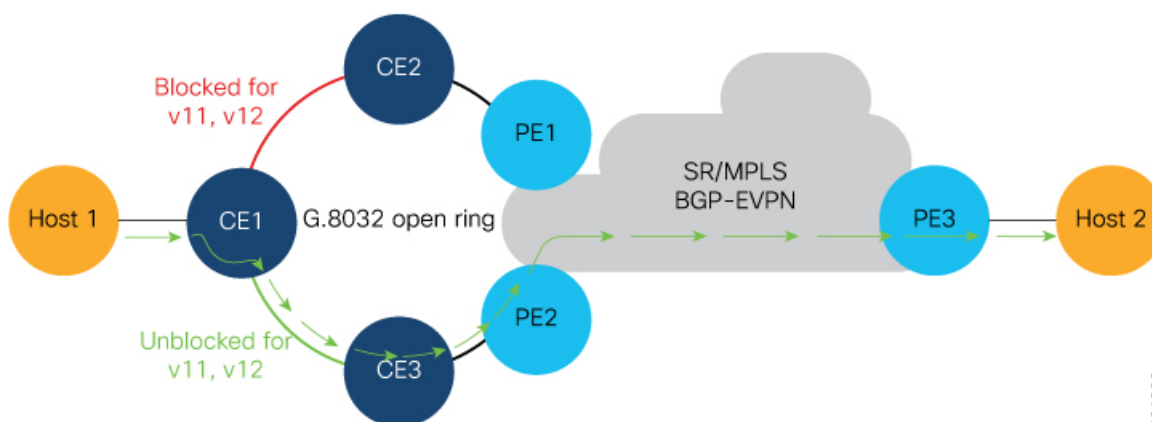

MSTI Flush and Flood	Release 7.3.1	<p>In the event of a link failure, this feature enables the router to switch traffic quickly to a precomputed loop-free alternative (LFA) path by allocating a label to the incoming traffic. Thus minimizes the traffic loss ensuring fast convergence. This feature is supported only when PE devices are in an EVPN single-flow-active mode.</p> <p>This feature introduces the convergence mac-mobility command.</p>
----------------------	---------------	---

The Multiple Spanning Tree Instance (MSTI) Flush and Flood feature reduces traffic loss during the failure of a primary link. You can use this feature only when PE devices are in EVPN single-flow active mode.

When the primary link connected to the PE device fails, the PE takes a few seconds to switch over from one PE to another. The convergence depends on MAC mobility or MAC-IP mobility. As the number of hosts connected to the CE device increases, convergence becomes slower, causing traffic loss during the switchover. This feature mitigates the traffic loss independent of the number of hosts.

When you enable this feature, the primary PE floods the received traffic to the peering PE and to the attached local AC soon after it detects the link failure. The primary PE continues to flood the traffic to the peering PE until the backup PE learns the MAC address of all the hosts.

Topology

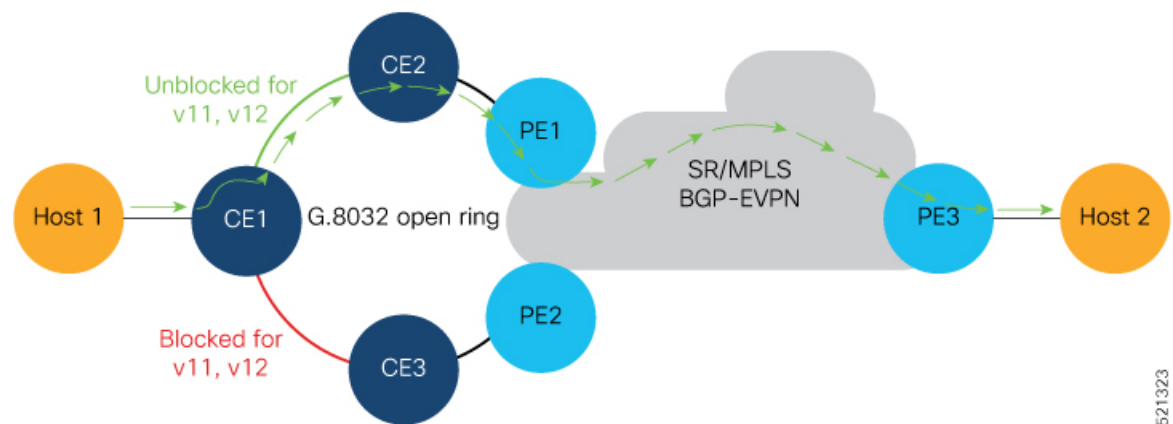

- Host 1 and Host 2 are multihomed in the ring topology.
- PE1 and PE2 are part of the access ring. The ring uses the G.8032 legacy protocol to prevent looping.
- Both PE1 and PE2 that forms the ring must be configured with the same ESI. Peering PEs must share the same ESI.
- Host 1 and Host 3 are configured with the same EV1 100.
- Host 2 and Host 4 are configured with the same EV1 200.

Traffic Flow

- When you send traffic from Host 1 to Host 3, the traffic is sent to CE1. In this ring topology, the link between CE1 to CE2 is in the blocked state; the link between CE1 to CE3 is in the forwarding state. Hence, CE1 sends the traffic to PE2 through CE3.

- PE2 first learns the MAC address of Host1 through CE1. PE2 advertises the learnt MAC address to the peering PE1.
- As PE2 has learnt the MAC address directly from Host 1, PE2 sends the traffic to PE3, which is a remote PE, with a local preference of 100. The PE which originates the MAC route due to access learning sets a local preference of 100 by default.
- The redundant PE1 also sends the traffic to PE3, but with a local preference of 80, as it has learned the MAC address from PE2. The reoriginated route on the peer PE sets a local preference of 80.
- PE3 always sends the traffic through the PE that has a local preference of 100.
- PE3 forwards the traffic to Host 3. Similarly, Host 3 sends the traffic to Host 1 always through PE2.

MSTI Flush and Flood

- When the link between CE1 and CE3 is down or when the link between CE3 and PE2 is down, the ring sends an MSTI Flush request for each MSTI instance to PE2.
- MAC addresses attached to all bridge ports under each MSTI instance are deleted. Therefore, when the traffic reaches the bridge, the traffic is flooded in the absence of the destination MAC address in the forwarding MAC table.
- Until PE1 learns the MAC address of all the hosts, PE2 floods traffic received from PE3. PE3 also keeps sending the traffic to PE2 until complete convergence occurs. There is no traffic loss even during the event of a failure.
- PE1 learns the MAC address of Host 1 directly and advertises the learnt MAC address to PE2.
- PE1 sends the traffic to Host 3 through the remote PE3 with a local preference of 100.
- PE3 sends and receives the traffic from PE1 until the access link between CE1 and CE3 becomes active.

Configuration Example

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-instance)# advertise-mac
Router(config-evpn-instance-mac)# commit
Router(config-evpn-instance-mac)# root
```

```

Router(config)# evpn
Router(config-evpn)# interface bundle-ether 1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 00.00.00.00.00.00.00.00
Router(config-evpn-ac-es)# load-balancing-mode single-flow-active
Router(config-evpn-ac-es)# convergence
Router(config-evpn-ac-es)# mac-mobility
Router(config-evpn-ac-es)# commit
Router(config-evpn-ac-es)# root

Router(config)# l2vpn
Router(config-l2vpn)# bridge group 100
Router(config-l2vpn-bg)# bridge-domain 100
Router(config-l2vpn-bg-bd)# interface Bundle-Ether1
Router(config-l2vpn-bg-bd-ac)# evi 100
Router(config-l2vpn-bg-bd-evi)# commit

```

Running Configuration

```

evpn
 evi 100
  advertise-mac
  !
 !
interface Bundle-Ether1
 ethernet-segment
  identifier type 0 00.00.00.00.00.00.00.01

Layer 2 fast reroute

Table 18: Feature History Table

Feature Name	Release Information	Feature Description
Layer 2 Fast Reroute on NCS 5700 fixed port routers	Release 24.2.11	Introduced in this release on: NCS 5700 fixed port routers This feature support is now extended to NCS 5700 fixed port routers.
Layer 2 Fast Reroute on NCS 5500 modular routers (NCS 5700 line cards [Mode: Native])	Release 24.2.1	Introduced in this release on: NCS 5500 modular routers (NCS 5700 line cards [Mode: Native]) This feature support is now extended to NCS 5500 modular routers (NCS 5700 line cards [Mode: Native]).
Layer 2 Fast Reroute	Release 7.3.1	In the event of a link failure, this feature enables the router to switch traffic quickly to a precomputed loop-free alternative (LFA) path by allocating a label to the incoming traffic. This minimizes the traffic loss ensuring fast convergence. This feature introduces the convergence reroute command.

The L2 FRR feature safeguards against traffic loss when a PE-CE link fails before the remote PE receives the mass withdraw message indicating the link is down. On the PE router with the failed link to the CE, traffic is redirected through a backup path to its EVPN Multi-home (MH) peer router, which then forwards the traffic to the CE.

In the control plane, the MAC address remains associated with the local bridge port ESI, but in the data-path L2FRR activates the backup path for the MAC address which has been pre-populated on the AC segment.

As a consequence, **show** commands keep displaying the MAC address - bridge port association even after the AC is down.

Through this permanent association of hosts (or MAC addresses) to an AC or bridge port, the L2 MAC-IP routes are retained on PE1 even on failure. In addition to displaying the retained MAC address - bridge port association, the **show** commands on PE1 continues to display the retained ARP entries and L2 MAC-IP routes. The AC service state displays the **Down** state.

Managing MAC on layer 2 FRR-enabled attachment circuits (AC)

MAC addresses remain intact when a layer 2 FRR-enabled attachment circuit goes down.

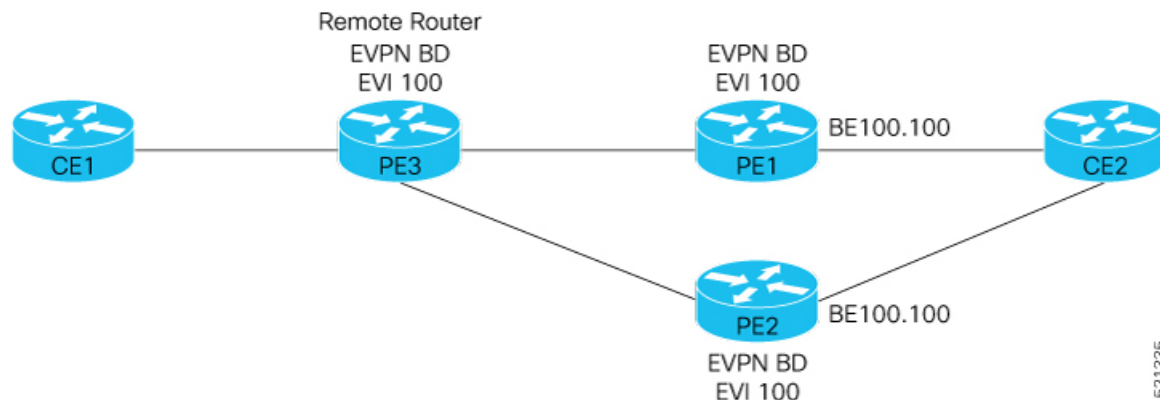

In ELAN configurations, retaining locally learned MAC addresses on layer 2 FRR-enabled circuits during downtime is crucial. This allows for quick identification and redirection of unicast traffic to the customer edge (CE) through MAC lookup.

Benefits

This feature provides fast and predictable convergence:

- Fast and predictable convergence.
- Manual configuration for predictable failover behavior.
- No need to change the topology.

Figure 15: Layer 2 Fast Reroute

In this topology:

- CE2 is multi-homed to PE1 and PE2.
- PE1 and PE2 are in EVPN active-active or single-active mode. They are connected to a remote router PE3 over the MPLS core network.
- CE1 is connected to PE3.
- Both PE1 and PE2 are enabled with L2 FRR. An FRR label is added per EVI for the backup path.

Consider a traffic flow from CE1 to CE2 in a regular scenario:

- The traffic is sent from CE1 to PE3.
- PE3 distributes the traffic over PE1 and PE2.
- PE1 and PE2 send the traffic to CE2.

When the PE3, CE2 traffic over PE1 takes the PE2 path which is PE1-PE2 backup path the traffic is forwarded to CE2. This traffic redirect lasts until PE3 updates the routes and sends to PE2.

- When L2FRR is enabled on PE1 and PE2, both PE1 and PE2 have the FRR labels. The logical backup path is pre-programmed in the hardware. When PE1 detects a failure on the access side (CE2), instead of sending traffic to CE2, PE1 sends the traffic over the pre-programmed backup path to PE2.
- All incoming traffic to PE1 is redirected to PE2 using this FRR label.
- PE1 encapsulates all the traffic with the FRR label of PE2 and forwards the traffic to PE2.
- Upon receiving the FRR label, PE2 forwards the traffic to CE2 through the attachment circuit (AC), even if the AC is in a blocking state.

Associated Commands

- **convergence reroute**
- **show evpn ethernet-segment**
- **show evpn evi**
- **show evpn evi ead private**

Restrictions for layer 2 fast reroute

This feature is supported on:

- BGP MPLS-based EVPN E-LAN.
- PE devices in EVPN active-active or single-active mode.
- Unicast traffic.

Configure layer 2 fast reroute for E-LAN service

Configure L2 FRR on a PE router in the E-LAN EVPN multi-homing network.

Procedure

- Step 1** Associate the Ethernet segment with the bundle interface and enable L2 FRR using the **convergence reroute** command. Configure this command on both PE1 and PE2 with in the specified topology map to enable L2FRR.

```
Router# configure
Router(config)# l2vpn

Layer 2 fast reroute for E-Line services

Layer 2 fast reroute (FRR) for E-Line service is a network capability that, in the event of a link or node failure,

- provides rapid traffic rerouting,
- improves network reliability,
- enhances service continuity, and
- ensures minimal disruption by pre-establishing backup paths.

Table 19: Feature History Table

Feature Name	Release Information	Feature Description
Layer 2 fast reroute for E-Line services	Release 25.1.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5700 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards; NCS 5700 line cards [Mode: Compatibility; Native])</p> <p>You can now ensure faster convergence and uninterrupted service by redirecting the traffic using the EVPN pseudowire (PW) in an E-Line configuration when a dual-homing link fails.</p>

The Layer 2 Fast Reroute (L2 FRR) feature minimizes traffic loss and ensures rapid convergence by redirecting traffic through a backup path when a primary link fails. It protects the Provider Edge-Customer Edge (PE-CE) connection by rerouting traffic to a peer PE if a local link failure occurs, allowing the peer PE to forward the traffic to the CE. In an E-Line (E-Line) service, an EVPN pseudowire provides a point-to-point Layer 2 connection over an IP/MPLS network using Ethernet VPN (EVPN), with all traffic redirected to the CE, excluding MAC address involvement.

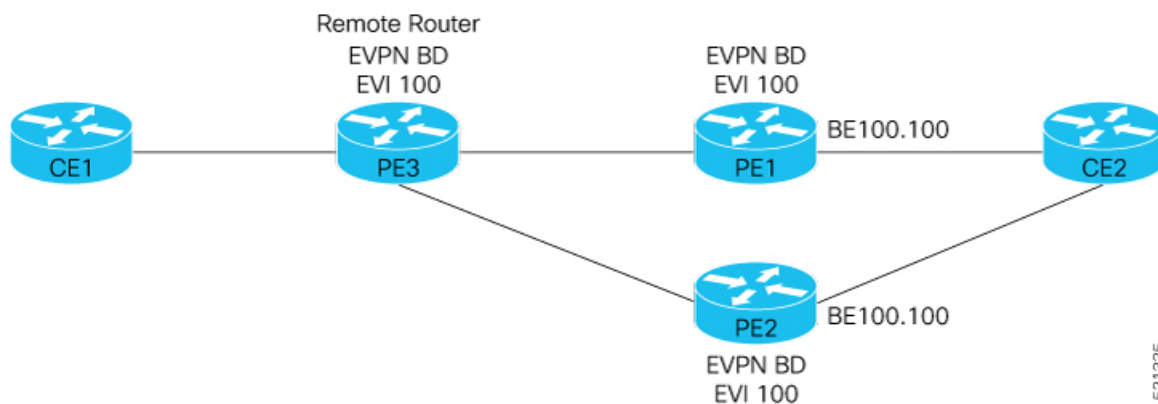

Benefits of L2 FRR on E-Line service

- Fast convergence with a 50 ms target time.
- You can use the same topology since no changes are needed.

Multi-homing topology for L2 FRR on E-Line service

Consider a sample topology with EVPN multi-homing for E-Line service.

Figure 16: Layer 2 FRR multi-homing topology

In this topology:

- CE2 is connected to both PE1 and PE2 as a multi-homed device.
- PE1 and PE2 operate either in EVPN active-active or single-active mode and connect to a remote router, PE3, over the MPLS core network.

- PE3 is connected to CE1.
- PE1 and PE2 are enabled with layer 2 FRR. A FRR label is assigned per EVI for the backup path.

Traffic flow from CE1 to CE2 in a regular scenario:

- Traffic is sent from CE1 to PE3.
- PE3 distributes the traffic over PE1 and PE2, provided PE1 is the Designated Forwarder (DF) router.
- PE1 and PE2 forward the traffic to CE2.

Traffic flow from CE1 to CE2 in a failover scenario:

The failover scenario occurs when the link between PE1 and CE2 is down.

The traffic is redirected from PE3 to CE2 through the PE1-PE2 backup path until PE3 updates the routes to PE2.

- When the layer 2 FRR is enabled on PE1 and PE2, both are assigned FRR labels, and a logical backup path is pre-programmed in the hardware. If PE1 detects a failure on the access side (CE2), it redirects traffic over the backup path to PE2 instead of sending it to CE2.
- PE1 encapsulates all incoming traffic with PE2's FRR label and forwards it to PE2.
- Upon receiving the FRR label, PE2 forwards the traffic to CE2 through the attachment circuit (AC), even if the AC is in a blocking state.

Restrictions for layer 2 fast reroute

This feature is supported on:

- BGP MPLS-based EVPN E-LAN.
- PE devices in EVPN active-active or single-active mode.
- Unicast traffic.

Configure layer 2 fast reroute for E-Line service

Configure L2 FRR on a PE router in the E-LINE EVPN multi-homing network.

Procedure

Step 1 EVPN E-Line configuration.

```
Router(config)# evpn
Router(config-evpn)# evi 1
Router(config-evpn-instance)# exit
Router(config-evpn)# evi 2
Router(config-evpn-instance)# exit
Router(config-evpn)# interface Bundle-Ether4
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 40.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode single-active
Router(config-evpn-ac-es)# convergence
```

```

Router(config-evpn-ac-es-conv)# reroute
Router(config-evpn-ac-es-conv)# exit
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# exit
Router(config-evpn)# exit
Router(config)#

```

Step 2 View the L2 FRR EVPN E-LINE running configuration for single-active mode.

```

Router# show evpn ethernet-segment carving detail
Wed Jan 22 17:15:05.606 EST
...

```

EVPN Preferred Nexthop

Table 20: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Preferred Nexthop	Release 7.3.1	<p>With this feature, you can set an active and backup path, in a dual-homed mode based on the nexthop IP address, thereby allowing greater control over traffic patterns. If you are unable to use single-active mode due to hardware, topology, or technological limitations, this feature enables you to direct traffic to a specific remote PE.</p> <p>This feature introduces the preferred nexthop command.</p>

The EVPN Preferred Nexthop feature allows you to choose a primary nexthop and backup nexthop among the remote PE devices in dual-homed mode. By default, in an all-active dual-homed topology, traffic is load balanced using ECMP across both remote PE devices.

Configure the **preferred-nexthop** command when you want to direct traffic to one specific remote PE, and you are unable to use single-active mode due to hardware, topology, or technological limitations. The router

allocates an internal label and will not allocate or consume ECMP FEC. The internal label enables fast switchover to backup PE when the primary link fails.

When remote PEs are operating in EVPN all-active mode, configure the **preferred-nexthop** command per EVI to choose an active and backup path based on the nexthop IP address. You can set the highest IP address as primary, which results in the lower IP address as a backup or vice versa. This feature provides you greater control over traffic patterns, that is to achieve symmetric traffic flow, and to allow support when a topology cannot support an all-active remote PE. Preferred nexthop is supported for native EVPN, EVPN VPWS, and EVPN PWHE. This feature supports a topology that has only two remote nexthops.

Configure EVPN Preferred Nexthop

Perform the following task to configure EVPN preferred nexthop.

Configuration Example

This example shows the configuration of highest IP address as the preferred nexthop.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-evi)# preferred-nexthop highest-ip
Router(config-evpn-evi)# commit
```

This example shows the configuration of lowest IP address as the preferred nexthop.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-evi)# preferred-nexthop lowest-ip
Router(config-evpn-evi)# commit
```

This example shows the configuration of preferred nexthop using the **modulo** keyword.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-evi)# preferred-nexthop modulo
Router(config-evpn-evi)# commit
```

Running Configuration

This section shows the EVPN preferred nexthop running configuration.

```
/* Configuration of highest IP address as the preferred nexthop */
evpn
 evi 100
  preferred-nexthop highest-ip
!

/* Configuration of lowest IP address as the preferred nexthop */
evpn
 evi 100
  preferred-nexthop lowest-ip
!

/* Configuration of preferred nexthop using the modulo keyword */
evpn
```

```
evi 100
preferred-nexthop modulo
```

Verification

The output shows that the Highest IP is selected as primary (P) and the lowest IP as backup (B). The path selection is programmed in CEF.

EVPN Access-Driven DF Election

Table 21: Feature History Table

Feature Name	Release Information	Feature Description
--------------	---------------------	---------------------

EVPN Access-Driven DF Election	Release 7.3.1	<p>This feature enables the access network to control EVPN PE devices by defining the backup path much before the event of a link failure, thereby reducing the traffic loss.</p> <p>The following keywords are added to the service-carving command:</p> <ul style="list-style-type: none"> • preference-based • access-driven
--------------------------------------	---------------	--

This feature includes a preference-based and access-driven DF election mechanism.

In a preference-based DF election mechanism, the weight decides which PE is the DF at any given time. You can use this method for topologies where interface failures are revertive. However, for topologies where an access-PE is directly connected to the core PE, use the access-driven DF election mechanism.

When access PEs are configured in a non-revertive mode, the access-driven DF election mechanism allows the access-PE to choose which PE is the DF.

Consider an interface in an access network that connects PE nodes running Multichassis Link Aggregation Control Protocol (mLACP) and the EVPN PE in the core. When this interface fails, there may be a traffic loss for a longer duration. The delay in convergence is because the backup PE is not chosen before failure occurs.

The EVPN Access-Driven DF Election feature allows the EVPN PE to preprogram a backup PE even before the failure of the interface. In the event of failure, the PE node will be aware of the next PE that will take over. Thereby reducing the convergence time. Use the *preference df weight* option for an Ethernet segment identifier (ESI) to set the backup path. By configuring the weight for a PE, you can control the DF election, thus define the backup path.

Restrictions

- The feature is supported only in an EVPN-VPWS scenario where EVPN PEs are in the port-active mode.
- The bundle attached to the ethernet segment must be configured with **lACP mode active**.

LACP mode on is not supported.

Topology

Let's understand the feature on how the backup path is precomputed with the following topology.

Figure 17: EVPN Access-Driven DF Election

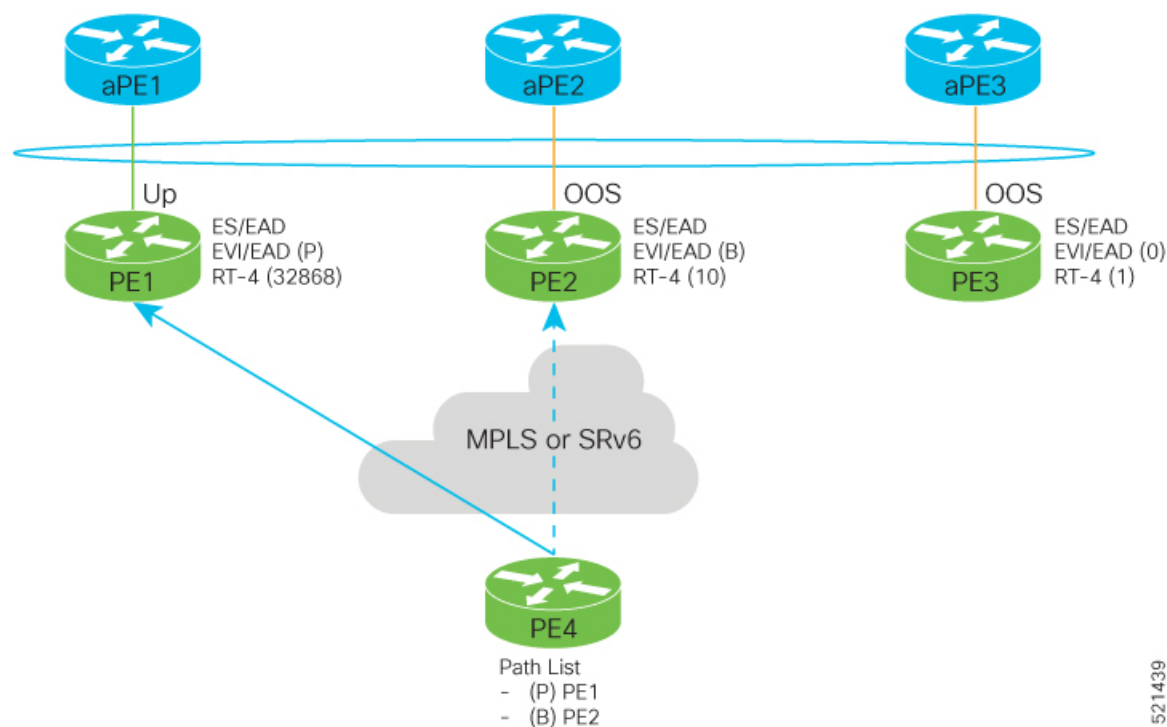

521446

- PE1, PE2, and PE3 are PEs for the EVPN core network.
- aPE1, aPE2, and aPE3 are their access PE counterparts and configured in a multichassis link aggregation group (MCLAG) redundancy group. Only one link among the three is active at any given time. aPE1, aPE2, and aPE3 are in a non-revertive mode.
- PE1 is directly connected to aPE1, PE2 to aPE2, and PE3 to aPE3. EVPN VPWS is configured on the PE devices in the core.
- All PE devices are attached to the same bundle and shares the same ethernet segment identifier.
- PE1, PE2, and PE3 are configured with a weight of 100, 10, and 1 respectively.

Traffic Flow

In this example, consider a traffic flow from a host connected to PE4 to the host connected to the access PE.

521439

- aPE1-PE1 interface state is up. The aPE2-PE2 and aPE3-PE3 remains in OOS state.
- The traffic is sent from PE4 to aPE1 through PE1 as the PE1 is configured with a highest weight of 100.
- The highest weight is modified by adding 32768 to the configured weight. For example, the weight of PE1 is 100, 32768 is added to this weight. Hence, 32868 is advertised to the peer EEs.
- The highest weight is advertised as P-bit, which is primary. The next highest weight is advertised as B-bit, which is secondary. The lowest weight as non-DF (NDF).
- When the EVPN PE devices are of same weight, the traffic is sent based on the IP address. Lowest IP address takes the precedence.
- Only one PE indicates that the state of the bundle for the Ethernet Segment is up. For all other PEs, the Ethernet Segment is standby and the bundle is in OOS state.
- All PE devices are aware of the associated next hop and weights of their peers.

Failure and Recovery Scenarios

The weights configured on the EVPN PE devices cascade in the same order as the protection mechanism on the access side PEs:

- During the network failure, the redundancy ordering for the access PEs is aPE1, aPE2, aPE3.
- The weights of PE1 through PE3 are weight of PE1 > weight of PE2 > weight of PE3.
- If this ordering is not satisfied, the network will eventually converge, but it will not be as efficient as if the weights are ordered correctly.

Scenario - 1

Consider a scenario where the aPE1-PE1 interface is down.

521440

When aPE1-PE1 interface is down, the PE1 withdraws the EAD/ES route, and the traffic is sent through the backup path, which is PE2.

The aPE2-PE2 becomes the primary with a weight of 32778, and aPE3-PE3 becomes the backup. The aPE2-PE2 advertises P-bit to PE4. aPE3-PE3 advertises the B-bit to PE4.

521441

Scenario - 2

Consider a scenario where aPE2-PE2 interface is also down.

521442

When the aPE2-PE2 interface is also down, the traffic is sent through aPE3-PE3 link. aPE3-PE3 becomes the primary path with a weight of 32769.

521443

Scenario - 3

When the aPE2-PE2 interface comes up, the aPE3-PE3 link still remains the primary path. aPE2-PE2 interface becomes the backup path with a weight of 10.

521444

Scenario - 4

When the aPE1-PE1 interface comes up, the aPE3-PE3 link remains the primary path with a weight of 32769. aPE1-PE1 interface becomes the backup path with a weight of 100. The aPE2-PE2 interface becomes NDF with a weight of 10.

521445

Configure EVPN Access-Driven DF Election

Perform the following tasks to configure EVPN Access-Driven DF Election feature:

- Configure EVPN access-driven DF election on PE1, PE2, and PE3
- Configure LACP on aPE1, aPE2, and aPE3
- Configure EVPN-VPWS for PE1, PE2, and PE3

See the *EVPN Virtual Private Wire Service (VPWS)* chapter on how to configure EVPN-VPWS.

Configuration Example

- All PE devices are configured with different weights. PE1, PE2, and PE3 are configured with a weight of 100, 10, and 1 respectively.
- The bundle attached to the ethernet segment is configured with **lacp mode active**.
- EVPN VPWS is configured on the PE devices.

```

EVPN Non-Revertive Designated Forwarder Election

Table 22: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Non-Revertive Designated Forwarder Election	Release 24.1.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5700 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards; NCS 5700 line cards [Mode: Compatibility; Native])</p> <p>In a preference-based Designated Forwarder (DF) election, non-revertive mode prevents the traffic disruption that occurs during the recovery of a node in a port-active multihoming network.</p> <p>While recovering from a link failure, an EVPN ethernet-segment (ES) performs DF re-election and re-carves the services among the multihomed nodes, which causes traffic interruption and interface flapping, leading to traffic loss. In the non-revertive mode, the EVPN ES does not re-carve the services after the recovery, thus avoiding the traffic disruption.</p> <p>The feature introduces these changes:</p> <p>CLI:</p> <ul style="list-style-type: none"> • non-revertive • revert • The ethernet-segment interface <i>interface-name</i> revert keyword is introduced in the l2vpn evpn command. <p>YANG Data Model:</p> <ul style="list-style-type: none"> • <code>Cisco-IOS-XR-evpn-oper.yang</code> • <code>Cisco-IOS-XR-l2vpn-cfg.yang</code> <p>(see GitHub, YANG Data Models Navigator)</p>

In a preference-based Designated Forwarder (DF) election mechanism, each PE router is assigned with a weight. The PE configured with the highest weight is selected as the DF, which forwards traffic to the customer devices on a particular Ethernet Segment (ES).

A link failure triggers the DF election process which involves the following:

- The DF goes down and becomes the non-Designated Forwarder (NDF).
- The PE with the next highest weight becomes the DF and transitions to active mode.

During the recovery of a link, the re-election of DF and the re-carving of services are triggered. When the Ethernet Segment is configured with more number of services, the time taken for service re-carving and the process of transferring the DF role to the PE with highest weight leads to traffic interruption and traffic loss.

To prevent traffic disruption during DF re-election and service re-carving, you can now configure the non-revertive mode of DF election. In the non-revertive mode, the weight of the PEs is adjusted so that the PE, which has become the DF during link failure, remains as the DF after the recovery. The service re-carving is not triggered.

Use the **non-revertive** command to enable the non-revertive mode.

Return to Revertive Mode

You can return to the revertive mode by ending the non-revertive mode, which triggers the DF election and service carving again. You can switch over to the revertive mode by using one of the following methods:

Revert Timer

In this method, use the **revert** command to configure a timer that starts running during the recovery of a node. The revertive mode takes effect once the revert timer expires, and the DF election happens again. You can use this option to delay the DF election for the specified seconds to avoid traffic disruption and then choose the PE with the highest preference to become the DF.

Disable Non-Revertive Mode

Choose this option whenever you want to end the non-revertive mode and perform the DF election again. Use the **l2vpn evpn ethernet-segment interface revert** command to disable the non-revertive mode. If you have already configured the revert timer, the timer is cancelled when the non-revertive mode is disabled.

Restrictions for EVPN Non-Revertive DF Election

Non-reverting mode of EVPN DF election is supported for:

- Preference-based DF election.
- Physical and bundle interfaces.
- EVPN port-active multihoming mode.

Non-reverting mode of EVPN DF election is not supported for:

- Access-driven DF election.
- Virtual interfaces like virtual Ethernet segment (vES), network virtualization endpoint (NVE), and pseudowire headend (PWHE) .
- Segment routing over IPv6 (SRv6).

Configure EVPN Non-Revertive DF Election

Prerequisites

It is recommended to configure the non-revertive mode of DF election on all the nodes in the network.

Configuration Example

1. Configure Ethernet-Segment in port-active load-balancing mode on peering PEs for a specific interface, using the **load-balancing-mode port-active** command.
2. Configure the service carving mode as preference-based using the **service-carving preference-based** command. The DF election happens based on the highest preference, that is the weight of the PE.
3. Configure the non-revertive mode of DF election using the **non-revertive** command, to enable the non-revertive mode on the PEs.
4. Configure the PE devices with different weights, using the **weight** command.

In the following example, PE1 and PE2 are configured with a weight of 100 and 10 respectively.

- After the DF election, PE1 is selected as the DF.
- When there is a link failure, PE1 goes down, and the next PE with the highest weight, PE2, becomes the DF.
- By default, the DF election happens during the recovery, and PE1 becomes the DF again. Transferring the DF role from PE2 to PE1 leads to traffic disruption.
- When the non-revertive mode is enabled, the weight of the PE1 is adjusted so that PE2 remains the DF. This prevents the traffic disruption incurred due to the DF election.

```
/* Configuration on PE1 */

Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 01.11.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# service-carving preference-based
Router(config-evpn-ac-es-sc-pref)# non-revertive
Router(config-evpn-ac-es-sc-pref)# weight 100
Router(config-evpn-ac-es-sc-pref)# commit

/* Configuration on PE2 */

Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 01.11.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# service-carving preference-based
Router(config-evpn-ac-es-sc-pref)# non-revertive
Router(config-evpn-ac-es-sc-pref)# weight 10
Router(config-evpn-ac-es-sc-pref)# commit
```

Running Configuration

```
/* PE1 Configuration */

evpn
 interface Bundle-Ether1
  ethernet-segment
   identifier type 0 01.11.00.00.00.00.00.01
   load-balancing-mode port-active
   service-carving preference-based
   non-revertive
   weight 100

/* PE2 Configuration */

evpn
 interface Bundle-Ether1
  ethernet-segment
   identifier type 0 01.11.00.00.00.00.00.01
   load-balancing-mode port-active
   service-carving preference-based
   non-revertive
   weight 10
```

Verification

The following output shows that non-revertive mode is enabled.

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 private

...
Topology          :
  Operational      : SH
  Configured       : Port-Active

    192.168.0.3 [PREF:DP:7fff:T] [2]
```

Configure to Return to Revertive Mode

In the non-revertive mode, the DF election does not happen during the recovery from a link failure. If you want to return to the default behavior, which is the revertive mode, use one of the following methods.

Configure Revert Timer

When you configure a revert timer on the PEs enabled with non-revertive mode, the timer starts once the nodes have recovered from link failure. Once the timer expires, the PEs return to the revertive mode and DF election happens in the network. The timer is configured in seconds.

```
/* Configure non-revertive mode on an interface and configure revert timer on the interface
*/

Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
```

```

Router(config-evpn-ac-es)# identifier type 0 01.11.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# service-carving preference-based
Router(config-evpn-ac-es-sc-pref)# non-revertive
Router(config-evpn-ac-es-sc-pref)# weight 100
Router(config-evpn-ac-es-sc-pref)# exit
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# timers
Router(config-evpn-ac-timers)# revert 300
Router(config-evpn-ac-es)# commit

```

You can also configure the revert timer globally.

```

Router(config)# evpn
Router(config-evpn)# timers
Router(config-evpn-timers)# revert 300
Router(config-evpn-timers)# commit

```

Running Configuration

```

/* Revert Timer Configuration on Interface */
evpn
interface Bundle-Ether1
  ethernet-segment
    identifier type 0 01.11.00.00.00.00.00.01
    load-balancing-mode port-active
    service-carving preference-based
    non-revertive
  !
  timers
    revert 300

/* Global Configuration of Revert Timer */
evpn
  timers
    revert 300

```

Verification

The following output shows non-revertive mode enabled along with the configured revert timer.

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 private
```

```

...
Topology          :
  Operational      : SH
  Configured       : Port-Active

Peering Details : 0 Nexthops
Service Carving Synchronization:
  Mode         : NONE
  Peer Updates  :
Service Carving Results:
  Forwarders    : 0
  Elected      : 0
  Not Elected   : 0
EVPN-VPWS Service Carving Results:
  Primary      : 0
  Backup       : 0
  Non-DF       : 0
  MAC Flush msg : STP-TCN
  Peering timer : 3 sec [not running]
  Recovery timer : 30 sec [not running]
  Carving timer : 0 sec [not running]
Revert timer  : 0 sec [not running]
  HRW Reset timer : 5 sec [not running]
  AC Debounce timer : 3000 msec [not running]

```

Disable Non-Revertive Mode

Use the following action command to disable the non-revertive behavior. The revert timer, if configured, is cancelled and DF election is performed again in the network.

```
Router# 12vpn evpn ethernet-segment interface Bundle-Ether1 revert
```

Inter-AS EVPN Option B

Table 23: Feature History Table

Feature Name	Release Information	Feature Description
--------------	---------------------	---------------------

Inter-AS EVPN Option B	Release 7.4.1	<p>This feature enables the service providers to establish an end-to-end EVPN service over an MPLS backbone that spans multiple autonomous systems (AS). Inter-AS EVPN Option B allows the autonomous system boundary routers (ASBRs) to exchange L2VPN EVPN label routes between AS without the need for dedicated interfaces. This feature helps you to increase the number of services terminated on PE devices without requiring a dedicated number of interfaces on ASBR nodes.</p> <p>This feature introduces the option-b-asbr-only command.</p>
------------------------	---------------	--

The Inter-AS Option B for EVPN feature allows the service providers to offer the L2VPN EVPN service across service provider boundaries similar to L3VPN. Typically, service providers are in charge of AS and offers L2VPN EVPN services to its customers. SP customers control access devices and would want pure L2 or a combination of L2 and L3 unicast or multicast services with single or dual-homing capabilities. This is achieved by setting up MPLS tunnels over the SP core similar to L3VPN.

Prior to this release, L2VPN EVPN routes could not be exchanged across AS boundaries because ASBRs do not assign a local label to L2VPN EVPN routes. Hence L2VPN EVPN routes were not advertised to other ASBRs.

Inter-AS EVPN Option B allows L2VPN EVPN routes to be exchanged across AS boundaries because the ASBRs allocate the local label for L2VPN EVPN route types, and also perform the rewrite action. To provide an end-to-end L2VPN EVPN service across AS boundaries, you must combine the EVPN Label Switched Path (LSP) together, from PE1 to ASBR1, ASBR1 to ASBR2, and from ASBR2 to PE3.

Figure 18: Inter-AS EVPN Option B

In this topology:

- The L2VPN EVPN session between ASBRs is used to exchange the L2VPN EVPN prefixes. BGP session is used to exchange L2VPN EVPN routes between PEs and ASBRs and between ASBRs.
- A labeled switched path must exist between the PEs or each carrier. Exchange of labels is accomplished using BGP on the Inter-AS link.

- These are the three LSPs where next-hop changes:
 - PE1 to ASBR1
 - ASBR1 to ASBR2
 - ASBR2 to the PE3
- End-to-end LSPs using three hops make QoS easier to manage.
- The ASBRs are configured to change the next-hop when sending L2VPN EVPN NLRI to the eBGP neighbors. Therefore, the ASBRs must allocate a new label when they forward the NLRI to the eBGP neighbors.
- ASBR assigns a local label to L2VPN EVPN routes and L2VPN EVPN routes are advertised to other ASBR.
- ASBRs must have all of the L2VPN EVPN prefixes, which requires them to be as resource intensive as route reflectors.

Restrictions

- Support EVPN Type-1, Type-2 (MAC only, MAC-IP with only MAC label), Type-3, and Type-5 routes.
- Type-2 MAC-IP routes with two labels, MAC label, and IP label are not supported.
- This feature does not support dual-home mode.

Configure Inter-AS EVPN Option B

Perform the following tasks to configure Inter-AS EVPN Option B.

- Configure EVPN-VPWS
- Configure native EVPN
- Configure EVPN IRB
- Configure BGP

Configuration Example

Configure EVPN-VPWS on PE1.

```
/* Type-1 Route */
Router# configure
Router(config)# interface TenGigE0/0/0/9.33 l2transport
Router(config-subif)# encapsulation dot1q 33
Router(config-subif)# exit
Router(config)# l2vpn
Router(config-l2vpn)# xconnect group xconnect-group
Router(config-l2vpn-xc)# p2p p2p_33
Router(config-l2vpn-xc-p2p)# interface TenGigE0/0/0/9.33
Router(config-l2vpn-xc-p2p)# neighbor evpn evi 4033 target 33 >> Exchange target and source
on remote PE
Router(config-l2vpn-xc-p2p-pw)# exit
Router(config-l2vpn-xc)# exit
```

```

Router(config-l2vpn)# exit
Router(config)# evpn
Router(config-evpn)# evi 4033
Router(config-evpn-instance)# bgp
Router(config-evpn-instance-bgp)# route-target 4033:4033
Router(config-evpn-instance-bgp)# commit

```

Configure native EVPN on PE1.

```

/* Type-2 MAC only Route */
Router# configure
Router(config)# interface TenGigE0/0/0/9.22 l2transport
Router(config-subif)# encapsulation dot1q 22
Router(config-subif)# exit
Router(config)# l2vpn
Router(config-l2vpn)# bridge group evpn-group
Router(config-l2vpn-bg)# bridge-domain evpn_3022
Router(config-l2vpn-bg-bd)# interface TenGigE0/0/0/9.22
Router(config-l2vpn-bg-bd-ac)# exit
Router(config-l2vpn-bg-bd)# evi 3022
Router(config-l2vpn-bg-bd-evi)# exit
Router(config-l2vpn-bg-bd)# exit
Router(config-l2vpn-bg)# exit
Router(config-l2vpn)# exit
Router(config)# exit
Router(config)# evpn
Router(config-evpn)# evi 3022
Router(config-evpn-instance)# bgp
Router(config-evpn-instance-bgp)# route-target 3022:3022
Router(config-evpn-instance-bgp)# exit
Router(config-evpn-instance)# advertise-ma >> advertise mac to other PEs using EVPN type-2
routes
Router(config-evpn-instance-mac)# commit

```

Configure EVPN IRB on PE1.

```

/* Type-2 MAC-IP Route with only MAC Layer Label */
Router# configure
Router(config)# interface TenGigE0/0/0/9.12 l2transport
Router(config-subif)# encapsulation dot1q 12
Router(config-subif)# rewrite ingress tag pop 1 symmetric
Router(config-subif)# exit
Router(config)# interface BVI12 > BVI under default vrf generate type-2 mac-ip route with
only MAC layer label
Router(config-if)# host-routing
Router(config-if)# ipv4 address 10.0.0.1 255.0.0.0
Router(config-if)# ipv6 address 2020:c::1/112
Router(config-if)# mac-address 20.12.1
Router(config-if)# exit
Router(config)# l2vpn
Router(config-l2vpn)# bridge group evpn-irb-group
Router(config-l2vpn-bg)# bridge-domain evpn_2012
Router(config-l2vpn-bg-bd)# interface TenGigE0/0/0/9.12

Inter-AS EVPN option C

Inter-AS Option C is a network design approach that

- allows service providers to efficiently interconnect multi-AS backbones
- provides scalable VPN services across Autonomous System boundaries, and
- facilitates seamless transport of labeled IPv4 routes.

Inter-AS Option C enhances scalability and convergence by using a streamlined configuration. Autonomous System Boundary Routers (ASBRs) do not hold VPN data and do not establish Virtual Routing and Forwarding (VRFs) or BGP VPNv4 sessions. Instead, they set up unicast IPv4 eBGP sessions between themselves. IPv4 eBGP sessions facilitate label sharing between ASBRs, completing the Label Switched Path (LSP) component necessary for effective data transport. This approach prevents ASBRs from storing VPN information, utilizing labeled unicast sessions to propagate labels and maintain LSPs.

Benefits of inter-AS EVPN option C

- Enhanced scalability by preventing ASBRs from storing external routing information.

- Efficient resource use as external data is not duplicated on ASBRs; instead, Route Reflectors (RRs) handle route storage.
- Isolation between different network planes for improved management.
 - Multi-hop External Border Gateway Protocol (eBGP) for VPNv4 routes.
 - Labeled IPv4 routing via eBGP for internal routes.

Restrictions and guidelines of inter-AS EVPN option C

- Security: If the Autonomous Systems don't have a strong trust relationship between them, advertising of PE addresses may not be a good decision.
- QoS enforcement per VPN is not possible at ASBR, as VPN context doesn't exist at ASBRs. Therefore, it is not possible to perform policing, filtering, or accounting with per VPN granularity at ASBR.

Topology of inter-AS EVPN option C

Figure 19: Inter-AS option C

This simplified topology consists of:

- Provider (P) routers: P1 and P2
- Provider Edge (PE) routers: PE1, PE2, and PE3
- Customer Edge (CE) devices
- Connections:
 - P1 is connected to P2.
 - P1 is connected to PE1 and PE2 with BGP AS 100.
 - P2 is connected to PE3 with BGP AS 200.

524024

Inter-AS option C emphasizes scalability by ensuring ASBRs focus solely on distributing labeled IPv4 routes for PEs within their own AS, without handling VPN routes. To enhance scalability, a single eBGP session manages all external routes between PEs or Route Reflectors (RR), maintaining next-hop information when RRs are used. ASBRs use eBGP to share internal PE routing details between ASes, which relate to the BGP next-hops of external routes advertised via multi-hop eBGP sessions. These internal routes enable multi-protocol eBGP sessions between PEs and facilitate LSP setup from the ingress PE to the egress PE.

Configure inter-AS EVPN option C

Perform these steps to configure the EVPN bridging and E-Line services over BGP-LU underlay using inter-AS EVPN option C.

Procedure

Step 1 Configure IGP, MPLS, and BGP on PE1 and PE2. The configuration is similar on both the routers.

Example:

```
/* Configure IGP */
/* IGP configuration is a pre-requisite to configure EVPN. IGP can be OSPF or ISIS. */
Router(config)#router ospf pyats_test
Router(config-ospf)#router-id 54.54.54.54
Router(config-ospf)#redistribute bgp 100
Router(config-ospf)#mpls ldp sync
Router(config-ospf)#mpls ldp auto-config
Router(config-ospf)#area 0
Router(config-ospf-ar)#interface loopback0
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface FourHundredGigE0/0/0/2
Router(config-ospf-ar-if)#commit

/* Configure MPLS */
Router(config)# mpls ldp
Router(config-ldp)# router-id 54.54.54.54
Router(config-ldp)# address-family ipv4
Router(config-ldp-af)# label
Router(config-ldp-af-lbl)# local
Router(config-ldp-af-lbl-lcl)# allocate for host-routes
Router(config-ldp-af-lbl-lcl)# root
Router(config)# mpls ldp
Router(config-ldp)# interface FourHundredGigE0/0/0/2
Router(config-ldp-if)#commit

/* Configure BGP */
Router(config)#router bgp 100
Router(config-bgp)#bgp router-id 54.54.54.54
Router(config-bgp)#address-family ipv4 unicast
Router(config-bgp-af)#exit
Router(config-bgp)#address-family l2vpn evpn
Router(config-bgp-af)#retain route-target all
Router(config-bgp-af)#exit
Router(config-bgp)#neighbor-group IBGP-PEERS
Router(config-bgp-nbrgrp)#remote-as 100
Router(config-bgp-nbrgrp)#update-source loopback0
Router(config-bgp-nbrgrp)#address-family ipv4 unicast
Router(config-bgp-nbrgrp-af)#exit
Router(config-bgp-nbrgrp)#address-family l2vpn evpn
```

```

/* Configure iBGP peer on P1 */
Router(config-bgp)# neighbor 52.52.52.52
Router(config-bgp-nbr)# use neighbor-group IBGP-PEERS

/* Configure iBGP peer on PE2 */
Router(config-bgp)# neighbor 55.55.55.55
Router(config-bgp-nbr)# remote-as 100
Router(config-bgp-nbr)# use neighbor-group IBGP-PEERS
Router(config-bgp-nbr)# update-source Loopback0
Router(config-bgp-nbr)# address-family l2vpn evpn

```

Step 2 Configure IGP, MPLS, and BGP on PE3.

Example:

```

/* Configure IGP */
Router# configure
Router(config)#router ospf pyats_test
Router(config-ospf)#router-id 51.51.51.51
Router(config-ospf)#redistribute bgp 200
Router(config-ospf)#mpls ldp sync
Router(config-ospf)#mpls ldp auto-config
Router(config-ospf)#area 0
Router(config-ospf-ar)#interface loopback0
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface FourHundredGigE0/0/0/10
Router(config-ospf-ar-if)#commit

/* Configure MPLS */
Router(config)# mpls ldp
Router(config-ldp)# router-id 51.51.51.51
Router(config-ldp)# address-family ipv4
Router(config-ldp-af)# label
Router(config-ldp-af-lbl)# local
Router(config-ldp-af-lbl-lcl)# allocate for host-routes
Router(config-ldp-af-lbl-lcl)# root
Router(config)# mpls ldp
Router(config-ldp)# interface FourHundredGigE0/0/0/10

/* Configure BGP */
Router(config)#router bgp 100
Router(config-bgp)#bgp router-id 54.54.54.54
Router(config-bgp)#address-family ipv4 unicast
Router(config-bgp-af)#exit
Router(config-bgp)#address-family l2vpn evpn
Router(config-bgp-af)#retain route-target all
Router(config-bgp-af)#exit
Router(config-bgp)# neighbor 56.56.56.56
Router(config-bgp-nbr)#remote-as 200
Router(config-bgp-nbr)#update-source loopback0
Router(config-bgp-nbr)#address-family ipv4 unicast
Router(config-bgp-nbr-af)#exit
Router(config-bgp-nbr)#address-family l2vpn evpn

```

Step 3 Configure P2 as route reflector.

Example:

```

Router(config)# prefix-set LOOPBACKS
Router(config-pfx)# 53.53.53.53,
Router(config-pfx)# 54.54.54.54,

```

```

Router(config-pfx) # 55.55.55.55,
Router(config-pfx) # 52.52.52.52,
Router(config-pfx) # 56.56.56.56,
Router(config-pfx) # 51.51.51.51
Router(config-pfx) # end-set

Router(config) # route-policy passall
Router(config-rpl) # pass
Router(config-rpl) # end-policy

Router(config) # route-policy MATCH_LOOPBACKS
Router(config-rpl) # if destination in LOOPBACKS then
Router(config-rpl-if) # pass
Router(config-rpl-if) # else
Router(config-rpl-else) # drop
Router(config-rpl-else) # endif
Router(config-rpl) # end-policy
Router(config) #

```

Step 4 Configure route policy, IGP, MPLS, and BGP on P2.

Example:

```

Router(config) # router ospf pyats_test
Router(config-ospf) # router-id 56.56.56.56
Router(config-ospf) # redistribute bgp 200
Router(config-ospf) # mpls ldp sync
Router(config-ospf) # mpls ldp auto-config
Router(config-ospf) # area 0
Router(config-ospf-ar) # interface loopback0
Router(config-ospf-ar-if) # passive enable
Router(config-ospf-ar-if) # exit
Router(config-ospf-ar) # interface FourHundredGigE0/0/0/2

Router(config) # router static
Router(config-static) # address-family ipv4 unicast
Router(config-static-afi) # 100.0.0.1/32 FourHundredGigE0/0/0/5

Router(config) # mpls ldp
Router(config-ldp) # router-id 56.56.56.56
Router(config-ldp) # address-family ipv4
Router(config-ldp-af) # label
Router(config-ldp-af-lbl) # local
Router(config-ldp-af-lbl-lcl) # allocate for host-routes
Router(config-ldp-af-lbl-lcl) # root
Router(config) # mpls ldp
Router(config-ldp) # interface FourHundredGigE0/0/0/4

```

Step 5 Configure router reflector client, which is essential for copying the EVPN routes between the AS.

Example:

```

Router(config) # router bgp 200
Router(config-bgp) # bgp router-id 56.56.56.56
Router(config-bgp) # address-family ipv4 unicast
Router(config-bgp-af) # network 51.51.51.51/32
Router(config-bgp-af) # network 52.52.52.52/32
Router(config-bgp-af) # network 53.53.53.53/32
Router(config-bgp-af) # network 54.54.54.54/32
Router(config-bgp-af) # network 55.55.55.55/32
Router(config-bgp-af) # network 56.56.56.56/32
Router(config-bgp-af) # redistribute connected

```

```

Router(config-bgp-af) #redistribute ospf 0
Router(config-bgp-af) #allocate-label all
Router(config-bgp-af) #exit
Router(config-bgp) #address-family l2vpn evpn
Router(config-bgp-af) #retain route-target all
Router(config-bgp-af) #exit
Router(config-bgp) #neighbor-group IBGP-PEERS
Router(config-bgp-nbrgrp) #remote-as 200
Router(config-bgp-nbr) #update-source loopback0
Router(config-bgp-nbr) #address-family ipv4 unicast
Router(config-bgp-nbr-af) #exit
Router(config-bgp-nbr) #address-family l2vpn evpn
Router(config-bgp-nbr-af) #route-reflector-client

```

Step 6 Configure P1 as eBGP neighbor.

Example:

```

Router(config-bgp) # neighbor 100.0.0.1
Router(config-bgp-nbr) #remote-as 100
Router(config-bgp-nbr) #ebgp-multihop 255
Router(config-bgp-nbr) #address-family ipv4 labeled-unicast
Router(config-bgp-nbr-af) #route-policy passall in
Router(config-bgp-nbr-af) #route-policy MATCH_LOOPBACKS out
Router(config-bgp-nbr-af) #send-extended-community-ebgp
Router(config-bgp-nbr-af) #exit
Router(config-bgp-nbr) #address-family l2vpn evpn
Router(config-bgp-nbr-af) #route-policy passall in
Router(config-bgp-nbr-af) #route-policy passall out
Router(config-bgp-nbr-af) #next-hop-unchanged

```

Step 7 Configure PE3 as iBGP neighbor.

Example:

```

Router(config-bgp) #neighbor 51.51.51.51
Router(config-bgp-nbr) #use neighbor-group IBGP-PEERS

```

For P1, the iBGP peers are PE1 and PE2, and the eBGP peer is P2.

Step 8 Configure P1 as route reflector.

Example:

```

Router(config) # prefix-set LOOPBACKS
Router(config-pfx) # 53.53.53.53,
Router(config-pfx) # 54.54.54.54,
Router(config-pfx) # 55.55.55.55,
Router(config-pfx) # 52.52.52.52,
Router(config-pfx) # 56.56.56.56,
Router(config-pfx) # 51.51.51.51
Router(config-pfx) # end-set

Router(config) # route-policy passall
Router(config-rpl) # pass
Router(config-rpl) # end-policy

Router(config) # route-policy MATCH_LOOPBACKS
Router(config-rpl) #if destination in LOOPBACKS then
Router(config-rpl-if) #pass
Router(config-rpl-if) #else
Router(config-rpl-else) #drop
Router(config-rpl-else) #endif

```

```
Router(config-rpl)#end-policy
Router(config)#
```

Step 9

Configure route policy, IGP, MPLS, and BGP on P1.

Example:

```
/* Configure route policy, IGP, MPLS, and BGP on P1 */
Router(config)#router ospf pyats_test
Router(config-ospf)#router-id 52.52.52.52
Router(config-ospf)#redistribute bgp 100
Router(config-ospf)#mpls ldp sync
Router(config-ospf)#mpls ldp auto-config
Router(config-ospf)#area 0
Router(config-ospf-ar)#interface loopback0
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface FourHundredGigE0/0/0/11
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface FourHundredGigE0/0/0/12

Router(config)# router static
Router(config-static)# address-family ipv4 unicast
Router(config-static-afi)# 100.0.0.2/32 FourHundredGigE0/0/0/13

Router(config)# mpls ldp
Router(config-ldp)# router-id 52.52.52
Router(config-ldp)# address-family ipv4
Router(config-ldp-af)# label
Router(config-ldp-af-lbl)# local
Router(config-ldp-af-lbl-lcl)# allocate for host-routes
Router(config-ldp-af-lbl-lcl)# root
Router(config)# mpls ldp
Router(config-ldp)# interface FourHundredGigE0/0/0/11
Router(config-ldp-if)# exit
Router(config-ldp)# interface FourHundredGigE0/0/0/12

/* Configure router reflector client */
Router(config)#router bgp 100
Router(config-bgp)#bgp router-id 52.52.52.52
Router(config-bgp)#address-family ipv4 unicast
Router(config-bgp-af)#network 51.51.51.51/32
Router(config-bgp-af)#network 52.52.52.52/32
Router(config-bgp-af)#network 53.53.53.53/32
Router(config-bgp-af)#network 54.54.54.54/32
Router(config-bgp-af)#network 55.55.55.55/32
Router(config-bgp-af)#network 56.56.56.56/32
Router(config-bgp-af)#redistribute connected
Router(config-bgp-af)#redistribute ospf 0
Router(config-bgp-af)#allocate-label all
Router(config-bgp-af)#exit
Router(config-bgp)#address-family l2vpn evpn
Router(config-bgp-af)#retain route-target all
Router(config-bgp-af)#exit
Router(config-bgp)#neighbor-group IBGP-PEERS
Router(config-bgp-nbrgrp)#remote-as 100
Router(config-bgp-nbr)#update-source loopback0
Router(config-bgp-nbr)#address-family ipv4 unicast
Router(config-bgp-nbr-af)#exit
Router(config-bgp-nbr)#address-family l2vpn evpn
Router(config-bgp-nbr-af)#route-reflector-client

/* Configure P2 as eBGP neighbor */
```

```

Router(config-bgp)# neighbor 100.0.0.2
Router(config-bgp-nbr)#remote-as 200
Router(config-bgp-nbr)#ebgp-multihop 255
Router(config-bgp-nbr)#address-family ipv4 labeled-unicast
Router(config-bgp-nbr-af)#route-policy passall in
Router(config-bgp-nbr-af)#route-policy MATCH_LOOPBACKS out
Router(config-bgp-nbr-af)#send-extended-community-ebgp
Router(config-bgp-nbr-af)#exit
Router(config-bgp-nbr)#address-family l2vpn evpn
Router(config-bgp-nbr-af)#route-policy passall in
Router(config-bgp-nbr-af)#route-policy passall out
Router(config-bgp-nbr-af)#next-hop-unchanged

/* Configure PE1 and PE2 as iBGP neighbors */
Router(config-bgp)#neighbor 54.54.54.54
Router(config-bgp-nbr)#use neighbor-group IBGP-PEERS
Router(config-bgp-nbr)#exit
Router(config-bgp)#neighbor 55.55.55.55
Router(config-bgp-nbr)#use neighbor-group IBGP-PEERS

```

Step 10 Configure L2VPN and EVPN on PE1, PE2, and PE3.

Example:

```

/* PE1 Configuration */

/* Configure Bridge Domain and EVI */
Router(config)# l2vpn
Router(config-l2vpn)# bridge group bg1
Router(config-l2vpn-bg)# bridge-domain bd1
Router(config-l2vpn-bg-bd)# interface Bundle-Ether3.1
Router(config-l2vpn-bg-bd-ac)# evi 1
Router(config-l2vpn-bg-bd-ac)# root

Router(config)# l2vpn
Router(config-l2vpn)# bridge group bg2
Router(config-l2vpn-bg)# bridge-domain bd2
Router(config-l2vpn-bg-bd)# interface Bundle-Ether3.2
Router(config-l2vpn-bg-bd-ac)# evi 2

/* Configure EVPN EVI */
Router(config)# evpn
Router(config-evpn)# evi 1
Router(config-evpn-evi)# advertise-mac
Router(config-evpn-evi)# exit
Router(config-evpn)# evi 2
Router(config-evpn-evi)# advertise-mac

```

Step 11 To verify the configuration, run these show commands.

Example:

```
Router# show evpn internal-label vpn-id 1 detail
```

VPN-ID	Encap	Ethernet Segment Id	EtherTag	Label
1	MPLS	0040.0000.0000.0000.0001	0	24010
Multi-paths resolved: TRUE (Remote all-active)				
Multi-paths Internal label: 24010				
EAD/ES (ID:0x00000000000000652)				
		54.54.54.54		0
		55.55.55.55		0
EAD/EVI (ID:0x00000000000000649)				
		54.54.54.54		24000

Configure inter-AS EVPN option C

```

55.55.55.55 24000
Summary pathlist (ID 0x000000000000064d):
0x02000001 (P) 54.54.54.54 24000
0x02000002 (P) 55.55.55.55 24000

```

Router# **show bgp l2vpn evpn route-type inclusive-mcast**

```

BGP router identifier 51.51.51.51, local AS number 200

AC-based Virtual Ethernet Segment

Table 24: Feature History Table

Feature Name	Release Information	Feature Description
AC-based Virtual Ethernet Segment	Release 7.5.1	<p>This feature allows you to extend the physical links to have VLANs (ACs) that act as Ethernet Virtual Circuits (EVCs). Many such EVCs can be aggregated on a single main interface called Virtual Ethernet Segment (vES). The main interface aggregates many vESs and creates a group to identify these vESs. This mechanism helps to minimize service disruption by mass withdrawal for main peering at the vES level.</p> <p>This feature is supported on routers that have Cisco NC57 line cards installed and operate in native mode.</p>

Many service providers want to extend the concept of the physical links in an Ethernet Segment. They are looking at having Ethernet Virtual Circuits (EVCs) where many of such EVCs (for example, VLANs) are aggregated on a single physical External Network-to-Network Interface (ENNI). An ES that consists of a set of EVCs instead of physical links is referred to as a virtual ES (vES).

To meet customers' Service Level Agreements (SLA), service providers typically build redundancy through multiple EVPN PEs and across multiple ENNIs where a given vES can be multihomed to two or more EVPN PE devices through their associated EVCs. These Virtual Ethernet Segments (vESes) can be single-homed or multi-homed ES's and when multi-homed, they can operate in either single-active or all-active redundancy modes.

The Ethernet Segment over a parent interface (main port) is represented by parent ES (pES) that can be the main or physical bundle interface. The vES represents the logical connectivity of the access service multi-homed to PE nodes. Multiple vESs are grouped to form one group ES (gES) for one parent interface. This new grouping allows for mass withdrawal of MAC addresses upon main port failure.

The parent interface advertises the grouping ES/EAD (gES/EAD) with the type-3 ESI (meant to represent the main port grouping scheme), which is populated with the six octet MAC address of the main port, and the three octet Local Discriminator value set to 0xFFFFF.

Similarly, the main port advertises grouping scheme in Type-3 ESI with gES/EAD (and Type-3 ESI also tagged on vES/EAD as an extcomm).

Supported Services

vES supports the following services:

- EVPN ELAN
- EVPN VPWS
- EVPN IRB
- EVPN FXC
- Single-homing load balancing mode
- Multi-homing load balancing mode - active-active and single-active
- Supports Highest Random Weight (HRW) and MODULO algorithm for per port DF election.
- Local switching on the same main port between two vES ACs (ELAN, FXC)

Restrictions

- You might observe a traffic drop during the AC shutdown with vES.
- For vES subinterface, the L3 route-sync is not supported when the main-port is vES-enabled. The syslog or warning message is not reported when the L3 subinterface is configured with VRF **evpn-route-sync**.
- You cannot configure an EVPN All-Active PE device in a vES setup to have paths with MPLS Explicit NULL label configuration.

Topology

In this example, vES-A is setup between PE1 and PE2. On PE1, there is a grouping ES gES-1 on the access facing interface. Similarly, on PE2 there is also a grouping ES gES-2.

In this topology, the following shows how PEs are peered:

- PE1 and PE2 routers peer using vES-A with RT-4 (each route colored with gES-1 and gES-2 respectively).
- PE2 and PE3 routers peer using vES-B with RT-4 (each route colored with gES-2 and gES-3 respectively).

The following information depicts how traffic is forwarded:

PE4 connects vES-B remotely through PE2 and PE3:

- vES-B - MAC2 [PE3]
- vES-B - EVI/EAD [PE2/L2, PE3/L3]
- vES-B - ES/EAD [PE2 (gES-2), PE3 (gES-3)]
- gES-2 - ES/EAD [PE2]
- gES-3 - ES/EAD [PE3]

PE3 connects vES-A remotely through PE1 and PE2:

- vES-A - MAC1 [PE1]
- vES-A - EVI/EAD [PE1/L1, PE2/L2]
- vES-A - ES/EAD [PE1 (gES-1), PE2 (gES-2)]
- gES-1 - ES/EAD [PE1]
- gES-2 - ES/EAD [PE2]

PE1 performs the same forwarding for PE3 for vES-B.

The following routes are advertised with the vESI in the NLRI:

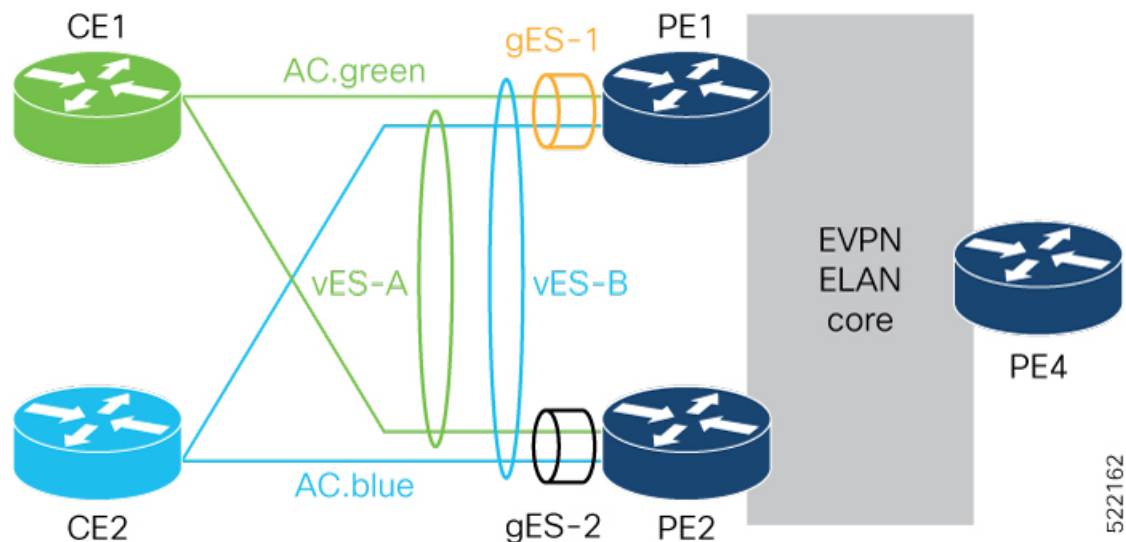

- RT-4 at the granularity of vES for peering and DF-election, along with BGP router MAC extcomm carrying grouping scheme value (gES), which is the main port MAC address. BGP extcomm carries six bytes data which is exactly the length of MAC address.

- Any locally learned MAC address through RT-2 for bridging.
- Per EVI/EAD for service reachability.
- Per ES/EAD for that vES along with BGP router MAC extcomm carrying gES MAC address.

Local Switching

Local switching allows you to switch Layer 2 data between two ACs on the same interface. Local switching involves the exchange of L2 data from one attachment circuit (AC) to the other, and between two interfaces of the same type on the same router. A local switching connection works like a bridge domain that has only two bridge ports, where traffic enters from one port of the local connection and leaves through the other.

Consider an example where the customer is provided a service by two different SPs. PE1 and PE2 can local-switch between vES-A and vES-B.

In this topology, the following shows how PEs are peered:

- PE1 and PE2 are peered for vES-A with RT-4
- PE1 and PE2 are peered for vES-B with RT-4

For BUM traffic, traffic is flooded to other ACs in Split-Horizon Group 0.

For Unicast traffic, the MAC lookup in the bridge forwards the traffic to the right AC.

If the local switching is not available, for example the AC goes down, then traffic is routed through the EVPN core. PE1 and PE2 will see each other's remote EVI/EAD and ES/EAD routes for vES-A and vES-B along with pES1 and pES2 ES/EAD.

Main Port Failure

When there is a main port failure, the gES/EAD is withdrawn to provide fast switchover. The vES EVI/EAD and vES/EAD are advertised. After the main port recovery, the gES/EAD is re-advertised on the last vES to prevent remote end steering traffic to node.

The vES failure is identified as an AC failure, and is signaled through CFM/OAM. During vES failure, not the main port failure, the vES EVI/EAD is advertised and the vES/EAD is withdrawn. On vES recovery, after the peering timer expires, the vES/EAD is advertised.

Figure 20:

The following are remote routes for PE3

- vES-A EVI/EAD [PE1/L1,PE2/L2]
- vES-A ES/EAD [PE1 [gESI-1],PE2 [gESI-2]]
- gES-1 ES/EAD [PE1]
- gES-2 ES/EAD [PE2]

After the main port failure, PE3 sees the following remote routes:

- vES-A EVI/EAD [PE1/L1,PE2/L2]
- vES-A ES/EAD [PE1 [gESI-1],PE2 [gESI-2]]
- gES-2 ES/EAD [PE2]
- gES-1 ES/EAD [PE1] is withdrawn

Configure Virtual Ethernet Segment - AC based

Configuration Example

The following example depicts a simple configuration for all-active vES sub-interface and non-vES enabled sub-interface under the same main-port:

```
evpn
  virtual interface Bundle-Ether1.1
    ethernet-segment
      identifier type 0 1.2.3.4.5.6.7.8.9
  !
l2vpn bridge-group g1
  bridge-domain d1
    interface Bundle-Ether1.1      >>MH vES
    interface Bundle-Ether1.2      >>Becomes SH
  evi 1
```

The following example depicts an expanded configuration to flex all options for vES (single-active bundle vES sub-interface with static gES-MAC):

```
interface Bundle-Ether1
  ethernet-segment
    load-balancing-mode single-active
  virtual-ethernet-segment
    identifier type 3 000a.000b.000c !
  virtual interface Bundle-Ether1.1
    ethernet-segment
      identifier type 0 1.2.3.4.5.6.7.8.9
  !
l2vpn bridge-group g1
  bridge-domain d1
    interface Bundle-Ether1.1      >>MH vES
    interface Bundle-Ether1.2      >>Becomes SH
  evi 1
```

EVPN BUM Flood Traffic Optimization

Table 25: Feature History Table

Feature Name	Release Information	Feature Description
EVPN BUM Flood Traffic Optimization	Release 7.10.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards)</p> <p>You can save network bandwidth consumption by preventing the replication of Broadcast, Unknown unicast, and Multicast (BUM) traffic towards EVPN core and attachment circuits (AC). This feature not only prevents the replication of BUM traffic but also ensures that only the designated router receives the BUM traffic.</p> <p>The feature introduces these changes:</p> <p>CLI</p> <ul style="list-style-type: none"> • hw-module l2-replication core-optimized • flood mode ac-shg-optimized <p>YANG Data Model:</p> <ul style="list-style-type: none"> • New XPaths for <code>Cisco-IOS-XR-um-hw-module-profile-cfg.yang</code> (see GitHub, YANG Data Models Navigator)

When you do not know the exact network address, the EVPN traffic is transmitted to multiple destinations in the network by using one of the following methods:

- Broadcast traffic: Transmits the network traffic to all the reachable destinations in the network.
- Unknown unicast traffic: When a unicast packet intended for a destination consists of unknown MAC address, the packets are flooded to all the ports.
- Multicast traffic: Transmits the network traffic to a group of devices in the network.

In EVPN operations, the PE routers automatically discover each other when connected on the same Ethernet segment and select a Designated Forwarder (DF) responsible for forwarding BUM traffic. The DF forwards the BUM traffic received from the core toward the access-facing interface.

BUM Traffic Replication

Each bridge domain uses an ingress multicast ID (MCID) and an egress MCID to replicate the BUM traffic. You can use the **hw-module l2-replication core-optimized** command to allocate two consecutive ingress MCIDs each bridge domain. This reduces the bridge domain scale by half and prevents the replication of BUM traffic.

When the network consists of a large number of PE devices on the bridge domain, you can optimize the consumption of recycle bandwidth due to the core-to-core and AC-to-AC replications using one of the following methods:

- Avoid Core-to-Core Replications

- Avoid AC-to-AC Replications

Avoid Core-to-Core Replications

By default, the BUM traffic from the core is replicated not only towards the attachment circuits (AC) but also towards the core and remote PEs. Due to the split horizon rule, which prevents forwarding traffic from one pseudowire to another pseudowire, the replicated traffic towards the core is discarded inside the router. The core replications are recycled, which results in recycle bandwidth being utilized when the replicated packets are dropped.

Use the **hw-module l2-replication core-optimized** command to avoid core-to-core replications of BUM traffic. When you enable this command, the following actions take place in the router:

- When the **hw-module l2-replication core-optimized** command is activated, two consecutive ingress MCIDs are allocated for each bridge domain.
- The first MCID points to the list of all the members in the bridge domain, like EVI and VPLS PWE, BVI recycle port, and egress MCID for ACs.
- The second MCID points to egress MCID containing all the ACs in the bridge domain.
- For BUM traffic received from AC, the first MCID is selected for replicating the traffic to all the members in the bridge domain.
- For BUM traffic received from core, the second MCID is selected for replicating the traffic to all the ACs. This avoids replications towards the core.

Avoid AC-to-AC Replications

When you configure a split-horizon group (SHG) on a bridge domain, the BUM traffic cannot flow between the ACs that are members of the SHG. The replicated traffic towards AC is discarded, and hence recycle bandwidth is utilized when the replicated packets are dropped.

In addition to the **hw-module l2-replication core-optimized** command, use the **flood mode ac-shg-optimized** command to avoid AC-to-AC replications of BUM traffic in a split-horizon group. When you enable both commands, the following actions take place in the router:

- When the **hw-module l2-replication core-optimized** command is activated, two consecutive ingress MCIDs are allocated for each bridge domain.
- The first MCID points to the EVPN and VPLS peers list.
- The second MCID points to the egress MCID containing all the ACs in the bridge domain.
- For BUM traffic received from AC, the first MCID is selected for replicating the traffic to all the EVPN and VPLS peers, avoiding replications towards other ACs.
- For BUM traffic received from core, the second MCID is selected for replicating the traffic to all the ACs.

Note

Reload the router after enabling the **hw-module l2-replication core-optimized** command for it to take effect.

Restrictions for EVPN BUM Flood Traffic Optimization

- When BUM traffic optimization is enabled, two ingress MCIDs are used per bridge domain. This reduces the bridge domain scale by half.
- Access pseudowire is not supported.
- EVPN unknown unicast flooding suppression is not supported.
- BVI is not supported on a bridge domain enabled with split horizon group.
- The router must be reloaded after enabling the **hw-module l2-replication core-optimized** command for it to take effect.
- Multicast features are not supported when the **hw-module l2-replication core-optimized** command is activated.

Configure EVPN BUM Flood Traffic Optimization

The following configuration examples show how to enable BUM traffic optimization that avoids replication of BUM traffic towards core and ACs.

Avoid core-to-core replication for EVPN

```
Router# configure
Router(config)# hw-module l2-replication core-optimized
```

Note You must manually reload the router to activate the **hw-module l2-replication core-optimized** command.

Avoid AC-to-AC replication in a Split-Horizon Group

Prerequisites:

- Ensure that all the ACs are available in a split-horizon group (SHG). For more information on configuring SHG, see the *Configure Point-to-Point Layer 2 Services* chapter in the *L2VPN and Ethernet Services Configuration Guide for Cisco NCS 5500 Series Routers*.
- Ensure that you have already configured the **hw-module l2-replication core-optimized** command and restarted the router to activate the command.

Note The **flood mode ac-shg-optimized** command works only after you configure the **hw-module l2-replication core-optimized** command and restart the router.

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group bg0
Router(config-l2vpn-bg)# bridge-domain bd0
Router(config-l2vpn-bg-bd)# flood mode ac-shg-optimized
```

CFM Support for EVPN

Ethernet Connectivity Fault Management (CFM) is a service-level OAM protocol that provides tools for monitoring and troubleshooting end-to-end Ethernet services per VLAN. This includes proactive connectivity monitoring, fault verification, and fault isolation. CFM can be deployed in an EVPN network. You can monitor the connections between the nodes using CFM in an EVPN network.

Restrictions

CFM for EVPN is supported with the following restrictions:

- In an active-active multi-homing scenario, when monitoring the connectivity between a multi-homed CE device and the PE devices to which it is connected, CFM can only be used across each individual link between a CE and a PE. Attempts to use CFM on the bundle between CE and PE devices cause sequence number errors and statistical inaccuracies.
- There is a possibility of artefacts in loopback and linktrace results. Either a loopback or linktrace may report multiple results for the same instance, or consecutive instances of a loopback and linktrace between the same two endpoints may produce different results.

For more information about Ethernet Connectivity Fault Management (CFM), refer to the *Configuring Ethernet OAM* chapter in the *Interface and Hardware Component Configuration Guide for Cisco NCS 5500 Series Routers*.

CFM on EVPN ELAN

Table 26: Feature History Table

Feature Name	Release Information	Feature Description
CFM on EVPN ELAN	Release 7.4.1	<p>This feature allows you to effectively manage a network with EVPN services running EVPN ELAN and helps you to monitor the ELAN services, thereby providing high-speed Layer 2 and Layer 3 services with high resiliency.</p> <p>This feature is now supported on routers that have Cisco NC57 line cards installed and operate in native mode only.</p> <p>The following offload types are supported:</p> <ul style="list-style-type: none"> • Hardware (HW) Offload • Non-Offload • Software (SW) Offload

Connectivity fault management (CFM) is a service-level Operations and Maintenance (OAM) protocol that provides tools for monitoring and troubleshooting end-to-end Ethernet services for each VLAN. This includes proactive connectivity monitoring, fault verification, and fault isolation.

Cisco IOS XR Software Release 6.6.1 introduces CFM support for single-homed EVPN Emulated Local Area Network (ELAN) services. This functionality helps you to monitor the ELAN services of users against their contractual service-level agreements (SLAs), thereby providing high speed Layer 2 and Layer 3 services with high resiliency and less operational complexity to different market segments.

Supported Offload Types and Timer Values

The following are supported offload types:

- Hardware (HW) Offload type: The check message (CCM) timers for a CFM session on a physical interface is less than one second.

Note The Hardware (HW) Offload type is supported only in Cisco NC 57 line cards.

- Non-Offload type: The CCM timers for a CFM session on a physical interface is greater than one second.
- Software (SW) Offload type: The CFM session on a bundle interface.

The following are the supported timer values:

- 10s: Interval of 10 seconds
- 1m: Interval of 1 minute
- 10m: Interval of 10 minutes
- In addition to the above timer values, the Cisco NC 57 line cards support the following:
 - 3.3ms: Interval of 3.3 milliseconds
 - 10ms: Interval of 10 milliseconds
 - 100ms: Interval of 100 milliseconds
 - 1s: Interval of 1 second
- Non-Offload type supports 10s, 1m on the physical interface
- SW Offload type supports 10s, 1m, LAG 3.33

Note The Cisco NC 57 line cards also support 100ms and 1s SW Offload type.

- CCM interval of 10m is not supported on NCS57 line cards operating in native mode.
- A maximum of 8K CFM UP MEP sessions are supported because EVPN ELAN supports 8K bridge domains on NCS57 line cards operating in native mode.
- You can configure both UP and DOWN MEPs on the same L2VPN with EVPN ELAN in the Cisco NC 57 line cards.
- Supports 3.3ms, 10ms, 100ms, 1s CCM timers for HW-Offload UP MEP with EVPN ELAN on NCS57 line cards operating in native mode.

Restrictions for CFM on EVPN ELAN

CFM on EVPN ELAN is subjected to these restrictions:

- Supports only single-homed EVPN ELAN.
- Supports single homing with one AC per PW.
- DOWN MEP on AC interface of EVPN-BD is not supported.
- Does not support loss measurement.
- CFM over EVPN ELAN with MEPs along with multiple AC scenarios supports CCM and does not support LBM or LBR.

CFM on EVPN ELAN does not support the following configurations:

- UP MEP of different domain and same level on same EVPN-BD
- UP MEP of different level on different AC part of same BD as all AC interfaces are part of same service provider domain (EVPN-BD) in PE.

Configure CFM on EVPN ELAN

Figure 21: CFM on EVPN ELAN: Full Mesh Topology

Node 1, 2 and 3 in this topology can be Cisco routers.

Configuring CFM on EVPN ELAN involves these main tasks:

- Enabling CFM service continuity check
- Configuring MEP cross-check
- Enabling CFM for the interface

Configuration Example for CFM on EVPN ELAN: Full Mesh Topology

```
/* Enabling CFM continuity check */
Router# ethernet cfm
Router(config-cfm# domain bd-domain level 1 id null
Router(config-cfm-dmn)# service bd-domain bridge group bg-elan bridge-domain bd-elan id
icc-based MC MCMC
```

```

Router(config-cfm-dmn-svc) # continuity-check interval 1m
/* Configuring MEP cross-check */
Router(config-cfm-dmn-svc) # mep crosscheck
Router(config-cfm-dmn-svc) # mep-id 1112
Router(config-cfm-dmn-svc) # mep-id 1113
Router(config-cfm-dmn-svc) # commit

```

Repeat the above configurations for node 2 and node 3, with the respective mep-id values. For node 2, configure MEP cross-check with respective mep-id values of node 1 and node 3 (1111 and 1113 respectively, in this example). For node 3, configure MEP cross-check with respective mep-id values of node 1 and node 2 (1111 and 1112 respectively, in this example).

```

/* Enabling CFM on the interface */
Router(config)# interface gigabitEthernet 0/0/0/2.100 l2transport
Router(config-subif) # description bg-elan
Router(config-subif) # encapsulation dot1q 100
Router(config-subif) # rewrite ingress tag pop 1 symmetric
Router(config-subif) # mtu 9100
Router(config-subif) # ethernet cfm
Router(config-if-cfm) # mep domain bd-domain service bd-service mep-id 1111
Router(config-if-cfm-mep) # commit

```

You must repeat the above configurations for node 2 and node 3, with the respective *mep-id* values (that is, 1112 for node 2 and 1113 for node 3, in this example).

Running Configuration for CFM on EVPN ELAN: Full Mesh Topology

This sections shows the running configuration on node 1.

```

ethernet cfm
domain bd-domain level 1 id null
service bd-domain bridge group bg-elan bridge-domain bd-elan id icc-based MC MCMC
continuity-check interval 1m
mep crosscheck
mep-id 1112
mep-id 1113
!
!
!
!

interface GigabitEthernet0/0/0/2.100 l2transport
description bg-elan

ethernet cfm
mep domain bd-domain service bd-service mep-id 1111
!

```

Figure 22: CFM on EVPN ELAN: Hub and Spoke Topology

Configuration Example for CFM on EVPN ELAN: Hub and Spoke Topology

The CFM configuration for the hub and spoke topology remains the same as that of full mesh topology mentioned above, except for these additional steps for SLA profile configuration to be done under the interface.

```
/* 1112 and 1113 in this example, are the mep-id values of node 2 and node 3 */
Router(config)#interface gigabitEthernet 0/0/0/2.100 l2transport
Router(config-subif)# ethernet cfm
Router(config-if-cfm)# mep domain bd-domain service bd-service mep-id 1111
Router(config-if-cfm-mep)# sla operation profile test-profile1 target mep-id 1112
Router(config-if-cfm-mep)# sla operation profile test-profile2 target mep-id 1112
Router(config-if-cfm-mep)# sla operation profile test-profile1 target mep-id 1113
Router(config-if-cfm-mep)# sla operation profile test-profile2 target mep-id 1113
Router(config-if-cfm-mep)# commit
```

Running Configuration for CFM on EVPN ELAN: Hub and Spoke Topology

This sections shows the running configuration on node 1.

```
interface GigabitEthernet0/0/0/2.100 l2transport
description bg-elan
encapsulation dot1q 100
rewrite ingress tag pop 1 symmetric
mtu 9100
ethernet cfm
mep domain bd-domain service bd-service mep-id 1111
sla operation profile test-profile1 target mep-id 1112
sla operation profile test-profile2 target mep-id 1112
sla operation profile test-profile1 target mep-id 1113
sla operation profile test-profile2 target mep-id 1113
!
```

Example 1: The below configurations details UP MEPs of same domain and level on the following:

- Multiple AC per BD on local
- Single AC per BD on remote

```
Router#sh run ethernet cfm
Tue Sep 14 19:08:32.666 UTC
ethernet cfm
domain BD-DOMAIN level 4 id null
```

```

service BD-SERVICE bridge group ELAN_FUNC_3 bridge-domain FUNC_3 id number 100
continuity-check interval 10s
mep crosscheck
mep-id 5
mep-id 1101
mep-id 1103

Router#sh run l2vpn

Y.1731 Support for EVPN-ELAN

Table 27: Feature History Table

Feature Name	Release Information	Feature Description
Y.1731 Support for EVPN-ELAN	Release 7.5.1	<p>EVPN ELAN services support CFM continuity check, ITU-T Y.1731 compliant Delay Measurement Message (DMM) and Synthetic Loss Measurement (SLM) functions. This feature is supported only on single-homed EVPN ELAN.</p> <p>This feature is now supported on routers that have Cisco NC57 line cards installed and operate in native mode.</p>

DMM is used to periodically measure frame delay and frame delay variation between a pair of point-to-point Maintenance End Point (MEPs). Measurements are made between two MEPs belonging to the same domain and Maintenance Association (MA).

SLM is used to periodically measure Frame Loss and Forward Loss Ratio (FLR) between a pair of point to point MEPs. Measurements are made between two MEPs that belong to the same domain and MA.

Note For Synthetic Loss Measurement (SLM) and Synthetic Loss Reply (SLR), the ethernet Service Level Agreement (SLA) profile needs to have a minimum of 5-minute intervals.

Limitation

Depending on the CPU usage, the DMM value can exceed 1ms causing higher mean latency for routers supporting only software time-stamping on DMM/DMR.

Configuration Example

```
l2vpn
 bridge group cfm
   bridge-domain cfm401
     interface GigabitEthernet0/0/0/2.100

EVPN Routing Policy

The EVPN Routing Policy feature provides the route policy support for address-family L2VPN EVPN. This feature adds EVPN route filtering capabilities to the routing policy language (RPL). The filtering is based on various EVPN attributes.

A routing policy instructs the router to inspect routes, filter them, and potentially modify their attributes as they are accepted from a peer, advertised to a peer, or redistributed from one routing protocol to another.

This feature enables you to configure route-policies using EVPN network layer reachability information (NLRI) attributes of EVPN route type 1 to 5 in the route-policy match criteria, which provides more granular definition of route-policy. For example, you can specify a route-policy to be applied to only certain EVPN route-types or any combination of EVPN NLRI attributes. This feature provides flexibility in configuring and deploying solutions by enabling route-policy to filter on EVPN NLRI attributes.

To implement this feature, you need to understand the following concepts:

- Routing Policy Language
- Routing Policy Language Structure
- Routing Policy Language Components
- Routing Policy Language Usage
- Policy Definitions

- Parameterization
- Semantics of Policy Application
- Policy Statements
- Attach Points

For information on these concepts, see [Implementing Routing Policy](#).

Currently, this feature is supported only on BGP neighbor "in" and "out" attach points. The route policy can be applied only on inbound or outbound on a BGP neighbor.

EVPN Route Types

The EVPN NLRI has the following different route types:

Route Type 1: Ethernet Auto-Discovery (AD) Route

The Ethernet (AD) routes are advertised on per EVI and per Ethernet Segment Identifier (ESI) basis. These routes are sent per Ethernet segment (ES). They carry the list of EVIs that belong to the ES. The ESI field is set to zero when a CE is single-homed.

An Ethernet A-D route type specific EVPN NLRI consists of the following fields:

Route Type (1 octet)	*
Length (1 octet)	
Route Distinguisher (RD) (8 octets)	*
Ethernet Segment Identifier (10 octets)	*
Ethernet Tag ID (4 octets)	*
MPLS Label (3 octets)	

NLRI Format: Route-type 1:

[Type] [Len] [RD] [ESI] [ETag] [MPLS Label]

Net attributes: [Type] [RD] [ESI] [ETag]

Path attributes: [MPLS Label]

Example

```
route-policy evpn-policy
  if rd in (10.0.0.1:0) [and/or evpn-route-type is 1] [and/or esi in
(0a1.a2a3.a4a5.a6a7.a8a9)] [and/or etag is 4294967295] then
    set ..
  endif
end-policy
!
```

```
route-policy evpn-policy
```

```

    if rd in (1.0.0.2:0) [and/or evpn-route-type is 1] [and/or esi in
(00a1.a2a3.a4a5.a6a7.a8a9)] [and/or etag is 4294967295] then
        set ..
    endif
end-policy

```

Route Type 2: MAC/IP Advertisement Route

The host's IP and MAC addresses are advertised to the peers within NLRI. The control plane learning of MAC addresses reduces unknown unicast flooding.

A MAC/IP Advertisement Route type specific EVPN NLRI consists of the following fields:

```

+-----+
|Route Type (1 octet)                |*
+-----+
|Length (1 octet)                    |
+-----+
|RD (8 octets)                       |*
+-----+
|Ethernet Segment Identifier (10 octets)|
+-----+
|Ethernet Tag ID (4 octets)           |*
+-----+
|MAC Address Length (1 octet)         |*
+-----+
|MAC Address (6 octets)               |*
+-----+
|IP Address Length (1 octet)          |*
+-----+
|IP Address (0, 4, or 16 octets)      |*
+-----+
|MPLS Label1 (3 octets)               |
+-----+
|MPLS Label2 (0 or 3 octets)          |
+-----+

```

NLRI Format: Route-type 2:

[Type] [Len] [RD] [ESI] [ETag] [MAC Addr Len] [MAC Addr] [IP Addr Len] [IP Addr] [MPLS Label1] [MPLS Label2]

Net attributes: [Type] [RD] [ETag] [MAC Addr Len] [MAC Addr] [IP Addr Len] [IP Addr]

Path attributes: [ESI], [MPLS Label1], [MPLS Label2]

Example

```
route-policy evpn-policy
```

```

    if rd in (10.0.0.2:0) [and/or evpn-route-type is 2] [and/or esi in
(0000.0000.0000.0000.0000)] [and/or etag is 0] [and/or macaddress in (0013.aabb.ccdd)]
[and/or destination in (1.2.3.4/32)] then
        set ..
    endif
end-policy

```

Route Type 3: Inclusive Multicast Ethernet Tag Route

This route establishes the connection for broadcast, unknown unicast, and multicast (BUM) traffic from a source PE to a remote PE. This route is advertised on per VLAN and per ESI basis.

An Inclusive Multicast Ethernet Tag route type specific EVPN NLRI consists of the following fields:

+	-----	+
	Route Type (1 octet)	*
+	-----	+
	Length (1 octet)	
+	-----	+
	RD (8 octets)	*
+	-----	+
	Ethernet Tag ID (4 octets)	*
+	-----	+
	IP Address Length (1 octet)	*
+	-----	+
	Originating Router's IP Address	*
	(4 or 16 octets)	
+	-----	+

3/63/57

NLRI Format: Route-type 3:

[Type] [Len] [RD] [ETag] [IP Addr Len] [Originating Router's IP Addr]

Net attributes: [Type] [RD] [ETag] [IP Addr Len] [Originating Router's IP Addr]

Example

```

route-policy evpn-policy
    if rd in (10.0.0.1:300) [and/or evpn-route-type is 3] [and/or etag is 0] [and/or
evpn-originator in (10.0.0.1)] then
        set ..
    endif
end-policy

```

Route Type 4: Ethernet Segment Route

Ethernet segment routes enable to connect a CE device to two or PE devices. ES route enables the discovery of connected PE devices that are connected to the same Ethernet segment.

An Ethernet Segment route type specific EVPN NLRI consists of the following fields:

+-----+ Route Type (1 octet) *
+-----+ Length (1 octet)
+-----+ RD (8 octets) *
+-----+ Ethernet Segment Identifier (10 octets) *
+-----+ IP Address Length (1 octet) *
+-----+ Originating Router's IP Address (4 or 16 octets) *
+-----+

3/6/3/6/8

NLRI Format: Route-type 4:

[Type] [Len] [RD] [ESI] [IP Addr Len] [Originating Router's IP Addr]

Net attributes: [Type] [RD] [ESI] [IP Addr Len] [Originating Router's IP Addr]

Example

```
route-policy evpn-policy
  if rd in (10.0.0.1:0) [and/or evpn-route-type is 4] [and/or esi in
(00a1.a2a3.a4a5.a6a7.a8a9)] [and/or evpn-originator in (10.0.0.1)] then
    set ..
  endif
end-policy
```

Route Type 5: IP Prefix Route

An IP Prefix Route type specific EVPN NLRI consists of the following fields:

+-----+-----+	
Route Type (1 octet)	*
+-----+-----+	
Length (1 octet)	
+-----+-----+	
RD (8 octets)	*
+-----+-----+	
Ethernet Segment Identifier (10 octets)	
+-----+-----+	
Ethernet Tag ID (4 octets)	*
+-----+-----+	
IP Address Length (1 octet)	*
+-----+-----+	
IP Address (4 or 16 octets)	*
+-----+-----+	
GW IP Address (4 or 16 octets)	
+-----+-----+	
MPLS Label (3 octets)	
+-----+-----+	

NLRI Format: Route-type 5:

[Type][Len][RD][ESI][ETag][IP Addr Len][IP Addr][GW IP Addr][Label]

Net attributes: [Type][RD][ETag][IP Addr Len][IP Addr]

Path attributes: [ESI], [GW IP Addr], [Label]

Example

```
route-policy evpn-policy
  if rd in (30.30.30.30:1) [and/or evpn-route-type is 5] [and/or esi in
(0000.0000.0000.0000.0000)] [and/or etag is 0] [and/or destination in (12.2.0.0/16)] [and/or
evpn-gateway in (0.0.0.0)] then
    set ..
  endif
end-policy
```

EVPN RPL Attribute

Route Distinguisher

A Route Distinguisher (rd) attribute consists of eight octets. An rd can be specified for each of the EVPN route types. This attribute is not mandatory in route-policy.

Example

```
rd in (1.2.3.4:0)
```

EVPN Route Type

EVPN route type attribute consists of one octet. This specifies the EVPN route type. The EVPN route type attribute is used to identify a specific EVPN NLRI prefix format. It is a net attribute in all EVPN route types.

Example

```
evpn-route-type is 3
```

The following are the various EVPN route types that can be used:

- 1 - ethernet-ad
- 2 - mac-advertisement
- 3 - inclusive-multicast
- 4 - ethernet-segment
- 5 - ip-advertisement

IP Prefix

An IP prefix attribute holds IPv4 or IPv6 prefix match specification, each of which has four parts: an address, a mask length, a minimum matching length, and a maximum matching length. The address is required, but the other three parts are optional. When IP prefix is specified in EVPN route type 2, it represents either a IPv4 or IPv6 host IP Address (/32 or /128). When IP prefix is specified in EVPN route type 5, it represents either IPv4 or IPv6 subnet. It is a net attribute in EVPN route type 2 and 5.

Example

```
destination in (128.47.10.2/32)
destination in (128.47.0.0/16)
destination in (128:47::1/128)
destination in (128:47::0/112)
```

esi

An Ethernet Segment Identifier (ESI) attribute consists of 10 octets. It is a net attribute in EVPN route type 1 and 4, and a path attribute in EVPN route type 2 and 5.

Example

```
esi in (ffff.ffff.ffff.ffff.fff0)
```

etag

An Ethernet tag attribute consists of four octets. An Ethernet tag identifies a particular broadcast domain, for example, a VLAN. An EVPN instance consists of one or more broadcast domains. It is a net attribute in EVPN route type 1, 2, 3 and 5.

Example

```
etag in (10000)
```

mac

The mac attribute consists of six octets. This attribute is a net attribute in EVPN route type 2.

Example

```
mac in (0206.acb1.e806)
```

evpn-originator

The evpn-originator attribute specifies the originating router's IP address (4 or 16 octets). This is a net attribute in EVPN route type 3 and 4.

Example

```
evpn-originator in (1.2.3.4)
```

evpn-gateway

The evpn-gateway attribute specifies the gateway IP address. The gateway IP address is a 32-bit or 128-bit field (IPv4 or IPv6), and encodes an overlay next-hop for the IP prefixes. The gateway IP address field can be zero if it is not used as an overlay next-hop. This is a path attribute in EVPN route type 5.

Example

```
evpn-gateway in (1.2.3.4)
```

EVPN RPL Attribute Set

In this context, the term set is used in its mathematical sense to mean an unordered collection of unique elements. The policy language provides sets as a container for groups of values for matching purposes. Sets are used in conditional expressions. The elements of the set are separated by commas. Null (empty) sets are allowed.

prefix-set

A prefix-set holds IPv4 or IPv6 prefix match specifications, each of which has four parts: an address, a mask length, a minimum matching length, and a maximum matching length. The address is required, but the other three parts are optional. The prefix-set specifies one or more IP prefixes.

Example

```
prefix-set ip_prefix_set
14.2.0.0/16,
54.0.0.0/16,
12.12.12.0/24,
50:50::1:0/112
end-set
```

mac-set

The mac-set specifies one or more MAC addresses.

Example

```
mac-set mac_address_set
1234.2345.6789,
2345.3456.7890
end-set
```

esi-set

The esi-set specifies one or more ESI's.

Example

```
esi-set evpn_esi_set
1234.2345.3456.4567.5678,
1234.2345.3456.4567.5670
end-set
```

etag-set

The etag-set specifies one or more Ethernet tags.

Example

```
etag-set evpn_etag_set
10000,
20000
end-set
```

Configure EVPN RPL Feature

The following section describe how to configure mac-set, esi-set, evpn-gateway, and evpn-originator.

```
/* Configuring a mac-set and referring it in a route-policy (Attach point - neighbor-in) */
Router# configure
Router(config)# mac-set demo_mac_set
Router(config-mac)# 1234.ffff.aaa3,
Router(config-mac)# 2323.4444.ffff
Router(config-mac)# end-set
Router(config)# !
Router(config)# route-policy policy_use_pass_mac_set
Router(config-rpl)# if mac in demo_mac_set then

Set EVPN Gateway IP Address in EVPN Route Type 5 NLRI

Table 28: Feature History Table

Feature Name	Release Information	Feature Description
Set EVPN Gateway IP Address in EVPN Route Type 5 NLRI	Release 7.9.1	<p>You can now facilitate optimal traffic load balancing across the Virtual Network Forwarders (VNFs) and minimize control plane updates when the VNFs or virtual machines (VMs) are moved across Top of Racks (ToR) by setting the EVPN gateway IP address in the EVPN route type 5 network layer reachability information (NLRI) that advertises IPv4 and IPv6 addresses. With this functionality, we can obtain prefix independent convergence due to the withdrawal of gateway IP.</p> <p>Previously, the gateway IP address field in the EVPN route type 5 NLRI was not used. By default, the NLRI advertisement included the EVPN gateway IP address of zero, which was represented as 0.0.0.0 for IPv4 and :: for IPv6. This resulted in the withdrawal of all prefixes one by one in the event of a failure, leading to traffic loss.</p> <p>The feature introduces these changes:</p> <p>CLI:</p> <ul style="list-style-type: none"> • set advertise-evpn-gw-ip • advertise gateway-ip-disable

EVPN route type 5 or IP prefix route is used for IP prefix advertisement. For more information on EVPN route types, see [EVPN Route Types, on page 5](#).

Previously, the gateway IP address field in the EVPN route type 5 network layer reachability information (NLRI) wasn't used and had the default value of 0.0.0.0 for IPv4 and :: for IPv6 addresses. This resulted in a scenario where multiple prefixes were advertised using the default gateway IP address, and subsequently, during a network failure, withdrawing each prefix individually led to traffic loss and delayed traffic convergence.

Starting from Cisco IOS XR Release 7.9.1, the Virtual Network Forwarders (VNFs) IP address can be designated as the gateway IP address for EVPN type 5 routes. When you set the gateway IP address, prefix independent convergence is obtained due to the withdrawal of gateway IP, resulting in a faster traffic switchover. The gateway IP address is a 32-bit field for IPv4 or a 128-bit field for IPv6.

To set the gateway IP address manually, use **set advertise-evpn-gw-ip** command.

Guidelines and Limitations

- Only per-vrf mode is supported for EVPN MAC/IP. If the gateway IP resolution is based on MAC/IP, then only the per-vrf resolution takes effect.
- To configure the ToRs to advertise the non-zero gateway IP address, use the **set advertise-evpn-gw-ip** command. However, if legacy peers can't process the gateway IP address, you can disable the non-zero gateway IP address using the **advertise gateway-ip-disable** command under the neighbor EVPN address-family configuration mode.
- The **set advertise-evpn-gw-ip** command flaps the specified peer session as gracefully as possible. The remote peer triggers a graceful restart if the peer supports this capability. When the session is reestablished, the local peer advertises EVPN route type 5 with gateway IP address set or with the gateway IP address as zero depending on whether the **set advertise-evpn-gw-ip** command has been used. This command is not enabled by default, and the gateway IP address is set to zero.

If route refresh is not supported, then a hard reset of the session is required for the EVPN gateway IP address to take effect on a change. Otherwise, route refresh will be triggered, and the EVPN gateway policy change will be executed.

Topology

Let's understand how this feature works using this sample topology.

523159

In this topology:

- VNF (VNF11, VNF 12, and VNF21), sends and receives prefixes from VMs (VM11, VM12, VM13, and VM14).
- VNF peers with ToRs use eBGP to advertise VM prefixes.
- ToRs distribute the VM prefixes across the VNFs using EVPN route-type 5 with the gateway IP address.
- Multiple ToRs advertise the same VM prefixes to achieve proportional multipath to the VMs.
- The EVPN route type 5 advertises the VNF IP address as the gateway to the remote ToR, which is ToR3 allowing it to select the appropriate VNF to send traffic to.
- EVPN type-5 routes are then imported into the VRF table on the receiving ToR, (ToR3 in this example) for which the next-hop is set to the VNF IP address based on the gateway IP address.
- The actual next-hops are advertised as part of the gateway IP address field in the EVPN type-5 routes.

When the gateway IP address isn't set and has the default value 0.0.0.0, the ToR3 next-hop are ToR1 and ToR2 and not the VNFs.

For example, consider VNF11 advertises 1000 prefixes to ToR1 using route type 5 without setting the gateway IP address. When the link from VNF11 to ToR1 goes down, all 1000 prefixes need to be withdrawn individually, resulting in traffic disruption and an increase in convergence time. However, when the gateway IP address is set to the VNF11 IP address, a single IP prefix route withdrawal is sufficient for ToR3 to send traffic toward VNF12.

When you set the gateway IP address to the actual VNF IP address, you can:

- Achieve proportional multipath
- Reduce control plane updates when VNF or VM moves

Proportional Multipath

Proportional multipath refers to the equal distribution of traffic across all available Virtual Network Forwarders (VNFs). Proportional multipath enables the advertisement of all available next hops to a destination network, and the router considers all paths to a given route as equal-cost multipath (ECMP), allowing traffic to be forwarded using all available links across multiple ToRs. When you set the VNF IP address as the gateway IP address, multiple ToRs advertise the same VM prefixes to achieve proportional multipath to the VMs.

Figure 23: Proportional Multipath

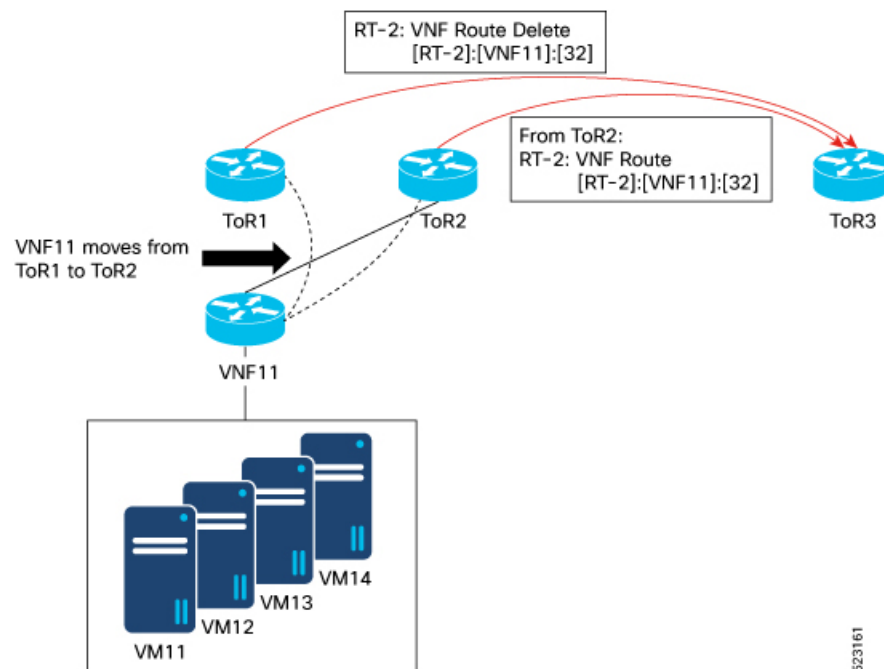

In this topology, traffic is distributed proportionally among multiple VNFs: VNF11, VNF12, and VNF21. Traffic from the remote ToR3 is hashed equally to the three VNFs, meaning ToR1 receives twice the traffic compared to ToR2. Because the ToR3 receives two paths from ToR1 and one path from ToR2, proportional ECMP can be achieved based on the number of paths available.

Reduce Control Plane Updates When VNF or VM Moves

In a data center environment, when VNFs or VMs are moved to different ToRs, it can lead to many updates in the EVPN fabric. For every VM move, a separate update is generated resulting in N number of updates for each VM.

When you set the VNF IP address as the gateway IP address and group multiple VMs under a single VNF, only one update is required for the entire workload when a VNF is moved to a different ToR reducing the number of control plane updates.

For example, VNF11 forms eBGP sessions with both ToR1 and ToR2. When VNF11 is moved from ToR1 to ToR2, only a single MAC-IP update is generated for the VNF, and this update is sufficient for the remote ToRs to start sending traffic to ToR2 for all VM prefixes associated with that VNF.

523161

Configure EVPN Gateway IP Address in EVPN Route Type 5 NLRI

Perform this task to configure the EVPN gateway IP address in EVPN route type 5 NLRI.

Configuration Example

```
Router(config)# route-policy gw
Router(config-rpl)# set advertise-evpn-gw-ip use-next-hop
Router(config-rpl)# end-policy
Router(config)# vrf VRF1
Router(config-vrf)# address-family ipv4 unicast
Router(config-vrf-af)# import route-target
Router(config-vrf-import-rt)# 10:10
Router(config-vrf-import-rt)# exit
Router(config-vrf-af)# export route-policy gw
Router(config-vrf-af)# export route-target
Router(config-vrf-export-rt)# 10:10
Router(config-vrf-export-rt)# exit
```

```

Router(config-vrf-af)#exit
Router(config-vrf)# address-family ipv6 unicast
Router(config-vrf-af)# import route-target
Router(config-vrf-import-rt)# 10:10
Router(config-vrf-import-rt)# exit
Router(config-vrf-af)# export route-policy gw6
Router(config-vrf-af)# export route-target
Router(config-vrf-export-rt)# 10:10
Router(config-vrf-export-rt)#commit

```

Running Configuration

This section shows the running configuration of EVPN gateway IP address in EVPN route type 5 NLRI.

```

route-policy gw
  set advertise-evpn-gw-ip use-next-hop
end-policy
!
vrf VRF1
address-family ipv4 unicast
  import route-target
    10:10
  !
  export route-policy gw
  export route-target
    10:10
  !
!
address-family ipv6 unicast
  import route-target
    10:10
  !
  export route-policy gw6
  export route-target
    10:10
  !
!
!

```

Verification

Verify that the EVPN gateway IP address is same as the the next-hop IP address.

For example, you can see that the next-hop IP address is same as the EVPN gateway IP address which is 5.5.5.5.

```

Selective multicast with IGMP proxy

Selective Multicast with IGMP proxy is a network traffic management feature that forwards multicast traffic only to EVPN peers with active receivers.

Table 29: Feature History Table

Feature Name	Release Information	Feature Description
Selective multicast with IGMP proxy	Release 25.2.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5700 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards; NCS 5700 line cards [Mode: Compatibility; Native])</p> <p>Selective Multicast with IGMP Proxy addresses the issue of unnecessary flooding of multicast traffic in EVPN fabrics. It ensures multicast traffic is only forwarded to peers with active receivers, optimizing bandwidth usage.</p>

In traditional EVPN implementations, Broadcast, Unknown Unicast, and Multicast (BUM) traffic is flooded to all peers in the network, regardless of whether they have active receivers. This can lead to unnecessary traffic distribution, consuming bandwidth and resources.

Selective Multicast enhances this behavior by limiting the distribution of multicast traffic to only those peers that have active receivers. This optimization is achieved through the use of IGMP Proxy functionality, which ensures that multicast traffic is forwarded only to interested parties, reducing overhead and improving network efficiency.

Restrictions for Selective multicast with IGMP proxy

- When the proxy is enabled and there is no active receiver in the bridge domain where the Ethernet Segment Identifier (ESI)/EVPN instance (EVI) is present, traffic will not be forwarded to other multi-homed devices. This changes the default behavior of source-based forwarding in EVPN Active-Active (AA) mode.
- Bridged Virtual Interface (BVI) with Selective Multicast Ethernet Tag (SMET) is not supported.
- IPv6 with SMET is not supported.

Configure Selective Multicast with IGMP proxy

Before you begin

- EVPN must be enabled in the fabric.
- IGMP join request must exist.
- BGP route 6 messages must be available for sharing IGMP join information.

Procedure

Step 1 Enable proxy igmp-snooping under the EVPN configuration.

Example:

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 3000
Router(config-evpn-evi)# proxy igmp-snooping
```

Step 2 View running configuration.

Example:

```
evpn
 evi 3000
  proxy
  igmp-snooping
!
```

Host-Tracking using BFD

Table 30: Feature History Table

Feature Name	Release Name	Description
Host-Tracking using BFD	Release 24.1.1	<p>Introduced in this release on: NCS 5500 modular routers (NCS 5500 line cards)</p> <p>You can now enhance the resilience of virtualized environments by hosting Virtual Network Functions (VNFs) for rapid failure detection via Bidirectional Forwarding Detection (BFD). You can set up BFD sessions between routers and VNFs so that when BFD identifies a failure, you can quickly scale or migrate VNFs as required. The system facilitates the assignment of a Virtual IP address (VIP) to a service that spans multiple VNF instances, which permits traffic rerouting if a failure occurs.</p> <p>You can configure this feature for traffic in EVPN single-homing mode and only on Bridged Virtual Interfaces (BVI).</p> <p>The feature introduces these changes:</p> <p>CLI:</p> <ul style="list-style-type: none"> • The bfd fast-detect command is made available in ARP host-tracking configuration mode. • bgp-gateway • host-tracking • show bgp l2vpn evpn <p>YANG Data Model</p> <ul style="list-style-type: none"> • New XPaths for <code>Cisco-IOS-XR-l2vpn-cfg</code> <p>(see GitHub, YANG Data Models Navigator)</p>

BFD and Detection of VNF Failures

Using single-hop asynchronous BFD sessions with NFs, you can minimize traffic disruptions and optimize routing. VNFs function as EVPN gateway-IP addresses for VIPs, and in case of a VNF failure, the leaf must halt fabric traffic to redirect it to other NFs providing the same VIP service. Detecting VNF failures is critical for maintaining seamless network functionality, and BFD allows for the rapid detection of VNF failures. BFD detects failures in the path between two forwarding engines, such as routers, by regularly sending and receiving BFD control packets.

Host-tracking and Detection of VNF Failures

Host-tracking using BFD ensures the high availability of services accessed via VIPs by monitoring the operational status and reachability of VNs and rapidly identifying any network path issues. The system quickly detects VNF failures by utilizing BFD, minimizing downtime, and facilitating immediate traffic rerouting to alternative VNFs to maintain uninterrupted service access through the VIPs.

VNF Failure Resolution Process and the Roles of ARP Timer and BGP Prefix Length

When a VNF becomes non-operational, the access leaf does not detect the change until the ARP timer expires. EVPN Route Type 5 facilitates the advertisement and resolution of VIPs used by VNFs, and to resolve the VIP learned from EVPN Route-Type 5, the router uses BGP over an EVPN local adjacency based on a non-zero Gateway IP address. The resolution process is essential for traffic to be correctly routed upon reaching a Top-of-Rack (ToR) router in the network infrastructure, ensuring that it is directed to the designated VNF or an alternative VNF in case of failure.

BGP sets a minimum prefix length requirement to resolve a route and forces the VIP to resolve only over a host with a prefix length of /32 for IPv4 or /128 for IPv6. Rapid updating and disseminating the VNFs' operational status is critical for maintaining seamless network functionality, and resolving VIPs based on accurate MAC-IP bindings enables the network to make correct forwarding decisions, particularly in a dynamic environment where VNFs may become unavailable, and traffic needs to be redirected to maintain service availability. It is vital to the network's capability to minimize traffic disruptions and optimize routing in a virtualized environment.

Support Information for BFD Host Tracking

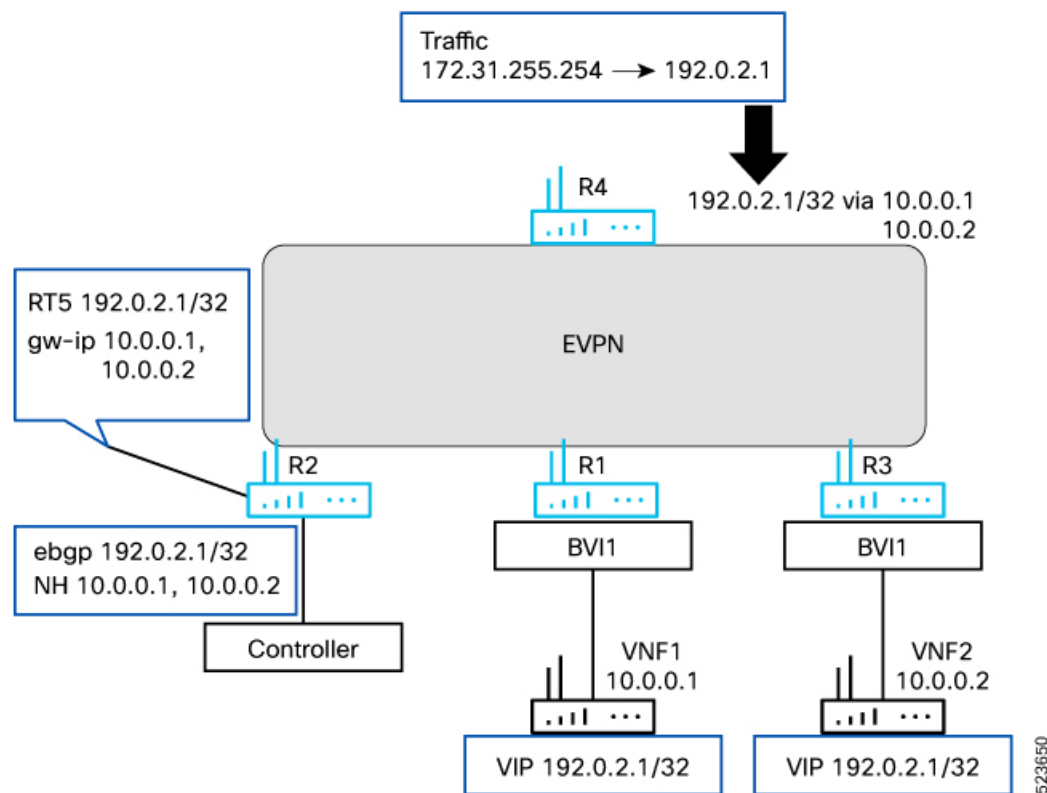

Host tracking using BFD is supported only in EVPN single-homing mode. You can configure this feature only on Bridged Virtual Interfaces (BVIS).

Restrictions for host tracking using BFD

- Host-tracking using BFD is only supported on EVPN Single-homing mode.
- You can configure this feature only on BVI.

Topology for Host-Tracking using BFD

Figure 24: Host-tracking using BFD

The following table delineates the critical elements involved and outlines their respective roles, illustrating how each contributes to the overall reliability and efficiency of the network's fault detection and signaling mechanisms.

Table 31: Elements and Their Roles in Host-tracking using BFD Topology

Topology Element	Role
VNF	VNF1 (IP: 10.0.0.1) and VNF2 (IP: 10.0.0.2) are virtualized services that perform network functions. These are the host that are being tracked using BFD. They route Virtual IP addresses, specifically 192.0.2.1/32 in this topology.
Controller	Connects to Router R2. It advertises the VIP 192.0.2.1/32 using a Provider Edge to Customer Edge (PE-CE) BGP session. It specifies VNFs as the next hop for the advertised VIP.
Router R2	Receives VIP advertisements from the controller. It advertises VNFs as the EVPN gateway-IP for type-5 VIP routes to other routers in the network.

Topology Element	Role
Router R4	Programs the VIP's reachability through VNF1 (IP: 10.0.0.1). It ensures reachability to the VIP through both VNF1 (10.0.0.1) and VNF2 (10.0.0.2). It updates reachability in the event of VNF1 failure.
Router R1 and Router R3	Load-balances traffic to the VIP across the multiple VNFs. Router R1 is connected to VNF1, while Router R3 is connected to VNF2.
BFD Session	Established between Router R1 and VNF1 (10.0.0.1). It detects failure of VNF1 in a shorter duration. Enables Router R1 to immediately withdraw the route upon VNF1 failure, which results in Router R4 updating the reachability to the VIP only through VNF2 (10.0.0.2) for faster network convergence.

Flow of traffic in topology

The following is the specific sequence of steps that characterize the flow of traffic through the established topology:

- Traffic flows from the source IP address 172.31.255.254 directly to Router R4.
- From Router R4, traffic reaches Virtual Network Functions VNF1 and VNF2 through Routers R1 and R3 respectively.
- Traffic flows from VNF1 and VNF2 to the VIP 192.0.2.1

Convergence and route withdrawal in host failure

When the host VNF1 fails, the BFD session between Router R1 and VNF1 (10.0.0.1) quickly detects the disruption, leading Router R1 to immediately withdraw VNF1's route from the ARP table. Consequently, Router R4 adjusts the network path, ensuring reachability to the VIP through host VNF2 (10.0.0.2), which results in improved convergence. The convergence time is significantly reduced compared to scenarios without an active BFD session.

Consequences of delayed ARP withdrawal on network convergence and traffic continuity

If the feature is absent, network traffic experiences outages. The network experiences poor convergence due to the delayed withdrawal of VNF1's route from the ARP. Convergence remains delayed until the expiration of the ARP entry. Throughout this interval, Router R4 directs packets to Router R1, which in turn discards them because it does not detect VNF1's failure. This causes to traffic disruption.

Role of BFD session in accelerating ARP withdrawal and mitigating traffic disruptions

Without a BFD session, Router R1 delays the withdrawal of VNF1's route until the ARP session times out, resulting in a traffic disruption until the withdrawal of VNF1's route 10.0.0.1 from ARP. However, with a BFD session in place, when the BFD session terminates, Router R1 immediately revokes the ARP entry. The absence of VNF1 causes the ARP probe to fail, leading to the instant withdrawal of the VNF1 route 10.0.01 from ARP.

Configure Host Tracking Using BFD

Configuration Example

Follow the steps given below to enable the Host Tracking using BFD feature.

- Configure a Bridged Virtual Interface (BVI) with identifier 1.
- Enable host tracking on a BVI interface, allowing the device to keep track of hosts directly connected to it.
- Enable BGP gateway monitoring for host tracking on the BVI and the bridge domain.
- Add a route entry in the ARP cache.
- Enable BFD fast detection for the ARP protocol to enable detecting failures in communication with ARP hosts.

```
Router(config)# interface BVI 1
```

```
Router(config-if)# host-tracking
Router(config-if-host-tracking)# bgp-gateway
Router(config-if-host-tracking)# arp
Router(config-if-host-tracking-arp)# bfd fast-detect
```

Running Configuration

```
interface BVI 1
  host-tracking
  bgp-gateway
  arp
  bfd fast-detect
```

Verification

Verify if the BFD session is established.

```
Router# show arp host-tracking bvi 1
Interface      TrackingIP      State
BVI1           10.0.0.1        BFD_SESS_UP
```

Verify if the EVPN gateway is enabled.

```
Router# show bgp l2vpn evpn gateway-track
Interface      Bridge          VRF
BVI1           evpn1           vrf1
```

Verify the hosts that are connected to the EVPN. TEP-ID is identifier the EVPN assigns to the host that is being tracked.

```
Router# show evpn tep
```

TEP-ID	Type	Local Info	Remote Info
0x09000004	Host-Track	10.0.0.1	::

EVPN Link Bandwidth for Proportional Multipath on VNF

Table 32: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Link Bandwidth for Proportional Multipath on VNF	Release 7.10.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5700 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards; NCS 5700 line cards [Mode: Compatibility; Native])</p> <p>You can now use the EVPN link bandwidth to set proportional multipath on Virtual Network Forwarders (VNFs) connected to Top of Racks (ToRs). You can advertise the link bandwidth extended community attribute for each path in a network. When you enable EVPN link bandwidth on multiple paths, the bandwidth values of these paths are aggregated and the cumulative bandwidth is advertised across the VNFs. The load metrics is installed in Routing Information Base (RIB) and the RIB redistributes nexthop prefixes to the paths to achieve proportional multipath.</p> <p>This allows distribution of traffic proportional to the capacity of the links across all the available Virtual Network Forwarders (VNFs) that facilitates optimal traffic load balancing across the VNFs.</p> <p>The feature introduces these changes:</p> <p>CLI:</p> <ul style="list-style-type: none"> • evpn-link-bandwidth • set extcommunity evpn-link-bandwidth • delete extcommunity evpn-link-bandwidth

EVPN link bandwidth enables multipath load balancing for external links with unequal bandwidth capacity. In a network, virtual machines (VMs) are connected to ToRs through VNFs. The EVPN link bandwidth extended community attribute is used for advertising the link bandwidth for each path to achieve proportional ECMP, leading to distribution of traffic proportional to the capacity of the links across all the available VNFs connected to ToRs.

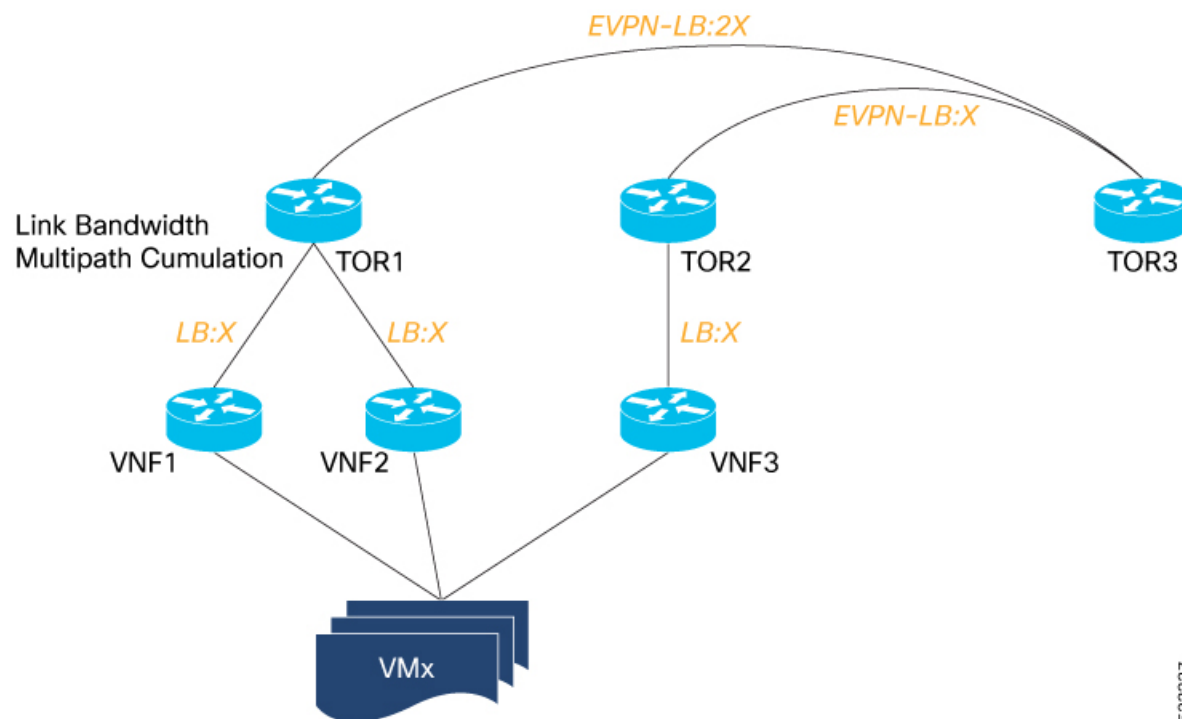

When you enable EVPN link bandwidth on multiple paths, the bandwidth values of these paths are aggregated and the cumulative bandwidth is advertised across the VNFs. The load metrics is installed in Routing Information Base (RIB) and the RIB redistributes nexthop prefixes to the paths to achieve proportional multipath.

To enable EVPN link bandwidth, use the **evpn-link-bandwidth** command.

Topology

The following sample topology shows advertising EVPN link bandwidth for each path in the network. The VMs are connected to ToRs through VNFs.

Figure 25: EVPN Link Bandwidth

In this network:

- VNF1 and VNF2 are connected to TOR1. VNF 3 is connected to TOR2.
- TOR1 performs link bandwidth multipath cumulation of the paths from VNF1 and VNF2.
- The link bandwidth sent from TOR1 to TOR3 is twice (LB:2X) compared to the link bandwidth sent from TOR2 (LB:X).
- The load distribution in TOR3 is proportional to the capacity of the links and traffic is distributed accordingly across the VNFs.

You can also achieve proportional multipath by configuring EVPN gateway IP address in EVPN route type 5 NLRI. For more information, see [Set EVPN Gateway IP Address in EVPN Route Type 5 NLRI, on page 203](#).

Restrictions for EVPN Link Bandwidth

- The EVPN bandwidth mode is supported only on directly connected external BGP neighbors.
- The Routing Information Base (RIB) can handle a maximum of 32 bits for load metrics. Even if you set the RIB weight to more than 32 bits, only 32 bits will be used by the RIB.

- You can configure the EVPN link bandwidth using the **evpn-link-bandwidth** command only with VRF neighbors so that EVPN Route Type 5 is used for originating the routes.

Configure EVPN Link Bandwidth

Perform the following tasks to configure EVPN link bandwidth.

- Create a route policy and add the extended community attribute for EVPN link bandwidth to the route policy by using the **set extcommunity evpn-link-bandwidth** command.
- Apply the route policy to BGP neighbors.
- Configure a VRF instance and enable EVPN link bandwidth for the VRF neighbors by using the **evpn-link-bandwidth** command.

To disable EVPN link bandwidth, you can use the **delete extcommunity evpn-link-bandwidth** command to remove the extended community attribute from the route policy.

Configuration Example

The following example shows how to add extended community attribute for EVPN link bandwidth to a route policy.

```
Router(config)# route-policy evpn-rpl
Router(config-rpl)# set extcommunity evpn-link-bandwidth (1 : 8000)
Router(config-rpl)# end-policy
```

In the following example, the EVPN bandwidth mode is enabled for VRF neighbors.

```
Router(config)# router bgp 100
Router(config-bgp)# neighbor 172.16.1.1
Router(config-bgp-nbr)# address-family l2vpn evpn
Router(config-bgp-nbr-af)# exit
Router(config-bgp-nbr)# exit
Router(config-bgp)# neighbor 172.16.1.2
Router(config-bgp-nbr)# address-family l2vpn evpn
Router(config-bgp-nbr-af)# route-policy evpn-rpl out
Router(config-bgp-nbr-af)# exit
Router(config-bgp-nbr)# exit

Router(config-bgp)# vrf vrf1
Router(config-bgp-vrf)# neighbor 172.16.1.3
Router(config-bgp-vrf-nbr)# evpn-link-bandwidth per path 100
Router(config-bgp-vrf-nbr)# exit
Router(config-bgp-vrf)# neighbor 172.16.1.4
Router(config-bgp-vrf-nbr)# evpn-link-bandwidth per path 100
Router(config-bgp-vrf-nbr)# commit
```

The following example shows how to remove the extended community attribute for EVPN link bandwidth from a route policy.

```
Router(config)# route-policy evpn-rpl
Router(config-rpl)# delete extcommunity evpn-link-bandwidth all
Router(config-rpl)# end-policy
```

Running Configuration

```
route-policy evpn-rpl
  set extcomm evpn-link-bandwidth (1:8000)
end-policy

router bgp 100
  neighbor 172.16.1.1
    address-family l2vpn evpn
  neighbor 172.16.1.2
    address-family l2vpn evpn
    route-policy evpn-rpl out
vrf vrf1
  neighbor 172.16.1.3
    evpn-link-bandwidth per path 100
  neighbor 172.16.1.4
    evpn-link-bandwidth per path 100

route-policy evpn-rpl
  delete extcomm evpn-link-bandwidth all
end-policy
```

Control Word and Flow Label Signaling Attributes in Extended Community Field

Table 33: Feature History Table

Feature Name	Release Information	Feature Description
Control Word and Flow Label Signaling Attributes in Extended Community Field	Release 7.11.1	<p>Introduced in this release on: NCS 5500 fixed port routers; NCS 5700 fixed port routers; NCS 5500 modular routers (NCS 5500 line cards; NCS 5700 line cards [Mode: Compatibility; Native])</p> <p>We have enhanced the information that the Extended Community carries for a route by including details such as frame sequencing information, type of payload, identifying encapsulated traffic, and identifying packets belonging to the same traffic flow (or sharing characteristics such as source or destination addresses). Such additional information helps in proper encapsulation, identification, and handling of traffic flows at the receiving end, and is possible because we've included the control word and flow label signaling attributes to the extended community field.</p> <p>The feature introduces these changes:</p> <p>CLI:</p> <p>The control word and flow label signaling attributes are added to:</p> <ul style="list-style-type: none"> • show bgp l2vpn evpn • show evpn evi

The Extended Community field, an 8-byte component, is part of EVPN Route Types 2 and 3. This field controls the distribution and propagation of EVPN routes across the network. The route type value is used for VPN routing and forwarding, enabling selective advertising of EVPN routes to specific EVPN instances or customer networks.

The **show bgp l2vpn evpn** and **show evpn evi** commands are used to verify BGP neighbours, route type advertisements, and various EVPN control plane parameters. These show commands now display the control word and the flow label signaling attributes in the Extended Community field.

- The control word is a 4-byte field added to the beginning of each MPLS packet that helps identify and distinguish MPLS packets from other types. Integrating the control-word into the Extended Community attribute allows network administrators to identify and address MPLS packet-related concerns.
- The flow label field, a component in the MPLS header, labels packets belonging to the same flow or traffic class. Integrating flow label information into the extended community assists network administrators in ensuring correct packet forwarding.

The **show bgp l2vpn evpn** output displays the control word and flow label signaling attributes. Mismatch in EVPN L2 attributes between the local and remote nodes can impact the EVPN-VPWS PW or E-LAN service.

The following table describes the EVPN L2 attributes.

EVPN L2 Attributes	Description
0x01	Indicates that the PE functions as a backup router.
0x02	Indicates that the PE functions as a primary router.
0x04	Indicates that the control word is enabled and flow label signalling is disabled on the PE.
0x08	Indicates that the flow label signalling is enabled and control word is disabled on the PE.

The following output indicates that the control word is enabled and flow label signalling is disabled on the PE.

```
Router# show bgp l2vpn evpn rd 192.168.10.1:2705 [3][0][32][192.168.10.1]/80 detail
BGP routing table entry for [3][0][32][192.168.10.1]/80, Route Distinguisher:
192.168.10.1:2705
Versions:
  Process          bRIB/RIB   SendTblVer
  Speaker          286721     286721
  Flags: 0x00140001+0x00000000;
Paths: (1 available, best #1)
  Advertised to update-groups (with more than one peer):
    0.2
  Path #1: Received by speaker 0
  Flags: 0x202000000504000b+0x00, import: 0x000, EVPN: 0x0
  Advertised to update-groups (with more than one peer):
    0.2
Local
  0.0.0.0 from 0.0.0.0 (192.168.1.1), if-handle 0x00000000
  Origin IGP, localpref 100, valid, redistributed, best, group-best, import-candidate
  Received Path ID 0, Local Path ID 1, version 286721
  Extended community: EVPN L2 ATTRS:0x04:0 RT:64600:2705
  IMET PMSI Originator Nexthop Address : 192.168.10.1 (reachable)
  PMSI: flags 0x00, type 6, label 24004, ID 0xc0a80a01
```

The **show evpn evi** command shows whether the control word and flow label signaling are locally enabled.

```
Router# show evpn evi vpn-id 2705 inclusive-multicast detail
VPN-ID      Encap  EtherTag  Originating IP
-----
2705        MPLS    0         192.168.10.1
```
