

# **Configuring Ethernet OAM**

This module describes the configuration of Ethernet Operations, Administration, and Maintenance (OAM).

#### **Feature History for Configuring Ethernet OAM**

Release	Modification	
Release 7.5.1	Support for Link Loss Forwarding (LLF) was introduced.	
Release 7.5.1	Support for CFM adaptive bandwidth notifications was introduced for Cisco Network Convergence System 5700 Series routers and routers with Cisco NC57 line cards operating in native mode.

# Information About Configuring Ethernet OAM

To configure Ethernet OAM, you should understand the following concepts:

## **Ethernet Link OAM**

#### Table 1: Feature History Table

Ethernet as a Metro Area Network (MAN) or a Wide Area Network (WAN) technology benefits greatly from the implementation of Operations, Administration and Maintenance (OAM) features. Ethernet link OAM features allow Service Providers to monitor the quality of the connections on a MAN or WAN. Service providers can monitor specific events, . Ethernet link OAM operates on a single, physical link and it can be configured to monitor either side or both sides of that link.

Ethernet link OAM can be configured in the following ways:

- A Link OAM profile can be configured, and this profile can be used to set the parameters for multiple interfaces.
- Link OAM can be configured directly on an interface.

When an interface is also using a link OAM profile, specific parameters that are set in the profile can be overridden by configuring a different value directly on the interface.

An Ethernet Link OAM profile simplifies the process of configuring EOAM features on multiple interfaces. An Ethernet OAM profile, and all of its features, can be referenced by other interfaces, allowing other interfaces to inherit the features of that Ethernet OAM profile.

Individual Ethernet link OAM features can be configured on individual interfaces without being part of a profile. In these cases, the individually configured features always override the features in the profile.

The preferred method of configuring custom EOAM settings is to create an EOAM profile in Ethernet configuration mode and then attach it to an individual interface or to multiple interfaces.

When an EOAM packet is received on any one of the AC interfaces on which EOAM is not configured, the AC interface multicasts the received EOAM packets to other AC interfaces that are part of EVPN-BD to reach the peer. When an EOAM is enabled on the bundle member in the peer, it punts the packet to the CPU in the peer. Also, the EOAM flaps the bundle member as the local or remote Key of the received EOAM does not match.

These standard Ethernet Link OAM features are supported on the router:

### **Neighbor Discovery**

Neighbor discovery enables each end of a link to learn the OAM capabilities of the other end and establish an OAM peer relationship. Each end also can require that the peer have certain capabilities before it will establish a session. You can configure certain actions to be taken if there is a capabilities conflict or if a discovery process times out, using the **action capabilities-conflict** or **action discovery-timeout** commands.

#### **EFD**

Ethernet Fault Detection (EFD) is a mechanism that allows Ethernet OAM protocols, such as CFM, to control the line protocol state of an interface.

Unlike many other interface types, Ethernet interfaces do not have a line protocol, whose state is independent from that of the interface. For Ethernet interfaces, this role is handled by the physical-layer Ethernet protocol itself, and therefore if the interface is physically up, then it is available and traffic can flow.

EFD changes this to allow CFM to act as the line protocol for Ethernet interfaces. This allows CFM to control the interface state so that if a CFM defect (such as AIS or loss of continuity) is detected with an expected peer MEP, the interface can be shut down. This not only stops traffic flow, but also triggers actions in any higher-level protocols to route around the problem. For example, in the case of Layer 2 interfaces, the MAC table would be cleared and MSTP would reconverge. For Layer 3 interfaces, the ARP cache would be cleared and potentially the IGP would reconverge.

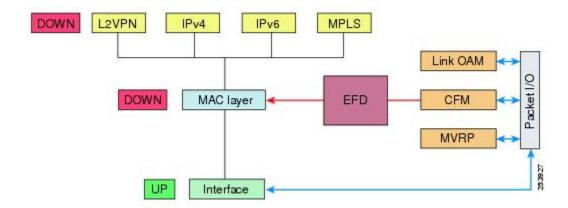

Note

EFD can only be used for down MEPs. When EFD is used to shut down the interface, the CFM frames continue to flow. This allows CFM to detect when the problem has been resolved, and thus bring the interface backup automatically.

This figure shows CFM detection of an error on one of its sessions EFD signaling an error to the corresponding MAC layer for the interface. This triggers the MAC to go to a down state, which further triggers all higher level protocols (Layer 2 pseudowires, IP protocols, and so on) to go down and also trigger a reconvergence where possible. As soon as CFM detects there is no longer any error, it can signal to EFD and all protocols will once again go active.

Figure 1: CFM Error Detection and EFD Trigger

### **MIB Retrieval**

MIB retrieval enables an OAM peer on one side of an interface to get the MIB variables from the remote side of the link. The MIB variables that are retrieved from the remote OAM peer are READ ONLY.

## **SNMP Traps**

SNMP traps can be enabled or disabled on an Ethernet OAM interface.

### **Unidirectional Link Detection Protocol**

Unidirectional Link Detection (UDLD) is a single-hop physical link protocol for monitoring an ethernet link, including both point-to-point and shared media links. This is a Cisco-proprietary protocol to detect link problems, which are not detected at the physical link layer. This protocol is specifically targeted at possible wiring errors, when using unbundled fiber links, where there can be a mismatch between the transmitting and receiving connections of a port.

## **Ethernet CFM**

Table 2: Feature History Table

Feature Name	Release	Description
Support for Link Loss Forwarding	Release 7.5.1	This feature enables high availability between two bridged interfaces by disabling both interfaces if any one of them fails. This functionality allows a fault detected on one side of a CFM-protected network to propagate to the other side, enabling the device to re-route around the failure at that end. In earlier releases, a failure on one bridged interface did not disable the other interface, and connected devices remained unaware of the link loss.

Ethernet Connectivity Fault Management (CFM) is a service-level OAM protocol that provides tools for monitoring and troubleshooting end-to-end Ethernet services per VLAN. This includes proactive connectivity monitoring, fault verification, and fault isolation. CFM uses standard Ethernet frames and can be run on any physical media that is capable of transporting Ethernet service frames. Unlike most other Ethernet protocols which are restricted to a single physical link, CFM frames can transmit across the entire end-to-end Ethernet network.

CFM is defined in two standards:

- IEEE 802.1ag—Defines the core features of the CFM protocol.
- ITU-T Y.1731—Redefines, but maintains compatibility with the features of IEEE 802.1ag, and defines some additional features.

Ethernet CFM supports these functions of ITU-T Y.1731:

• ETH-CC, ETH-RDI, ETH-LB, ETH-LT—These are equivalent to the corresponding features defined in IEEE 802.1ag.

Note

The Linktrace responder procedures defined in IEEE 802.1ag are used rather than the procedures defined in Y.1731; however, these are interoperable.

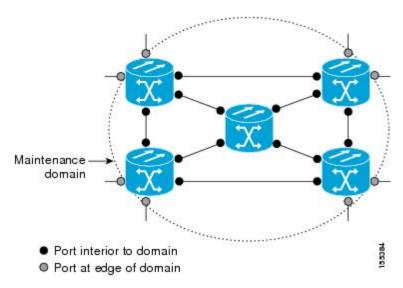

• ETH-AIS—The reception of ETH-LCK messages is also supported.

To understand how the CFM maintenance model works, you need to understand these concepts and features:

#### **Maintenance Domains**

A maintenance domain describes a management space for the purpose of managing and administering a network. A domain is owned and operated by a single entity and defined by the set of interfaces internal to it and at its boundary, as shown in this figure.

Figure 2: CFM Maintenance Domain

A maintenance domain is defined by the bridge ports that are provisioned within it. Domains are assigned maintenance levels, in the range of 0 to 7, by the administrator. The level of the domain is useful in defining the hierarchical relationships of multiple domains.

CFM maintenance domains allow different organizations to use CFM in the same network, but independently. For example, consider a service provider who offers a service to a customer, and to provide that service, they use two other operators in segments of the network. In this environment, CFM can be used in the following ways:

- The customer can use CFM between their CE devices, to verify and manage connectivity across the whole network.
- The service provider can use CFM between their PE devices, to verify and manage the services they are providing.
- Each operator can use CFM within their operator network, to verify and manage connectivity within their network.

Each organization uses a different CFM maintenance domain.

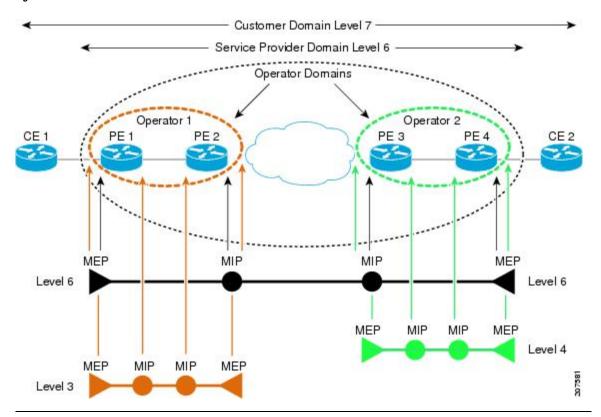

This figure shows an example of the different levels of maintenance domains in a network.

Note

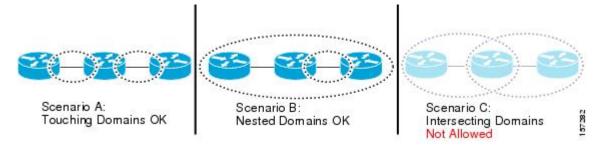

In CFM diagrams, the conventions are that triangles represent MEPs, pointing in the direction that the MEP sends CFM frames, and circles represent MIPs.

Figure 3: Different CFM Maintenance Domains Across a Network

To ensure that the CFM frames for each domain do not interfere with each other, each domain is assigned a maintenance level, between 0 and 7. Where domains are nested, as in this example, the encompassing domain must have a higher level than the domain it encloses. In this case, the domain levels must be negotiated between the organizations involved. The maintenance level is carried in all CFM frames that relate to that domain.

CFM maintenance domains may touch or nest, but cannot intersect. This figure illustrates the supported structure for touching and nested domains, and the unsupported intersection of domains.

#### Services

A CFM service allows an organization to partition its CFM maintenance domain, according to the connectivity within the network. For example, if the network is divided into a number of virtual LANs (VLANs), a CFM service is created for each of these. CFM can then operate independently in each service. It is important that the CFM services match the network topology, so that CFM frames relating to one service cannot be received in a different service. For example, a service provider may use a separate CFM service for each of their customers, to verify and manage connectivity between that customer's end points.

A CFM service is always associated with the maintenance domain that it operates within, and therefore with that domain's maintenance level. All CFM frames relating to the service carry the maintenance level of the corresponding domain.

Note

CFM Services are referred to as *Maintenance Associations* in IEEE 802.1ag and as *Maintenance Entity Groups* in ITU-T Y.1731.

#### **Maintenance Points**

A CFM Maintenance Point (MP) is an instance of a particular CFM service on a specific interface. CFM only operates on an interface if there is a CFM maintenance point on the interface; otherwise, CFM frames are forwarded transparently through the interface.

A maintenance point is always associated with a particular CFM service, and therefore with a particular maintenance domain at a particular level. Maintenance points generally only process CFM frames at the same level as their associated maintenance domain. Frames at a higher maintenance level are always forwarded transparently, while frames at a lower maintenance level are normally dropped. This helps enforce the maintenance domain hierarchy, and ensures that CFM frames for a particular domain cannot leak out beyond the boundary of the domain.

There are two types of MP:

- Maintenance End Points (MEPs)—Created at the edge of the domain. Maintenance end points (MEPs) are members of a particular service within a domain and are responsible for sourcing and sinking CFM frames. They periodically transmit continuity check messages and receive similar messages from other MEPs within their domain. They also transmit traceroute and loopback messages at the request of the administrator. MEPs are responsible for confining CFM messages within the domain.
- Maintenance Intermediate Points (MIPs)—Created in the middle of the domain. Unlike MEPS, MIPs do allow CFM frames at their own level to be forwarded.

#### **MIP Creation**

Unlike MEPs, MIPs are not explicitly configured on each interface. MIPs are created automatically according to the algorithm specified in the CFM 802.1ag standard. The algorithm, in brief, operates as follows for each interface:

- The bridge-domain or cross-connect for the interface is found, and all services associated with that bridge-domain or cross-connect are considered for MIP auto-creation.
- The level of the highest-level MEP on the interface is found. From among the services considered above, the service in the domain with the lowest level that is higher than the highest MEP level is selected. If there are no MEPs on the interface, the service in the domain with the lowest level is selected.

• The MIP auto-creation configuration (**mip auto-create** command) for the selected service is examined to determine whether a MIP should be created.

Note

Configuring a MIP auto-creation policy for a service does not guarantee that a MIP will automatically be created for that service. The policy is only considered if that service is selected by the algorithm first.

### **MEP and CFM Processing Overview**

The boundary of a domain is an interface, rather than a bridge or host. Therefore, MEPs can be sub-divided into two categories:

- Down MEPs—Send CFM frames from the interface where they are configured, and process CFM frames received on that interface. Down MEPs transmit AIS messages upward (toward the cross-connect).
- Up MEPs—Send frames into the bridge relay function, as if they had been received on the interface where the MEP is configured. They process CFM frames that have been received on other interfaces, and have been switched through the bridge relay function as if they are going to be sent out of the interface where the MEP is configured. Up MEPs transmit AIS messages downward (toward the wire). However, AIS packets are only sent when there is a MIP configured on the same interface as the MEP and at the level of the MIP.

Note

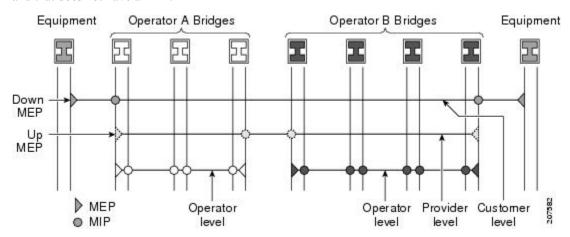

- The terms *Down MEP* and *Up MEP* are defined in the IEEE 802.1ag and ITU-T Y.1731 standards, and refer to the direction that CFM frames are sent from the MEP. The terms should not be confused with the operational status of the MEP.
- The router only supports the "Down MEP level < Up MEP level" configuration.

This figure illustrates the monitored areas for Down and Up MEPs.

DOWN MEP Bridge 1 Bridge 2 Bridge Bridge Bridge Bridge Port Port Port Port Relay Relay Entity Entity Monitored area UP MEP Bridge 1 Bridge 2 Bridge Bridge Bridge Bridge Port Port Port Port Relay Relay Entity Entity 253925 Monitored area

Figure 4: Monitored Areas for Down and Up MEPs

This figure shows maintenance points at different levels. Because domains are allowed to nest but not intersect (see ), a MEP at a low level always corresponds with a MEP or MIP at a higher level. In addition, only a single MIP is allowed on any interface—this is generally created in the lowest domain that exists at the interface and that does not have a MEP.

MIPs and Up MEPs can only exist on switched (Layer 2) interfaces, because they send and receive frames from the bridge relay function. Down MEPs can be created on switched (Layer 2) interfaces.

MEPs continue to operate normally if the interface they are created on is blocked by the Spanning Tree Protocol (STP); that is, CFM frames at the level of the MEP continue to be sent and received, according to the direction of the MEP. MEPs never allow CFM frames at the level of the MEP to be forwarded, so the STP block is maintained.

MIPs also continue to receive CFM frames at their level if the interface is STP blocked, and can respond to any received frames. However, MIPs do not allow CFM frames at the level of the MIP to be forwarded if the interface is blocked.

Note

A separate set of CFM maintenance levels is created every time a VLAN tag is pushed onto the frame. Therefore, if CFM frames are received on an interface which pushes an additional tag, so as to "tunnel" the frames over part of the network, the CFM frames will not be processed by any MPs within the tunnel, even if they are at the same level. For example, if a CFM MP is created on an interface with an encapsulation that matches a single VLAN tag, any CFM frames that are received at the interface that have two VLAN tags will be forwarded transparently, regardless of the CFM level.

### **CFM Protocol Messages**

The CFM protocol consists of a number of different message types, with different purposes. All CFM messages use the CFM EtherType, and carry the CFM maintenance level for the domain to which they apply.

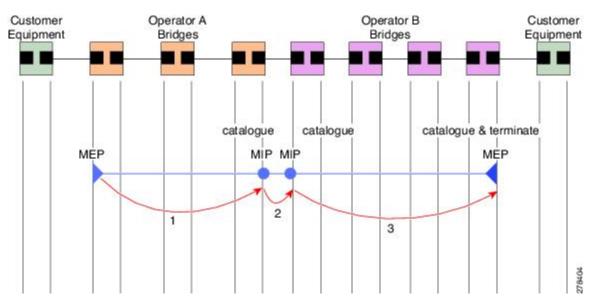

This section describes the following CFM messages:

### Continuity Check (IEEE 802.1ag and ITU-T Y.1731)

Continuity Check Messages (CCMs) are "heartbeat" messages exchanged periodically between all the MEPs in a service. Each MEP sends out multicast CCMs, and receives CCMs from all the other MEPs in the service—these are referred to as *peer MEPs*. This allows each MEP to discover its peer MEPs, and to verify that there is connectivity between them.

MIPs also receive CCMs. MIPs use the information to build a MAC learning database that is used when responding to Linktrace. For more information about Linktrace, see the Linktrace (IEEE 802.1ag and ITU-T Y.1731).

Figure 5: Continuity Check Message Flow

All the MEPs in a service must transmit CCMs at the same interval. IEEE 802.1ag defines 7 possible intervals that can be used:

- 3.3ms
- 10ms
- 100ms
- 1s
- 10s
- 1 minute

A MEP detects a loss of connectivity with one of its peer MEPs when some number of CCMs have been missed. This occurs when sufficient time has passed during which a certain number of CCMs were expected, given the CCM interval. This number is called the *loss threshold*, and is usually set to 3.

CFM is supported only on interfaces which have Layer 2 transport feature enabled.

#### **Maintenance Association Identifier (MAID)**

CCM messages carry a variety of information that allows different defects to be detected in the service. This information includes:

- A configured identifier for the domain of the transmitting MEP. This is referred to as the Maintenance Domain Identifier (MDID).
- A configured identifier for the service of the transmitting MEP. This is referred to as the Short MA Name (SMAN). Together, the MDID and the SMAN make up the Maintenance Association Identifier (MAID). The MAID must be configured identically on every MEP in the service.
- These are restrictions on the type of MAID that are supported for sessions with time interval of less than 1 minute. The MAID supports two types of formats on offloaded MEPs:
  - No Domain Name Format
    - MD Name Format = 1-NoDomainName
    - Short MA Name Format = 3 2 bytes integer value
    - Short MA NAme Length = 2 fixed length
    - Short MA Name = 2 bytes of integer
  - 1731 Maid Format
    - MD Name Format = 1-NoDomainName
    - MA Name Format(MEGID Format) = 32
    - MEGID Length = 13 fixed length
    - MEGID(ICCCode) = 6 Bytes
    - MEGID(UMC) = 7 Bytes
    - ITU Carrier Code (ICC) Number of different configurable ICC code 15 (for each NPU)
    - Unique MEG ID Code (UMC) 4

Maintenance Association Identifier (MAID) comprises of the Maintenance Domain Identifier (MDID) and Short MA Name (SMAN).

MDID **only** supports **null** value and SMAN supports ITU Carrier Code (ICC) or a numerical. No other values are supported.

An example for configuring domain ID null is: ethernet cfm domain SMB level 3 id null

An example for configuring SMAN is: ethernet cfm domain SMB level 3 id null service 901234AB xconnect group 99999 p2p 99999 id number 1

The following table summarizes the supported values and parameters for MDID and SMAN. This table only details the MAID restriction on the hardware offload feature. There is no MAID restriction for software offload or non-offloaded MEPs.

Format	MDID	SMAN	Support	Comment
	No	2 byte integer	Yes	Up to 2000 entries
	No	13 bytes ICCCode (6 bytes) and UMC (7 bytes)	Yes	Up to 15 unique ICC Up to 4K UMC values
48 bytes string based	1-48 bytes of MDID ar	nd SMAN	No	Most commonly used

- A configured numeric identifier for the MEP (the MEP ID). Each MEP in the service must be configured with a different MEP ID.
- Dynamic Remote MEPs are not supported for MEPs with less than 1min interval. You must configure MEP CrossCheck for all such MEPS.
- Sequence numbering is not supported for MEPs with less than 1 minute interval.
- In a Remote Defect Indication (RDI), each MEP includes this in the CCMs it is sending, if it has detected a defect relating to the CCMs it is receiving. This notifies all the MEPs in the service that a defect has been detected somewhere in the service.
- The interval at which CCMs are being transmitted.
- CCM Tx/Rx statistics counters are not supported for MEPs with less than 1 minute intervals.
- Sender TLV and Cisco Proprietary TLVs are not supported for MEPs with less than 1min intervals.
- The status of the interface where the MEP is operating—for example, whether the interface is up, down, STP blocked, and so on.

Note

The status of the interface (up/down) should not be confused with the direction of any MEPs on the interface (Up MEPs/Down MEPs).

These defects can be detected from received CCMs:

- Interval mismatch—The CCM interval in the received CCM does not match the interval that the MEP is sending CCMs.
- Level mismatch—A MEP has received a CCM carrying a lower maintenance level than the MEPs own level.
- Loop—A CCM is received with the source MAC address equal to the MAC address of the interface where the MEP is operating.
- Configuration error—A CCM is received with the same MEP ID as the MEP ID configured for the receiving MEP.
- Cross-connect—A CCM is received with an MAID that does not match the locally configured MAID.
   This generally indicates a VLAN misconfiguration within the network, such that CCMs from one service are leaking into a different service.
- Peer interface down—A CCM is received that indicates the interface on the peer is down.
- Remote defect indication—A CCM is received carrying a remote defect indication.

Note

This defect does not cause the MEP to include a remote defect indication in the CCMs that it is sending.

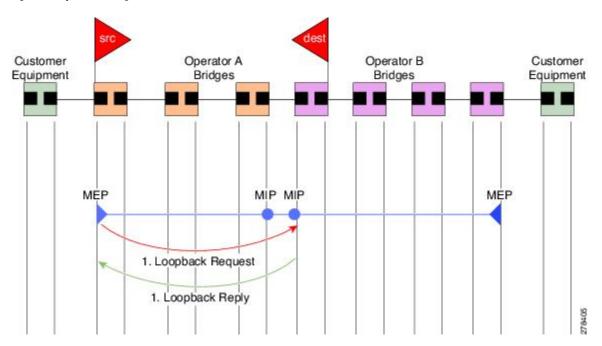

Out-of-sequence CCMs can also be detected by monitoring the sequence number in the received CCMs from each peer MEP. However, this is not considered a CCM defect.

### Loopback (IEEE 802.1ag and ITU-T Y.1731)

Loopback Messages (LBM) and Loopback Replies (LBR) are used to verify connectivity between a local MEP and a particular remote MP. At the request of the administrator, a local MEP sends unicast LBMs to the remote MP. On receiving each LBM, the target maintenance point sends an LBR back to the originating MEP. Loopback indicates whether the destination is reachable or not—it does not allow hop-by-hop discovery of the path. It is similar in concept to an ICMP Echo (ping). Since loopback messages are destined for unicast addresses, they are forwarded like normal data traffic, while observing the maintenance levels. At each device that the loopback reaches, if the outgoing interface is known (in the bridge's forwarding database), then the frame is sent out on that interface. If the outgoing interface is not known, then the message is flooded on all interfaces.

This figure shows an example of CFM loopback message flow between a MEP and MIP.

Figure 6: Loopback Messages

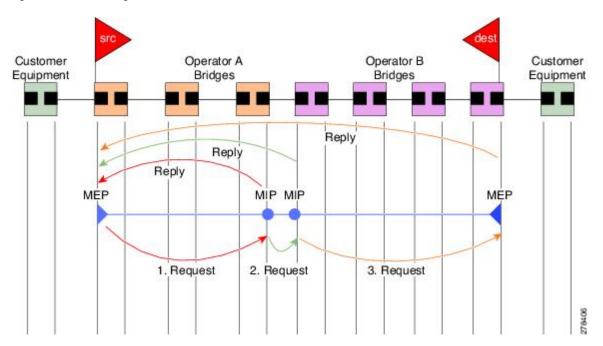

Loopback messages can be padded with user-specified data. This allows data corruption to be detected in the network. They also carry a sequence number which allows for out-of-order frames to be detected.

### Linktrace (IEEE 802.1ag and ITU-T Y.1731)

Linktrace Messages (LTM) and Linktrace Replies (LTR) are used to track the path (hop-by-hop) to a unicast destination MAC address. At the request of the operator, a local MEP sends an LTM. Each hop where there is a maintenance point sends an LTR back to the originating MEP. This allows the administrator to discover connectivity data about the path. It is similar in concept to IP traceroute, although the mechanism is different. In IP traceroute, successive probes are sent, whereas CFM Linktrace uses a single LTM which is forwarded by each MP in the path. LTMs are multicast, and carry the unicast target MAC address as data within the frame. They are intercepted at each hop where there is a maintenance point, and either retransmitted or dropped to discover the unicast path to the target MAC address.

This figure shows an example of CFM linktrace message flow between MEPs and MIPs.

Figure 7: Linktrace Message Flow

The linktrace mechanism is designed to provide useful information even after a network failure. This allows it to be used to locate failures, for example after a loss of continuity is detected. To achieve this, each MP maintains a CCM Learning Database. This maps the source MAC address for each received CCM to the interface through which the CCM was received. It is similar to a typical bridge MAC learning database, except that it is based only on CCMs and it times out much more slowly—on the order of days rather than minutes.

Note

In IEEE 802.1ag, the CCM Learning Database is referred to as the MIP CCM Database. However, it applies to both MIPs and MEPs.

In IEEE 802.1ag, when an MP receives an LTM message, it determines whether to send a reply using the following steps:

- 1. The target MAC address in the LTM is looked up in the bridge MAC learning table. If the MAC address is known, and therefore the egress interface is known, then an LTR is sent.
- **2.** If the MAC address is not found in the bridge MAC learning table, then it is looked up in the CCM learning database. If it is found, then an LTR is sent.
- 3. If the MAC address is not found, then no LTR is sent (and the LTM is not forwarded).

If the target MAC has never been seen previously in the network, the linktrace operation will not produce any results.

Note

IEEE 802.1ag and ITU-T Y.1731 define slightly different linktrace mechanisms. In particular, the use of the CCM learning database and the algorithm described above for responding to LTM messages are specific to IEEE 802.1ag. IEEE 802.1ag also specifies additional information that can be included in LTRs. Regardless of the differences, the two mechanisms are interoperable.

### **Configurable Logging**

CFM supports logging of various conditions to syslog. Logging can be enabled independently for each service, and when the following conditions occur:

- New peer MEPs are detected, or loss of continuity with a peer MEP occurs.
- Changes to the CCM defect conditions are detected.
- · Cross-check "missing" or "unexpected" conditions are detected.
- AIS condition detected (AIS messages received) or cleared (AIS messages no longer received).
- EFD used to shut down an interface, or bring it back up.

### Flexible VLAN Tagging for CFM

The Flexible VLAN Tagging for CFM feature ensures that CFM packets are sent with the right VLAN tags so that they are appropriately handled as a CFM packet by the remote device. When packets are received by an edge router, they are treated as either CFM packets or data packets, depending on the number of tags in the header. The system differentiates between CFM packets and data packets based on the number of tags in the packet, and forwards the packets to the appropriate paths based on the number of tags in the packet.

CFM frames are normally sent with the same VLAN tags as the corresponding customer data traffic on the interface, as defined by the configured encapsulation and tag rewrite operations. Likewise, received frames are treated as CFM frames if they have the correct number of tags as defined by the configured encapsulation and tag rewrite configuration, and are treated as data frames (that is, they are forwarded transparently) if they have more than this number of tags.

In most cases, this behavior is as desired, since the CFM frames are then treated in exactly the same way as the data traffic flowing through the same service. However, in a scenario where multiple customer VLANs are multiplexed over a single multipoint provider service (for example, N:1 bundling), a different behavior might be desirable.

This figure shows an example of a network with multiple VLANS using CFM.

encapsulation dot1q 1-1000
rewrite ingress tag push dot1ad 100
OR
encapsulation dot1q 10
rewrite ingress tag push dot1ad 100

Figure 8: Service Provider Network With Multiple VLANs and CFM

This figure shows a provider's access network, where the S-VLAN tag is used as the service delimiter. PE1 faces the customer, and PE2 is at the edge of the access network facing the core. N:1 bundling is used, so the interface encapsulation matches a range of C-VLAN tags. This could potentially be the full range, resulting in all:1 bundling. There is also a use case where only a single C-VLAN is matched, but the S-VLAN is nevertheless used as the service delimiter—this is more in keeping with the IEEE model, but limits the provider to 4094 services.

CFM is used in this network with a MEP at each end of the access network, and MIPs on the boxes within the network (if it is native Ethernet). In the normal case, CFM frames are sent by the up MEP on PE1 with two VLAN tags, matching the customer data traffic. This means that at the core interfaces and at the MEP on PE2, the CFM frames are forwarded as if they were customer data traffic, since these interfaces match only on the S-VLAN tag. So, the CFM frames sent by the MEP on PE1 are not seen by any of the other MPs.

Flexible VLAN tagging changes the encapsulation for CFM frames that are sent and received at Up MEPs. Flexible VLAN tagging allows the frames to be sent from the MEP on PE1 with just the S-VLAN tag that represents the provider service. If this is done, the core interfaces will treat the frames as CFM frames and they will be seen by the MIPs and by the MEP on PE2. Likewise, the MEP on PE1 should handle received frames with only one tag, as this is what it will receive from the MEP on PE2.

To ensure that CFM packets from Up MEPs are routed to the appropriate paths successfully, tags may be set to a specific number in a domain service, using the **tags** command. Currently, tags can only be set to one (1).

# **How to Configure Ethernet OAM**

This section provides these configuration procedures:

## **Configuring Ethernet Link OAM**

Custom EOAM settings can be configured and shared on multiple interfaces by creating an EOAM profile in Ethernet configuration mode and then attaching the profile to individual interfaces. The profile configuration does not take effect until the profile is attached to an interface. After an EOAM profile is attached to an interface, individual EOAM features can be configured separately on the interface to override the profile settings when desired.

This section describes how to configure an EOAM profile and attach it to an interface in these procedures:

## **Configuring an Ethernet OAM Profile**

Perform these steps to configure an Ethernet OAM profile.

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure terminal	
Step 2	ethernet oam profile profile-name	Creates a new Ethernet Operations, Administration and Maintenance (OAM)
	Example:	profile and enters Ethernet OAM configuration
	<pre>RP/0/RP0/CPU0:router(config) # ethernet   oam profile Profile_1</pre>	mode.
Step 3	link-monitor	Enters the Ethernet OAM link monitor
	Example:	configuration mode.
	<pre>RP/0/RP0/CPU0:router(config-eoam)# link-monitor</pre>	
Step 4	symbol-period window window	(Optional) Configures the window size (in
	Example:	milliseconds) for an Ethernet OAM symbol-period error event. The IEEE 802.3
	RP/0/RP0/CPU0:router(config-eoam-lm)#symbol-period window 60000	standard defines the window size as a number of symbols rather than a time duration. These two formats can be converted either way by using a knowledge of the interface speed and encoding.
		The range is 1000 to 60000.
		The default value is 1000.
Step 5	symbol-period threshold low threshold high threshold symbol-period threshold { ppm [ low threshold ] [ high threshold ]   symbols [ low threshold [ thousand   million   billion ]] [ high threshold [ thousand   million   billion	(Optional) Configures the thresholds (in symbols) that trigger an Ethernet OAM symbol-period error event. The high threshold is optional and is configurable only in conjunction with the low threshold.
		The range is 1 to 1000000.
	Example:	The default low threshold is 1.
	<pre>RP/0/RP0/CPU0:router(config-eoam-lm)# symbol-period threshold ppm low 1 high 1000000</pre>	
Step 6	frame window window	(Optional) Configures the frame window size
	Example:	(in milliseconds) of an OAM frame error event.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router(config-eoam-lm)#	The range is from 1000 to 60000.
	frame window 6000	The default value is 1000.
Step 7	frame threshold low threshold high threshold  Example:  RP/0/RP0/CPU0:router(config-eoam-lm) # frame threshold low 10000000 high 60000000	(Optional) Configures the thresholds (in symbols) that triggers an Ethernet OAM frame error event. The high threshold is optional and is configurable only in conjunction with the low threshold.
		The range is from 0 to 60000000.
		The default low threshold is 1.
Step 8	frame-period window window  Example:  RP/0/RP0/CPU0:router(config-eoam-lm)#	(Optional) Configures the window size (in milliseconds) for an Ethernet OAM frame-period error event. The IEEE 802.3 standard defines the window size as number of frames rather than a time duration. These
	frame-period window 60000  RP/0/RP0/CPU0:router(config-eoam-lm)# frame-period window milliseconds 60000	two formats can be converted either way by using a knowledge of the interface speed. Note that the conversion assumes that all frames are of the minimum size.
		The range is from 1000 to 60000.
		The default value is 1000.
		Note  The only accepted values are multiples of the line cardinterface module-specific polling interval, that is, 1000 milliseconds for most line cardsinterface modules.
Step 9	frame-period threshold lowthreshold high threshold frame-period threshold { ppm [ low threshold ] [ high threshold ]   frames [ low threshold [ thousand   million   billion ]] [ high threshold [ thousand   million   billion ]]}  Example:  RP/0/RP0/CPU0:router(config-eoam-lm) #	(Optional) Configures the thresholds (in errors per million frames ) that trigger an Ethernet OAM frame-period error event. The frame period window is defined in the IEEE specification as a number of received frames, in our implementation it is x milliseconds. The high threshold is optional and is configurable only in conjunction with the low threshold.
	frame-period threshold ppm low 100 high 1000000	The range is from 1 to 1000000.
	11-91.	The default low threshold is 1.
		To obtain the number of frames, the configured time interval is converted to a window size in frames using the interface speed. For example, for a 1Gbps interface, the IEEE defines minimum frame size as 512 bits. So, we get a maximum of approximately 1.5 million frames per second. If the window size is configured

	Command or Action	Purpose
		to be 8 seconds (8000ms) then this would give us a Window of 12 million frames in the specification's definition of Errored Frame Window.
		The thresholds for frame-period are measured in errors per million frames. Hence, if you configure a window of 8000ms (that is a window of 12 million frames) and a high threshold of 100, then the threshold would be crossed if there are 1200 errored frames in that period (that is, 100 per million for 12 million).
Step 10	frame-seconds window window	(Optional) Configures the window size (in
	Example:	milliseconds) for the OAM frame-seconds error event.
	RP/0/RP0/CPU0:router(config-eoam-lm)#	The range is 10000 to 900000.
	frame-seconds window 900000	The default value is 60000.
		Note  The only accepted values are multiples of the line cardinterface module-specific polling interval, that is, 1000 milliseconds for most line cardsinterface modules.
Step 11	frame-seconds threshold low threshold high threshold	seconds) that trigger a frame-seconds error
	Example:	event. The high threshold value can be configured only in conjunction with the low threshold value.
	<pre>RP/0/RP0/CPU0:router(config-eoam-lm) # frame-seconds threshold low 3 high 900</pre>	The range is 1 to 900
		The default value is 1.
Step 12	exit	Exits back to Ethernet OAM mode.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-eoam-lm) # exit</pre>	
Step 13	mib-retrieval	Enables MIB retrieval in an Ethernet OAM
	Example:	profile or on an Ethernet OAM interface.
	<pre>RP/0/RP0/CPU0:router(config-eoam) # mib-retrieval</pre>	

	Command or Action	Purpose
Step 14	connection timeout <timeout>  Example:</timeout>	Configures the connection timeout period for an Ethernet OAM session. as a multiple of the hello interval.
	RP/0/RP0/CPU0:router(config-eoam)#	The range is 2 to 30.
	connection timeout 30	The default value is 5.
Step 15	hello-interval {100ms 1s}  Example:	Configures the time interval between hello packets for an Ethernet OAM session. The default is 1 second (1s).
	<pre>RP/0/RP0/CPU0:router(config-eoam) # hello-interval 100ms</pre>	
Step 16	mode {active passive} Example:	Configures the Ethernet OAM mode. The default is active.
	RP/0/RP0/CPU0:router(config-eoam) # mode passive	
Step 17	require-remote mode {active passive}  Example:	Requires that active mode or passive mode is configured on the remote end before the OAM session becomes active.
	<pre>RP/0/RP0/CPU0:router(config-eoam)# require-remote mode active</pre>	
Step 18	require-remote mib-retrieval  Example:	Requires that MIB-retrieval is configured on the remote end before the OAM session becomes active.
	<pre>RP/0/RP0/CPU0:router(config-eoam) # require-remote mib-retrieval</pre>	
Step 19	action capabilities-conflict {disable   efd   error-disable-interface}  Example:	Specifies the action that is taken on an interface when a capabilities-conflict event occurs. The default action is to create a syslog entry.
	RP/0/RP0/CPU0:router(config-eoam)# action capabilities-conflict efd	Note  • If you change the default, the log keyword option is available in Interface Ethernet OAM configuration mode to override the profile setting and log the event for the interface when it occurs.
Step 20	action critical-event {disable   error-disable-interface}	Specifies the action that is taken on an interface when a critical-event notification is received from the remote Ethernet OAM peer. The
	<pre>Example:  RP/0/RP0/CPU0:router(config-eoam)#</pre>	default action is to create a syslog entry.

	Command or Action	Purpose
	action critical-event error-disable-interface	Note  • If you change the default, the log keyword option is available in Interface Ethernet OAM configuration mode to override the profile setting and log the event for the interface when it occurs.
Step 21	action discovery-timeout {disable   efd   error-disable-interface}	Specifies the action that is taken on an interface when a connection timeout occurs. The default action is to create a syslog entry.
	RP/0/RP0/CPU0:router(config-eoam)# action discovery-timeout efd	Note  • If you change the default, the log keyword option is available in Interface Ethernet OAM configuration mode to override the profile setting and log the event for the interface when it occurs.
Step 22	action dying-gasp {disable   error-disable-interface}  Example:	Specifies the action that is taken on an interface when a dying-gasp notification is received from the remote Ethernet OAM peer. The default action is to create a syslog entry.
	<pre>RP/0/RP0/CPU0:router(config-eoam)# action dying-gasp error-disable-interface</pre>	Note  • If you change the default, the log keyword option is available in Interface Ethernet OAM configuration mode to override the profile setting and log the event for the interface when it occurs.
Step 23	action high-threshold {error-disable-interface   log}	Specifies the action that is taken on an interface when a high threshold is exceeded. The default is to take no action when a high threshold is
	Example:	exceeded.
	RP/0/RP0/CPU0:router(config-eoam)#	

	Command or Action	Purpose	
	action high-threshold error-disable-interface	Note  • If you change the the disable keyword is available in Intercept DAM configuration more override the profit and take no action interface when the occurs.	ord option erface  de to le setting at the
Step 24	action session-down {disable   efd   error-disable-interface}	Specifies the action that is taken on an interfac when an Ethernet OAM session goes down.	
	<pre>Example:  RP/0/RP0/CPU0:router(config-eoam)# action session-down efd</pre>	Note  • If you change the the log keyword of available in Interfection Ethernet OAM configuration more override the profit and log the event interface when it	option is face  de to le setting for the
Step 25	action session-up disable  Example:	Specifies that no action is taken on an interface when an Ethernet OAM session is established. The default action is to create a syslog entry.	
	RP/0/RP0/CPU0:router(config-eoam)# action session-up disable	Note  • If you change the the log keyword of available in Interfection Ethernet OAM configuration most override the profit and log the event interface when it	option is accede to le setting for the
Step 26	action uni-directional link-fault {disable efd   error-disable-interface}	Specifies the action that is taken on a when a link-fault notification is received the remote Ethernet OAM peer. The action is to create a syslog entry.  Note  • If you change the the log keyword of available in Interfection Ethernet OAM configuration more override the profit and log the event interface when it	default, option is cace de to le setting for the

	Command or Action	Purpose
Step 27	action wiring-conflict {disable   efd   log}  Example:  RP/0/RP0/CPU0:router(config-eoam) # action session-down efd	Specifies the action that is taken on an interface when a wiring-conflict event occurs. The default is to put the interface into error-disable state.  Note  • If you change the default, the error-disable-interface keyword option is available in Interface Ethernet OAM configuration mode to override the profile setting and put the interface into error-disable state when the event occurs.
Step 28	<pre>uni-directional link-fault detection Example:  RP/0/RP0/CPU0:router(config-eoam) # uni-directional link-fault detection</pre>	Enables detection of a local, unidirectional link fault and sends notification of that fault to an Ethernet OAM peer.
Step 29	<pre>commit Example:  RP/0/RP0/CPU0:router(config-if) # commi</pre>	Saves the configuration changes to the running configuration file and remains within the configuration session.
Step 30	<pre>end Example:  RP/0/RP0/CPU0:router(config-if) # end</pre>	Ends the configuration session and exits to the EXEC mode.

## Attaching an Ethernet OAM Profile to an Interface

Perform these steps to attach an Ethernet OAM profile to an interface:

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure terminal	

	Command or Action	Purpose
Step 2	interface [   HundredGigE  TenGigE] interface-path-id Example:	Enters interface configuration mode and specifies the Ethernet interface name and notation <i>rack/slot/module/port</i> .
	<pre>RP/0/RP0/CPU0:router(config) # interface TenGigE 0/0/0/0</pre>	
Step 3	ethernet oam	Enables Ethernet OAM and enters interface
	Example:	Ethernet OAM configuration mode.
	RP/0/RP0/CPU0:router(config-if)# ethernet oam	
Step 4	profile profile-name  Example:	Attaches the specified Ethernet OAM profile ( <i>profile-name</i> ), and all of its configuration, to the interface.
	<pre>RP/0/RP0/CPU0:router(config-if-eoam)# profile Profile_1</pre>	
Step 5	commit	Saves the configuration changes to the running
	Example:	configuration file and remains within the configuration session.
	RP/0/RP0/CPU0:router(config-if)# commit	
Step 6	end	Ends the configuration session and exits to the
	Example:	EXEC mode.
	RP/0/RP0/CPU0:router(config-if)# end	

## Configuring Ethernet OAM at an Interface and Overriding the Profile Configuration

Using an EOAM profile is an efficient way of configuring multiple interfaces with a common EOAM configuration. However, if you want to use a profile but also change the behavior of certain functions for a particular interface, then you can override the profile configuration. To override certain profile settings that are applied to an interface, you can configure that command in interface Ethernet OAM configuration mode to change the behavior for that interface.

In some cases, only certain keyword options are available in interface Ethernet OAM configuration due to the default settings for the command. For example, without any configuration of the **action** commands, several forms of the command have a default behavior of creating a syslog entry when a profile is created and applied to an interface. Therefore, the **log** keyword is not available in Ethernet OAM configuration for these commands in the profile because it is the default behavior. However, the **log** keyword is available in Interface Ethernet OAM configuration if the default is changed in the profile configuration so you can retain the action of creating a syslog entry for a particular interface.

To see all of the default Ethernet OAM configuration settings, see the Verifying the Ethernet OAM Configuration.

To configure Ethernet OAM settings at an interface and override the profile configuration, perform these steps:

#### **Procedure**

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:  RP/0/RP0/CPU0:router# configure terminal	
<u> </u>		
Step 2	interface [HundredGigE   TenGigE] interface-path-id	Enters interface configuration mode and specifies the Ethernet interface name and notation <i>rack/slot/module/port</i> .
	Example:  RP/0/RP0/CPU0:router(config) # interface TenGigE 0/0/0/0	Note • The example indicates an
Step 3	ethernet oam  Example:	Enables Ethernet OAM and enters interface Ethernet OAM configuration mode.
	RP/0/RP0/CPU0:router(config-if)# ethernet	
Step 4	<pre>interface-Ethernet-OAM-command Example:     RP/0/RP0/CPU0:router(config-if-eoam) #     action capabilities-conflict     error-disable-interface</pre>	Configures a setting for an Ethernet OAM configuration command and overrides the setting for the profile configuration, where <i>interface-Ethernet-OAM-command</i> is one of the supported commands on the platform in interface Ethernet OAM configuration mode.
Step 5	commit Example:	Saves the configuration changes to the running configuration file and remains within the configuration session.
	RP/0/RP0/CPU0:router(config-if)# commit	
Step 6	end Example:	Ends the configuration session and exits to the EXEC mode.
	RP/0/RP0/CPU0:router(config-if)# end	

### **Verifying the Ethernet OAM Configuration**

Use the **show ethernet oam configuration** command to display the values for the Ethernet OAM configuration for a particular interface, or for all interfaces. The following example shows the default values for Ethernet OAM settings:

RP/0/RP0/CPU0:router# show ethernet oam configuration Thu Aug 5 22:07:06.870 DST GigabitEthernet0/0/0/0: Hello interval: 1s Mib retrieval enabled: Ν Uni-directional link-fault detection enabled: N Configured mode: Active Connection timeout: 5 Symbol period window: 0 Symbol period low threshold: Symbol period high threshold: None 1000 Frame window: Frame low threshold: Frame high threshold: None Frame period window: 1000 Frame period low threshold: 1 Frame period high threshold: None 60000 Frame seconds window: Frame seconds low threshold: Frame seconds high threshold: None High threshold action: None Link fault action: Log Dying gasp action: Log Critical event action: Log Discovery timeout action: Log Capabilities conflict action: Loa Wiring conflict action: Error-Disable Session up action: Log Session down action: Log Require remote mode: Ignore Require remote MIB retrieval:

## **Configuring Ethernet CFM**

Note

CFM is not supported for the following:

- L3 Interfaces and Sub-Interfaces
- Bundle Member Ports
- EVPN-FXC
- Bridge Domain
- VPLS

### **Configuring a CFM Maintenance Domain**

To configure a CFM maintenance domain, perform the following steps:

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters Ethernet Connectivity Fault Management
	Example:	(CFM) configuration mode.
	RP/0/RP0/CPU0:router(config)# ethernet cfm	
Step 3	traceroute cache hold-time minutes size entries	(Optional) Sets the maximum limit of traceroute cache entries or the maximum time limit to hold
	Example:	the traceroute cache entries. The default is 100 minutes and 100 entries.
	<pre>RP/0/RP0/CPU0:router(config-cfm)# traceroute cache hold-time 1 size 3000</pre>	
Step 4	domain domain-name level level-value [id [null] [dns DNS-name] [mac H.H.H] [string string] ]	Creates and names a container for all domain configurations and enters CFM domain configuration mode.
	Example:	The level must be specified.
	RP/0/RP0/CPU0:router(config-cfm)# domain Domain_One level 1 id string D1	The <b>id</b> is the maintenance domain identifier (MDID) and is used as the first part of the maintenance association identifier (MAID) in CFM frames. If the MDID is not specified, the domain name is used as the MDID by default.
Step 5	end or commit	Saves configuration changes.
	Example:	• When you use the <b>end</b> command, the
	RP/0/RP0/CPU0:router(config-cfm-dmn)#	system prompts you to commit change
	commit	Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
		• Entering <b>yes</b> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
		Entering <b>no</b> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
		• Entering <b>cancel</b> leaves the router in the current configuration session without

Command or Action	Purpose
	exiting or committing the configuration changes.
	Use the <b>commit</b> command to save the configuration changes to the running configuration file and remain within the configuration session.

## **Configuring Services for a CFM Maintenance Domain**

You can configure up to 2000 CFM services for a maintenance domain. To configure services for a CFM maintenance domain, perform the following steps:

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters Ethernet CFM configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config) # ethernet cfm	
Step 3	domain domain-name level level-value [id [null] [dns DNS-name] [mac H.H.H] [string string] ]	Creates and names a container for all domain configurations at a specified maintenance level, and enters CFM domain configuration mode.
	Example:  RP/0/RP0/CPU0:router(config-cfm)# domain Domain_One level 1 id string D1	The <b>id</b> is the maintenance domain identifier (MDID) and is used as the first part of the maintenance association identifier (MAID) in CFM frames. If the MDID is not specified, the domain name is used as the MDID by default.
Step 4	service service-name {down-meps   xconnect group xconnect-group-name m2mp   p2p xconnect-name}[id [icc-based icc-string umc-string]   [ [number number] Example:	Configures and associates a service with the domain and enters CFM domain service configuration mode. You can specify that the service is used only for down MEPs, or associate the service with a bridge domain where MIPs and up MEPs will be created.
	RP/0/RP0/CPU0:router(config-cfm-dmn)# service ABC xconnect group X1 p2p ADB	The <b>id</b> sets the short MA name.
Step 5	end or commit	Saves configuration changes.
	Example:	

 Command or Action	Purpose
RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# commit	When you use the <b>end</b> command, the system prompts you to commit changes:
	Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
	• Entering <b>yes</b> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
	• Entering <b>no</b> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
	• Entering <b>cancel</b> leaves the router in the current configuration session without exiting or committing the configuration changes.
	Use the <b>commit</b> command to save the configuration changes to the running configuration file and remain within the configuration session.

## **Enabling and Configuring Continuity Check for a CFM Service**

To configure Continuity Check for a CFM service, complete the following steps:

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters Ethernet Connectivity Fault Management
	Example:	(CFM) configuration mode.
	RP/0/RP0/CPU0:router(config)# ethernet cfm	
Step 3	domain domain-name level level-value [id	Creates and names a container for all domain
	[null] [dns DNS-name] [mac H.H.H] [string string]]	configurations and enters the CFM domain configuration mode.
	Example:	The level must be specified.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router(config-cfm)# domain Domain_One level 1 id string D1	The <b>id</b> is the maintenance domain identifier (MDID) and is used as the first part of the maintenance association identifier (MAID) in CFM frames. If the MDID is not specified, the domain name is used as the MDID by default.
Step 4	service service-name {down-meps   xconnect group xconnect-group-name p2p xconnect-name}[id [icc-based icc-string umc-string]   [ [number number]  Example:  RP/0/RP0/CPU0:router(config-cfm-dmn) # service ABC xconnect group X1 p2p ADB	Configures and associates a service with the domain and enters CFM domain service configuration mode. You can specify that the service is used only for down MEPs, or associate the service with a bridge domain or xconnect where MIPs and up MEPs will be created.  The id sets the short MA name.
Step 5	<pre>continuity-check interval time [loss-threshold threshold]  Example:  RP/0/RP0/CPU0:router(config-cfm-dmn-svc)#   continuity-check interval 100m loss-threshold 10</pre>	(Optional) Enables Continuity Check and specifies the time interval at which CCMs are transmitted or to set the threshold limit for when a MEP is declared down.
Step 6	<pre>continuity-check archive hold-time minutes Example:  RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# continuity-check archive hold-time 100</pre>	(Optional) Configures how long information about peer MEPs is stored after they have timed out.
Step 7	<pre>continuity-check loss auto-traceroute Example:  RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# continuity-check loss auto-traceroute</pre>	(Optional) Configures automatic triggering of a traceroute when a MEP is declared down.
Step 8	end or commit	Saves configuration changes.
	<pre>Example:  RP/0/RP0/CPU0:router(config-cfm-dmn-svc)#   commit</pre>	<ul> <li>When you use the end command, the system prompts you to commit changes:</li> <li>Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:</li> <li>Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.</li> <li>Entering no exits the configuration session</li> </ul>
		and returns the router to EXEC mode

Command or Action	Purpose
	without committing the configuration changes.
	• Entering <b>cancel</b> leaves the router in the current configuration session without exiting or committing the configuration changes.
	<ul> <li>Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.</li> </ul>

### **Configuring Automatic MIP Creation for a CFM Service**

For more information about the algorithm for creating MIPs, see the **MIP Creation** section.

To configure automatic MIP creation for a CFM service, complete the following steps:

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters the Ethernet Connectivity Fault
	Example:	Management (CFM) configuration mode.
	RP/0/RP0/CPU0:router# ethernet cfm	
Step 3	domain domain-name level level-value [id [null] [dns DNS-name] [mac H.H.H] [string string] ]	Creates and names a container for all domain configurations and enters the CFM domain configuration mode.
	Example:  RP/0/RP0/CPU0:router(config-cfm) # domain	The level must be specified. The only supported option is <b>id [null]</b> for less than 1min interval MEPS.
	Domain_One level 1 id string D1	The <b>id</b> is the maintenance domain identifier (MDID) and is used as the first part of the maintenance association identifier (MAID) in CFM frames. If the MDID is not specified, the domain name is used as the MDID by default.
Step 4	service service-name {down-meps   xconnect	Configures and associates a service with the
	group xconnect-group-name	domain and enters CFM domain service
	p2p xconnect-name}[id [icc-basedicc-string	configuration mode. You can specify that the
	umc-string]   [number number]	service is used only for down MEPs, or

	Command or Action	Purpose
	Example:	associate the service with a bridge domain where MIPs and up MEPs will be created.
	RP/0/RP0/CPU0:router(config-cfm-dmn)# service ABC xconnect group X1 p2p ADB	The <b>id</b> sets the short MA name.
Step 5	mip auto-create {all   lower-mep-only} {ccm-learning}	(Optional) Enables the automatic creation of MIPs in a bridge domain. <b>ccm-learning</b> option
	Example:	enables CCM learning for MIPs created in this service. This must be used only in services with
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# mip auto-create all ccm-learning</pre>	a relatively long CCM interval of at least 100
Step 6	end or commit	Saves configuration changes.
	Example:	When you use the <b>end</b> command, the system prompts you to commit changes:
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# commit</pre>	Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
		• Entering <b>yes</b> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
		Entering <b>no</b> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
		• Entering <b>cancel</b> leaves the router in the current configuration session without exiting or committing the configuration changes.
		Use the <b>commit</b> command to save the configuration changes to the running configuration file and remain within the configuration session.

## **Configuring Cross-Check on a MEP for a CFM Service**

To configure cross-check on a MEP for a CFM service and specify the expected set of MEPs, complete the following steps:

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters the Ethernet Connectivity Fault
	Example:	Management (CFM) configuration mode.
	RP/0/RP0/CPU0:router# ethernet cfm	
Step 3	domain domain-name level level-value [id [null] [dns DNS-name] [mac H.H.H] [string string] ]	Creates and names a container for all domain configurations and enters the CFM domain configuration mode.
	Example:	The level must be specified.
	RP/0/RP0/CPU0:router(config-cfm)# domain Domain_One level 1 id string D1	The <b>id</b> is the maintenance domain identifier (MDID) and is used as the first part of the maintenance association identifier (MAID) in CFM frames. If the MDID is not specified, the domain name is used as the MDID by default.
Step 4	service service-name {bridge group bridge-domain-group bridge-domain bridge-domain-name   down-meps   xconnect group xconnect-group-name p2p xconnect-name}[id [icc-based icc-string umc-string]   [string text]   [number number]   [vlan-id id-number]   [vpn-id oui-vpnid]]	Configures and associates a service with the domain and enters CFM domain service configuration mode. You can specify that the service is used only for down MEPs, or associate the service with a bridge domain or xconnect where MIPs and up MEPs will be created.
	Example:	The <b>id</b> sets the short MA name.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn)# service Bridge_Service bridge group BD1 bridge-domain B1</pre>	
Step 5	mep crosscheck	Enters CFM MEP crosscheck configuration
	Example:	mode.
	<pre>RP/0/RP0/CPU0:router(config-cfm-xcheck)# mep crosscheck mep-id 10</pre>	
Step 6	mep-id mep-id-number [mac-address	Enables cross-check on a MEP.
	mac-address]	Note • Repeat this command for
	Example:	every MEP that you want included in the expected set
	<pre>RP/0/RP0/CPU0:router(config-cfm-xcheck)# mep-id 10</pre>	0.455
Step 7	end or commit	Saves configuration changes.

Command or Action	Purpose
Example:  RP/0/RP0/CPU0:router(config-cfm-xcheck)#	When you use the <b>end</b> command, the system prompts you to commit changes:
commit	Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
	• Entering <b>yes</b> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
	Entering <b>no</b> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
	• Entering <b>cancel</b> leaves the router in the current configuration session without exiting or committing the configuration changes.
	Use the <b>commit</b> command to save the configuration changes to the running configuration file and remain within the configuration session.

## **Configuring Other Options for a CFM Service**

To configure other options for a CFM service, complete the following steps:

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters the Ethernet Connectivity Fault Management (CFM) configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# ethernet cfm	
Step 3	domain domain-name level level-value [id [null] [dns DNS-name] [mac H.H.H] [string string] ]	Creates and names a container for all domain configurations and enters the CFM domain configuration mode.
	Example:	The level must be specified.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router(config-cfm)# domain Domain_One level 1 id string D1	The <b>id</b> is the maintenance domain identifier (MDID) and is used as the first part of the maintenance association identifier (MAID) in CFM frames. If the MDID is not specified, the domain name is used as the MDID by default.
Step 4	service service-name {bridge group bridge-domain-group bridge-domain bridge-domain-name   down-meps   xconnect group xconnect-group-name p2p xconnect-name}[id [icc-based icc-string umc-string]   [string text]   [number number]   [vlan-id id-number]   [vpn-id oui-vpnid]]	Configures and associates a service with the domain and enters CFM domain service configuration mode. You can specify that the service is used only for down MEPs, or associate the service with a bridge domain or xconnect where MIPs and up MEPs will be created.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn)# service Bridge_Service bridge group BD1</pre>	The <b>id</b> sets the short MA name.
	bridge-domain B1	
Step 5	maximum-meps number  Example:	(Optional) Configures the maximum number (2 to 8190) of MEPs across the network, which limits the number of peer MEPs recorded in the database.
	RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# maximum-meps 1000	
Step 6	log {ais continuity-check errors continuity-check mep changes crosscheck errors efd}	(Optional) Enables logging of certain types of events.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# log continuity-check errors</pre>	
Step 7	end or commit	Saves configuration changes.
	<pre>Example:  RP/0/RP0/CPU0:router(config-cfm-dmn-svc)#   commit</pre>	• When you use the <b>end</b> command, the system prompts you to commit changes:  Uncommitted changes found, commit them before exiting (yes/no/cancel)?
		<ul> <li>Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.</li> <li>Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</li> </ul>

Command or Action	Purpose
	Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.      Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.

# **Configuring CFM MEPs**

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	<pre>interface {HundredGigE   TenGigE} interface-path-id</pre>	Type of Ethernet interface on which you want to create a MEP. Enter <b>HundredGigE</b> or
	Example:	<b>TenGigE</b> and the physical interface or virtual interface.
	<pre>RP/0/RP0/CPU0:router(config) # interface TenGigE 0/0/0/1</pre>	Note  • Use the show interfaces command to see a list of all interfaces currently configured on the router.
Step 3	<pre>interface {HundredGigE   TenGigE   Bundle-Ether} interface-path-id.subinterface Example:  RP/0/RP0/CPU0:router(config) # interface TenGigE 0/0/0/1.1</pre>	Type of Ethernet interface on which you want to create a MEP. Enter <b>HundredGigE</b> , <b>TenGigE</b> , or <b>Bundle-Ether</b> and the physical interface or virtual interface followed by the subinterface path ID.  Naming convention is interface-path-id.subinterface. The period in front of the subinterface value is required as part of the notation.
Step 4	<pre>interface {HundredGigE   TenGigE} interface-path-id  Example:  RP/0/RP0/CPU0:router(config) # interface TenGigE 0/0/0/1</pre>	Type of Ethernet interface on which you want to create a MEP. Enter <b>HundredGigE</b> or <b>TenGigE</b> and the physical interface or virtual interface.

	Command or Action	Purpose
		Note  • Use the show interfaces command to see a list of all interfaces currently configured on the router.
Step 5	<pre>ethernet cfm Example:  RP/0/RP0/CPU0:router(config-if)# ethernet cfm</pre>	Enters interface Ethernet CFM configuration mode.
Step 6	mep domain domain-name service service-name mep-id id-number  Example:  RP/0/RP0/CPU0:router(config-if-cfm) # mep domain Dm1 service Sv1 mep-id 1	Creates a maintenance end point (MEP) on an interface and enters interface CFM MEP configuration mode.
Step 7	<pre>cos cos Example:  RP/0/RP0/CPU0:router(config-if-cfm-mep) # cos 7</pre>	(Optional) Configures the class of service (CoS) (from 0 to 7) for all CFM packets generated by the MEP on an interface. If not configured, the CoS is inherited from the Ethernet interface.  Note  For Ethernet interfaces, the CoS is carried as a field in the VLAN tag. Therefore, CoS only applies to interfaces where packets are sent with VLAN tags. If the cos (CFM) command is executed for a MEP on an interface that does not have a VLAN encapsulation configured, it will be ignored.
Step 8	<pre>end or commit Example:  RP/0/RP0/CPU0:router(config-if-cfm-mep)# commit</pre>	Saves configuration changes.  • When you use the end command, the system prompts you to commit changes:  Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:  • Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.  • Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.

Command or Action	Purpose
	<ul> <li>Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.</li> </ul>
	• Use the <b>commit</b> command to save the configuration changes to the running configuration file and remain within the configuration session.

# **Configuring Y.1731 AIS**

This section has the following step procedures:

### **Configuring AIS in a CFM Domain Service**

Use the following procedure to configure Alarm Indication Signal (AIS) transmission for a CFM domain service and configure AIS logging.

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters Ethernet CFM global configuration
	Example:	mode.
	<pre>RP/0/RP0/CPU0:router(config) # ethernet cfm</pre>	
Step 3	domain name level level	Specifies the domain and domain level.
	Example:	
	RP/0/RP0/CPU0:router(config-cfm)# domain D1 level 1	
Step 4	service name bridge group name bridge-domain name	Specifies the service, bridge group, and bridge domain.
	Example:	
	RP/0/RP0/CPU0:router(config-cfm-dmn)# service S1 bridge group BG1 bridge-domain BD2	

	Command or Action	Purpose
Step 5	service name xconnect group xconnect-group-name p2p xconnect-name	Specifies the service and cross-connect group and name.
	Example:	
	RP/0/RP0/CPU0:router(config-cfm-dmn)# service S1 xconnect group XG1 p2p X2	
Step 6	ais transmission [interval $\{1s 1m\}$ ][cos $cos$ ]	Configures Alarm Indication Signal (AIS)
	Example:	transmission for a Connectivity Fault Management (CFM) domain service.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# ais transmission interval 1m cos 7</pre>	
Step 7	log ais	Configures AIS logging for a Connectivity Fault
	Example:	Management (CFM) domain service to indicate when AIS or LCK packets are received.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# log ais</pre>	
Step 8	no domain namelevel level	Disables the domain and domain level.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# no domain D1 level 1</pre>	
Step 9	end or commit	Saves configuration changes.
	Example:	• When you issue the <b>end</b> command, the
	RP/0/RP0/CPU0:router(config-sla-prof-stat-cfg)#	system prompts you to commit changes:
	commit	Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
		• Entering <b>yes</b> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
		• Entering <b>no</b> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
		• Entering <b>cancel</b> leaves the router in the current configuration session without exiting or committing the configuration changes.
		Use the <b>commit</b> command to save the configuration changes to the running

Command or Action	Purpose
	configuration file and remain within the configuration session.

# **Configuring AIS on a CFM Interface**

To configure AIS on a CFM interface, perform the following steps:

	Command or Action	Purpose	
Step 1	configure	Enters global configuration mode.	
	Example:		
	RP/0/RP0/CPU0:router# configure		
Step 2	interface gigabitethernet interface-path-id	Enters interface configuration mode.	
	Example:		
	RP/0/RP0/CPU0:router# interface TenGigE 0/0/0/2		
Step 3	ethernet cfm	Enters Ethernet CFM interface configuration	
	Example:	mode.	
	RP/0/RP0/CPU0:router(config)# ethernet cfm		
Step 4	ais transmission up interval 1m cos cos Example:	Configures Alarm Indication Signal (AIS) transmission on a Connectivity Fault Management (CFM) interface.	
	RP/0/RP0/CPU0:router(config-if-cfm) # ais transmission up interval 1m cos 7		
Step 5	end or commit	Saves configuration changes.	
	Example:	• When you issue the <b>end</b> command, the system prompts you to commit changes:	
	<pre>RP/0/RP0/CPU0:router(config-sla-prof-stat-cfg)# commit</pre>	Uncommitted changes found, commit them before exiting (yes/no/cancel)? [cancel]:  • Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.  • Entering no exits the configuration session and returns the router to EXEC mode	

Command or Action	Purpose
	without committing the configuration changes.
	• Entering <b>cancel</b> leaves the router in the current configuration session without exiting or committing the configuration changes.
	<ul> <li>Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.</li> </ul>

# **Configuring EFD for a CFM Service**

To configure EFD for a CFM service, complete the following steps.

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters CFM configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# ethernet cfm	
Step 3	domain domain-name level level-value	Specifies or creates the CFM domain and enters
	Example:	CFM domain configuration mode.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn)# domain D1 level 1</pre>	
Step 4	service service-name down-meps	Specifies or creates the CFM service for down
	Example:	MEPS and enters CFM domain service configuration mode.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn) # service S1 down-meps</pre>	
Step 5	efd	Enables EFD on all down MEPs in the down
	Example:	MEPS service.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# efd</pre>	

	Command or Action	Purpose
Step 6	log efd Example:	(Optional) Enables logging of EFD state changes on an interface.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# log efd</pre>	
Step 7	end or commit	Saves configuration changes.
	<pre>Example:  RP/0/RP0/CPU0:router(config-cfm-dmn-svc)#   commit</pre>	<ul> <li>When you issue the end command, the system prompts you to commit changes:</li> <li>Uncommitted changes found, commit them before exiting (yes/no/cancel)? [cancel]:</li> <li>Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.</li> <li>Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</li> <li>Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.</li> <li>Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.</li> </ul>

### **Verifying the EFD Configuration**

This example shows how to display all interfaces that are shut down because of Ethernet Fault Detection (EFD):

### **Configuring Flexible VLAN Tagging for CFM**

Use this procedure to set the number of tags in CFM packets in a CFM domain service.

	Command or Action	Purpose
Step 1	configure	Enters global configuration mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	
Step 2	ethernet cfm	Enters Ethernet CFM global configuration
	Example:	mode.
	RP/0/RP0/CPU0:router(config)# ethernet cfm	
Step 3	domain name level level	Specifies the domain and domain level.
	Example:	
	RP/0/RP0/CPU0:router(config-cfm) # domain D1 level 1	
Step 4	service name bridge group name bridge-domain name	Specifies the service, bridge group, and bridge domain.
	Example:	
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn)# service S2 bridge group BG1 bridge-domain BD2</pre>	
Step 5	tags number	Specifies the number of tags in CFM packets.
	Example:	Currently, the only valid value is 1.
	<pre>RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# tags 1</pre>	
Step 6	end or commit	Saves configuration changes.
	Example:	• When you issue the <b>end</b> command, the system prompts you to commit changes:
	RP/0/RP0/CPU0:router(config-cfm-dmn-svc)#	system prompts you to commit changes.
	commit	Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
		• Entering <b>yes</b> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
		Entering <b>no</b> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.

Command or Action	Purpose		
	Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.      Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.		

### **Verifying the CFM Configuration**

To verify the CFM configuration, use one or more of the following commands:

show ethernet cfm configuration-errors [domain domain-name] [interface interface-path-id]	Displays information about errors that are preventing configured CFM operations from becoming active, as well as any warnings that have occurred.
show ethernet cfm local maintenance-points domain name [service name]   interface type interface-path-id] [mep   mip]	Displays a list of local maintenance points.

Note

After you configure CFM, the error message, cfmd[317]: %L2-CFM-5-CCM\_ERROR\_CCMS\_MISSED: Some received CCMs have not been counted by the CCM error counters, may display. This error message does not have any functional impact and does not require any action from you.

### **Troubleshooting Tips**

To troubleshoot problems within the CFM network, perform these steps:

#### **Procedure**

**Step 1** To verify connectivity to a problematic MEP, use the **ping ethernet cfm** command as shown in this example:

```
Type escape sequence to abort.

Sending 5 CFM Loopbacks, timeout is 2 seconds -

Domain foo (level 2), Service foo

Source: MEP ID 1, interface TenGigEO/0/0/1

Target: 0001.0002.0003 (MEP ID 16):

Running (5s) ...

Success rate is 60.0 percent (3/5), round-trip min/avg/max = 1251/1349/1402 ms

Out-of-sequence: 0.0 percent (0/3)

Bad data: 0.0 percent (0/3)

Received packet rate: 1.4 pps
```

**Step 2** If the results of the **ping ethernet cfm** command show a problem with connectivity to the peer MEP, use the **traceroute ethernet cfm** command to help further isolate the location of the problem as shown in the following example:

RP/0/RP0/CPU0:router# traceroute ethernet cfm domain D1 service S1 mep-id 16 source interface TenGigE 0/0/0/2

```
Traceroutes in domain D1 (level 4), service S1
Source: MEP-ID 1, interface TenGigE0/0/0/2
______
Traceroute at 2009-05-18 12:09:10 to 0001.0203.0402,
TTL 64, Trans ID 2:
                                                             Relay
Hop Hostname/Last
                       Ingress MAC/name
                                          Egress MAC/Name
                      0001.0203.0400 [Down]
 1 ios
                                                             FDB
    0000-0001.0203.0400 TenGigE0/0/0/2
                                         0001.0203.0401 [Ok]
 2 abc
                                                             FDB
    ios
                                         Not present
 3 bcd
                       0001.0203.0402 [Ok]
                                                             Hit.
                       TenGigE0/0
    abc
Replies dropped: 0
```

If the target was a MEP, verify that the last hop shows "Hit" in the Relay field to confirm connectivity to the peer MEP.

If the Relay field contains "MPDB" for any of the hops, then the target MAC address was not found in the bridge MAC learning table at that hop, and the result is relying on CCM learning. This result can occur under normal conditions, but it can also indicate a problem. If you used the **ping ethernet cfm** command before using the **traceroute ethernet cfm** command, then the MAC address should have been learned. If "MPDB" is appearing in that case, then this indicates a problem at that point in the network.

## **Configuration Examples for Ethernet OAM**

This section provides the following configuration examples:

### **Configuration Examples for EOAM Interfaces**

This section provides the following configuration examples:

#### Configuring an Ethernet OAM Profile Globally: Example

This example shows how to configure an Ethernet OAM profile globally:

```
configure terminal
ethernet oam profile Profile_1
link-monitor
symbol-period window 60000
symbol-period threshold ppm low 10000000 high 60000000
frame window 60
frame threshold ppm low 10000000 high 60000000
frame-period window 60000
frame-period threshold ppm low 100 high 12000000
frame-seconds window 900000
frame-seconds threshold low 3 high 900
```

```
exit
mib-retrieval
connection timeout 30
require-remote mode active
require-remote mib-retrieval
action dying-gasp error-disable-interface
action critical-event error-disable-interface
action discovery-timeout error-disable-interface
action session-down error-disable-interface
action capabilities-conflict error-disable-interface
action wiring-conflict error-disable-interface
action remote-loopback error-disable-interface
action remote-loopback error-disable-interface
```

#### Configuring Ethernet OAM Features on an Individual Interface: Example

This example shows how to configure Ethernet OAM features on an individual interface:

```
configure terminal
interface TenGigE 0/0/0/0
 ethernet oam
  link-monitor
   symbol-period window 60000
   symbol-period threshold ppm low 10000000 high 60000000
   frame window 60
   frame threshold ppm low 10000000 high 60000000
   frame-period window 60000
   frame-period threshold ppm low 100 high 12000000
   frame-seconds window 900000
   frame-seconds threshold low 3 high 900
   exit
  mib-retrieval
   connection timeout 30
  require-remote mode active
  require-remote mib-retrieval
  action link-fault error-disable-interface
  action dying-gasp error-disable-interface
  action critical-event error-disable-interface
  action discovery-timeout error-disable-interface
  action session-down error-disable-interface
  action capabilities-conflict error-disable-interface
  action wiring-conflict error-disable-interface
  action remote-loopback error-disable-interface
  commit
```

#### Configuring Ethernet OAM Features to Override the Profile on an Individual Interface: Example

This example shows the configuration of Ethernet OAM features in a profile followed by an override of that configuration on an interface:

```
configure terminal
ethernet oam profile Profile_1
mode passive
action dying-gasp disable
action critical-event disable
action discovery-timeout disable
action session-up disable
action session-down disable
action capabilities-conflict disable
action wiring-conflict disable
action remote-loopback disable
action uni-directional link-fault error-disable-interface
```

```
commit
configure terminal
interface TenGigE 0/0/0/0
 ethernet oam
  profile Profile 1
   mode active
   action dying-gasp log
   action critical-event log
   action discovery-timeout log
   action session-up log
   action session-down log
   action capabilities-conflict log
   action wiring-conflict log
   action remote-loopback log
    action uni-directional link-fault log
    uni-directional link-fault detection
    commit
```

#### **Clearing Ethernet OAM Statistics on an Interface: Example**

This example shows how to clear Ethernet OAM statistics on an interface:

RP/0/RP0/CPU0:router# clear ethernet oam statistics interface gigabitethernet 0/0/0/1

#### **Enabling SNMP Server Traps on a Router: Example**

This example shows how to enable SNMP server traps on a router:

```
configure terminal
  snmp-server traps ethernet oam events
```

### **Configuration Examples for Ethernet CFM**

This section includes the following examples:

#### **Ethernet CFM Domain Configuration: Example**

This example shows how to configure a basic domain for Ethernet CFM:

```
configure
  ethernet cfm
   traceroute cache hold-time 1 size 3000
  domain Domain_One level 1 id string D1
  commit
```

#### **Ethernet CFM Service Configuration: Example**

This example shows how to create a service for an Ethernet CFM domain:

```
service Bridge_Service bridge group BD1 bridge-domain B1
service Cross_Connect_1 xconnect group XG1 p2p X1
commit
```

#### Flexible Tagging for an Ethernet CFM Service Configuration: Example

This example shows how to set the number of tags in CFM packets from down MEPs in a CFM domain service:

```
configure
  ethernet cfm
  domain D1 level 1
   service S2 bridge group BG1 bridge-domain BD2
  tags 1
  commit
```

#### **Continuity Check for an Ethernet CFM Service Configuration: Example**

This example shows how to configure continuity-check options for an Ethernet CFM service:

```
continuity-check archive hold-time 100 continuity-check loss auto-traceroute continuity-check interval 100ms loss-threshold 10 commit
```

#### MIP Creation for an Ethernet CFM Service Configuration: Example

This example shows how to enable MIP auto-creation for an Ethernet CFM service:

```
RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# mip auto-create all
RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# commit
```

#### **Cross-check for an Ethernet CFM Service Configuration: Example**

This example shows how to configure cross-check for MEPs in an Ethernet CFM service:

```
mep crosscheck
mep-id 10
mep-id 20
commit
```

#### Other Ethernet CFM Service Parameter Configuration: Example

This example shows how to configure other Ethernet CFM service options:

```
maximum-meps 4000
log continuity-check errors
commit
exit
exit
exit
```

#### **MEP Configuration: Example**

This example shows how to configure a MEP for Ethernet CFM on an interface:

```
interface TenGigE 0/0/0/1
  ethernet cfm
  mep domain Dm1 service Sv1 mep-id 1
  commit
```

#### **Ethernet CFM Show Command: Examples**

These examples show how to verify the configuration of Ethernet Connectivity Fault Management (CFM):

#### **Example 1**

This example shows how to display all the maintenance points that have been created on an interface:

RP/0/RP0/CPU0:router# show ethernet cfm local maintenance-points

Domain/Level	Service	Interface	Type	ID	MAC
fig/5	bay	Gi0/10/0/12	Dn MEP	2	44:55:66
fig/5	bay	Gi0/0/1/0	MIP		55:66:77
fred/3	barney	Gi0/1/0/0	Dn MEP	5	66:77:88!

#### Example 2

This example shows how to display all the CFM configuration errors on all domains:

RP/0/RP0/CPU0:router# show ethernet cfm configuration-errors

```
Domain fig (level 5), Service bay
```

- \* MIP creation configured using bridge-domain blort, but bridge-domain blort does not exist.
- \* An Up MEP is configured for this domain on interface TenGigEO/O/O/3 and an Up MEP is also configured for domain blort, which is at the same level (5).
- \* A MEP is configured on interface TenGigE0/0/0/1 for this domain/service, which has CC interval 100ms, but the lowest interval supported on that interface is 1s

#### Example 3

This example shows how to display operational state for local maintenance end points (MEPs):

RP/0/RP0/CPU0:router# show ethernet cfm local meps

```
A - AIS received
                            I - Wrong interval
R - Remote Defect received V - Wrong Level
L - Loop (our MAC received) T - Timed out (archived)
C - Config (our ID received) M - Missing (cross-check)
X - Cross-connect (wrong MAID) U - Unexpected (cross-check)
P - Peer port down
Domain foo (level 6), Service bar
 ID Interface (State) Dir MEPs/Err RD Defects AIS
 100 Gi1/1/0/1 (Up)
                     Up
Domain fred (level 5), Service barney
 ID Interface (State) Dir MEPs/Err RD Defects AIS
2 Gi0/1/0/0 (Up) Up 3/2 Y RPC L6
Domain foo (level 6), Service bar
 ID Interface (State) Dir MEPs/Err RD Defects AIS
 100 Gi1/1/0/1 (Up) Up 0/0 N A
Domain fred (level 5), Service barney
 ID Interface (State) Dir MEPs/Err RD Defects AIS
  2 Gi0/1/0/0 (Up) Up 3/2 Y RPC
```

#### Example 4

This example shows how to display operational state of other maintenance end points (MEPs) detected by a local MEP:

```
RP/0/RP0/CPU0:router# show ethernet cfm peer meps
Flags:
> - Ok
                     I - Wrong interval
X - Cross-connect (wrong MAID) U - Unexpected (cross-check)

```

#### **AIS for CFM Configuration: Examples**

#### Example 1

This example shows how to configure Alarm Indication Signal (AIS) transmission for a CFM domain service:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ethernet cfm
RP/0/RP0/CPU0:router(config-cfm)# domain D1 level 1
RP/0/RP0/CPU0:router(config-cfm-dmn)# service S1 bridge group BG1 bridge-domain BD2
RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# ais transmission interval 1m cos 7

RP/0/RP0/CPU0:routerconfigure
RP/0/RP0/CPU0:router(config)# ethernet cfm
RP/0/RP0/CPU0:router(config-cfm)# domain D1 level 1
RP/0/RP0/CPU0:router(config-cfm-dmn)# service Cross_Connect_1 xconnect group XG1 p2p X1
RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# ais transmission interval 1m cos 7
```

#### Example 2

This example shows how to configure AIS logging for a Connectivity Fault Management (CFM) domain service to indicate when AIS or LCK packets are received:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# ethernet cfm
RP/0/RP0/CPU0:router(config-cfm)# domain D1 level 1
RP/0/RP0/CPU0:router(config-cfm-dmn)# service S2 bridge group BG1 bridge-domain BD2
RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# log ais

RP/0/RP0/CPU0:routerconfigure
RP/0/RP0/CPU0:router(config)# ethernet cfm
RP/0/RP0/CPU0:router(config-cfm)# domain D1 level 1
RP/0/RP0/CPU0:router(config-cfm-dmn)# service Cross_Connect_1 xconnect group XG1 p2p X1
RP/0/RP0/CPU0:router(config-cfm-dmn-svc)# log ais
```

This example shows how to configure AIS transmission on a CFM interface.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface TenGigE 0/0/0/2
RP/0/RP0/CPU0:router(config-if)# ethernet cfm
RP/0/RP0/CPU0:router(config-if-cfm)# ais transmission up interval 1m cos 7
```

#### **AIS for CFM Show Commands: Examples**

This section includes the following examples:

#### show ethernet cfm interfaces ais Command: Example

This example shows how to display the information published in the Interface AIS table:

```
Trigger Transmission

```

D - Local port down

#### show ethernet cfm local meps Command: Examples

#### **Example 1: Default**

P - Peer port down

This example shows how to display statistics for local maintenance end points (MEPs):

```
RP/0/RP0/CPU0:router# show ethernet cfm local meps
```

#### **Example 2: Domain Service**

This example shows how to display statistics for MEPs in a domain service:

```
RP/0/RP0/CPU0:router# show ethernet cfm local meps domain foo service bar detail
Domain foo (level 6), Service bar
Down MEP on TenGigE0/0/0/1, MEP-ID 100
      Peer MEPs: 0 up, 0 with errors, 0 timed out (archived)
      CCM generation enabled: No
      AIS generation enabled: Yes (level: 7, interval: 1s)
      Sending AIS: Yes (started 01:32:56 ago)

Receiving AIS: Yes (from lower MED started of the start
      Receiving AIS:
                                                                                    Yes (from lower MEP, started 01:32:56 ago)
Domain fred (level 5), Service barney
Down MEP on TenGigE0/0/0/1, MEP-ID 2
    _____
      Peer MEPs: 3 up, 2 with errors, 0 timed out (archived)
      Cross-check defects: 0 missing, 0 unexpected
      CCM generation enabled: Yes (Remote Defect detected: Yes)
```

```
CCM defects detected: R - Remote Defect received
P - Peer port down
C - Config (our ID received)

AIS generation enabled: Yes (level: 6, interval: 1s)

Sending AIS: Yes (to higher MEP, started 01:32:56 ago)

Receiving AIS: No
```

#### **Example 4: Detail**

This example shows how to display detailed statistics for MEPs in a domain service:

```
RP/0/RP0/CPU0:router# show ethernet cfm local meps detail
Domain foo (level 6), Service bar
Down MEP on TenGigE0/0/0/1, MEP-ID 100
______
 Interface state: Up MAC address: 1122.3344.5566
 Peer MEPs: 0 up, 0 with errors, 0 timed out (archived)
 CCM generation enabled: No
 AIS generation enabled: Yes (level: 7, interval: 1s)
               Yes (started 01:32:56 ago)
 Sending AIS:
 Receiving AIS:
                       Yes (from lower MEP, started 01:32:56 ago)
Domain fred (level 5), Service barney
Down MEP on TenGigE0/0/0/1, MEP-ID 2
 Interface state: Up
                    MAC address: 1122.3344.5566
 Peer MEPs: 3 up, 2 with errors, 0 timed out (archived)
 Cross-check defects: 0 missing, 0 unexpected
 CCM generation enabled: Yes (Remote Defect detected: Yes)
 CCM defects detected: R - Remote Defect received
                       P - Peer port down
                       C - Config (our ID received)
 AIS generation enabled: Yes (level: 6, interval: 1s)
 Sending AIS:
                        Yes (to higher MEP, started 01:32:56 ago)
 Receiving AIS:
```

#### show ethernet cfm local meps detail Command: Example

Use the **show ethernet cfm local meps detail** command to display MEP-related EFD status information. This example shows that EFD is triggered for MEP-ID 100:

```
RP/0/RP0/CPU0:router# show ethernet cfm local meps detail
Domain foo (level 6), Service bar
Down MEP on TenGigE0/0/0/1, MEP-ID 100
______
                   MAC address: 1122.3344.5566
 Interface state: Up
 Peer MEPs: 0 up, 0 with errors, 0 timed out (archived)
 Cross-check errors: 2 missing, 0 unexpected
 CCM generation enabled: No
 AIS generation enabled: Yes (level: 7, interval: 1s)
                     Yes (started 01:32:56 ago)
 Sending AIS:
 Receiving AIS:
                    Yes (from lower MEP, started 01:32:56 ago)
 EFD triggered:
                    Yes
Domain fred (level 5), Service barney
Down MEP on TenGigE0/0/0/1, MEP-ID 2
______
```

```
Interface state: Up MAC address: 1122.3344.5566

Peer MEPs: 3 up, 0 with errors, 0 timed out (archived)

Cross-check errors: 0 missing, 0 unexpected

CCM generation enabled: Yes (Remote Defect detected: No)

AIS generation enabled: Yes (level: 6, interval: 1s)

Sending AIS: No

Receiving AIS: No

EFD triggered: No
```

Note

You can also verify that EFD has been triggered on an interface using the **show interfaces** and **show interfaces brief** commands. When an EFD trigger has occurred, these commands will show the interface status as *up* and the line protocol state as *down*.

# **CFM Over Bundles**

CFM over bundle supports the following:

- CFM Maintenance Points—Up Maintenance-association End Points (MEP), Down MEP, and MIP, which includes L2 bundle main and sub-interfaces.
- CCM interval of 100 microsecond, 1second, 10 seconds, and 1 minute. CCM interval of 10 minutes is supported only in the versions earlier than IOS XR 7.3.2.
- RP OIR/VM reload, without impacting learned CFM peer MEPs.
- Process restart without impacting CFM sessions.
- CFM MEPs on bundle interfaces as software-offloaded-MEPs with all possible rewrite and encapsulation combinations supported by L2 sub-interfaces.
- CCM learning on MIP over bundle interfaces. CCM database learning supports investigation of one CCM out of 50 that goes over MIP.
- · Static and dynamic MEPs.

#### **Restrictions for Configuration of CFM on Bundles**

Following are the restrictions for configuring CFM over bundle member interfaces:

- Only Layer 2 bundle Ethernet interfaces and sub-interfaces are supported except for those matching the VLAN tag any.
- CCM interval of 3.3 milliseconds and 10 milliseconds are not supported.
- CCM interval of 10 minutes is not supported from IOS XR 7.3.2.
- Supports 5000 pps rates of CCM traffic for bundle interfaces.
- Ethernet CFM is not supported with MEP that are configured on default and untagged encapsulated sub-interfaces that are part of a single physical interface.

# **Unidirectional Link Detection Protocol**

Unidirectional Link Detection (UDLD) is a single-hop physical link protocol for monitoring an ethernet link, including both point-to-point and shared media links. This is a Cisco-proprietary protocol to detect link problems, which are not detected at the physical link layer. This protocol is specifically targeted at possible wiring errors, when using unbundled fiber links, where there can be a mismatch between the transmitting and receiving connections of a port.

# **UDLD Operation**

UDLD works by exchanging protocol packets between the neighboring devices. In order for UDLD to work, both devices on the link must support UDLD and have it enabled on respective ports.

UDLD sends an initial PROBE message on the ports where it is configured. Once UDLD receives a PROBE message, it sends periodic ECHO (hello) messages. Both messages identify the sender and its port, and also contain some information about the operating parameters of the protocol on that port. They also contain the device and port identifiers on the port for any neighbor devices that the local device has heard from. Similarly, each device gets to know where it is connected and where its neighbors are connected. This information can then be used to detect faults and miswiring conditions.

The protocol operates an aging mechanism where information from neighbors that is not periodically refreshed is eventually timed out. This mechanism can also be used to detect fault.

A FLUSH message is used to indicate that UDLD is disabled on a port, which causes the peers to remove the local device from their neighbor cache to prevent a time out.

If a problem is detected, UDLD disables the affected interface and also notifies the user. This is to avoid further network problems beyond traffic loss, such as loops which are not detected or prevented by Spanning Tree Protocol (STP).

# **Types of Fault Detection**

UDLD can detect these types of faults:

- Transmit faults These are cases where there is a failure in transmitting packets from the local port to the peer device, but packets are being received from the peer. These faults are caused by failure of the physical link (where notification at layer 1 of unidirectional link faults is not supported by the media) as well as packet path faults on the local or peer device.
- Miswiring faults These are cases where the receiving and transmitting sides of a port on the local device are connected to different peer ports (on the same device or on different devices). This can occur when using unbundled fibers to connect fiber optic ports.
- Loopback faults These are cases where the receiving and transmitting sides of a port are connected to each other, creating a loopback condition. This can be an intentional mode of operation, for certain types of testing, but UDLD must not be used in these cases.
- Receive faults The protocol includes a heartbeat signal that is transmitted at a negotiated periodic interval to the peer device. Missed heartbeats can therefore be used to detect failures on the receiving side of the link (where they do not result in interface state changes). These could be caused by a unidirectional link with a failure only affecting the receiving side, or by a link which has developed a bidirectional fault. This detection depends on reliable, regular packet transmission by the peer device.

For this reason, the UDLD protocol has two (configurable) modes of operation which determine the behavior on a heartbeat timeout. These modes are described in the section UDLD Modes of Operation, on page 58.

## **UDLD Modes of Operation**

UDLD can operate in these modes:

- Normal mode: In this mode, if a Receive Fault is detected, the user is informed and no further action is taken
- Aggressive mode: In this mode, if a Receive Fault is detected, the user is informed and the affected port is disabled.

# **UDLD Aging Mechanism**

This is a scenario that happens in a Receive Fault condition. Aging of UDLD information happens when the port that runs UDLD does not receive UDLD packets from the neighbor port for a duration of the hold time. The hold time for the port is dictated by the remote port and depends on the message interval at the remote side. The shorter the message interval, the shorter is the hold time and the faster the detection of the fault. The hold time is three times the message interval in Cisco IOS XR Software.

UDLD information can age out due to the high error rate on the port caused by a physical issue or duplex mismatch. Packet drops due to age out does not mean that the link is unidirectional. UDLD in normal mode does not disable such link.

It is important to choose the right message interval in order to ensure proper detection time. The message interval should be fast enough to detect the unidirectional link before the forwarding loop is created. The default message interval is 60 seconds. The detection time is equal to approximately three times the message interval. So, when using default UDLD timers, UDLD does not timeout the link faster than the STP aging time.

### **State Machines**

UDLD uses two types of finite state machines (FSMs), generally referred as state machines. The Main FSM deals with all the phases of operation of the protocol while the Detection FSM handles only the phases that determine the status of a port.

## **Main FSM**

The Main FSM can be in one of these states:

- Init: Protocol is initializing.
- UDLD inactive: Port is down or UDLD is disabled.
- Linkup: Port is up and running, and UDLD is in the process of detecting a neighbor.
- **Detection**: A hello message from a new neighbor is received and the Detection FSM determines the status of the port.

- Advertisement: The Detection FSM concludes that the port is operating correctly, periodic hello messages will continue to be sent and monitored from neighbors.
- **Port shutdown**: The Detection FSM detected a fault, or all neighbors were timed out in Aggressive mode, and as a result, the port is disabled.

### **Detection FSM**

The Detection FSM can be in one of these states:

- Unknown: Detection has not yet been performed or UDLD has been disabled.
- **Unidirectional detected**: A unidirectional link condition has been detected because a neighbor does not see the local device. The port will be disabled.
- **Tx/Rx loop**: A loopback condition has been detected by receiving a TLV with the ports own identifiers. The port will be disabled.
- **Neighbor mismatch**: A miswiring condition has been detected in which a neighbor can identify other devices than those the local device can see. The port will be disabled.
- **Bidirectional detected**: UDLD hello messages are exchanged successfully in both directions. The port is operating correctly.

# **Ethernet SLA Statistics Measurement in a Profile**

**Table 3: Feature History Table** 

Feature Name	Release Information	Feature Description
Enhancement to Ethernet SLA Statistics Measurement	Release 7.7.1	You can now configure the size of bins that are used to aggregate the results of Ethernet SLA statistics, in microseconds. The size of the bins is defined by the width value of delay and jitter measurement in Ethernet SLA statistics. You can configure the width value ranging from 1 to 10000000 microseconds. This enhancement provides granularity to store more accurate results of Ethernet SLA statistics in the aggregate bins.
		In earlier releases, you could only configure the <b>width</b> value for the delay and jitter measurement in milliseconds.
		This feature introduces the <b>usec</b> keyword in the <b>aggregate</b> command.

The Ethernet SLA feature supports measurement of one-way and two-way delay and jitter statistics, and one-way FLR statistics.

Ethernet SLA statistics measurement for network performance is performed by sending packets and storing data metrics such as:

- Round-trip delay time—The time for a packet to travel from source to destination and back to source again.
- Round-trip jitter—The variance in round-trip delay time (latency).
- One-way delay and jitter—The router also supports measurement of one-way delay or jitter from source to destination, or from destination to source.
- One-way frame loss—The router also supports measurement of one-way frame loss from source to destination, or from destination to source.

In addition to these metrics, these statistics are also kept for SLA probe packets:

- Packet loss count
- · Packet corruption event
- Out-of-order event

• Frame Loss Ratio (FLR)

Counters for packet loss, corruption, and, out-of-order packets are kept for each bucket, and in each case, a percentage of the total number of samples for that bucket is reported (for example, 4% packet corruption). For delay, jitter, and loss statistics, the minimum, maximum, mean and standard deviation for the whole bucket are reported, as well as the individual samples or aggregated bins. Also, the overall FLR for the bucket, and individual FLR measurements or aggregated bins are reported for synthetic loss measurement statistics. The packet loss count is the overall number of measurement packets lost in either direction and the one-way FLR measures the loss in each direction separately.

When aggregation is enabled using the **aggregate** command, bins are created to store a count of the samples that fall within a certain value range, which is set by the **width** keyword. Only a counter of the number of results that fall within the range for each bin is stored. This uses less memory than storing individual results. When aggregation is not used, each sample is stored separately, which can provide a more accurate statistics analysis for the operation, but it is highly memory-intensive due to the independent storage of each sample.

A bucket represents a time period during which statistics are collected. All the results received during that time period are recorded in the corresponding bucket. If aggregation is enabled, each bucket has its own set of bins and counters, and only results relating to the measurements initiated during the time period represented by the bucket are included in those counters.

Frame Loss Ratio (FLR) is a primary attribute that can be calculated based on loss measurements. FLR is defined by the ratio of lost packets to sent packets and expressed as a percentage value. FLR is measured in each direction (source to destination and destination to source) separately. Availability is an attribute that is typically measured over a long period of time, such as weeks or months. The intent is to measure the proportion of time when there was prolonged high loss.

To configure one-way delay or jitter measurements, you must first configure the **profile** (**SLA**) command using the **type cfm-delay-measurement** form of the command.

For valid one-way delay results, you must have both local and remote devices time synchronized. In order to do this, you must select sources for frequency and time-of-day (ToD).

Frequency selection can be between any source of frequency available to the router, such as: BITS, GPS, SyncE, or PTP. The ToD selection is between the source selected for frequency and PTP or DTI. Note that NTP is not sufficient.

#### **Configuration Guidelines**

Caution

Certain SLA configurations can use a large amount of memory which can affect the performance of other features on the router.

Before you configure Ethernet SLA, consider the following guidelines:

- Aggregation—Use of the **aggregate none** command significantly increases the amount of memory required because each individual measurement is recorded, rather than just counts for each aggregation bin. When you configure aggregation, consider that more bins will require more memory.
- Buckets archive—When you configure the **buckets archive** command, consider that the more history that is kept, the more memory will be used.
- Measuring two statistics (such as both delay and jitter) will use approximately twice as much memory as measuring one.

- Separate statistics are stored for one-way source-to-destination and destination-to-source measurements, which consumes twice as much memory as storing a single set of round-trip statistics.
- You must define the schedule before you configure SLA probe parameters to send probes for a particular profile. It is recommended to set up the profile—probe, statistics, and schedule before any commit.

#### Restrictions

One-way delay and jitter measurements are not supported by cfm-loopback profile types.

#### Configure Ethernet SLA Statistics Measurement in a Profile

To configure SLA statistics measurement in a profile, perform these steps:

- Enter the Ethernet SLA configuration mode, using the ethernet sla command in Global Configuration mode.
- 2. Create an SLA operation profile with the **profile** profile-name type cfm-delay-measurement command.
- 3. Enable the collection of SLA statistics using the **statistics measure** {one-way-delay-ds | one-way-jitter-ds | one-way-jitter-sd | round-trip-delay | round-trip-jitter | one-way-loss-ds | one-way-loss-sd} command.
- **4.** Configure the size and number of bins into which to aggregate the results of statistics collection. For delay measurements and data loss measurements, the default is that all values are aggregated into 1 bin. For synthetic loss measurements, by default the aggregation is disabled. Use the **aggregate** {**bins** *count* **width** [**usec**] *width* | **none**} command to configure the bins.
  - For delay and jitter measurements, you can configure a width value from 1 to 10000 milliseconds, if the number of bins is at least 2. To configure the width value in microseconds, use the **usec** option. You can configure the width value from 1 to 10000000 microseconds.
  - For data loss and synthetic loss measurements, you can configure a width value from 1 to 100 percentage points, if the number of bins is at least 2.
- 5. Configure the size of the buckets in which statistics are collected, using the **buckets size** *number* **probes** command.
- **6.** Configure the number of buckets to store in memory using the **buckets archive** *number* command.
- 7. Save the configuration changes using the **end** or **commit** command.

#### **Configuration Example**

This example shows configuration of round-trip-delay statistics measurement in 5 bins each with a range of 123 microseconds:

```
Router(config) # ethernet sla
Router(config-sla) # profile test type cfm-delay-measurement
Router(config-sla-prof) # statistics measure round-trip-delay
Router(config-sla-prof-stat-cfg) # aggregate bins 5 width usec 123
Router(config-sla-prof-stat-cfg) # buckets size 1 probes
Router(config-sla-prof-stat-cfg) # buckets archive 50
Router(config-sla-prof-stat-cfg) # commit
```

This example shows configuration of round-trip-delay statistics measurement in 5 bins each with a range of 10 milliseconds:

```
Router(config)# ethernet sla
Router(config-sla)# profile test type cfm-delay-measurement
Router(config-sla-prof)# statistics measure round-trip-delay
Router(config-sla-prof-stat-cfg)# aggregate bins 5 width 10
Router(config-sla-prof-stat-cfg)# buckets size 1 probes
Router(config-sla-prof-stat-cfg)# buckets archive 50
Router(config-sla-prof-stat-cfg)# commit
```

#### Verification

This example displays aggregate bins configured with a range of 123 microseconds:

```
Router# show ethernet sla statistics detail
Tue Sep 28 07:59:22.340 PDT
Source: Interface GigabitEthernet0/0/0/2, Domain dom1
Destination: Target MAC Address 0012.0034.0056
______
Profile 'test', packet type 'cfm-delay-measurement'
Scheduled to run every 1min first at 00:00:31 UTC for 10s
Round Trip Delay
1 probes per bucket
No stateful thresholds.
Bucket started at 07:56:31 PDT Tue 28 September 2021 lasting 10s
   Pkts sent: 10; Lost: 0 (0.0%); Corrupt: 0 (0.0%);
                Misordered: 0 (0.0%); Duplicates: 0 (0.0%)
   Result count: 10
   Min: 0.000ms, occurred at 07:56:32 PDT Tue 28 September 2021
   Max: 1.000ms, occurred at 07:56:31 PDT Tue 28 September 2021
   Mean: 0.100ms; StdDev: 0.300ms
   Bins:
   Range
                      Samples Cum. Count
                                            Mean
       0 to 0.123 ms 9 (90.0%) 9 (90.0%) 0.000ms
   0.123 to 0.246 ms 0 (0.0%) 9 (90.0%)
   0.246 to 0.369 ms 0 (0.0%) 9 (90.0%)
   0.369 to 0.492 ms 0 (0.0%) 9 (90.0%)
   > 0.492 ms 1 (10.0%) 10 (100.0%) 1.000ms
```

This example displays aggregate bins configured with a range of 10 milliseconds:

```
Pkts sent: 9; Lost: 0 (0.0%); Corrupt: 0 (0.0%);
            Misordered: 1 (11.1%); Duplicates: 0 (0.0%)
Min: 0.000ms, occurred at 08:00:32 PDT Tue 28 September 2021
Max: 0.000ms, occurred at 08:00:32 PDT Tue 28 September 2021
Mean: 0.000ms; StdDev: 0.000ms
Results suspect due to a probe starting mid-way through a bucket

# Y.1731 Performance Monitoring

Y.1731 Performance Monitoring (PM) provides a standard Ethernet PM function that includes measurement of Ethernet frame delay, frame delay variation, frame loss, and frame throughput measurements. This is specified by the ITU-T Y-1731 standard and interpreted by the Metro Ethernet Forum (MEF) standards group.

The router supports the following:

- Delay Measurement (DM)
- Synthetic Loss Measurement (SLM)

## **Two-Way Delay Measurement for Scalability**

Use the Ethernet frame delay measurement to measure frame delay and frame delay variations. The system measures the Ethernet frame delay by using the Delay Measurement Message (DMM) method.

#### **Restrictions for Configuring Two-Way Delay Measurement**

Follow the guidelines and restrictions listed here when you configure two-way delay measurement:

### **Configuring Two-Way Delay Measurement**

Perform the following steps to configure two-way delay measurement:

#### RP/0/RP0/CPU0:router (config) # ethernet sla

```
profile DMM type cfm-delay-measurement
  probe
  send burst every 5 seconds packet count 5 interval 1 seconds
!
  schedule
  every 1 minutes for 40 seconds
!
  statistics
```

```
measure round-trip-delay
  buckets size 1 probes
  buckets archive 5
!
  measure round-trip-jitter
  buckets size 1 probes
  buckets archive 1
!
!
!
!
!
interface TenGigE0/0/0/10.1 l2transport
encapsulation dotlq 1
ethernet cfm
  mep domain DOWNO service s10 mep-id 2001
  sla operation profile DMM target mep-id 6001
```

#### Configuring an On-Demand Ethernet SLA Operation for CFM Delay Measurement

To configure an on-demand Ethernet SLA operation for CFM delay measurement, use this command in privileged EXEC configuration mode:

```
RP/0/RP0/CPU0:router (config) #
```

ethernet sla on-demand operation type cfm-synthetic-loss-measurement probe domain D1 source interface TenGigE 0/6/1/0 target mac-address 2.3.4

#### **Running Configuration**

# **Synthetic Loss Measurement**

The synthetic loss measurement mechanism defined in Y.1731 can only be used in point-to-point networks, and only works when there is sufficient flow of data traffic. The difficulties with the Y.1731 loss measurement mechanism was recognized across the industry and hence an alternative mechanism has been defined and standardized for measuring loss of traffic.

This alternative mechanism does not measure the loss of the actual data traffic, but instead injects synthetic CFM frames and measures the loss of these synthetic frames. You can perform a statistical analysis to give an approximation of the loss of data traffic. This technique is called Synthetic Loss Measurement (SLM). SLM has been included in the latest version of the Y.1731 standard. Use SLA to perform the following measurements:

- One-way loss (Source to Destination)
- One-way loss (Destination to Source)

Starting with Cisco IOS XR Release 7.1.1, SLM is supported on the routers.

SLM supports the following:

- All Layer 2 transport interfaces, such as physical, bundle interfaces, Layer2 sub-interfaces, pseudowire Head-end interfaces or attachment circuits. Transport network can be EVPN or BGP-MPLS.
- Up and Down MEPs.
- Transparent passing of the SLM packets through the MIP without punting it to the software.

### **Configuring Synthetic Loss Measurement**

The following section describes how you can configure Synthetic Loss Measurement:

#### RP/0/RP0/CPU0:router (config) # ethernet sla

```
profile test-slm type cfm-synthetic-loss-measurement
  probe
   send packet every 1 seconds
   synthetic loss calculation packets 24
!
  schedule
  every 3 minutes for 120 seconds
```

```
!
statistics
measure one-way-loss-sd
buckets size 1 probes
buckets archive 5
!
measure one-way-loss-ds
buckets size 1 probes
buckets archive 5
!
!
!
!
!
interface TenGigEO/0/0/10.1 12transport
encapsulation dot1q 1
ethernet cfm
mep domain DOWNO service s10 mep-id 2001
sla operation profile test-slm target mep-id 6001
```

#### Configuring an On-Demand Ethernet SLA Operation for CFM Synthetic Loss Measurement

To configure an on-demand Ethernet SLA operation for CFM synthetic loss measurement, use this command in privileged EXEC configuration mode:

RP/0/RP0/CPU0:router (config) # ethernet sla on-demand operation type cfm-synthetic-loss-measurement probe domain D1 source interface TenGigE 0/0/0/0 target mac-address 2.3.4

#### **Running Configuration**

```
