EVPN Features

This chapter describes how to configure Layer 2 Ethernet VPN (EVPN) features on the router.

EVPN Overview

Ethernet VPN (EVPN) is a solution that provides Ethernet multipoint services over MPLS networks. EVPN operates in contrast to the existing Virtual Private LAN Service (VPLS) by enabling control-plane based MAC learning in the core. In EVPN, PEs participating in the EVPN instances learn customer MAC routes in control-plane using MP-BGP protocol. Control-plane MAC learning brings a number of benefits that allow EVPN to address the VPLS shortcomings, including support for multihoming with per-flow load balancing.

EVPN provides the solution for network operators for the following emerging needs in their network:

- Data center interconnect operation (DCI)
- Cloud and services virtualization
- Remove protocols and network simplification
- Integration of L2 and L3 services over the same VPN
- Flexible service and workload placement
- Multi-tenancy with L2 and L3 VPN
- Optimal forwarding and workload mobility
- Fast convergence
- Efficient bandwidth utilization

EVPN Benefits

The EVPN provides the following benefits:

- Integrated Services: Integrated L2 and L3 VPN services, L3VPN-like principles and operational experience for scalability and control, all-active multihoming and PE load-balancing using ECMP, and enables load balancing of traffic to and from CEs that are multihomed to multiple PEs.
- Network Efficiency: Eliminates flood and learn mechanism, fast-reroute, resiliency, and faster reconvergence when the link to dual-homed server fails, optimized Broadcast, Unknown-unicast, Multicast (BUM) traffic delivery.
- Service Flexibility: MPLS data plane encapsulation, support existing and new services types (E-LAN, E-Line), peer PE auto-discovery, and redundancy group auto-sensing.

EVPN Modes

The following EVPN modes are supported:

- Single-homing - Enables you to connect a customer edge (CE) device to one provider edge (PE) device.
- Multihoming - Enables you to connect a customer edge (CE) device to more than one provider edge (PE) device. Multihoming ensures redundant connectivity. The redundant PE device ensures that there is no traffic disruption when there is a network failure. Following are the types of multihoming:

- All-Active - In all-active mode all the PEs attached to the particular Ethernet-Segment is allowed to forward traffic to and from that Ethernet Segment.

EVPN Restrictions

When paths of different technologies are resolved over ECMP, it results in *heterogeneous* ECMP, leading to severe network traffic issues. Don't use ECMP for any combination of the following technologies:

- LDP.
- BGP-LU, including services over BGP-LU loopback peering or recursive services at Level-3
- VPNv4.
- 6PE and 6VPE.
- EVPN.
- Recursive static routing.

EVPN Concepts

To implement EVPN features, you need to understand the following concepts:

- Ethernet Segment (ES): An Ethernet segment is a set of Ethernet links that connects a multihomed device. If a multi-homed device or network is connected to two or more PEs through a set of Ethernet links, then that set of links is referred to as an Ethernet segment. The Ethernet segment route is also referred to as Route Type 4. This route is used for designated forwarder (DF) election for BUM traffic.
- Ethernet Segment Identifier (ESI): Ethernet segments are assigned a unique non-zero identifier, which is called an Ethernet Segment Identifier (ESI). ESI represents each Ethernet segment uniquely across the network.
- EVI: The EVPN instance (EVI) is represented by the virtual network identifier (VNI). An EVI represents a VPN on a PE router. It serves the same role of an IP VPN Routing and Forwarding (VRF), and EVIs are assigned import/export Route Targets (RTs). Depending on the service multiplexing behaviors at the User to Network Interface (UNI), all traffic on a port (all-to-one bundling), or traffic on a VLAN (one-to-one mapping), or traffic on a list/range of VLANs (selective bundling) can be mapped to a Bridge Domain (BD). This BD is then associated to an EVI for forwarding towards the MPLS core.

  Before Release 25.2.1, the EVPN EVI range was from 1 to 65534.

  From Release 25.2.1, the EVPN EVI range is from 1 to 16777215.
- EAD/ES: Ethernet Auto Discovery Route per ES is also referred to as Route Type 1. This route is used to converge the traffic faster during access failure scenarios. This route has Ethernet Tag of 0xFFFFFFFF.
- EAD/EVI: Ethernet Auto Discovery Route per EVI is also referred to as Route Type 1. This route is used for aliasing and load balancing when the traffic only hashes to one of the switches. This route cannot have Ethernet tag value of 0xFFFFFFFF to differentiate it from the EAD/ES route.
- Aliasing: It is used for load balancing the traffic to all the connected switches for a given Ethernet segment using the Route Type 1 EAD/EVI route. This is done irrespective of the switch where the hosts are actually learned.

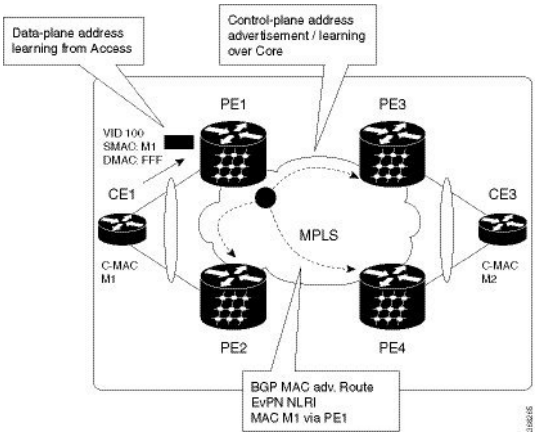
- Mass Withdrawal: It is used for fast convergence during the access failure scenarios using the Route Type 1 EAD/ES route.
- DF Election: It is used to prevent forwarding of the loops. Only a single router is allowed to decapsulate and forward the traffic for a given Ethernet Segment.

EVPN Operation

At startup, PEs exchange EVPN routes in order to advertise the following:

- **VPN membership**: The PE discovers all remote PE members of a given EVI. In the case of a multicast ingress replication model, this information is used to build the PEs flood list associated with an EVI. BUM labels and unicast labels are exchanged when MAC addresses are learned.
- **Ethernet segment reachability**: In multihoming scenarios, the PE auto-discovers remote PE and their corresponding redundancy mode (all-active or single-active). In case of segment failures, PEs withdraw the routes used at this stage in order to trigger fast convergence by signaling a MAC mass withdrawal on remote PEs.
- **Redundancy Group membership**: PEs connected to the same Ethernet segment (multihoming) automatically discover each other and elect a Designated Forwarder (DF) that is responsible for forwarding Broadcast, Unknown unicast and Multicast (BUM) traffic for a given EVI.

Figure 1: EVPN Operation



EVPN can operate in single-homing or dual-homing mode. Consider single-homing scenario, when EVPN is enabled on PE, Route Type 3 is advertised where each PE discovers all other member PEs for a given EVPN instance. When an unknown unicast (or BUM) MAC is received on the PE, it is advertised as EVPN Route Type 2 to other PEs. MAC routes are advertised to the other PEs using EVPN Route Type 2. In multihoming scenarios, Route Types 1, 3, and 4 are advertised to discover other PEs and their redundancy modes (single-active or all-active). Use of Route Type 1 is to auto-discover other PE which hosts the same CE. The other use of this route type is to fast route unicast traffic away from a broken link between CE and PE. Route Type 4 is used for electing designated forwarder. For instance, consider the topology when customer traffic arrives at the PE, EVPN MAC advertisement routes distribute reachability information over the core for each customer MAC address learned on local Ethernet segments. Each EVPN MAC route announces the customer MAC address and the Ethernet segment associated with the port where the MAC was learned from and its

associated MPLS label. This EVPN MPLS label is used later by remote PEs when sending traffic destined to the advertised MAC address.

Behavior Change due to ESI Label Assignment

To adhere to RFC 7432 recommendations, the encoding or decoding of MPLS label is modified for extended community. Earlier, the lower 20 bits of extended community were used to encode the split-horizon group (SHG) label. Now, the SHG label encoding uses from higher 20 bits of extended community.

According to this change, routers in same ethernet-segment running old and new software release versions decodes extended community differently. This change causes inconsistent SHG labels on peering EVPN PE routers. Almost always, the router drops BUM packets with incorrect SHG label. However, in certain conditions, it may cause remote PE to accept such packets and forward to CE potentially causing a loop. One such instance is when label incorrectly read as NULL.

To overcome this problem, Cisco recommends you to:

- Minimize the time both PEs are running different software release versions.
- Before upgrading to a new release, isolate the upgraded node and shutdown the corresponding AC bundle.
- After upgrading both the PEs to the same release, you can bring both into service.

Similar recommendations are applicable to peering PEs with different vendors with SHG label assignment that does not adhere to RFC 7432.

EVPN Route Types

The EVPN network layer reachability information (NLRI) provides different route types.

Table 1: EVPN Route Types

Route Type	Name	Usage
1	Ethernet Auto-Discovery (AD) Route	Few routes are sent per ES, carries the list of EVIs that belong to ES
2	MAC/IP Advertisement Route	Advertise MAC, address reachability, advertise IP/MAC binding
3	Inclusive Multicast Ethernet Tag Route	Multicast Tunnel End point discovery
4	Ethernet Segment Route	Redundancy group discovery, DF election
5	IP Prefix Route	Advertise IP prefixes.

Route Type 1: Ethernet Auto-Discovery (AD) Route

The Ethernet Auto-Discovery (AD) routes are advertised on per EVI and per ESI basis. These routes are sent per ES. They carry the list of EVIs that belong to the ES. The ESI field is set to zero when a CE is single-homed. This route type is used for mass withdrawal of MAC addresses and aliasing for load balancing.

Route Type 2: MAC/IP Advertisement Route

These routes are per-VLAN routes, so only PEs that are part of a VNI require these routes. The host's IP and MAC addresses are advertised to the peers within NRLI. The control plane learning of MAC addresses reduces unknown unicast flooding.

Route Type 3: Inclusive Multicast Ethernet Tag Route

This route establishes the connection for broadcast, unknown unicast, and multicast (BUM) traffic from a source PE to a remote PE. This route is advertised on per VLAN and per ESI basis.

Route Type 4: Ethernet Segment Route

Ethernet segment routes enable to connect a CE device to two or PE devices. ES route enables the discovery of connected PE devices that are connected to the same Ethernet segment.

Route Type 5: IP Prefix Route

The IP prefixes are advertised independently of the MAC-advertised routes. With EVPN IRB, host route /32 is advertised using RT-2 and subnet /24 is advertised using RT-5.

Note With EVPN IRB, host route /32 are advertised using RT-2 and subnet /24 are advertised using RT-5.

EVPN Timers

The following table shows various EVPN timers:

Configure EVPN L2 Bridging Service

Perform the following steps to configure EVPN L2 bridging service.

Note Always ensure to change the label mode from per-prefix to per-VRF label mode. Since L2FIB and VPNv4 route (labels) shares the same resource, BVI ping fails when you exhaust the resources.

Note Traffic to directly connected neighbor on EVPN or VPLS bridge won't work in the following scenarios:

- If neighbor doesn't advertise MPLS explicit null.
- If imposition node has a mix of implicit-null and labeled paths in ECMP or LFA deployment.

Note A device can contain up to 128K MAC address entries. A bridge domain on a device can contain up to 64K MAC address entries.

Note Flooding disable isn’t supported on EVPN bridge domains.

```
/* Configure address family session in BGP */
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router#(config)# router bgp 200
RP/0/RSP0/CPU0:router#(config-bgp)# bgp router-id 209.165.200.227
RP/0/RSP0/CPU0:router#(config-bgp)# address-family l2vpn evpn
RP/0/RSP0/CPU0:router#(config-bgp)# neighbor 10.10.10.10
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# remote-as 200
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# description MPLSFACING-PEER
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# update-source Loopback 0
RP/0/RSP0/CPU0:router#(config-bgp-nbr)# address-family l2vpn evpn

/* Configure EVI and define the corresponding BGP route targets */
```

Note EVI route target used for multicast EVPN supports only extcomm type sub-type 0xA for EVI route target, the two-octet Autonomous System (AS) specific Extended Community. This means that when using a 4-byte AS number for BGP, you must additionally configure BGP import and export route targets under the EVPN configuration.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 6005
Router(config-evpn-evi)# bgp
Router(config-evpn-evi-bgp)# rd 200:50
Router(config-evpn-evi-bgp)# route-target import 100:6005
Router(config-evpn-evi-bgp)# route-target export 100:6005
Router(config-evpn-evi-bgp)# exit
Router(config-evpn-evi)# advertise-mac

/* Configure a bridge domain */
Router# configure
Router(config)# l2vpn

```

EVPN Single-Active Multi-Homing Mode

In single-active multihoming mode, only a single edge (PE) Router among a group of PE Routers attached to a host is allowed to send and recieve traffic on a given VLAN.

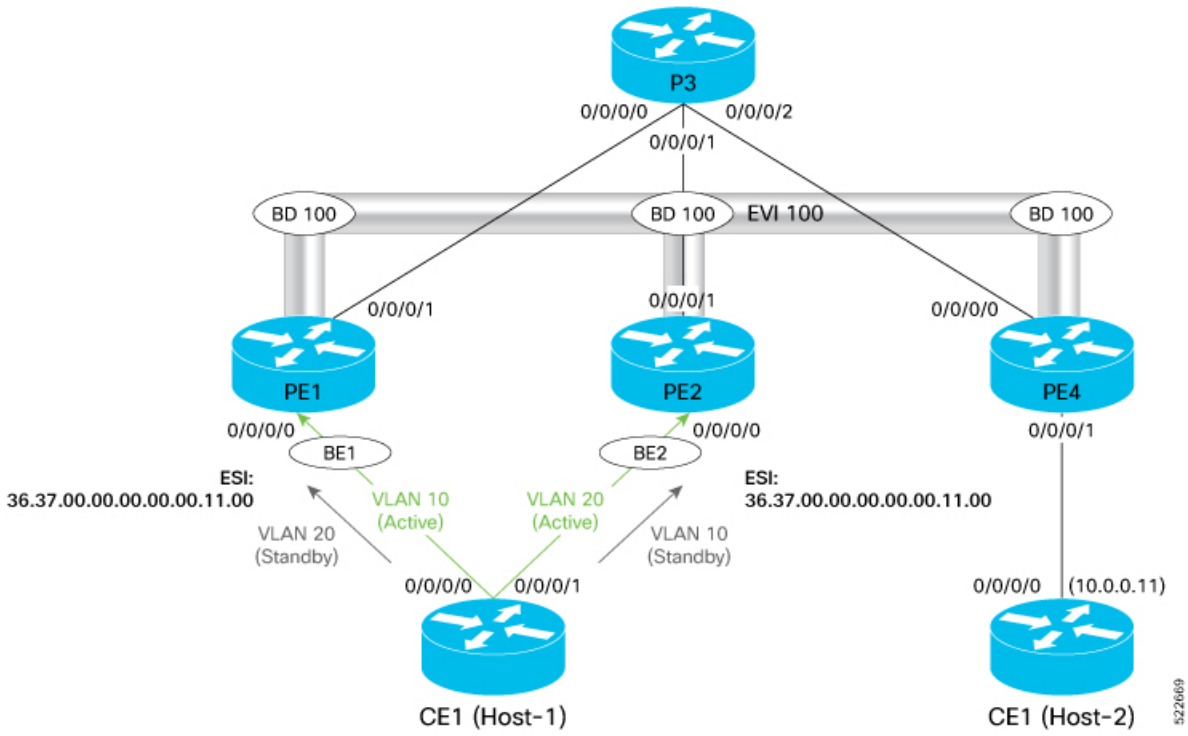
The single-active mode offers redundant connectivity for a VLAN on a single link at a time with failover to the second link in case the active link fails. The single-active mode directs the traffic to a single uplink. This mode is useful for network scenarios where policing, metering, and billing are required.

In Single-Active mode, Cisco IOS XR sends a topology change notification on the Ethernet segment links when a service carving update occurs, so that CEs flush their MAC tables and redirect traffic to the new DF-Elected PE.

Starting from Cisco IOS XR Release 7.11.2, the MAC flush message can be disabled for an Ethernet segment if it causes undesired behaviour at the CE, like triggering BPDU guard. Use the **mac-flush-message disable** command to disable the MAC flush messages.

Topology

Let's understand how the single-active mode works with this sample topology.



In this topology,

- The CE Router is multihomed to PE1 and PE2. Only one active uplink is allowed to send and receive traffic at any given time.
- In this mode, each link towards PE is in a unique ethernet bundle interface. In this example, BE1 is the ethernet bundle interface connecting CE1 and PE1. BE2 is the ethernet bundle interface connecting CE1 and PE2.
- As both the links are in a separate ethernet bundle interface, CE1 floods traffic at first to both the PE devices, but only the PE that is the Designated Forwarder (DF) forwards the traffic.
- In this mode, the uplinks to PE1 and PE2 are individual links and by default, the host chooses the DF uplink for forwarding for a given VLAN.

Configure EVPN Single-Active Multi-Homing

Perform the following tasks to configure EVPN single-active multi-homing:

- Configure Ethernet bundles on CE1 for multi-homing.
- Configure EVPN based single-active multi-homing.

Note Sub-interface shutdown is not supported in Single-Active load-balancing mode

Configure Ethernet bundles on CE1 for Multihoming:

```
Router#configure
Router(config)#interface Bundle-Ether1
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface Bundle-Ether2
Router(config-if)# no shutdown
Router(config)#exit
Router(config)#interface HundredGigE0/0/0/0
Router(config-if)#bundle id 1 mode active
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface HundredGigE0/0/0/1
Router(config-if)#bundle id 2 mode active
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface HundredGigE0/0/0/2
Router(config-if)#exit
Router(config)#interface HundredGigE0/0/0/3
Router(config-if)#no shutdown
Router(config-if)#commit
Router(config-if)#exit
Router(config)#interface Bundle-Ether1.10 l2transport
Router(config-subif)#encapsulation dot1q 10
Router(config-subif)#rewrite ingress tag pop 1 symmetric
Router(config-subif)#commit
Router(config-subif)#exit
Router(config)#interface Bundle-Ether2.10 l2transport
Router(config-subif)#encapsulation dot1q 10
Router(config-subif)#rewrite ingress tag pop 1 symmetric
Router(config-subif)#commit
Router(config-subif)#root
Router(config)#interface BVI10
Router(config-if)#ipv4 address 10.0.0.10 255.255.255.0
Router(config-if)exit
Router(config)#interface BVI10
Router(config-if)#ipv4 address 10.0.0.10 255.255.255.0
Router(config-if)#exit
Router(config)#l2vpn
Router(config-l2vpn)#bridge group bg1
Router(config-l2vpn-bg)#bridge-domain bd-10
Router(config-l2vpn-bg-bd)#interface Bundle-Ether1.10
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)#interface Bundle-Ether2.10
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)#routed interface BVI10
Router(config-l2vpn-bg-bd-bvi)#commit
```

Configure EVPN based single-active multi-homing on PE Routers.

PE1 Configuration:

```
Router#configure
Router(config)#interface Bundle-Ether1
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface Bundle-Ether2
Router(config-if)#no shutdown
Router(config)#exit
Router(config)#interface Bundle-Ether1.10 l2transport
Router(config-subif)#encapsulation dot1q 10
Router(config-subif)#rewrite ingress tag pop 1 symmetric
```

```
Router(config-subif)#exit
Router(config)#evpn
Router(config-evpn)#evi 100
Router(config-evpn-instance)#advertise-mac
Router(config-evpn-instance-mac)#exit
Router(config-evpn-instance)#exit
Router(config-evpn)#interface Bundle-Ether1
Router(config-evpn-ac)#ethernet-segment
Router(config-evpn-ac-es)#identifier type 0 36.37.00.00.00.00.00.11.00
Router(config-evpn-ac-es)#load-balancing-mode single-active
Router(config-evpn-ac-es)#root
Router(config)#l2vpn
Router(config-l2vpn)#bridge group 100
Router(config-l2vpn-bg)#bridge-domain 100
Router(config-l2vpn-bg-bd)#interface Bundle-Ether2.10
Router(config-l2vpn-bg-bd)#evi 100
Router(config-l2vpn-bg-bd-evi)#commit
```

PE2 Configuration:

```
Router#configure
Router(config)#interface Bundle-Ether1
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#interface Bundle-Ether2
Router(config-if)#no shutdown
Router(config)#exit
Router(config)#interface Bundle-Ether2.10 l2transport
Router(config-subif)#encapsulation dot1q 10
Router(config-subif)#rewrite ingress tag pop 1 symmetric
Router(config-subif)#exit
Router(config)#evpn
Router(config-evpn)#evi 100
Router(config-evpn-instance)#advertise-mac
Router(config-evpn-instance-mac)#exit
Router(config-evpn-instance)#exit
Router(config-evpn)#interface Bundle-Ether2
Router(config-evpn-ac)#ethernet-segment 0 36.37.00.00.00.00.00.11.00

Verification

The following output shows that the EVPN single-active mode is enabled:

```
Router#show evpn ethernet-segment detail

Legend:
  B   - No Forwarders EVPN-enabled,
  C   - Backbone Source MAC missing (PBB-EVPN),
  RT  - ES-Import Route Target missing,
  E   - ESI missing,
  H   - Interface handle missing,
  I   - Name (Interface or Virtual Access) missing,
  M   - Interface in Down state,
  O   - BGP End of Download missing,
  P   - Interface already Access Protected,
  Pf  - Interface forced single-homed,
  R   - BGP RID not received,
  S   - Interface in redundancy standby state,
  X   - ESI-extracted MAC Conflict
  SHG - No local split-horizon-group label allocated

Disable MAC Flush Messages for EVPN Single-Active Multi-Homing

To disable the MAC flush messages on an Ethernet segment, use the **mac-flush-message disable** while configuring EVPN single-active multi-homing on PE Routers.

```
Router(config)#evpn
Router(config-evpn)#evi 100
Router(config-evpn-instance)#advertise-mac
Router(config-evpn-instance-mac)#exit
Router(config-evpn-instance)#exit
Router(config-evpn)#interface Bundle-Ether1
```

```
Router(config-evpn-ac)#ethernet-segment
Router(config-evpn-ac-es)#identifier type 0 36.37.00.00.00.00.00.11.00
Router(config-evpn-ac-es)#load-balancing-mode single-active
Router(config-evpn-ac-es)#exit
Router(config-evpn-ac)# mac-flush-message disable
Router(config-evpn-ac)# root

Router(config)#l2vpn
Router(config-l2vpn)#bridge group 100
Router(config-l2vpn-bg)#bridge-domain 100
Router(config-l2vpn-bg-bd)#interface Bundle-Ether2.10
Router(config-l2vpn-bg-bd)#evi 100
Router(config-l2vpn-bg-bd-evi)#commit
```

Running Configuration

```
evpn
 evi 100
  advertise-mac
  !
 !
 interface Bundle-Ether1
  ethernet-segment
   identifier type 0 36.37.00.00.00.00.00.11.00
   load-balancing-mode single-active
  !
  mac-flush-message disable
  !
 !
!
l2vpn
 bridge group 100
  bridge-domain 100
   interface Bundle-Ether1.10
   !
   evi 100

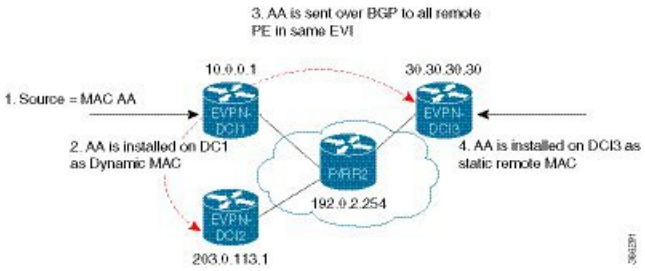
EVPN Software MAC Learning

The MAC addresses learned on one device needs to be learned or distributed on the other devices in a VLAN. EVPN Software MAC Learning feature enables the distribution of the MAC addresses learned on one device to the other devices connected to a network. The MAC addresses are learnt from the remote devices using BGP.

Note A device can contain up to 128K MAC address entries. A bridge domain on a device can contain up to 64K MAC address entries.

Figure 2: EVPN Software MAC Learning



The above figure illustrates the process of software MAC learning. The following are the steps involved in the process:

1. Traffic comes in on one port in the bridge domain.
2. The source MAC address (AA) is learnt on the PE and is stored as a dynamic MAC entry.
3. The MAC address (AA) is converted into a type-2 BGP route and is sent over BGP to all the remote PEs in the same EVI.
4. The MAC address (AA) is updated on the PE as a remote MAC address.

Configure EVPN Software MAC Learning

The following section describes how you can configure EVPN Software MAC Learning:

Note On EVPN bridge domain, the router does not support control word and does not enable control word by default.

From Release 7.4.1 Control word is enabled by default. If the **control-word-disable** command is not configured, ensure to configure it under EVPN or EVI configuration mode before an upgrade to avoid inconsistent behaviour with routers running before Release 7.4.2.

If you want to enable **control-word** command for EVPN Bridging feature, then you must configure it only when both the endpoints run Release 7.4.1 or later.

If you want to disable control word command, use **control-word-disable** before Release 7.8.1, it needed a router to reload to take effect.

Note The router does not support flow-aware transport (FAT) pseudowire.

```
/* Configure bridge domain. */

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group EVPN_SH

Supported Modes for EVPN Software MAC Learning

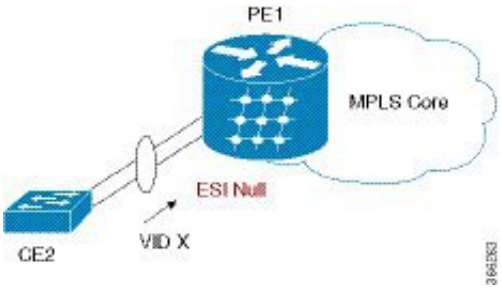
The following are the modes in which EVPN Software MAC Learning is supported:

- Single Home Device (SHD) or Single Home Network (SHN)
- Dual Home Device (DHD)—All Active Load Balancing

Single Home Device or Single Home Network Mode

The following section describes how you can configure EVPN Software MAC Learning feature in single home device or single home network (SHD/SHN) mode:

Figure 3: Single Home Device or Single Home Network Mode



In the above figure, the PE (PE1) is attached to Ethernet Segment using bundle or physical interfaces. Null Ethernet Segment Identifier (ESI) is used for SHD/SHN.

Configure EVPN in Single Home Device or Single Home Network Mode

This section describes how you can configure EVPN Software MAC Learning feature in single home device or single home network mode.

```
/* Configure bridge domain. */

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group EVPN_ALL_ACTIVE
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain EVPN_2001
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface Bundle-Ether1.2001
```

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# evi 2001

/* Configure advertisement of MAC routes. */

RP/0/RSP0/CPU0:router(config)# evpn
RP/0/RSP0/CPU0:router(config-evpn)# evi 2001

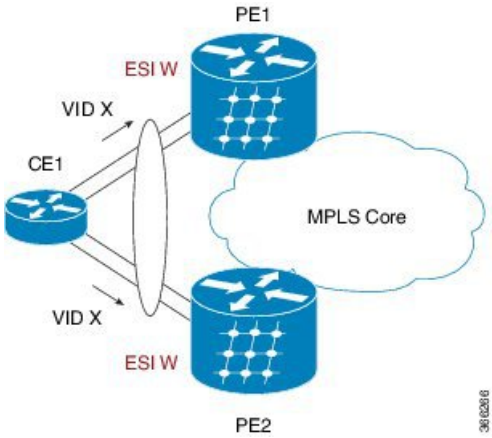
……
 Topology :
 Operational : SH
 Configured : Single-active (AApS) (default)
```

Dual Home Device—All-Active Load Balancing Mode

The following section describes how you can configure EVPN Software MAC Learning feature in dual home device (DHD) in all-active load balancing mode:

Figure 4: Dual Home Device —All-Active Load Balancing Mode



All-active load-balancing is known as Active/Active per Flow (AApF). In the above figure, identical Ethernet Segment Identifier is used on both EVPN PEs. PEs are attached to Ethernet Segment using bundle interfaces. In the CE, single bundles are configured towards two EVPN PEs. In this mode, the MAC address that is learnt is stored on both PE1 and PE2. Both PE1 and PE2 can forward the traffic within the same EVI.

Configure EVPN Software MAC Learning in Dual Home Device—All-Active Mode

This section describes how you can configure EVPN Software MAC Learning feature in dual home device—all-active mode:

```
/* Configure bridge domain. */

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group EVPN_ALL_ACTIVE
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain EVPN_2001

EVPN Out of Service

The EVPN Out of Service feature enables you to control the state of bundle interfaces that are part of an Ethernet segment that have Link Aggregation Control protocol (LACP) configured. This feature enables you to put a node out of service (OOS) without having to manually shutdown all the bundles on their provider edge (PE).

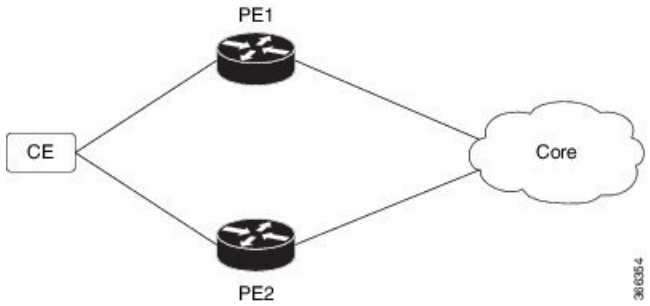
Use the **cost-out** command to bring down all the bundle interfaces belonging to an Ethernet VPN (EVPN) Ethernet segment on a node. The Ethernet A-D Ethernet Segment (ES-EAD) routes are withdrawn before shutting down the bundles. The PE signals to the connected customer edge (CE) device to bring down the corresponding bundle member. This steers away traffic from this PE node without traffic disruption. The

traffic that is bound for the Ethernet segment from the CE is directed to the peer PE in a multi-homing environment.

Note EVPN cost-out is supported only on manually configured ESIs.

In the following topology, the CE is connected to PE1 and PE2. When you configure the **cost-out** command on PE1, all the bundle interfaces on the Ethernet segment are brought down. Also, the corresponding bundle member is brought down on the CE. Hence, the traffic for this Ethernet segment is now sent to PE2 from the CE.

Figure 5: EVPN Out of Service



To bring up the node into service, use **no cost-out** command. This brings up all the bundle interfaces belonging to EVPN Ethernet segment on the PE and the corresponding bundle members on the CE.

When the node is in cost-out state, adding a new bundle Ethernet segment brings that bundle down. Similarly, removing the bundle Ethernet segment brings that bundle up.

Use **startup-cost-in** command to bring up the node into service after the specified time on reload. The node will cost-out when EVPN is initialized and remain cost-out until the set time. If you execute **evpn no startup-cost-in** command while timer is running, the timer stops and node is cost-in.

The 'cost-out' configuration always takes precedence over the 'startup-cost-in' timer. So, if you reload with both the configurations, cost-out state is controlled by the 'cost-out' configuration and the timer is not relevant. Similarly, if you reload with the startup timer, and configure 'cost-out' while timer is running, the timer is stopped and OOS state is controlled only by the 'cost-out' configuration.

If you do a proc restart while the startup-cost-in timer is running, the node remains in cost-out state and the timer restarts.

Configure EVPN Out of Service

This section describes how you can configure EVPN Out of Service.

```
/* Configuring node cost-out on a PE */

Router# configure
Router(config)# evpn
Router(config-evpn)# cost-out
Router(config-evpn)commit

/* Bringing up the node into service */
```

```
Router# configure
Router(config)# evpn
Router(config-evpn)# no cost-out
Router(config-evpn)commit

/* Configuring the timer to bring up the node into service after the specified time on
reload */

Router# configure
Router(config)# evpn
Router(config-evpn)# startup-cost-in 6000
Router(config-evpn)commit
```

Running Configuration

```
configure
evpn
 cost-out
!

configure
evpn
 startup-cost-in 6000
!
```

Verification

Verify the EVPN Out of Service configuration.

```
/* Verify the node cost-out configuration */

CFM Support for EVPN

Ethernet Connectivity Fault Management (CFM) is a service-level OAM protocol that provides tools for monitoring and troubleshooting end-to-end Ethernet services per VLAN. This includes proactive connectivity monitoring, fault verification, and fault isolation. CFM can be deployed in an EVPN network. You can monitor the connections between the nodes using CFM in an EVPN network.

Restrictions

CFM for EVPN is supported with the following restrictions:

- Starting with Cisco IOS XR 7.4.1 release, CFM over EVPN services are not supported in N540-24Q8L2DD-SYS router.
- In an active-active multi-homing scenario, when monitoring the connectivity between a multi-homed CE device and the PE devices to which it is connected, CFM can only be used across each individual link between a CE and a PE. Attempts to use CFM on the bundle between CE and PE devices cause sequence number errors and statistical inaccuracies.
- There is a possibility of artefacts in loopback and linktrace results. Either a loopback or linktrace may report multiple results for the same instance, or consecutive instances of a loopback and linktrace between the same two endpoints may produce different results.

Control Word Support for ELAN

Table 2: Feature History Table

Feature Name	Release Information	Feature Description

Control-word support for EVPN Bridge-Mode (E-LAN)	Release 7.4.1	Control word is now supported and enabled by default in ELAN mode. If the **control-word-disable** command is not configured, ensure to configure it under EVPN or EVI configuration mode before an upgrade to avoid inconsistent behaviour with routers before this release.
		`Router# configure`
		`Router(config)# evpn`
		`Router(config-evpn)# evi 1`
		`Router(config-evpn-instance)# control-word-disable`
		`// Apply to interop with older releases EVPN ELAN`
		If you want to enable **control-word** command for EVPN Bridging feature, then you must configure it only when both the endpoints run Release 7.4.1 or later.

Note Control word is enabled by default in ELAN mode as well. If the **control-word-disable** command is not configured, ensure to configure it under EVPN or EVI configuration mode before an upgrade to avoid inconsistent behaviour with routers before Release 7.4.1.

If you want to enable **control-word** command for EVPN Bridging feature, then you must configure it only when both the endpoints run Release 7.4.1 or later.

EVPN Multiple Services per Ethernet Segment

EVPN Multiple Services per Ethernet Segment feature allows you to configure multiple services over single Ethernet Segment (ES). Instead of configuring multiple services over multiple ES, you can configure multiple services over a single ES.

You can configure the following services on a single Ethernet Bundle; you can configure one service on each sub-interface.

- Flexible cross-connect (FXC) service. It supports VLAN Unaware, VLAN Aware, and Local Switching modes.

  For more information, see *Configure Point-to-Point Layer 2 Services* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS Series Routers*.

- EVPN-VPWS Xconnect service

  For more information, see *EVPN Virtual Private Wire Service (VPWS)* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS Series Routers*.

- EVPN Integrated Routing and Bridging (IRB)

  For more information, see *Configure EVPN IRB* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS Series Routers*.

- Native EVPN

  For more information see, *EVPN Features* chapter in *L2VPN and Ethernet Services Configuration Guide for Cisco NCS Series Routers*.

All these services are supported only on all-active multihoming scenario.

Configure EVPN Multiple Services per Ethernet Segment

Consider a customer edge (CE) device connected to two provider edge (PE) devices through Ethernet Bundle interface 22001. Configure multiple services on Bundle Ethernet sub-interfaces.

Configuration Example

Consider Bundle-Ether22001 ES, and configure multiple services on sub-interface.

```
/* Configure attachment circuits */
Router# configure
Router(config)# interface Bundle-Ether22001.12 l2transport
Router(config-l2vpn-subif)# encapsulation dot1q 1 second-dot1q 12
```

```
Router(config-l2vpn-subif)# exit
Router(config-l2vpn)# exit
Router(config)# interface Bundle-Ether22001.13 l2transport
Router(config-l2vpn-subif)# encapsulation dot1q 1 second-dot1q 13
Router(config-l2vpn-subif)# exit
Router(config-l2vpn)# exit
Router(config)# interface Bundle-Ether22001.14 l2transport
Router(config-l2vpn-subif)# encapsulation dot1q 1 second-dot1q 14
Router(config-l2vpn-subif)# exit
Router(config-l2vpn)# exit

EVPN Single-Flow-Active Multihoming Load-Balancing Mode

Table 3: Feature History Table

Feature Name	Release Information	Feature Description
Single-Flow Active (for Access Rings) - VPNv4 Hosts	Release 7.4.1	This feature extends the current implementation of EVPN Single-Flow-Active Multihoming Load-Balancing Mode, on Cisco routers with VPNv4 routes.
EVPN Single-Flow-Active Multihoming Load-Balancing Mode	Release 7.3.1	This feature introduces EVPN Single-Flow-Active multihoming mode to connect PE devices in an access network that run Layer 2 access gateway protocols. In this mode, only the PE that first advertises the host MAC address in a VLAN forwards the traffic in a specific flow. When the primary link fails, the traffic quickly switches to the standby PE that learns the MAC address from the originated path, thereby providing fast convergence. A keyword, **single-flow-active** is added to the **load-balancing-mode** command.

In a ring topology, only one of the PEs, which is the active PE, sends and receives the traffic to prevent a traffic loop. When the link to the active PE fails, the traffic switches over to the standby PE. Traffic switchover takes a while because the standby PE has to learn the MAC addresses of the connected hosts. There's a traffic loss until the traffic switch over happens.

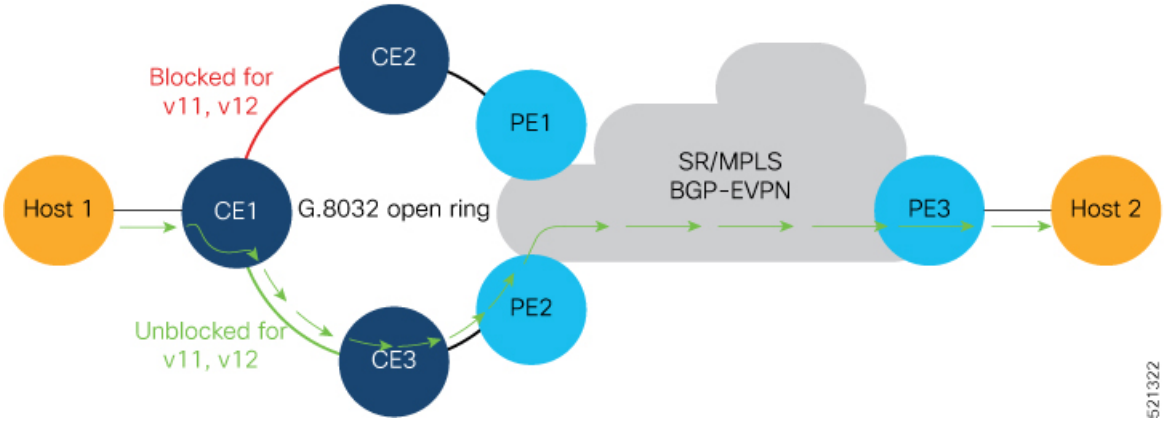
The EVPN Single-Flow-Active multihoming mode connects PE devices in an access network, and in the event of active link failure the switchover happens immediately and reduces the traffic loss.

Both active and standby PEs learn the MAC addresses of the connected host. The PE that learns the MAC address of the host directly is called the Primary (active) PE. The primary PE advertises the learnt MAC addresses to the peer PE, which is referred as standby PE. As the standby PE learns the MAC address of the host through the active PE, this learnt path is referred to as the reoriginated path.

When the primary link fails, the convergence happens fast and the traffic is sent through the standby PE (reoriginated path).

Let us understand how EVPN single flow-active mode helps in fast convergence:

- In this topology, the access network devices are connected through a ring topology. The access network uses Layer-2 gateway protocols such as G.8032, MPLS-TP, STP,REP-AG or MSTP-AG to prevent traffic loop due to continuous flooding.



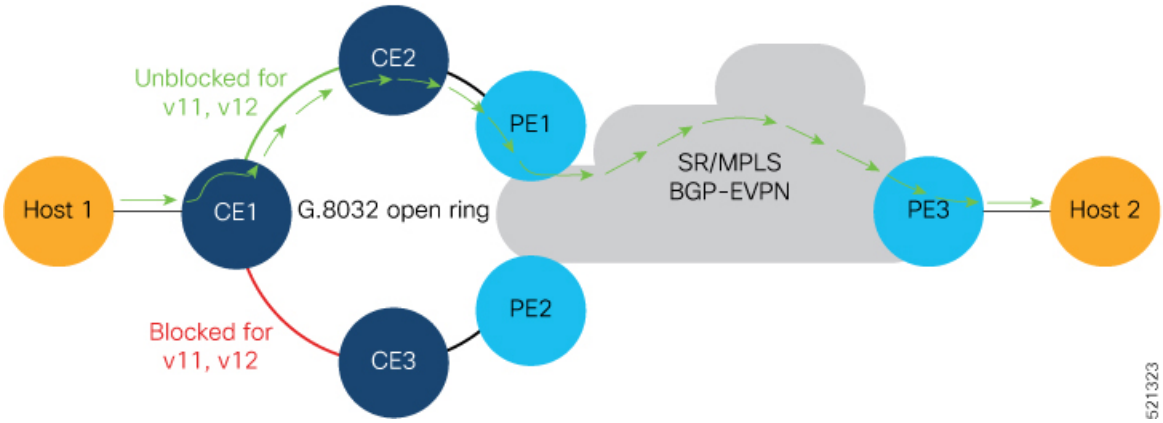
- Host 1 is connected to CE1.
- CE1 is connected to both PE1 and PE2, thus is multihomed.
- PE1 and PE2 are Multihoming devices.
- Both PE1 and PE2 is configured with the same non-zero Ethernet Segment ID (ESI) number `0 36.37.00.00.00.00.00.11.00` for the bundle interface to enable multihoming of the host (CE1).
- PE1 and PE2 belongs to te same VLAN and hence configured with the same EVPN instance (EVI) 100.

Traffic Flow

- Consider a traffic flow from Host 1 to Host 2. The traffic is sent from Host 1 to CE1.
- In this ring topology, the link between CE1 to CE2 is in the blocked state; the link between CE1 to CE3 is in the forwarding state. Hence, CE1 sends the traffic to PE2 through CE3.
- PE2 first learns the MAC address of Host1 through CE1. PE2 advertises the learnt MAC address to the peering PE1.
- As PE2 has learnt the MAC address directly from Host 1, and acts as an active PE.
- The PE which originates the MAC route due to access learning sets the default BGP local preference attribute value to 100.
- PE1 learns the MAC address from PE2 and acts as a stand-by PE. As PE1 gets the reoriginated MAC route from PE2, PE1 sets the BGP local preference attribute value to 80.
- The PE that has the higher local preference always sends and receives the traffic. Thus PE1 sends the traffic to PE3. PE3 sends the traffic to Host 2.

Failure Scenario

When the link between CE1 and CE3 is down or when the link between CE3 and PE2 is down, traffic is sent through PE1.



- When the link fails, the link CE1-CE2 changes to the forwarding state.
- PE1 learns the MAC address of Host 1 directly and advertises the learnt MAC address to PE2.
- PE1 sends the traffic to Host 2 through the remote PE3 with a BGP local preference value of 100.
- PE3 sends and receives the traffic from PE1 until the access link between CE1 and CE2 changes to the blocked state.

Restrictions

Single-Flow Active is not supported for EVPN VPWS.

Configuration Example

- Configure both PE1 and PE2 with the same EVI of 100.
- Configure both PE1 and PE2 with the same ESI 0 36.37.00.00.00.00.00.11.01.

Perform these tasks on both PE1and PE2.

```
/* Configure advertisement of MAC routes */
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-instance)# advertise-mac
Router(config-evpn-instance-mac)# root

/* Configure single-flow-active load-balancing mode */
Router(config)# evpn
Router(config-evpn)# interface bundle-ether 1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 36.37.00.00.00.00.00.11.01
Router(config-evpn-ac-es)# load-balancing-mode single-flow-active
Router(config-evpn-ac-es)# root

/* Configure bridge domain and associating the evi to the bridge domain */
Router(config)# l2vpn
```

```
Router(config-l2vpn)# bridge group 100
Router(config-l2vpn-bg)# bridge-domain 100
Router(config-l2vpn-bg-bd)# interface Bundle-Ether1.2
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)# evi 100
Router(config-l2vpn-bg-bd-evi)# root
Router(config)# interface Bundle-Ether1.2 l2transport

Verification

Verify the Ethernet Segment Status:

- Verify that the Ethernet Segment Id is the same as that you have configured: In this example, you notice that the ESI on PE1 is 0 36.37.00.00.00.00.00.11.01.
- Verify that the Single-flow-active mode is enabled in the Topology section.

```
Router#show  evpn  ethernet-segment  interface  be 1 detail
Legend:
B   - No Forwarders EVPN-enabled,
C   - MAC missing (Backbone S-MAC PBB-EVPN / Grouping ES-MAC vES),
RT  - ES-Import Route Target missing,
E   - ESI missing,
H   - Interface handle missing,
I   - Name (Interface or Virtual Access) missing,
M   - Interface in Down state,
O   - BGP End of Download missing,
P   - Interface already Access Protected,
```

```
Pf  - Interface forced single-homed,
R   - BGP RID not received,
S   - Interface in redundancy standby state,
X   - ESI-extracted MAC Conflict
SHG - No local split-horizon-group label allocated
Hp  - Interface blocked on peering complete during HA event
Rc  - Recovery timer running during peering sequence

Improved scalability and convergence for EVPN single-flow active using ARP pacing

The improved scalability and convergence for EVPN single-flow active using ARP pacing is a network capability that

- supports large-scale deployments
- improves traffic patterns and convergence speed, and
- leverages all L2 protocols such as, Resilient Ethernet Protocol Access Gateway (REP-AG), Spanning Tree Protocol (STP), G.8032 ring to converge hosts with bidirectional traffic in less than one second.

Table 4: Feature History Table

Feature Name	Release Information	Feature Description
Improved scalability and convergence for EVPN single-flow active using ARP pacing	Release 25.2.1	You now have the ability to converge hosts in less than a second, with bidirectional traffic. This feature enables the network to recover quickly from failures or changes in topology, ensuring continuous service and balanced data transmission. This capability is achieved by optimizing the management of MAC and IP routes through ARP pacing. This feature introduces the **arp probe pace** command.

Traffic convergence challenges in ring failures

In the event of a ring failure, redirecting traffic from the active Provider Edge (PE) router to the standby PE router may take some time. This delay occurs because the standby PE router transitions to an active state and learns new MAC addresses. The new active PE router sends Address Resolution Protocol (ARP) requests to the hosts, but the Local Packet Transport Services (LPTS) limits the ARP replies, which leads to queue overflows, dropped responses, and repeated retries, further delaying the convergence.

Optimized solution for traffic convergence

By optimizing the management of MAC and IP routes through ARP pacing, this solution resolves scalability and convergence challenges. This capability ensures efficient handling of ARP probing and reduces convergence time to less than one second, enabling faster network recovery and improved service continuity.

ARP pacing

ARP pacing is a network mechanism that controls the rate at which ARP probes are sent. This control helps manage network traffic and prevents overload from sending too many ARP requests simultaneously. ARP pacing enhances network convergence and reliability by pacing these requests, which are essential for optimal performance.

ARP probes are sent out at a configured rate to prevent the LPTS from dropping the replies. To further improve efficiency, devices avoid redundant requests; they do not send ARP requests if an entry is already being probed.

Benefits of ARP pacing

ARP pacing offers these benefits:

- Scalability—controls the rate of ARP requests to prevent network congestion and maintain scalability, even with numerous devices.
- Convergence—improves network convergence by performing ARP learning in a controlled manner.
- Stability—becomes more resilient to sudden surges in ARP activity, reducing the likelihood of service disruptions caused by excessive ARP processing.

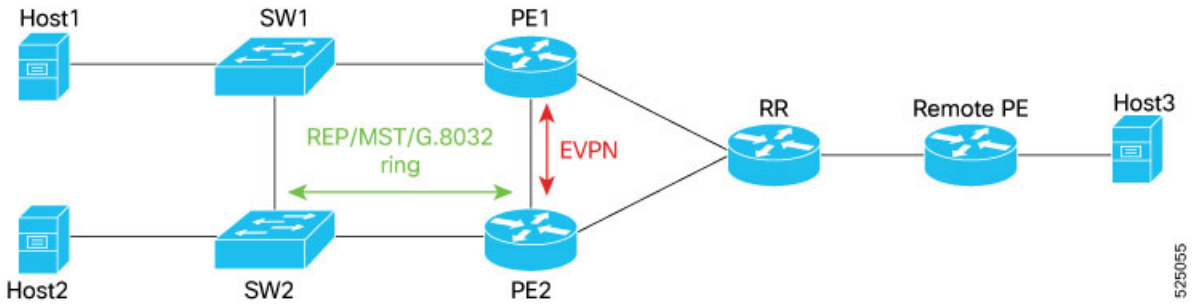
How does the provider edge router learn the MAC address after a link or ring failure

Summary

After a link or ring failure, PE2 learns the MAC address of Host1 through a combination of events. The actors or components:

- PE1: The PE that initially forwards traffic.
- PE2: The peering PE that takes over forwarding traffic after a failure.
- SW1 and SW2: An intermediary element.
- Host1 and Host2: A target host.
- EVPN control plane: Uses BGP to distribute MAC address reachability information between PEs.
- L2 protocol such as, STP, MSTP, RSTP, REP, G.8032 ring: Protocol responsible for detecting and reacting to link failures, and unblocking the alternate path.

Workflow



Prior to the link failure, PE2 learns Host1's MAC address through EVPN synchronization from PE1.

The process by which the PE2 learns the MAC address after a link or ring failure involves these steps:

1. Link failure detection: The PE1 and SW1 detect a failure in the link between them. The REP mechanism in the ring identifies and responds to such failures. Subsequently, REP unblocks the previously blocked link between SW1 and SW2, establishing an alternate traffic path
2. PE2 forwards traffic for Host1: Due to the link failure between PE1 and SW1, and the subsequent unblocking of the SW1-SW2 link, PE2 now becomes the designated forwarder for traffic destined to Host1. This is due to the change in the network topology and the L2 protocol's convergence.
3. MAC address withdrawal: PE1, upon detecting the failure, withdraws the MAC address advertisements it had previously sent for the hosts reachable through SW1 (including Host1). This withdrawal is signaled through EVPN control plane messages to PE2.
4. ARP pacing and new ARP requests: PE2, now needing to forward traffic to Host1 (which was previously reachable through PE1), initiates its own ARP requests to learn the MAC address to IP mapping for Host1. The ARP pacing mechanism controls the rate at which PE2 sends these requests.

   When a large number of hosts are present in the Ethernet segment, the responses to ARP requests generated by PE2 can arrive in bursts, potentially overwhelming the Local Packet Transport Services (LPTS) and leading to dropped responses. ARP pacing mitigates this issue by controlling and slowing down the rate at which PE2 generates ARP requests, ensuring a more stable and reliable convergence process.
5. MAC advertisement: Host1 responds to the ARP request from PE2. PE2 then learns the MAC address of Host1 and forwards traffic accordingly. PE2 then advertises the MAC address to other PEs.
6. EVPN control plane: The EVPN control plane is crucial for distributing MAC address reachability information between the PEs. The remote PE learns the new location of the MAC address through EVPN updates.

Configure ARP pacing for improved scalability and convergence

Follow these steps to configure EVPN single-flow active and ARP pacing on PE1 and PE2:

Procedure

Step 1 Configure advertisement of MAC routes.

Example:

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-instance)# advertise-mac
Router(config-evpn-instance-mac)# root
```

Step 2 Configure single-flow-active load-balancing mode.

Example:

```
Router(config)# evpn
Router(config-evpn)# interface bundle-ether 1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 36.37.00.00.00.00.00.11.01
Router(config-evpn-ac-es)# load-balancing-mode single-flow-active
Router(config-evpn-ac-es)# convergence
Router(config-evpn-ac-es-conv)# mac-mobility
Router(config-evpn-ac-es-conv)# exit
```

Step 3 Configure bridge domain and associate the EVI to the bridge domain.

Example:

```
Router(config)# l2vpn
Router(config-l2vpn)# bridge group 100
Router(config-l2vpn-bg)# bridge-domain 100
Router(config-l2vpn-bg-bd)# interface Bundle-Ether1.2
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)# evi 100
Router(config-l2vpn-bg-bd-evi)# root
Router(config)# interface Bundle-Ether1.2 l2transport
Router(config-l2vpn-subif)#encapsulation dot1q 2
Router(config-l2vpn-subif)#commit
```

Step 4 Setup the ring topology using REP, MST, or G.8032.

This example shows REP access gateway configuration.

Example:

```
Router(config)# spanning-tree repag REPAG
Router(config-repag)# interface Bundle-Ether1.2
Router(config-repag-subif)#commit
```

Step 5 Configure ARP pacing to set the rate at which ARP probes are sent.

Set the ARP pacing rate between 1 and 1000 packets per second (PPS). If you don't specify a rate, the router defaults to 500 PPS.

Example:

```
Router(config)# arp probe pace rate 1000
Router(config)#commit
```

Step 6 Verify the configured ARP pace rate using the **show arp trace** command.

Example:

```
Router# show arp trace  location all | inc PACE
Apr  1 09:33:50.985684 ipv4_arp/slow 0/0/CPU0 118# t6183 [ARPTP_340] PROBE-PACE: Starting
a Pacing timer 999899278ns
Apr  1 09:33:51.985884 ipv4_arp/slow 0/0/CPU0 118# t6183 [ARPTP_364] PROBE-PACE: Sent a
```

```
burst of 1000 packets, Remaining 0, Rate 500, Time elapsed 166830ns
Apr  1 09:33:11.545292 ipv4_arp/slow 0/0/CPU0 t6183 [ARPTP_340] PROBE-PACE: Starting a
Pacing timer 925727805ns
Apr  1 09:33:12.471209 ipv4_arp/slow 0/0/CPU0 t6183 [ARPTP_364] PROBE-PACE: Sent a burst
of 1000 packets, Remaining 7000, Rate 500, Time elapsed 116596ns
Apr  1 09:33:12.471211 ipv4_arp/slow 0/0/CPU0 t6183 [ARPTP_340] PROBE-PACE: Starting a
Pacing timer 999883404ns
Apr  1 09:33:13.471679 ipv4_arp/slow 0/0/CPU0 t6183 [ARPTP_364] PROBE-PACE: Sent a burst
of 1000 packets, Remaining 6500, Rate 500, Time elapsed 162890ns
```

EVPN Convergence Using NTP Synchronization

Table 5: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Convergence Using NTP Synchronization	Release 7.3.1	This feature leverages the NTP clock synchronization mechanism to handle the transfer of DF role from one edge device to another. In this mechanism, the newly added or recovered PE advertises the Service Carving Timestamp along with the current time to peering PEs. This improves convergence by reducing the time for DF election from three seconds to a few tens of milliseconds. The **show evpn ethernet-segment** command is modified to display the Service-Carving wall clock Timestamp (SCT).

In Ethernet VPN, depending on the load-balancing mode, the Designated Forwarder (DF) is responsible for forwarding Unicast, Broadcast, Unknown Unicast, and Multicast (BUM) traffic to a multihomed Customer Edge (CE) device on a given VLAN on a particular Ethernet Segment (ES).

The DF is selected from the set of multihomed edge devices attached to a given ES. When a new edge router joins the peering group either through failure recovery or booting up of a new device, the DF election process is triggered.

By default, the process of transferring the DF role from one edge device to another takes 3 seconds. The traffic may be lost during this period.

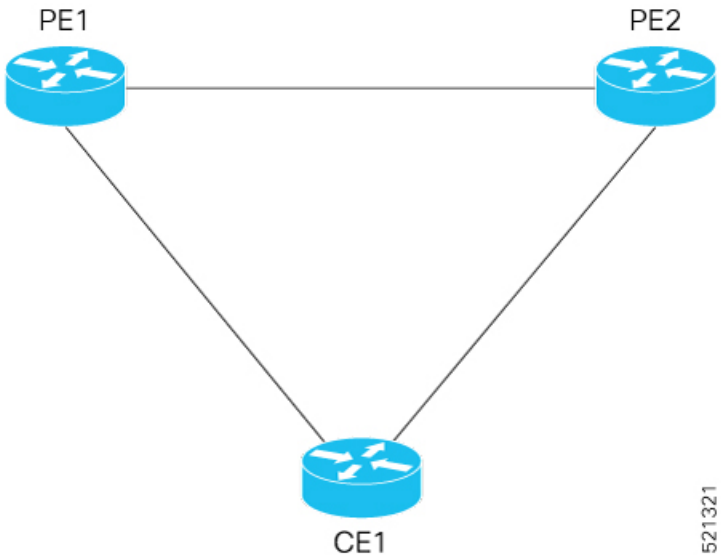
The NTP synchronization mechanism for fast DF election upon recovery leverages the NTP clock synchronization to better align DF events between peering PEs.

If all edge devices attached to a given Ethernet Segment are clock-synchronized with each other using NTP, the default DF election time reduces from 3 seconds to few tens of milliseconds, thereby reducing traffic loss.

Note If the NTP is not synchronized with the NTP server when the EVPN Ethernet Segment interface is coming up, EVPN performs normal DF election.

Let's understand how NTP synchronization works:

Figure 6: EVPN Convergence Using NTP Synchronization



In this topology, CE1 is multihomed to PE1 and PE2.

- PE1 joins the peering group after failure recovery at time (t) = 99 seconds.
- When PE1 joins the peering group, PE1 advertises Route-Type 4 at t = 100 seconds with target Service Carving Time (SCT) value t = 103 seconds to PE2.
- PE2 receives peering Route-Type 4 and learns the DF election time of PE1 to be t =103 seconds.
- If all the peers support NTP, PE2 starts a timer based on the SCT received from PE1 along with a skew value in the Service Carving Time. The skew values are used to eliminate any potential duplicate traffic or loops. Both PE1 and PE2 carves at time t = 103 seconds.

Benefits

- Helps in fast convergence during a primary link recovery
- Supports all the existing load-balancing modes:
  - All-active multihoming
  - Single-active multihoming
  - Port-active multihoming
  - Single-Flow-Active multihoming

Limitations

- All devices attached to a given Ethernet Segment must be configured with NTP. If one of the devices doesn't support NTP clock, the mechanism falls back to default timers.

Verification

Use the **show evpn ethernet-segment** command to view the **Service Carving Time** of the edge device.

For example,

```
Router# show evpn ethernet-segment interface Bundle-Ether200 carving detail

EVPN MPLS Seamless Integration with VPLS

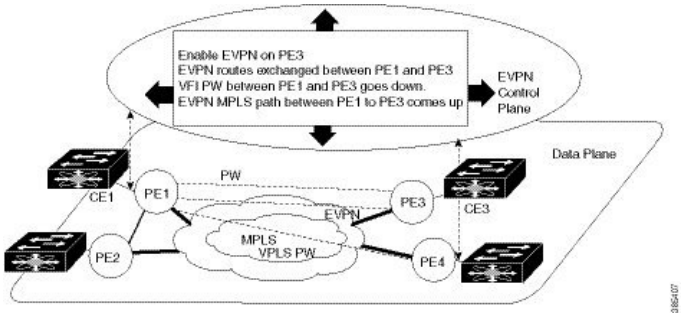
Migrate VPLS Network to EVPN Network through Seamless Integration

In EVPN network, VPN instances are identified by EVPN instance ID (EVI-ID). Similar to other L2VPN technologies, EVPN instances are also associated with route-targets and route-distinguisher. EVPN uses control plane for learning and propagating MAC unlike traditional VPLS, where MAC is learnt in the data plane (learns using "flood and learn technique"). In EVPN, MAC routes are carried by MP-BGP protocol. In

EVPN enabled PEs, PEs import the MAC route along with the label to their respective EVPN forwarding table only if their route targets (RTs) match. An EVPN PE router is capable of performing VPLS and EVPN L2 bridging in the same VPN instance. When both EVPN and BGP-AD PW are configured in a VPN instance, the EVPN PEs advertise the BGP VPLS auto-discovery (AD) route as well as the BGP EVPN Inclusive Multicast route (type-3) for a given VPN Instance. Route type-3 referred to as ingress replication multicast route, is used to send broadcast, unknown unicast, and multicast (BUM) traffic. Other remote PEs import type-3 routes for the same VPN instance only if the sending PE RTs match with their configured RT. Thus, at the end of these route-exchanges, EVPN capable PEs discover all other PEs in the VPN instance and their associated capabilities. The type-3 routes used by PE to send its BUM traffic to other PEs ensure that PEs with the same RTs receive the BUM traffic. EVPN advertises the customer MAC address using type-2 route.

EVPN MPLS Seamless Integration with VPLS allows you to upgrade the VPLS PE routers to EVPN one by one without any network service disruption. Consider the following topology where PE1, PE2, PE3, and PE4 are interconnected in a full-meshed network using VPLS PW.

Figure 7: EVPN MPLS Seamless Integration with VPLS



The EVPN service can be introduced in the network one PE node at a time. The VPLS to EVPN migration starts on PE1 by enabling EVPN in a VPN instance of VPLS service. As soon as EVPN is enabled, PE1 starts advertising EVPN inclusive multicast route to other PE nodes. Since PE1 does not receive any inclusive multicast routes from other PE nodes, VPLS pseudo wires between PE1 and other PE nodes remain active. PE1 keeps forwarding traffic using VPLS pseudo wires. At the same time, PE1 advertises all MAC address learned from CE1 using EVPN route type-2. In the second step, EVPN is enabled in PE3. PE3 starts advertising inclusive multicast route to other PE nodes. Both PE1 and PE3 discover each other through EVPN routes. As a result, PE1 and PE3 shut down the pseudo wires between them. EVPN service replaces VPLS service between PE1 and PE3. At this stage, PE1 keeps running VPLS service with PE2 and PE4. It starts EVPN service with PE3 in the same VPN instance. This is called EVPN seamless integration with VPLS. The VPLS to EVPN migration then continues to remaining PE nodes. In the end, all four PE nodes are enabled with EVPN service. VPLS service is completely replaced with EVPN service in the network. All VPLS pseudo wires are shut down.

Configure EVPN on the Existing VPLS Network

Perform the following tasks to configure EVPN on the existing VPLS network.

- Configure L2VPN EVPN address-family
- Configure EVI and corresponding BGP route-targets under EVPN configuration mode
- Configure EVI under a bridge-domain

See EVI Configuration Under L2VPN Bridge-Domain, on page 50 section for how to migrate various VPLS-based network to EVPN.

Configure L2 EVPN Address-Family

Perform this task to enable EVPN address family under both BGP and participating neighbor.

Configuration Example

```
Router# configure
Router(config)#router bgp 65530
Router(config-bgp)#nsr
Router(config-bgp)#bgp graceful-restart
Router(config-bgp)#bgp router-id 200.0.1.1

Configure EVI and Corresponding BGP Route Target under EVPN Configuration Mode

Perform this task to configure EVI and define the corresponding BGP route targets. Also, configure advertise-mac, else the MAC routes (type-2) are not advertised.

Configuration Example

```
Router# configure
Router(config)#evpn
Router(config-evpn)#evi 1
Router(config-evpn-evi-bgp)#bgp
Router(config-evpn-evi-bgp)#table-policy spp-basic-6
Router(config-evpn-evi-bgp)#route-target import 100:6005
Router(config-evpn-evi-bgp)#route-target export 100:6005
Router(config-evpn-evi-bgp)#exit
```

```
Router(config-evpn-evi)#advertise-mac
Router(config-evpn-evi)#commit
```

Running Configuration

```
configure
 evpn
  evi
   bgp
    table-policy spp-basic-6
    route-target import 100:6005
    route-target export 100:6005
    !
   advertise-mac
   !
  !
 !
```

Configure EVI under a Bridge Domain

Perform this task to configure EVI under the corresponding L2VPN bridge domain.

Configuration Example

```
Router# configure
Router(config)#l2vpn
Router(config-l2vpn)#bridge group bg1
Router(config-l2vpn-bg)#bridge-domain bd1
Router(config-l2vpn-bg-bd)#interface GigabitEthernet
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)#evi 1
Router(config-l2vpn-bg-bd-evi)#exit
Router(config-l2vpn-bg-bd)#vfi v1
Router(config-l2vpn-bg-bd-vfi)#neighbor 10.1.1.2 pw-id 1000
Router(config-l2vpn-bg-bd-vfi-pw)#mpls static label local 20001 remote 10001
Router(config-l2vpn-bg-bd-vfi-pw)#commit
```

Running Configuration

```
configure
 l2vpn
  bridge group bg1
   bridge-domain bd1
    interface GigabitEthernet
    !
    evi 1
    !
   vfi v1
    neighbor 10.1.1.2 pw-id 1000
     mpls static label local 20001 remote 10001
     !
    !
    evi 1
 !
```

EVI Configuration Under L2VPN Bridge-Domain

The following examples show EVI configuration under L2VPN bridge-domain for various VPLS-based networks:

Note On reloading the Standby route processor (RP), traffic glitch occurs on the VPLS BUM traffic (< 1 second) in a single direction. Effective from release 7.1.1, this restrcition is not applicable.

MPLS Static Labels Based VPLS

```
l2vpn
 bridge group bg1
  bridge-domain bd-1-1
   interface GigabitEthernet
   !
   vfi vfi-1-1
    neighbor 200.0.2.1 pw-id 1200001
     mpls static label local 20001 remote 10001
    !
    neighbor 200.0.3.1 pw-id 1300001
     mpls static label local 30001 remote 10001
    !
    neighbor 200.0.4.1 pw-id 1400001
     mpls static label local 40001 remote 10001
    !
  !
  evi 1
!
```

AutoDiscovery BGP and BGP Signalling Based VPLS

```
l2vpn
bridge group bg1
bridge-domain bd-1-2
   interface GigabitEthernet
   !
   vfi vfi-1-2
    vpn-id 2
    autodiscovery bgp
     rd 101:2
     route-target 65530:200
     signaling-protocol bgp
      ve-id 11
      ve-range 16
     !
    !
   evi 2
  !
```

Targeted LDP-Based VPLS

```
bridge-domain bd-1-4
   interface GigabitEthernet
```

```
!
vfi vfi-1-4
 neighbor 200.0.2.1 pw-id 1200004
 !
 neighbor 200.0.3.1 pw-id 1300004
 !
 neighbor 200.0.4.1 pw-id 1400004
 !
evi 3
!
```

Verify EVPN Configuration

Use the following commands to verify EVPN configuration and MAC advertisement. Verify EVPN status, AC status, and VFI status.

- show l2vpn bridge-domain
- show evpn summary
- show bgp rt l2vpn evpn
- show evpn evi
- show l2route evpn mac all

Verify the state of the bridge domain, number of ACs, and VFIs.

```
Router#show l2vpn bridge-domain bd-name bd-1-1

Clear Forwarding Table

To clear an L2VPN forwarding table at a specified location, you can use the **clear l2vpn forwarding table** command. When BVI is present in the bridge domain, you might experience traffic loss during the command execution. Refer the following work-around to resolve such issues.

When you encounter such issues, delete the BVI and roll back the action. As a result, the traffic on the BVI returns to normal state. The following example shows how to delete the BVI and perform roll back action:

```
Router#clear l2vpn forwarding table location 0/0/CPU0
Fri Mar 24 09:34:02.083 UTC
Router(config)#no int BVI100
Router(config)#commit
Router#roll configuration las 1
Wed Dec 16 18:26:52.869 UTC
Loading Rollback Changes.
Loaded Rollback Changes in 1 sec
Committing
```

Note We can also clear the forwarding table by shutting and unshutting the interface.

Hierarchical EVPN Access Pseudowire

Table 6: Feature History Table

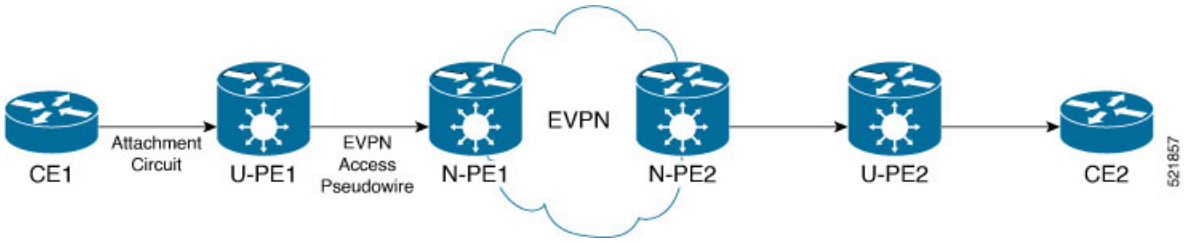
Feature Name	Release Information	Feature Description

Hierarchical EVPN Access Pseudowire	Release 7.6.1	You can configure EVPN VPWS in the access node under the same bridge domain as EVPN in the core to build a PW to the nearest high-end PE that stitches those access circuits using EVPN. This allows the access nodes to leverage the benefits of EVPN. This feature also allows you to reduce the number of pseudowires (PWs) between the network provider edge (N-PE) devices by replacing PE devices with user provider edge (U-PE) and network provider edge (N-PE) devices. This feature prevents signaling overhead and packet replication.

A standard VPN configuration comprises of CE devices and PE devices. With this feature, each PE device is replaced with a user provider edge (U-PE) and network provider edge (N-PE) devices. U-PE devices communicate with the CE devices and N-PE devices on the access side, and N-PE devices communicate with other N-PE devices on the core.

The Hierarchical EVPN Access Pseudowire feature allows you to reduce the number of pseudowires (PWs) between the network provider edge (N-PE) devices. The user provider edge (U-PE) device connects to the N-PE device using EVPN access pseudowire (PW) for each VPN instance. Each CE device is connected to a U-PE device through an attachment circuit.

Hierarchical EVPN Access Pseudowire Topology



In this topology, a user provider edge (U-PE1) device is connected to the CE1 through an attachment circuit. The U-PE1 device transports the CE1 traffic over an EVPN access PW to a network provider edge (N-PE1) device. The N-PE1 is connected with other N-PE2 in an EVPN core. On the N-PE1, the access PW coming from the U-PE1 is much like an AC. The U-PE is not part of the core with the other N-PEs. The N-PE forwards traffic from that access PW to the core PWs that are part of the EVPN core.

Configure Hierarchical EVPN Access Pseudowire

Perform the following task to configure Hierarchical EVPN Access Pseudowire feature on U-PEs and N-PEs.

Configuration Example

```
/* Configure U-PE1 */
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# xconnect group XG1
Router(config-l2vpn-xc)# p2p P1
Router(config-l2vpn-xc-p2p)# interface TenGigE0/0/0/31
Router(config-l2vpn-xc-p2p)# neighbor evpn evi 4 target 33 source 33
Router(config-l2vpn-xc-p2p-pw)# commit

/* Configure N-PE1 */
```

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group evpn
Router(config-l2vpn-bg)# bridge-domain evpn1
Router(config-l2vpn-bg-bd)# neighbor evpn evi 4 target 33
Router(config-l2vpn-bg-bd)# evi 1
Router(config-l2vpn-bg-bd-evi)# commit
```

Running Configuration

This section shows the Hierarchical EVPN Access Pseudowire running configuration.

```
/* U-PE1 Configuration */
l2vpn
 xconnect group XG1
  p2p P1
   interface TenGigE0/0/0/31 l2transport
   neighbor evpn evi 4 target 33 source 33
   !
!
/* N-PE1 Configuration */
l2vpn
bridge group evpn
  bridge-domain evpn1
   neighbor evpn evi 4 target 33
   evi 1
   !
  !
!
!
```

Verification

Verify the EVPN state, and the list of access PWs. The following is the sample output on N-PE1:

```
Router:N-PE1# show l2vpn bridge-domain bd-name evpn1
Wed Jun 16 09:22:30.328 EDT

      EVPN 4,33,192.168.0.4, state: up, Static MAC addresses: 0
  List of VFIs:
  List of Access VFIs:
```

EVPN Seamless Integration with VPWS

Table 7: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Seamless Integration with VPWS	Release 7.4.2	This feature enables you to seamlessly migrate the PE nodes from VPWS to EVPN-VPWS service without disruption in traffic. Such a migration offers your service providers the option to use VPWS or EVPN-VPWS services on PE nodes This feature introduces the **vpws-seamless-integration** command.

Although VPWS is a widely deployed Layer 2 VPN technology, some service providers prefer to migrate to EVPN service in their existing VPWS networks to leverage the benefits of EVPN services.

With EVPN-VPWS Seamless Integration feature, you can migrate the PE nodes from legacy VPWS service to EVPN-VPWS gradually and incrementally without any service disruption.

You can migrate an Attachment Circuit (AC) connected to a legacy VPWS pseudowire (PW) to an EVPN-VPWS PW either by using targeted-LDP signaling or BGP-AD signaling.

Instead of performing network-wide software upgrade at the same time on all PEs, this feature provides the flexibility to migrate one PE at a time. Thus allows the coexistence of legacy VPWS and EVPN-VPWS dual-stack in the core for a given L2 Attachment Circuit (AC) over the same MPLS network. You can enable this feature using the **vpws-seamless-integration** command.

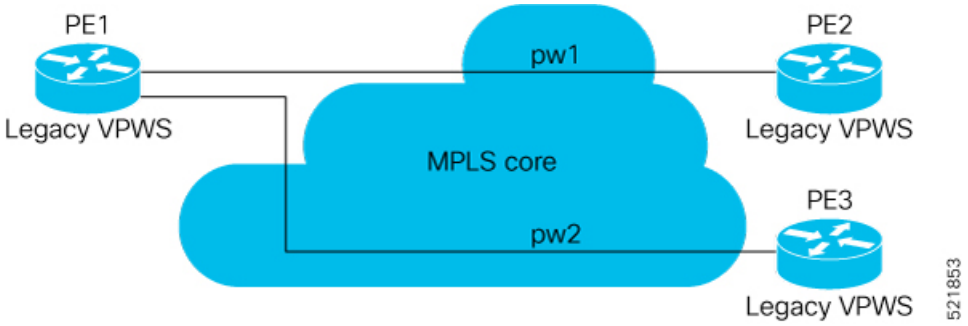
In an EVPN-VPWS network, VPN instances are grouped by EVPN Instance VPN ID (EVI) and identified by an ethernet tag or attachment circuit ID (AC-ID). EVI is also associated with route-targets and route-distinguisher.

During migration, an EVPN-VPWS PE router performs either VPWS or EVPN-VPWS L2 cross-connect for a given AC. When both EVPN-VPWS and BGP-AD PWs are configured for the same AC, the EVPN-VPWS PE during migration advertises the BGP VPWS Auto-Discovery (AD) route as well as the BGP EVPN Auto-Discovery (EVI/EAD) route and gives preference to EVPN-VPWS Pseudowire (PW) over the BGP-AD VPWS PW.

Let’s understand how a legacy VPWS network can be migrated seamlessly to EVPN-VPWS with the following scenario:

Consider that a service provider plans to migrate VPWS node to an EVPN node one at a time. The service provider expects the migration to span over multiple years.

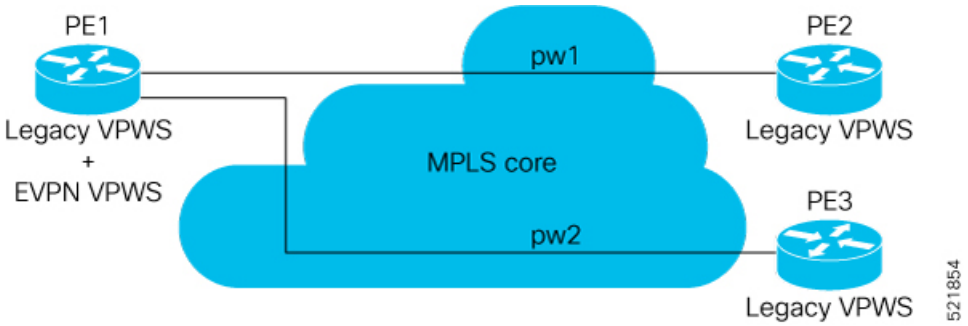
Figure 8:



In this topology, PE1, PE2, PE3 are provider edge devices in the MPLS network and the legacy VPWS cross-connects are up and running between PE1, PE2, and PE3.

- PE1 and PE2 have a legacy PW established between them. (pw1)
- PE1 and PE3 have a legacy PW established between them. (pw2)

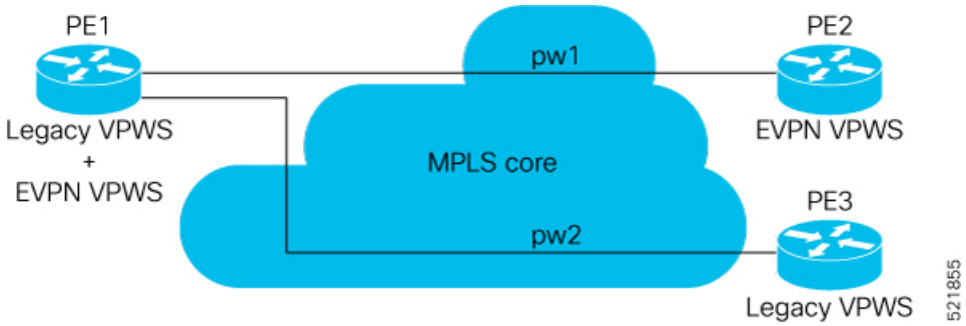
  Service provider wants to replace PE1 with a new hardware. So after replacing the equipment, service provider enables EVPN-VPWS on PE1 first.



Let's understand what happens when only PE1 is migrating to EVPN-VPWS:

- When EVPN-VPWS is enabled, PE1 starts advertising EVPN EVI or Ethernet-AD route to other PE nodes.
- PE1 advertises BGP VPWS Auto-Discovery route and the BGP EVPN Ethernet-AD per EVI route for a given PW.
- As PE2 and PE3 aren't yet migrated, PE1 does not receive any EVI/EAD routes from these PE nodes. Therefore, legacy VPWS runs between PE1, PE2, and PE3.
- PE1 keeps forwarding traffic using legacy VPWS.

After one year, service provider decides to upgrade PE2 and wants to migrate from VPWS to EVPN-VPWS.



- When the upgrade is completed, PE2 starts advertising EVI/EAD route to other PE nodes.
- Both PE1 and PE2 discover each other through EVPN routes.
- As a result, EVPN-VPWS service replaces legacy VPWS service between PE1 and PE2. This is called EVPN-VPWS MPLS Seamless Integration with VPWS.
- EVPN-VPWS service takes high-precedence over legacy VPWS network.
- PE1 and PE2 shuts down the legacy VPWS between them to prevent ongoing duplicate packets from remote CE.

Service provider plans not to migrate PE3 device as of now:

- At this stage, PE1 keeps running legacy VPWS service with PE3.
- The legacy VPWS to EVPN-VPWS migration then continues to remaining PE nodes. The legacy VPWS and EVPN-VPWS dual-stack coexist in the core for a given L2 Attachment Circuit (AC).

After another year, service provider plans to upgrade the PE3 device.

- PE3 is now enabled with EVPN-VPWS service.
- All the PE devices are replaced with EVPN-VPWS services in the network.
- Service provider plans to retain both legacy and an EVPN-VPWS related configuration on PE1 and PE2 nodes.
- During any uncertainties, service provider can roll back the migration. If you rollback the migration to VPWS at node PE2, then PE1 and PE2 will revert to the legacy VPWS between them.

Restriction

- Supported only in single-homing or EVPN port-active multi-homing.
- PWHE is not supported.

Configuration Example

To enable the feature, use the **vpws-seamless-integration** command.

In this example, let's see how to migrate each PE at a time.

When you migrate only PE1, here is the configuration example for PE1, PE2, and PE3:

```
/* Here is the configuration for PE1: */
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# mp2mp 2
Router(config-l2vpn-xc-mp2mp)# autodiscovery bgp
Router(config-l2vpn-xc-mp2mp-ad)# signaling-protocol bgp
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 3

/* Migrate VPWS to EVPN-VPWS*/
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# vpws-seamless-integration
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.1
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# root
Router(config)# l2vpn xconnect group 2
Router(config-l2vpn-xc)# p2p 3
Router(config-l2vpn-xc-p2p)# interface Bundle-Ether 1.1
Router(config-l2vpn-xc-p2p)# neighbor evpn evi 4 service 5
Router(config-l2vpn-xc-p2p-pw)# commit

/* Here is the configuration for PE2: */
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# mp2mp 2
Router(config-l2vpn-xc-mp2mp)# autodiscovery bgp
Router(config-l2vpn-xc-mp2mp-ad)# signaling-protocol bgp
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 3
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.1
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# exit
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 5
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.2
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit

/* Here is the configuration for PE3:*/
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# mp2mp 2
Router(config-l2vpn-xc-mp2mp)# autodiscovery bgp
Router(config-l2vpn-xc-mp2mp-ad)# signaling-protocol bgp
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 3
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.1
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# exit
Router(config-l2vpn-xc-mp2mp-ad-sig)# ce-id 5
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# interface Bundle-Ether1.2
Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit
```

The following show output indicates that only VPWS is up and EVPN is down:

```
Router# show l2vpn xconnect
Tue Jun  8 12:36:20.253 EDT
Legend: ST = State, UP = Up, DN = Down, AD = Admin Down, UR = Unresolved,
        SB = Standby, SR = Standby Ready, (PP) = Partially Programmed,
        LU = Local Up, RU = Remote Up, CO = Connected, (SI) = Seamless Inactive

XConnect                   Segment 1                       Segment 2

Router(config-l2vpn-xc-mp2mp-ad-sig-ce)# commit
```

Verification

The following example shows that VPWS is inactive and indicates the status as SB(SI).

```
Router# show l2vpn xconnect
Thu Feb 25 11:57:27.622 EST
```

```
Legend: ST = State, UP = Up, DN = Down, AD = Admin Down, UR = Unresolved,
        SB = Standby, SR = Standby Ready, (PP) = Partially Programmed,
        LU = Local Up, RU = Remote Up, CO = Connected, (SI) = Seamless Inactive

XConnect                    Segment 1                       Segment 2
Group      Name       ST    Description            ST       Description            ST
-------------------------   ------------------------------  ------------------------------
evpn-vpws  test11-1   UP    BE11                   UP       EVPN 11,11,24048       UP
-------------------------------------------------------------------------------------------
legacy-tldp
           test11     DN    BE11                   SB(SI)   192.168.12.110  11     UP
-------------------------------------------------------------------------------------------
```

The following example shows whether EVPN-VPWS or VPWS is used for forwarding the traffic. In this example, `evi: 1` indicates that EVPN is used for forwarding the traffic.

```
Router# show l2vpn forwarding interface gigabitEthernet 0/2/0/8.1 detail location 0/2/CPU0
Wed Apr 28 09:08:37.512 EDT
Local interface: GigabitEthernet0/2/0/8.1, Xconnect id: 0x800001, Status: up
  Segment 1
    AC, GigabitEthernet0/2/0/8.1, status: Bound
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
  Segment 2
    MPLS, Destination address: 192.168.0.4, evi: 1,
ac-id: 1, status: Bound
Pseudowire label: 24004
    Control word enabled
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
```

In the following example, `pw-id: 1` indicates that VPWS is used for forwarding the traffic:

```
Router# show l2vpn forwarding interface gigabitEthernet 0/2/0/8.1 detail location 0/2/CPU0
Wed Apr 28 09:09:45.204 EDT
Local interface: GigabitEthernet0/2/0/8.1, Xconnect id: 0x800001, Status: up
  Segment 1
    AC, GigabitEthernet0/2/0/8.1, status: Bound
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
  Segment 2
    MPLS, Destination address: 192.168.0.4, pw-id: 1, status: Bound
Pseudowire label: 24000
    Control word disabled
    Statistics:
      packets: received 0, sent 0
      bytes: received 0, sent 0
```

Use the **l2vpn logging pseudowire** command to track the migration of AC from one PW to another.

For example,

```
Router(config)# l2vpn logging pseudowire
RP/0/0/CPU0:Jan 18 15:35:15.607 EST:
l2vpn_mgr[1234]: %L2-EVPN-5-VPWS_SEAMLESS_INTEGRATION_STATE_CHANGE :
GigabitEthernet0/2/0/8.1 - Active XC is now service-1:evpn-vpws-1, standby XC is
service-1:tldp-1
```

TLDP PW to EVPN-VPWS Migration

Similar to migrating VPWS to EVPN, we can migrate TLDP PW to EVPN-VPWS on all the PE routers incrementally.

You can perform this task on all the PE router incrementaly. The following configuration example shows the TLDP PW to EVPN-VPWS migration on PE1:

```
/*Here is an example using TLDP*/
Router# configure
Router(config)# l2vpn xconnect group 1
Router(config-l2vpn-xc)# p2p p1
Router(config-l2vpn-xc-p2p)# interface BE1.1
Router(config-l2vpn-xc-p2p)# neighbor 10.0.0.1 pw-id 1
Router(config-l2vpn-xc-p2p)# vpws-seamless-integration
```

Network Convergence using Core Isolation Protection

The Network Convergence using Core Isolation Protection feature allows the router to converge fast when remote links and local interfaces fail. This feature reduces the duration of traffic drop by rapidly rerouting traffic to alternate paths. This feature uses Object Tracking (OT) to detect remote link failure and failure of connected interfaces.

Tracking interfaces can only detect failure of connected interfaces and not failure of a remote router interfaces that provides connectivity to the core. Tracking one or more BGP neighbor sessions along with one or more of the neighbor's address-families enables you to detect remote link failure.

Object Tracking

Object tracking (OT) is a mechanism for tracking an object to take any client action on another object as configured by the client. The object on which the client action is performed may not have any relationship to the tracked objects. The client actions are performed based on changes to the properties of the object being tracked.

You can identify each tracked object by a unique name that is specified by the track command in the configuration mode.

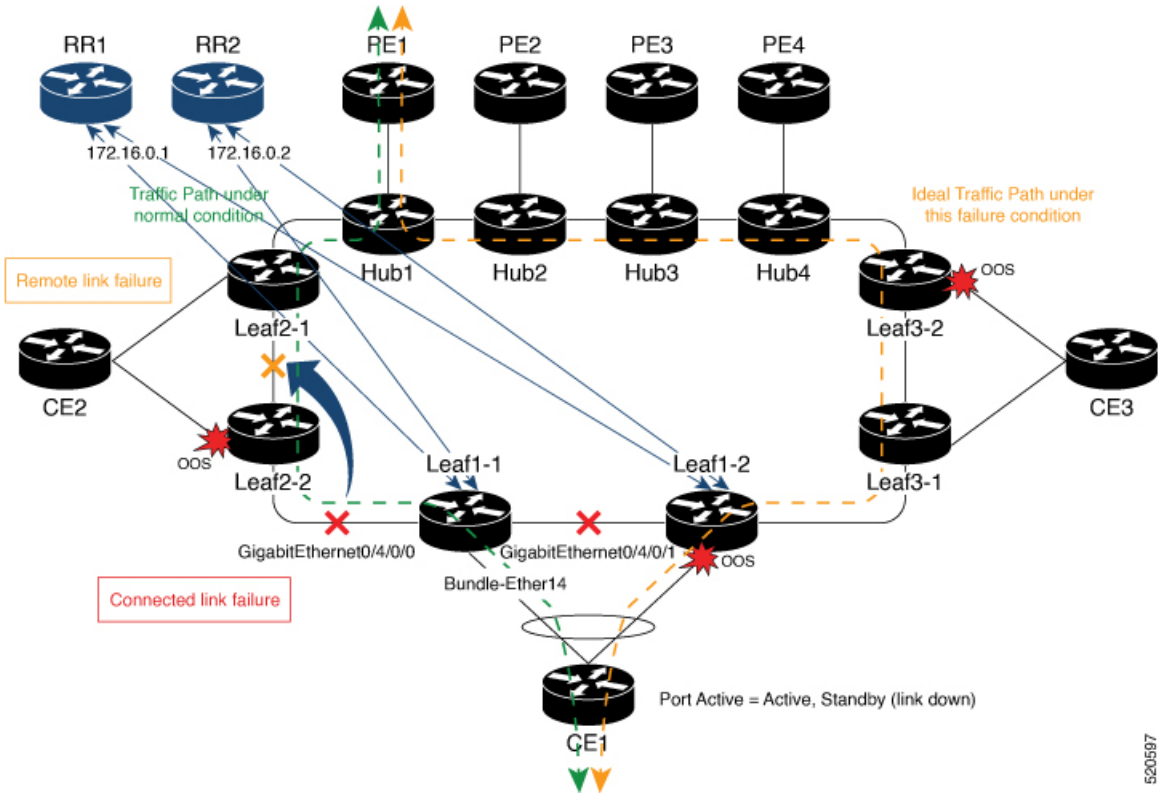
The tracking process receives the notification when the tracked object changes its state. The state of the tracked objects can be up or down.

You can also track multiple objects by a list. You can use a flexible method for combining objects with Boolean logic. This functionality includes:

- Boolean AND function—When a tracked list has been assigned a Boolean AND function, each object defined within a subset must be in an up state, so that the tracked object can also be in the up state.
- Boolean OR function—When the tracked list has been assigned a Boolean OR function, it means that at least one object defined within a subset must also be in an up state, so that the tracked object can also be in the up state.

For more information on OT, see the *Configuring Object Tracking* chapter in the *System Management Configuration Guide for Cisco NCS 560 Series Routers*.

Figure 9: EVPN Convergence Using Core Isolation Protection



Consider a traffic flow from CE1 to PE1. The CE1 can send the traffic either from Leaf1-1 or Leaf1-2. When Leaf1-1 loses the connectivity to both the local links and remote link, BGP sessions to both route reflectors (RRs) are down; the Leaf1-1 brings down the Bundle-Ether14 connected to CE1. The CE1 redirects the traffic from Leaf1-2 to PE1.

You can track the connected interfaces to identify the connected link failures. However, if there is a remote link failure, tracking connected interfaces does not identify the remote link failures. You must track BGP sessions to identify the remote link failure.

Note When you configure the **bgp graceful-restart** command, unconfiguring a neighbor is considered as a non-gr event. This generates a BGP notification to the neighbor before the neighbor is unconfigured.

On the remote router, if the track is configured for this neighbor, the track state is brought down immediately.

However, certain configurations are treated as graceful reset reason and when unconfigured they supress the BGP notification to the neighbor. The route-reflector-client configuration under the neighbor or neighbor address-family is one of the examples.

On the remote router, if the track is configured for this neighbor, the track state is not brought down immediately because a notification is not received.

To overcome this situation, shutdown the neighbor before unconfiguring the neighbor. This generates a BGP notification to the neighbor, and any track configured for the neighbor is brought down immediately.

Configure EVPN Convergence using Core Isolation Protection

A tracked list contains one or more objects. The Boolean expression enables tracking objects using either AND or OR operators. For example, when tracking two interfaces, using the AND operator, up means that *both* interfaces are up, and down means that *either* interface is down.

Note An object must exist before it can be added to a tracked list.

The NOT operator is specified for one or more objects and negates the state of the object.

After configuring the tracked object, you must associate the neighbor or interface whose state must be tracked.

Perform the following tasks to configure EVPN convergence using core isolation protection:

- Configure BGP
- Track the Line Protocol State of an Interface
- Track neighbor adress-family state
- Track objects for both interfaces and neighbors

Configuration Example

In this example, Leaf1-1 brings the down the AC connected to CE1 when:

Both local interfaces GigabitEthernet0/4/0/0 and GigabitEthernet0/4/0/1of Leaf1-1 are down.

OR

Leaf1-1 BGP sessions to both RRs are down.

CE1 re-directs the traffic it was sending to Leaf1-1 to Leaf1-2.

Perform the following tasks on Leaf1-1:

```
/* Configure BGP */
Router# configure
Router(config)# router bgp 100
Router(config-bgp)# address-family l2vpn evpn
Router(config-bgp-af)# exit
Router(config-bgp)# neighbor 172.16.0.1
Router(config-bgp-nbr)# remote-as 100
Router(config-bgp-nbr)# address-family l2vpn evpn
Router(config-bgp-nbr-af)# neighbor 172.16.0.1
Router(config-bgp-nbr)# remote-as 100
Router(config-bgp-nbr)# address-family l2vpn evpn
Router(config-bgp-nbr-af)# commit

/* Track the Line Protocol State of an Interface */

Configurable Recovery Time for EVPN Core Isolation Group

Table 8: Feature History Table

Feature Name	Release Information	Feature Description
Configurable Recovery Time for EVPN Core Isolation Group	Release 7.6.1	You can now configure the recovery time for the EVPN core isolation group after the core interfaces recover from a network failure. This functionality is important because post-failure recovery, you can provide sufficient time for the EVPN PE nodes to relearn the MAC addresses and BGP routes received from the remote PEs. There's also time to handle delays in exchanging EVPN routes after recovery. This feature introduces the **core-de-isolation** command under the EVPN Timers configuration mode.

When the core link failure is detected on the PE device, the PE device is isolated from the network and brings down the access interfaces connected to this PE till the core interfaces recover. When the core links recover, the default recovery delay timer begins. The access interfaces become active after the default recover delay timer of 60 seconds expire. The core isolation group recovery delay timer was not user-configurable.

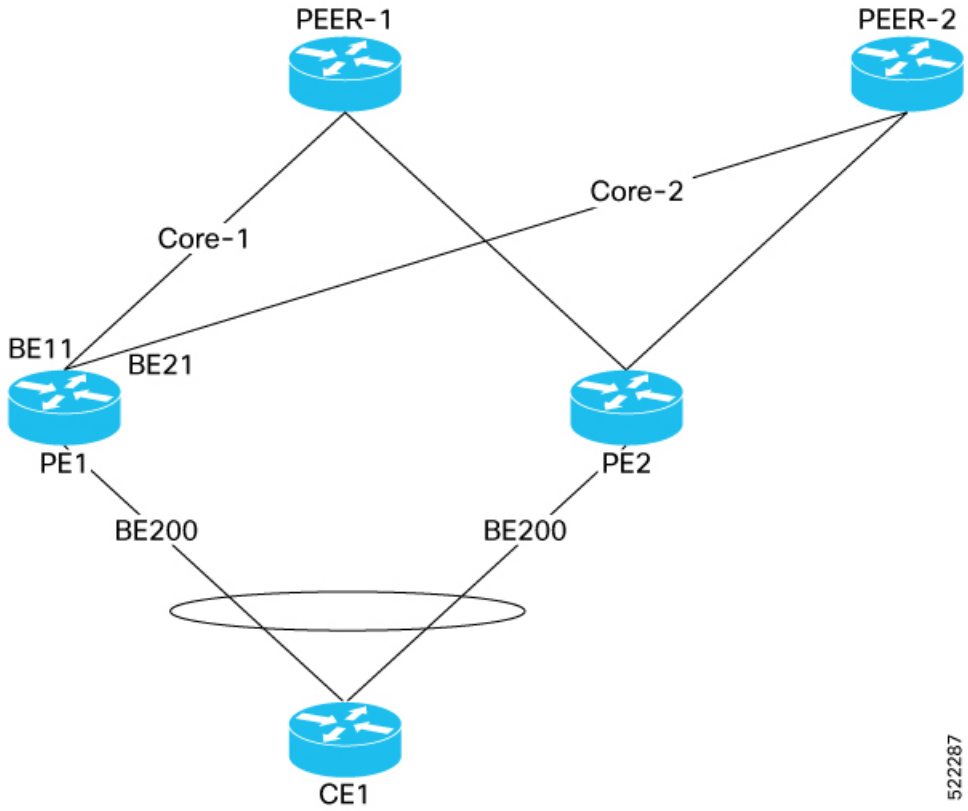
Under scale situations where a network has high MAC addresses, it is observed that the 60 seconds is too short to bring up the access bundle interface as there can be multiple reasons which can delay the exchange of EVPN routes even after the core interfaces have come up.

This feature allows you to configure the core isolation group recovery time to handle delays coming from the core and provides enough time for the EVPN PE nodes to relearn the MAC addresses. You can configure the core isolation group recovery time using the **core-de-isolation** command.

Topology

Consider a topology where CE1 is connected to PE1 and PE2. PE1 and PE2 are running EVPN over the MPLS core network. The core interfaces on PE1 are configured with BE11 and BE22. When the core links of PE1 go down, the EVPN detects the link failure and isolates the PE1 node from the core network, and brings down the access interfaces connected to PE1. This prevents CE1 from sending any traffic to PE1.

When all the core interfaces and BGP sessions come up, PE1 advertises Ethernet A-D Ethernet Segment (ES-EAD) routes again, triggers the service carving, and becomes part of the core network. The access interfaces connected to PE1 from CE1 also come up after the *core-de-isolation* timer value expires.



Configurable Recovery Time for EVPN Core Isolation Group

To enable this feature, configure core interfaces under the EVPN group and associate that group to the Ethernet Segment which is an attachment circuit (AC) attached to the CE.

Perform the following tasks to configure recovery time for EVPN core isolation group:

- Configure EVPN core interfaces on PE1
- Configure *core-de-isolation* timer on PE1
- Configure attachment circuits on CE1

Configuration Example

Configure EVPN core interfaces on PE1.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# group 100
Router(config-evpn-group)# core interface BE11
Router(config-evpn-group)# core interface BE21
Router(config-evpn-group)# commit
```

Configure core-de-isolation timer on PE1.

```
Router# configure
```

```
Router(config)# evpn timers
Router(config-evpn-timers)# core-de-isolation 120
Router(config-evpn-timers)# commit
```

Configure attachment circuits on CE1.

```
/* Configure interface Bundle-Ether200 and associate it to core isolation group 100 */
Router # configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether200
Router(config-evpn-ac)# ethernet-segment identifier type 0 11.11.11.11.11.11.11.11.11
Router(config-evpn-ac-es)# bgp route-target 1111.1111.1111
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# core-isolation-group 100

/* Configure interface Bundle-Ether201 and associate it to core isolation group 100 */
Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether201
Router(config-evpn-ac)# ethernet-segment identifier type 0 11.22.22.22.22.22.22.22.22
Router(config-evpn-ac-es)# bgp route-target 1111.2222.2222
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# core-isolation-group 100
```

Running Configuration

This section shows the EVPN core isolation group recovery delay timer running configuration.

```
/* Configure EVPN core interfaces on PE1 */
evpn
 group 100
  core interface Bundle-Ether11
  core interface Bundle-Ether21
!
!
/* Configure core-de-isolation timer on PE1 */
evpn timers
  core-de-isolation 120
!
!
/* Configure attachment circuits on CE1 */
evpn
 interface Bundle-Ether200
  ethernet-segment
   identifier type 0 11.11.11.11.11.11.11.11.11
   bgp route-target 1111.1111.1111
  !
  core-isolation-group 100
!
!
evpn
 interface Bundle-Ether201
  ethernet-segment
   identifier type 0 11.22.22.22.22.22.22.22.22
   bgp route-target 1111.2222.2222
  !
  core-isolation-group 100
!
!
```

Verification

The following output shows that all core interfaces and access interfaces are UP. The *core de-isolation* timer value is configured as 120 seconds, but not running as the core interfaces are UP.

```
Router# show evpn group
EVPN Group: 100

  state: Ready

  Core Interfaces:
     Bundle-Ether11: up
     Bundle-Ether21: up

  Access Interfaces:
     Bundle-Ether200: up
     Bundle-Ether201: up

EVPN services costed out on node  : No
          Startup-cost-in timer   : Not configured
          EVPN manual cost-out    : No
          EVPN Bundle Convergence : No
```

Failure Scenario

The following example shows the failure scenario and how the *core de-isolation* timer works.

Let’s bring down the core interfaces:

```
Router# configure
Router(config)# interface Bundle-Ether11
Router(config-if)# shutdown
Router(config-if)# exit
Router(config)# interface Bundle-Ether21
Router(config-if)# shutdown
Router(config-if)# commit
```

This example shows when the core interfaces are shutdown even the access interfaces are down and the core is isolated.

```
Router# show evpn group

EVPN Group: 100

  state: Isolated

  Core Interfaces:
     Bundle-Ether11: shutdown
     Bundle-Ether21: shutdown

  Access Interfaces:
     Bundle-Ether200: down
     Bundle-Ether201: down
```

This example shows that the *core de-isolation timer* is not yet running because the core interfaces are still down.

```
Router# show evpn summary

          EVPN manual cost-out     : No
          EVPN Bundle Convergence  : No
```

Let's bring up the core interfaces and see how the *core de-isolation* timer starts.

```
Router# rollback configuration last 1

Loading Rollback Changes.
Loaded Rollback Changes in 1 sec
Committing.
6 items committed in 1 sec (5)items/sec
Updating.
Updated Commit database in 1 sec
Configuration successfully rolled back 1 commits.
```

In this example, you can see that the *core de-isolation* timer starts running after the core interfaces come up. When the core interfaces are UP, the state of core changes to Deisolating. In the following output you can see the state as Deisolating and core interfaces are up and the *core de-isolation* timer has started.

The access interfaces come up only after the *core de-isolation* timer value expires. In the following output you can see the access interfaces are still down.

```
Router# show evpn group

EVPN Group: 100

  state: Deisolating

  Core Interfaces:
     Bundle-Ether11: up
     Bundle-Ether21: up

  Access Interfaces:
     Bundle-Ether200: down
     Bundle-Ether201: down

```

After the *core de-isolation* timer expires, you can see that the state is Ready, and both core and access interfaces are UP.

```
Router# show evpn group

EVPN Group: 100

  state: Ready
```

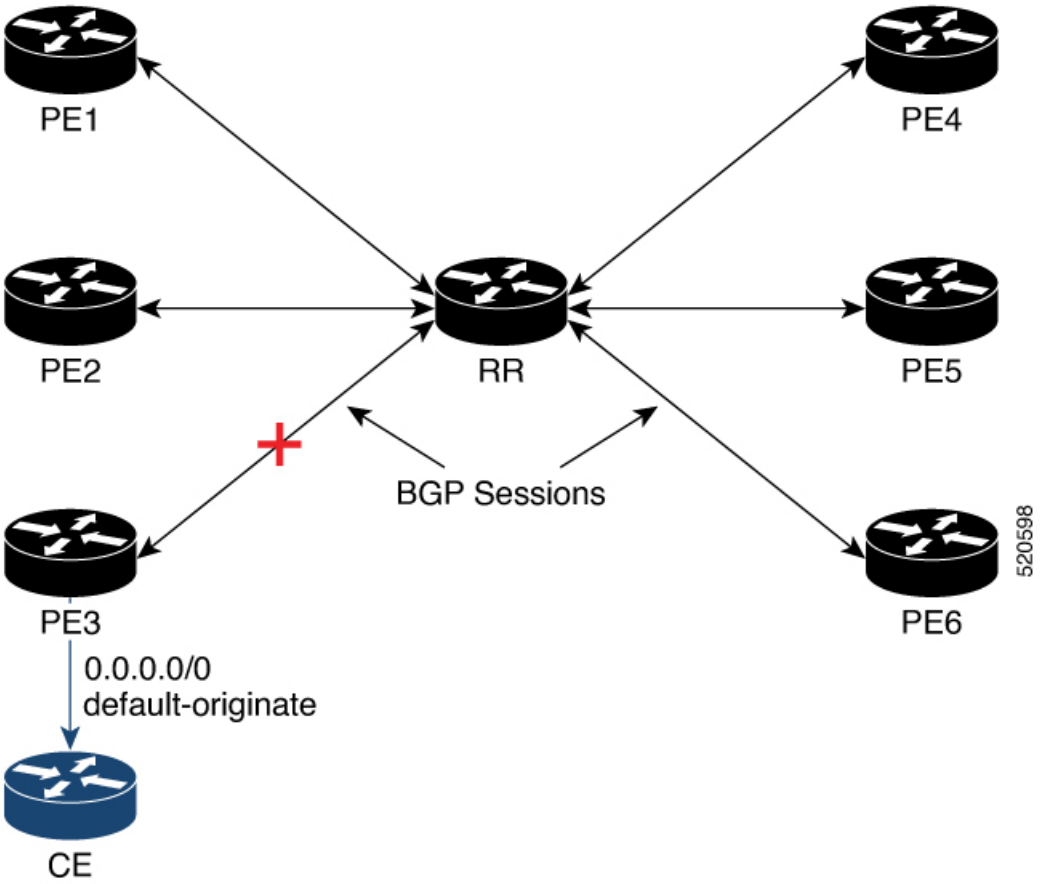
```
Core Interfaces:
   Bundle-Ether11: up
   Bundle-Ether21: up

Access Interfaces:
   Bundle-Ether200: up
   Bundle-Ether201: up
```

Conditional Advertisement of Default-Originate

The router advertises the default-originate (0.0.0.0/0) towards the network fabric only upon receiving all the core routes. The router withdraws the advertisement of default-originate when the core is isolated. To avoid traffic drop, install the routes in the hardware. To accommodate an additional delay for the routes to be installed in the hardware, you can configure a timeout for the installed routes.

Figure 10: Advertisement of default-originate



In this topology, PE3 advertises the default-originate to CE only when the PE3 session to RR is established and all the routes are received from the RR.

Configure Conditional Advertisement of Default-Originate

Perform the following tasks to configure conditional advertisement of default-originate.

- Configure BGP
- Configure RPL
- Track BGP neighbor address-family state

Configuration Example

Perform the following task on PE3:

```
/* Configure BGP */
Router# configure
Router(config)# router bgp 100
Router(config-bgp)# bgp router-id 192.0.2.1
Router(config-bgp)# address-family vpnv4 unicast
Router(config-bgp-af)# exit
Router(config-bgp)# neighbor 172.16.0.5
Router(config-bgp-nbr)# remote-as 200
Router(config-bgp-nbr)# address-family vpnv4 unicast
Router(config-bgp-nbr-af)# exit
Router(config-bgp-nbr)# exit
Router(config-bgp)# vrf cust1
Router(config-bgp-vrf)# rd auto
Router(config-bgp-vrf)# address-family ipv4 unicast
Router(config-bgp-vrf-af)# redistribute connected
Router(config-bgp-vrf-af)# redistribute static
Router(config-bgp-vrf-af)# exit
Router(config-bgp-vrf)# neighbor 172.16.0.5
Router(config-bgp-vrf-nbr)# remote-as 200
Router(config-bgp-vrf-nbr)# address-family ipv4 unicast
Router(config-bgp-vrf-nbr-af)# default-originate route-policy track-bgp-core-policy
Router(config-bgp-vrf-nbr-af)# route-policy pass in
Router(config-bgp-vrf-nbr-af)# route-policy pass out
Router(config-bgp-vrf-nbr-af) commit

/* Configure RPL */
Router# configure
Router(config)# route-policy track-bgp-core-policy
Router(config-rpl)# if track core-group-1 is up then
Router(config-rpl-if)# pass
Router(config-rpl-if)# endif
Router(config-rpl)# end-policy
Router(config)# commit

/* Track BGP neighbor address-family state */
Router# configure
Router(config)# track core-group-1
Router(config-track)# type bgp neighbor address-family state
Router(config-track-bgp-nbr-af)# address-family vpnv4 unicast
Router(config-track-bgp-neighbor)# neighbor 172.16.0.5
Router(config-track-bgp-neighbor)# commit
```

Running Configuration

This section shows conditional advertisement of default-originate running configuration.

```
configure
 router bgp 100
```

```
  bgp router-id 192.0.2.1
  address-family vpnv4 unicast
!
 neighbor 172.16.0.5
  remote-as 200
  address-family vpnv4 unicast
!

 vrf cust1
  rd auto
  address-family ipv4 unicast
   redistribute connected
   redistribute static
!
 neighbor 172.16.0.5
  remote-as 200
  address-family ipv4 unicast
   default-originate route-policy track-bgp-core-policy
   route-policy pass in
   route-policy pass out
!

route-policy track-bgp-core-policy
 if track core-group-1 is up then
  pass
  endif
 end-policy
!
track network-core
 type bgp neighbor address-family state
  address-family vpnv4 unicast
   neighbor 172.16.0.5
!
```

Verification

Verify conditional advertisement of default-originate.

```
Router# show rpl active route-policy
Wed May 27 06:54:31.902 UTC

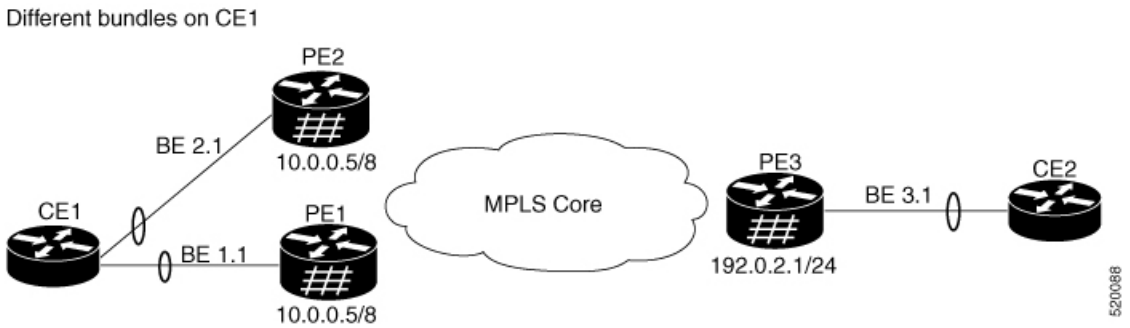
EVPN Single-Active Multihoming for Anycast Gateway IRB

The EVPN Single-Active Multihoming for Anycast Gateway IRB feature supports single-active redundancy mode. In this mode, the provider edge (PE) nodes locally connected to an Ethernet Segment load balance traffic to and from the Ethernet Segment based on EVPN service instance (EVI). Within an EVPN service instance, only one PE forwards traffic to and from the Ethernet Segment (ES). This feature supports intersubnet scenario only.

Figure 11: EVPN: Single-Active Multihoming for Anycast Gateway IRB



Consider a topology where CE1 is multihomed to PE1 and PE2. Bundle Ethernet interfaces BE 1.1, BE 2.1, and the ingress interface must belong to the same switching domain on CE1. Enable host routing and configure anycast gateway IP address on both these peering PEs. PE1 and PE2 are connected to PE3 through MPLS core. PE3 has reachability of subnet 10.0.0.5/8 to both peering PEs. Peering PEs has reachability to PE3 subnet 192.0.2.1/24. CE2 is connected to PE3 through an Ethernet interface bundle. PE1 and PE2 advertise Type 4 routes, and then performs designated forwarder (DF) election. The non-DF blocks the traffic in both the directions in single-active mode.

Consider a traffic flow from CE1 to CE2. CE1 sends an address resolution protocol (ARP) broadcast request to both PE1 and PE2. Peering PEs performs designated forwarder (DF) election for shared ESI. If PE1 is the designated forwarder for the EVI, PE1 replies to the ARP request from CE1. PE2 drops the traffic from CE1. Thereafter, all the unicast traffic is sent through PE1. PE2 is set to stand-by or blocked state and traffic is not sent over this path. PE1 advertises MAC to PE3. PE3 always sends and receives traffic through PE1. PE3 sends the traffic to CE2 over Ethernet interface bundle. If BE1 fails, PE2 becomes the DF and traffic flows through PE2.

Configure EVPN Single-Active Multihoming

Perform the following tasks on PE1 and PE2 to configure EVPN Single-Active Multihoming feature:

- Configure EVPN IRB with host routing
- Configure EVPN Ethernet Segment
- Configure Layer 2 Interface
- Configure a Bridge Domain
- Configure VRF

Configure EVPN Ethernet Segment

Perform this task to configure the EVPN Ethernet segment.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 40.00.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode single-active
Router(config-evpn-ac-es)# bgp route-target 4000.0000.0001
Router(config-evpn-ac-es)# commit
```

Running Configuration

```
configure
evpn
 interface Bundle-Ether1
   ethernet-segment
    identifier type 0 40.00.00.00.00.00.00.00.01
    load-balancing-mode single-active
    bgp route-target 4000.0000.0001
    !
!
!
```

Configure EVPN Service Instance (EVI) Parameters

Perform this task to define EVPN service instance (EVI) parameters.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 6005
Router(config-evpn-evi)# bgp
Router(config-evpn-evi-bgp)# rd 200:50
Router(config-evpn-evi-bgp)# route-target import 100:6005
Router(config-evpn-evi-bgp)# route-target export 100:6005
Router(config-evpn-evi-bgp)# commit
```

Running Configuration

```
configure
 evpn
```

```
  evi 6005
   bgp
    rd 200:50
    route-target import 100:6005
    route-target export 100:6005
!
!
```

Configure Layer 2 Interface

Perform this task to define Layer 2 interface.

```
Router# configure
Router(config)# interface bundle-ether2.1 l2transport
Router(config-subif-l2)# no shutdown
Router(config-subif-l2)# encapsulation dot1q 1
Router(config-subif-l2)# rewrite ingress tag pop 1 symmetric
Router(config-subif-l2)#commit
Router(config-subif-l2)#exit
```

Running Configuration

This section shows the Layer 2 interface running configuration.

```
configure
 interface bundle-ether2.1 l2transport
  no shutdown
  encapsulation dot1q 1
  rewrite ingress tag pop 1 symmetric
!
```

Configure a Bridge Domain

Perform the following steps to configure the bridge domain on PE1 and PE2.

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group 6005
Router(config-l2vpn-bg)# bridge-domain 6005
Router(config-l2vpn-bg-bd)# interface Bundle-Ether2.1
Router(config-l2vpn-bg-bd-ac)# evi 6005
Router(config-l2vpnbg-bd-evi)# commit
Router(config-l2vpnbg-bd-evi)# exit
```

Running Configuration

This section shows the bridge domain running configuration.

```
configure
l2vpn
 bridge group 6005
  bridge-domain 6005
   interface Bundle-Ether2.1
    evi 6005
!
```

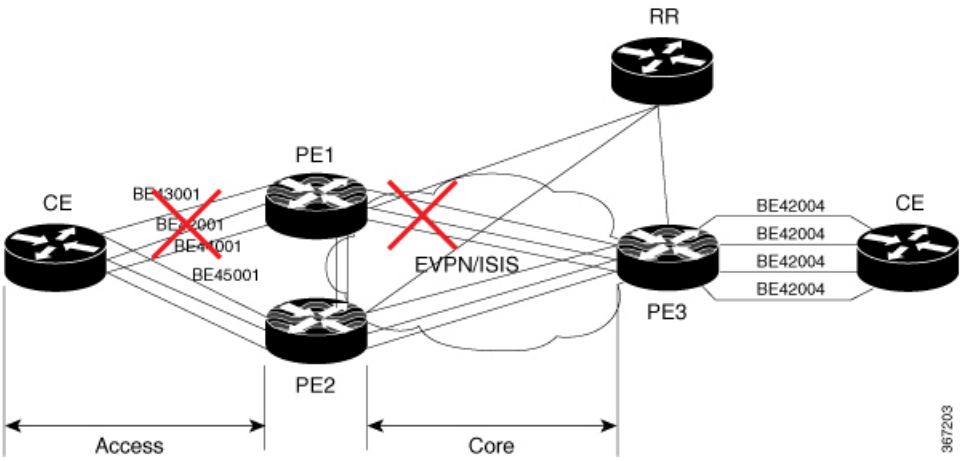
EVPN Core Isolation Protection

The EVPN Core Isolation Protection feature enables you to monitor and detect the link failure in the core. When a core link failure is detected in the provider edge (PE) device, EVPN brings down the PE's Ethernet Segment (ES), which is associated with access interface attached to the customer edge (CE) device.

EVPN replaces ICCP in detecting the core isolation. This new feature eliminates the use of ICCP in the EVPN environment.

Consider a topology where CE is connected to PE1 and PE2. PE1, PE2, and PE3 are running EVPN over the MPLS core network. The core interfaces can be Gigabit Ethernet or bundle interface.

Figure 12: EVPN Core Isolation Protection



When the core links of PE1 go down, the EVPN detects the link failure and isolates PE1 node from the core network by bringing down the access network. This prevents CE from sending any traffic to PE1. Since BGP session also goes down, the BGP invalidates all the routes that were advertised by the failed PE. This causes the remote PE2 and PE3 to update their next-hop path-list and the MAC routes in the L2FIB. PE2 becomes the forwarder for all the traffic, thus isolating PE1 from the core network.

When all the core interfaces and BGP sessions come up, PE1 advertises Ethernet A-D Ethernet Segment (ES-EAD) routes again, triggers the service carving and becomes part of the core network.

Configure EVPN Core Isolation Protection

Configure core interfaces under EVPN group and associate that group to the Ethernet Segment which is an attachment circuit (AC) attached to the CE. When all the core interfaces go down, EVPN brings down the associated access interfaces which prevents the CE device from using those links within their bundles. All interfaces that are part of a group go down, EVPN brings down the bundle and withdraws the ES-EAD route.

Starting from Cisco IOS-XR software version 7.1.2, you can configure a sub-interface as an EVPN Core. With this enhancement, when using IOS-XR software versions 7.1.2 and above, EVPN core facing interfaces can be physical, bundle main, or sub-interfaces. For all Cisco IOS-XR software versions lower than 7.1.2, EVPN core facing interfaces must be physical or bundle main. Sub-interfaces are not supported.

EVPN core facing interfaces can be physical main interface or subinterface, or bundle main interface or subinterface.

Restrictions

- A maximum of 24 groups can be created under the EVPN.
- A maximum of 12 core interfaces can be added under the group.
- The core interfaces can be reused among the groups. The core interface can be a bundle interface.
- EVPN group must only contain core interfaces, do not add access interfaces under the EVPN group.
- The access interface can only be a bundle interface.
- EVPN core facing interfaces must be physical or bundle main interfaces only. Sub-interfaces are not supported.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# group 42001
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/1
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/3
Router(config-evpn-group)#exit
!
Router(config-evpn)# group 43001
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/2
Router(config-evpn-group)# core interface GigabitEthernet0/2/0/4
Router(config-evpn-group)#exit
!
Router# configure
Router(config)# evpn
Router(config-evpn)# interface bundle-Ether 42001
Router(config-evpn-ac)# core-isolation-group 42001
Router(config-evpn-ac)# exit
!
Router(config-evpn)# interface bundle-Ether 43001
Router(config-evpn-ac)# core-isolation-group 43001
Router(config-evpn-ac)# commit
```

Running Configuration

```
configure
 evpn
  group 42001
   core interface GigabitEthernet0/2/0/1
   core interface GigabitEthernet0/2/0/3
   !
  group 43001
   core interface GigabitEthernet0/2/0/2
   core interface GigabitEthernet0/2/0/4
   !
 !
configure
 evpn
  interface bundle-Ether 42001
   core-isolation-group 42001
   !
  interface bundle-Ether 43001
   core-isolation-group 43001
   !
  !
```

Verification

The **show evpn group** command displays the complete list of evpn groups, their associated core interfaces and access interfaces. The status, up or down, of each interface is displayed. For the access interface to be up, at least one of the core interfaces must be up.

```
Router# show evpn group /* Lists specific group with core-interfaces and access interface
status */
EVPN Group: 42001
  State: Ready
  Core Interfaces:
     Bundle-Ethernet110: down
     Bundle-Ethernet111: down
     GigabethEthernet0/2/0/1: up
     GigabethEthernet0/2/0/3: up
     GigabethEthernet0/4/0/8: up
     GigabethEthernet0/4/0/9: up
     GigabethEthernet0/4/0/10: up
  Access Interfaces:
     Bundle-Ether42001: up

EVPN Group: 43001
  State: Ready
  Core Interfaces:
     Bundle-Ethernet110: down
     GigabethEthernet0/2/0/2: up
     GigabethEthernet0/2/0/4: up
     GigabethEthernet0/4/0/9: up

  Access Interfaces:
     Bundle-Ether43001: up
```

EVPN Routing Policy

The EVPN Routing Policy feature provides the route policy support for address-family L2VPN EVPN. This feature adds EVPN route filtering capabilities to the routing policy language (RPL). The filtering is based on various EVPN attributes.

A routing policy instructs the router to inspect routes, filter them, and potentially modify their attributes as they are accepted from a peer, advertised to a peer, or redistributed from one routing protocol to another.

This feature enables you to configure route-policies using EVPN network layer reachability information (NLRI) attributes of EVPN route type 1 to 5 in the route-policy match criteria, which provides more granular definition of route-policy. For example, you can specify a route-policy to be applied to only certain EVPN route-types or any combination of EVPN NLRI attributes. This feature provides flexibility in configuring and deploying solutions by enabling route-policy to filter on EVPN NLRI attributes.

To implement this feature, you need to understand the following concepts:

- Routing Policy Language
- Routing Policy Language Structure
- Routing Policy Language Components
- Routing Policy Language Usage
- Policy Definitions

- Parameterization
- Semantics of Policy Application
- Policy Statements
- Attach Points

For information on these concepts, see Implementing Routing Policy.

Currently, this feature is supported only on BGP neighbor "in" and "out" attach points. The route policy can be applied only on inbound or outbound on a BGP neighbor.

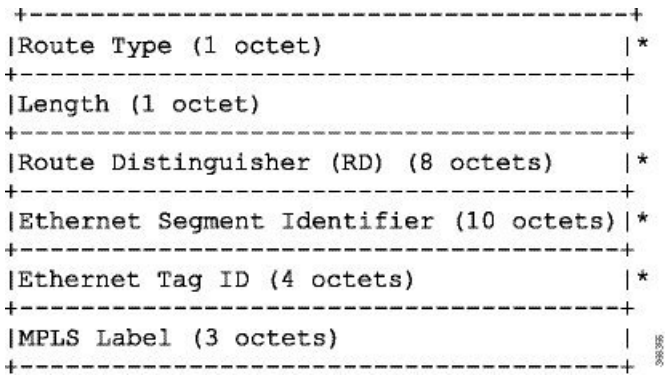
EVPN Route Types

The EVPN NLRI has the following different route types:

Route Type 1: Ethernet Auto-Discovery (AD) Route

The Ethernet (AD) routes are advertised on per EVI and per Ethernet Segment Identifier (ESI) basis. These routes are sent per Ethernet segment (ES). They carry the list of EVIs that belong to the ES. The ESI field is set to zero when a CE is single-homed.

An Ethernet A-D route type specific EVPN NLRI consists of the following fields:



NLRI Format: Route-type 1:

`[Type][Len][RD][ESI][ETag][MPLS Label]`

Net attributes: `[Type][RD][ESI][ETag]`

Path attributes: `[MPLS Label]`

Example

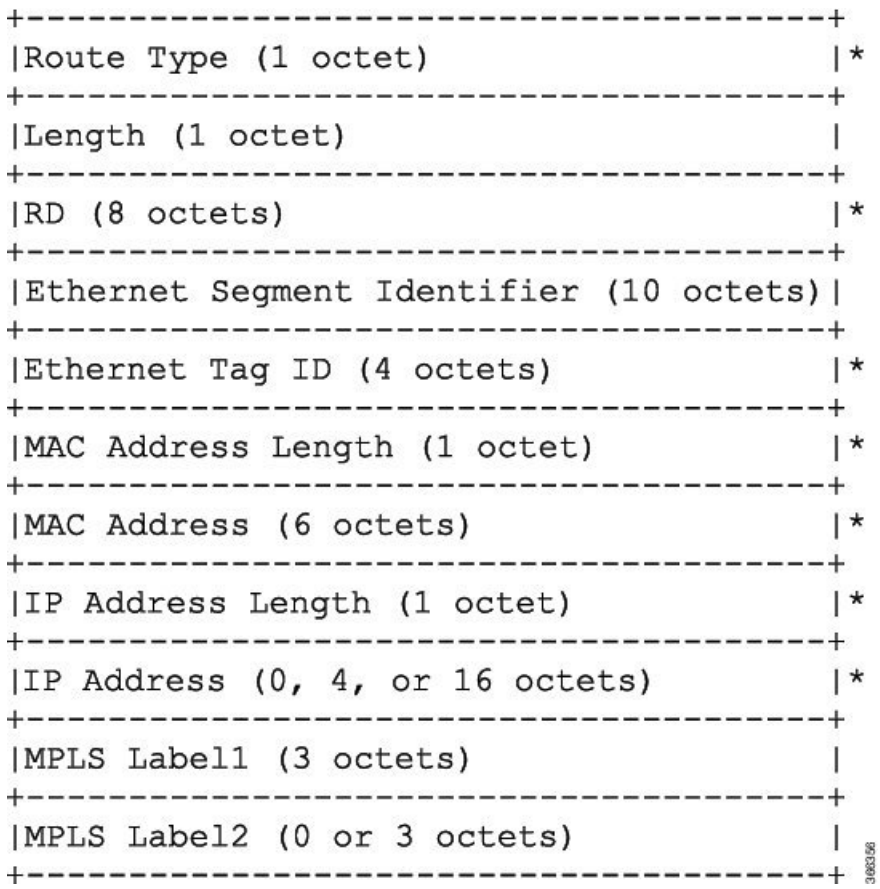
```
route-policy evpn-policy
  if rd in (10.0.0.1:0) [and/or evpn-route-type is 1] [and/or esi in
(0a1.a2a3.a4a5.a6a7.a8a9)] [and/or etag is 4294967295] then
    set ..
  endif
end-policy
!
route-policy evpn-policy
```

```
  if rd  in (1.0.0.2:0) [and/or evpn-route-type is 1] [and/or esi in
(00a1.a2a3.a4a5.a6a7.a8a9)] [and/or etag is 4294967295] then
    set ..
  endif
end-policy
```

Route Type 2: MAC/IP Advertisement Route

The host's IP and MAC addresses are advertised to the peers within NLRI. The control plane learning of MAC addresses reduces unknown unicast flooding.

A MAC/IP Advertisement Route type specific EVPN NLRI consists of the following fields:



NLRI Format: Route-type 2:

`[Type][Len][RD][ESI][ETag][MAC Addr Len][MAC Addr][IP Addr Len][IP Addr][MPLS Label1][MPLS Label2]`

Net attributes: `[Type][RD][ETag][MAC Addr Len][MAC Addr][IP Addr Len][IP Addr]`

Path attributes: `[ESI], [MPLS Label1], [MPLS Label2]`

Example

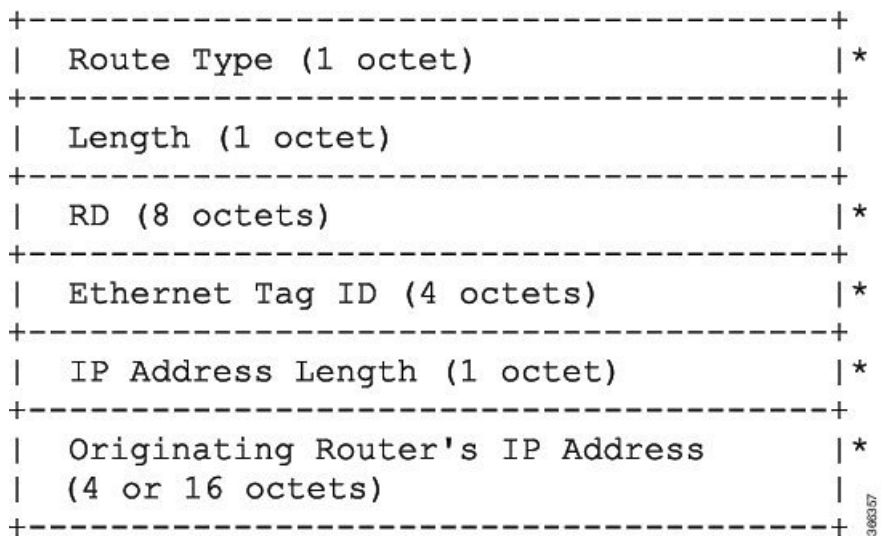
```
route-policy evpn-policy
```

```
  if rd in (10.0.0.2:0) [and/or evpn-route-type is 2] [and/or esi in
(0000.0000.0000.0000.0000)] [and/or etag is 0] [and/or macaddress in (0013.aabb.ccdd)]
[and/or destination in (1.2.3.4/32)] then
    set ..
  endif
end-policy
```

Route Type 3: Inclusive Multicast Ethernet Tag Route

This route establishes the connection for broadcast, unknown unicast, and multicast (BUM) traffic from a source PE to a remote PE. This route is advertised on per VLAN and per ESI basis.

An Inclusive Multicast Ethernet Tag route type specific EVPN NLRI consists of the following fields:



NLRI Format: Route-type 3:

```
[Type][Len][RD][ETag][IP Addr Len][Originating Router's IP Addr]
```

Net attributes: `[Type][RD][ETag][IP Addr Len][Originating Router's IP Addr]`

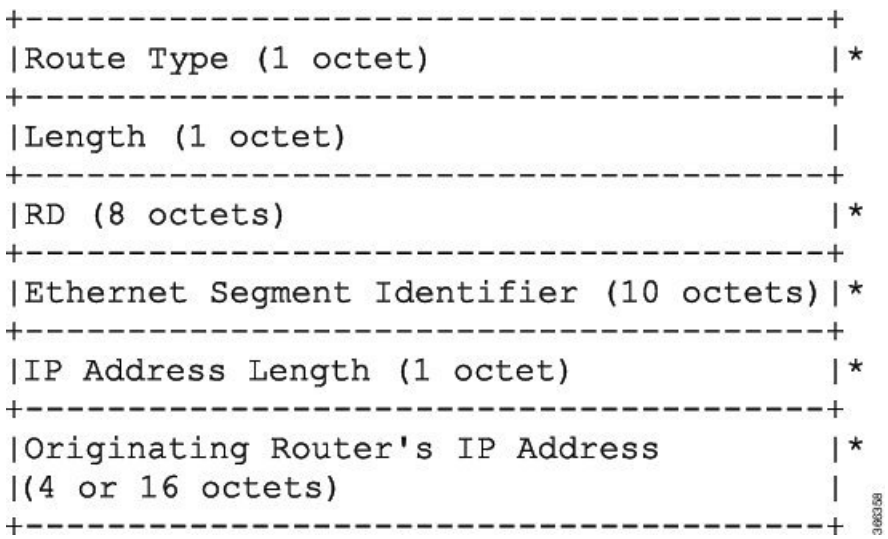
Example

```
route-policy evpn-policy
  if rd  in (10.0.0.1:300) [and/or evpn-route-type is 3] [and/or etag is 0] [and/or
evpn-originator in (10.0.0.1)] then
    set ..
  endif
end-policy
```

Route Type 4: Ethernet Segment Route

Ethernet segment routes enable to connect a CE device to two or PE devices. ES route enables the discovery of connected PE devices that are connected to the same Ethernet segment.

An Ethernet Segment route type specific EVPN NLRI consists of the following fields:



NLRI Format: Route-type 4:

```
[Type][Len][RD][ESI][IP Addr Len][Originating Router's IP Addr]
```

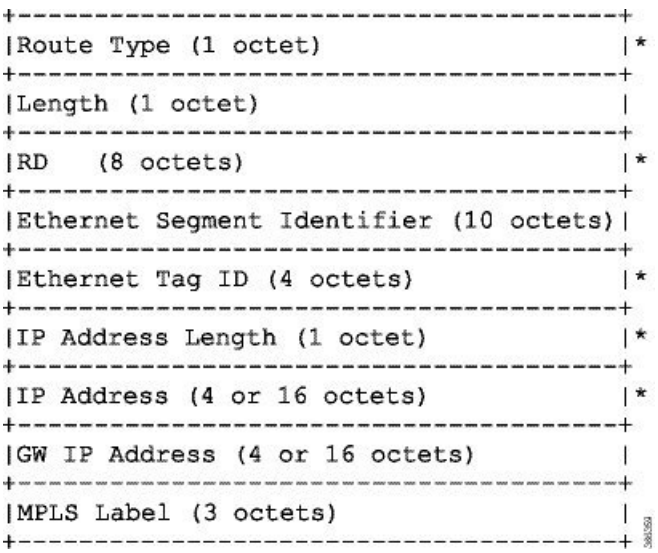
Net attributes: `[Type][RD][ESI][IP Addr Len][Originating Router's IP Addr]`

Example

```
route-policy evpn-policy
  if rd  in (10.0.0.1:0) [and/or evpn-route-type is 4] [and/or esi in
(00a1.a2a3.a4a5.a6a7.a8a9)] [and/or evpn-originator in (10.0.0.1)] then
    set ..
  endif
end-policy
```

Route Type 5: IP Prefix Route

An IP Prefix Route type specific EVPN NLRI consists of the following fields:



NLRI Format: Route-type 5:

```
[Type][Len][RD][ESI][ETag][IP Addr Len][IP Addr][GW IP Addr][Label]
```

Net attributes: `[Type][RD][ETag][IP Addr Len][IP Addr]`

Path attributes: `[ESI], [GW IP Addr], [Label]`

Example

```
route-policy evpn-policy
  if rd in (30.30.30.30:1) [and/or evpn-route-type is 5] [and/or esi in
(0000.0000.0000.0000.0000)] [and/or etag is 0] [and/or destination in (12.2.0.0/16)] [and/or
 evpn-gateway in (0.0.0.0)] then
    set ..
  endif
end-policy
```

EVPN RPL Attribute

Route Distinguisher

A Route Distinguisher (rd) attribute consists of eight octets. An rd can be specified for each of the EVPN route types. This attribute is not mandatory in route-policy.

Example

```
rd in (1.2.3.4:0)
```

EVPN Route Type

EVPN route type attribute consists of one octet. This specifies the EVPN route type. The EVPN route type attribute is used to identify a specific EVPN NLRI prefix format. It is a net attribute in all EVPN route types.

Example

```
evpn-route-type is 3

The following are the various EVPN route types that can be used:
1 - ethernet-ad
2 - mac-advertisement
3 - inclusive-multicast
4 - ethernet-segment
5 - ip-advertisement
```

IP Prefix

An IP prefix attribute holds IPv4 or IPv6 prefix match specification, each of which has four parts: an address, a mask length, a minimum matching length, and a maximum matching length. The address is required, but the other three parts are optional. When IP prefix is specified in EVPN route type 2, it represents either a IPv4 or IPv6 host IP Address (/32 or /128). When IP prefix is specified in EVPN route type 5, it represents either IPv4 or IPv6 subnet. It is a net attribute in EVPN route type 2 and 5.

Example

```
destination in (128.47.10.2/32)
destination in (128.47.0.0/16)
destination in (128:47::1/128)
destination in (128:47::0/112)
```

esi

An Ethernet Segment Identifier (ESI) attribute consists of 10 octets. It is a net attribute in EVPN route type 1 and 4, and a path attribute in EVPN route type 2 and 5.

Example

```
esi in (ffff.ffff.ffff.ffff.fff0)
```

etag

An Ethernet tag attribute consists of four octets. An Ethernet tag identifies a particular broadcast domain, for example, a VLAN. An EVPN instance consists of one or more broadcast domains. It is a net attribute in EVPN route type 1, 2, 3 and 5.

Example

```
etag in (10000)
```

mac

The mac attribute consists of six octets. This attribute is a net attribute in EVPN route type 2.

Example

```
mac in (0206.acb1.e806)
```

evpn-originator

The evpn-originator attribute specifies the originating router's IP address (4 or 16 octets). This is a net attribute in EVPN route type 3 and 4.

Example

```
evpn-originator in (1.2.3.4)
```

evpn-gateway

The evpn-gateway attribute specifies the gateway IP address. The gateway IP address is a 32-bit or 128-bit field (IPv4 or IPv6), and encodes an overlay next-hop for the IP prefixes. The gateway IP address field can be zero if it is not used as an overlay next-hop. This is a path attribute in EVPN route type 5.

Example

```
evpn-gateway in (1.2.3.4)
```

EVPN RPL Attribute Set

In this context, the term set is used in its mathematical sense to mean an unordered collection of unique elements. The policy language provides sets as a container for groups of values for matching purposes. Sets are used in conditional expressions. The elements of the set are separated by commas. Null (empty) sets are allowed.

prefix-set

A prefix-set holds IPv4 or IPv6 prefix match specifications, each of which has four parts: an address, a mask length, a minimum matching length, and a maximum matching length. The address is required, but the other three parts are optional. The prefix-set specifies one or more IP prefixes.

Example

```
prefix-set ip_prefix_set
14.2.0.0/16,
54.0.0.0/16,
12.12.12.0/24,
50:50::1:0/112
end-set
```

mac-set

The mac-set specifies one or more MAC addresses.

Example

```
mac-set mac_address_set
1234.2345.6789,
2345.3456.7890
end-set
```

esi-set

The esi-set specifies one or more ESI's.

Example

```
esi-set evpn_esi_set
1234.2345.3456.4567.5678,
1234.2345.3456.4567.5670
end-set
```

etag-set

The etag-set specifies one or more Ethernet tags.

Example

```
etag-set evpn_etag_set
10000,
20000
end-set
```

Configure EVPN RPL Feature

The following section describe how to configure mac-set, esi-set, evpn-gateway, and evpn-originator.

```
/* Configuring a mac-set and refering it in a route-policy (Attach point - neighbor-in) */
Router# configure
Router(config)# mac-set demo_mac_set
Router(config-mac)# 1234.ffff.aaa3,
Router(config-mac)# 2323.4444.ffff
Router(config-mac)# end-set
Router(config)# !
Router(config)# route-policy policy_use_pass_mac_set
Router(config-rpl)# if mac in demo_mac_set then
Router(config-rpl-if)# set med 200
Router(config-rpl-if)# else
Router(config-rpl-else)# set med 1000
Router(config-rpl-else)# endif
Router(config-rpl)# end-policy
Router(config)# commit
```

```
Router(config)# router bgp 100

Selective multicast with IGMP proxy

Selective Multicast with IGMP proxy is a network traffic management feature that forwards multicast traffic only to EVPN peers with active receivers.

Table 9: Feature History Table

Feature Name	Release Information	Feature Description
Selective multicast with IGMP proxy	Release 25.2.1	Selective Multicast with IGMP Proxy addresses the issue of unnecessary flooding of multicast traffic in EVPN fabrics. It ensures multicast traffic is only forwarded to peers with active receivers, optimizing bandwidth usage.

In traditional EVPN implementations, Broadcast, Unknown Unicast, and Multicast (BUM) traffic is flooded to all peers in the network, regardless of whether they have active receivers. This can lead to unnecessary traffic distribution, consuming bandwidth and resources.

Selective Multicast enhances this behavior by limiting the distribution of multicast traffic to only those peers that have active receivers. This optimization is achieved through the use of IGMP Proxy functionality, which ensures that multicast traffic is forwarded only to interested parties, reducing overhead and improving network efficiency.

Configure Selective Multicast with IGMP proxy

Before you begin

- EVPN must be enabled in the fabric.
- IGMP join request must exist.
- BGP route 6 messages must be available for sharing IGMP join information.

Procedure

Step 1 Enable proxy igmp-snooping under the EVPN configuration.

Example:

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 3000
Router(config-evpn-evi)# proxy igmp-snooping
```

Step 2 View running configuration.

Example:

```
evpn
 evi 3000
  proxy
   igmp-snooping
  !
 !
!
```

CFM on EVPN ELAN

Table 10: Feature History Table

Feature Name	Release Information	Feature Description
CFM on EVPN ELAN	Release 7.6.1	Connectivity fault management (CFM) enables monitoring an Ethernet network with multiple service instances. With CFM now supporting single-homed EVPN Emulated Local Area Network (ELAN) services, you can monitor users' services against their contractual service level agreements. This removes the operational complexity of managing different market segments and subscribers on your network.

Connectivity fault management (CFM) is a service-level Operations and Maintenance (OAM) protocol that provides tools for monitoring and troubleshooting end-to-end Ethernet services for each VLAN. This includes proactive connectivity monitoring, fault verification, and fault isolation.

Cisco IOS XR Software Release 6.6.1 introduces CFM support for single-homed EVPN Emulated Local Area Network (ELAN) services. This functionality helps you to monitor the ELAN services of users against their contractual service-level agreements (SLAs), thereby providing high speed Layer 2 and Layer 3 services with high resiliency and less operational complexity to different market segments.

Restrictions for CFM on EVPN ELAN

CFM on EVPN ELAN is subjected to these restrictions:

- Supports only single-homed EVPN ELAN.
- Supports single homing with one AC per PW.
- DOWN MEP on AC interface of EVPN-BD is not supported.
- Does not support loss measurement.
- Does not support Y1731.

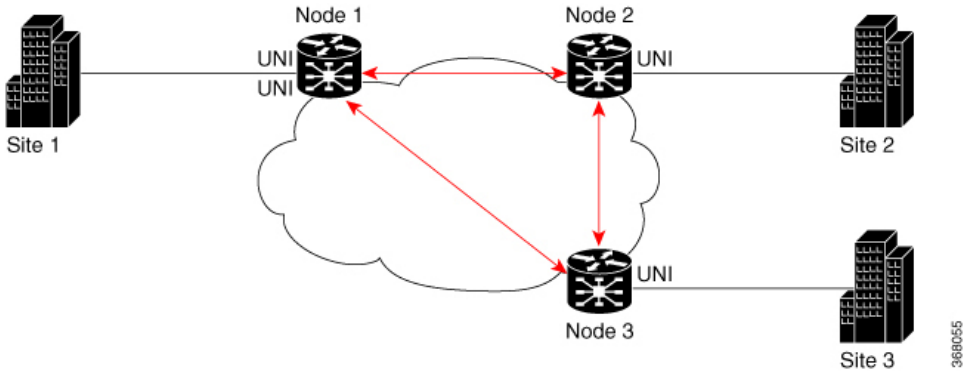
- CFM over EVPN ELAN with MEPs along with multiple AC scenarios supports CCM and does not support LBM or LBR.

CFM on EVPN ELAN does not support the following configurations:

- UP MEP of different domain and same level on same EVPN-BD
- UP MEP of different level on different AC part of same BD as all AC interfaces are part of same service provider domain (EVPN-BD) in PE.

Configure CFM on EVPN ELAN

Figure 13: CFM on EVPN ELAN: Full Mesh Topology



Node 1, 2 and 3 in this topology can be Cisco routers.

Configuring CFM on EVPN ELAN involves these main tasks:

- Enabling CFM service continuity check
- Configuring MEP cross-check
- Enabling CFM for the interface

Configuration Example for CFM on EVPN ELAN: Full Mesh Topology

```
/* Enabling CFM continuity check */
Router# ethernet cfm
Router(config-cfm# domain bd-domain level 1 id null
Router(config-cfm-dmn)# service bd-domain bridge group bg-elan bridge-domain bd-elan id
icc-based MC MCMC
Router(config-cfm-dmn-svc)# continuity-check interval 1m
/* Configuring MEP cross-check */
Router(config-cfm-dmn-svc)# mep crosscheck
Router(config-cfm-dmn-svc)# mep-id 1112
Router(config-cfm-dmn-svc)# mep-id 1113
Router(config-cfm-dmn-svc)# commit
```

Repeat the above configurations for node 2 and node 3, with the respective mep-id values. For node 2, configure MEP cross-check with respective mep-id values of node 1 and node 3 (1111 and 1113 respectively, in this

example). For node 3, configure MEP cross-check with respective mep-id values of node 1 and node 2 (1111 and 1112 respectively, in this example).

```
/* Enabling CFM on the interface */
Router(config)# interface gigabitEthernet  l2transport
Router(config-subif)# description bg-elan
Router(config-subif)# encapsulation dot1q 100
Router(config-subif)# rewrite ingress tag pop 1 symmetric
Router(config-subif)# mtu 9100
Router(config-subif)# ethernet cfm
Router(config-if-cfm)# mep domain bd-domain service bd-service mep-id 1111
Router(config-if-cfm-mep)# commit
```

You must repeat the above configurations for node 2 and node 3, with the respective *mep-id* values (that is, 1112 for node 2 and 1113 for node 3, in this example).

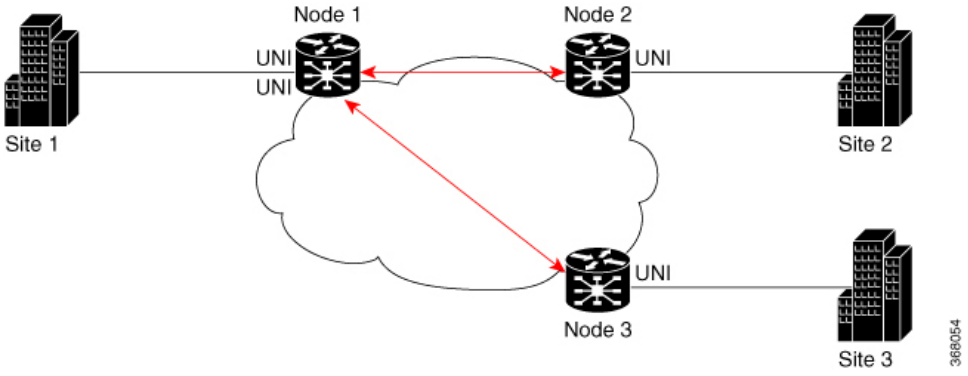
Running Configuration for CFM on EVPN ELAN: Full Mesh Topology

This sections shows the running configuration on node 1.

```
ethernet cfm
 domain bd-domain level 1 id null
  service bd-domain bridge group bg-elan bridge-domain bd-elan id icc-based MC MCMC
   continuity-check interval 1m
   mep crosscheck
    mep-id 1112
    mep-id 1113
   !
  !
 !
!

interface GigabitEthernet l2transport
 description bg-elan
 encapsulation dot1q 100
 rewrite ingress tag pop 1 symmetric
 mtu 9100
 ethernet cfm
  mep domain bd-domain service bd-service mep-id 1111
 !
```

Figure 14: CFM on EVPN ELAN: Hub and Spoke Topology



Configuration Example for CFM on EVPN ELAN: Hub and Spoke Topology

The CFM configuration for the hub and spoke topology remains the same as that of full mesh topology mentioned above, except for these additional steps for SLA profile configuration to be done under the interface.

```
/* 1112 and 1113 in this example, are the mep-id values of node 2 and node 3 */
Router(config)#interface gigabitEthernet  l2transport
Router(config-subif)# ethernet cfm
Router(config-if-cfm)# mep domain bd-domain service bd-service mep-id 1111
Router(config-if-cfm-mep)# sla operation profile test-profile1 target mep-id 1112
Router(config-if-cfm-mep)# sla operation profile test-profile2 target mep-id 1112
Router(config-if-cfm-mep)# sla operation profile test-profile1 target mep-id 1113
Router(config-if-cfm-mep)# sla operation profile test-profile2 target mep-id 1113
Router(config-if-cfm-mep)# commit
```

Running Configuration for CFM on EVPN ELAN: Hub and Spoke Topology

This sections shows the running configuration on node 1.

```
interface GigabitEthernet l2transport
 description bg-elan
 encapsulation dot1q 100
 rewrite ingress tag pop 1 symmetric
 mtu 9100
 ethernet cfm
  mep domain bd-domain service bd-service mep-id 1111
   sla operation profile test-profile1 target mep-id 1112
   sla operation profile test-profile2 target mep-id 1112
   sla operation profile test-profile1 target mep-id 1113
   sla operation profile test-profile2 target mep-id 1113
 !
```

Example 1: The below configurations details UP MEPs of same domain and level on the following:

- Multiple AC per BD on local
- Single AC per BD on remote

```
Router#sh run ethernet cfm
Tue Sep 14 19:08:32.666 UTC
ethernet cfm
 domain BD-DOMAIN level 4 id null
  service BD-SERVICE bridge group ELAN_FUNC_3 bridge-domain FUNC_3 id number 100
   continuity-check interval 10s
   mep crosscheck
    mep-id 5
    mep-id 1101
    mep-id 1103

Router#sh run l2vpn
Tue Sep 14 19:08:37.979 UTC
l2vpn
 bridge group ELAN_FUNC_3
  bridge-domain FUNC_3
   interface TenGigE0/0/0/0.1
   !
   interface TenGigE0/0/0/1.2
   !
   evi 101
```

```
Router#sh run int Te0/0/0/0.1
Tue Sep 14 19:08:42.677 UTC
interface TenGigE0/0/0/0.1 l2transport
 encapsulation dot1q 1
 ethernet cfm
  mep domain BD-DOMAIN service BD-SERVICE mep-id 1103

Router#sh run int Te0/0/0/1.2
Tue Sep 14 19:08:49.485 UTC
interface TenGigE0/0/0/1.2 l2transport
 encapsulation dot1q 2
 ethernet cfm
  mep domain BD-DOMAIN service BD-SERVICE mep-id 5
```

Example 2: The below configurations details multiple UP MEPs of same domain and level on AC interfaces that are part of the same BD:

```
Router#sh run ethernet cfm
ethernet cfm
 domain BD-DOMAIN level 4 id null
  service BD-SERVICE bridge group ELAN_FUNC_3 bridge-domain FUNC_3
   continuity-check interval 10s
   mep crosscheck
    mep-id 1
    mep-id 2
    mep-id 21
    mep-id 22
domain BD-DOMAIN1 level 3 id null
  service BD-SERVICE1 bridge group ELAN_FUNC_3 bridge-domain FUNC_3
   continuity-check interval 10s
   mep crosscheck
    mep-id 1001
    mep-id 1021
    mep-id 2001
    mep-id 2021

EVPN Bridging and VPWS Services over BGP-LU Underlay

The EVPN Bridging and VPWS Services over BGP-LU Underlay feature allows you to configure end-to-end EVPN services between data centers (DCs). This feature allows you to perform ECMP at three-levels: transport, BGP- LU, and service level.

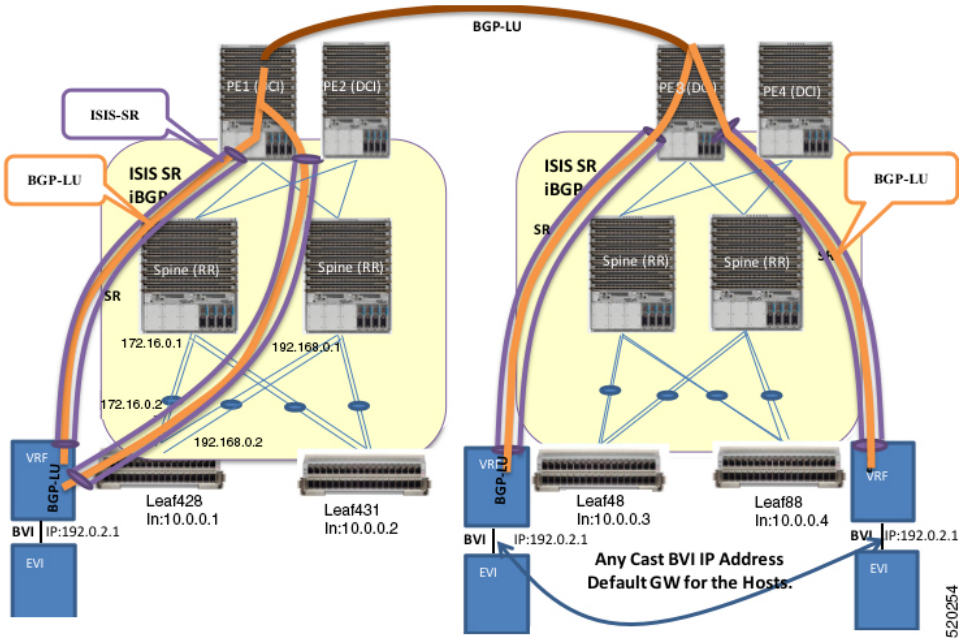
This feature supports the following services:

- IRB VRF over BGP-LU using IGP (SR or non-SR (LDP or IGP))

- EVPN Aliasing over BGP-LU using IGP (SR or non-SR (LDP or IGP))
- VPWS over BGP-LU using IGP

Note EVPN IRB with default-vrf over BGP-LU over IGP is not supported on the Cisco NCS routers.

Figure 15: EVPN Bridging and VPWS Services over BGP-LU Underlay



This section explains the topology of EVPN Bridging and VPWS Services over BGP-LU Underlay feature:

- Consider two data centers that are connected through DCI. Configure EVPN with bridging and inter-subnet routing on the leaf nodes.
- Configure EVPN instance with BVI attachment circuit to interface with L3-VRF.
- Configure BVI interface with anycast IP address with the same MAC address. This is the default gateway for all the hosts across the same EVPN bridged domain.
- The leaf acts as default gateway for its local hosts.
- Connect hosts to leaf nodes. Leaf nodes are routed across the spines. For DC interconnectivity, the spines are connected through provider edge (PE) device and Data Center Interconnect (DCI).
- IS-IS labelled IGP and I-BGP are enabled internally across the leaf nodes, spine and DCI. The spine acts as a Route Reflector (RR).
- Configure IS-IS SR policy across the leaf node, spine and DCI.
- Configure BGP-LU between the DCs.
- Labelled Unicast BGP routers are learnt across the leaf nodes and tunnelled through IGP labelled paths (IS-IS SR).

For example, at Leaf428, BGP-LU routes are learnt for remote loopback 10.0.0.3 and 10.0.0.4.

- IRB (BVI) interface routes are learnt across the EVPN instances and programmed as labelled routes tunnelled through BGP-LU.

  For example, at Leaf428, 192.0.2.1 can be reached with two BGP-LU paths 10.0.0.3 and 10.0.0.4.

After establishing the BGP-LU services, you can configure either EVPN instance or EVPN VPWS to support BGP-LU.

Configure EVPN Bridging and VPWS Services over BGP-LU Underlay

Perform these tasks to configure the EVPN Bridging and VPWS Services over BGP-LU Underlay feature.

- Configure IGP
- Configure BGP
- Configure EVPN instance and ESI
- Configure BVI (IRB) Interface
- Configure VRF
- Configure BVI with VRF
- Configure VRF under BGP
- Configure bridge domain and associate with attachment circuits and EVPN instance
- Configure bridge domain and associate with attachment circuits, EVPN instance and BVI
- Configure EVPN VPWS

Configuration Example

```
/* Configure IGP */
IGP configuration is a pre-requisite to configure EVPN. IGP can be OSPF or ISIS.
Router# configure
Router(config)#router ospf 1
Router(config-ospf)#router-id 209.165.201.1
Router(config-ospf)#area 10
Router(config-ospf-ar)#interface loopback0\
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface TenGigE0/0/0/1\
Router(config-ospf-ar-if)#exit
Router(config-ospf-ar)#interface TenGigE0/0/0/17\
Router(config-ospf-ar-if)#commit

/* Configure BGP enable BGP-LU, and configure iBGP peering */
Router# configure
Router(config)#router bgp 100
Router(config-bgp)#router-id 209.165.201.1
Router(config-bgp)#bgp graceful-restart
Router(config-bgp)#address-family ipv4 unicast
Router(config-bgp-af)#redistribute connected
Router(config-bgp-af)#network 209.165.200.225/27
Router(config-bgp-af)#allocate-label all
```

```
Router(config-bgp-af)#exit
Router(config-bgp)#address-family ipv6 unicast
Router(config-bgp-af)#allocate-label all
Router(config-bgp-af)#exit
Router(config-bgp)#neighbor-group spines
Router(config-bgp-nbrgrp)#remote-as 100
Router(config-bgp-nbrgrp)#update-source loopback0
Router(config-bgp-nbrgrp)#address-family ipv4 labeled-unicast multipath
Router(config-bgp-nbrgrp-af)#exit
Router(config-bgp-nbrgrp)#address-family ipv6 labeled-unicast multipath
Router(config-bgp-nbrgrp-af)#exit
Router(config-bgp-nbrgrp)#address-family l2vpn evpn
Router(config-bgp-nbrgrp-af)#advertise vpnv4 unicast re-originated
Router(config-bgp-nbrgrp-af)#advertise vpnv6 unicast re-originated
Router(config-bgp-nbrgrp-af)#exit
Router(config-bgp-nbrgrp)exit
Router(config-bgp)neighbor 209.165.200.225
Router(config-bgp-nbr)#use neighbor-group spines
Router(config-bgp-nbr)#commit

/* Configure VPN4 address-family to enforce iBGP policy. */
Router(config)#router bgp 100
Router(config-bgp)#router-id 209.165.201.1
Router(config-bgp)#ibgp policy out enforce-modifications
Router(config-bgp)#address-family vpnv4 unicast
Router(config-bgp-af)#commit

The above steps establish BGP-LU. You can configure either EVPN VPLS or EVPN VPWS on the
PE routers to support BGP-LU.
/* Configure EVPN instance and ESI */
Router#configure
Router(config)#evpn
Router(config-evpn)#evi 100
Router(config-evpn-instance)#advertise-mac
Router(config-evpn-instance-mac)#exit
Router(config-evpn-instance)#exit
Router(config-evpn)#interface Bundle-Ether1
Router(config-evpn-ac)#ethernet-segment identifier type 0 aa.aa.aa.aa.aa.aa.aa.aa.ac

Verification

Verify that you have configured EVPN Bridging and VPWS Services over BGP-LU Underlay feature successfully.

Note Load Balancing is not supported for EVPN Bridging over BGP-LU with Multipaths.

```

Set EVPN Gateway IP Address in EVPN Route Type 5 NLRI

Table 11: Feature History Table

Feature Name	Release Information	Feature Description
Set EVPN Gateway IP Address in EVPN Route Type 5 NLRI	Release 7.10.1	You can now facilitate optimal traffic load balancing across the Virtual Network Forwarders (VNFs) and minimize control plane updates when the VNFs or virtual machines (VMs) are moved across Top of Racks (ToR) by setting the EVPN gateway IP address in the EVPN route type 5 network layer reachability information (NLRI) that advertises IPv4 and IPv6 addresses. With this functionality, we can obtain prefix independent convergence due to the withdrawal of gateway IP. Previously, the gateway IP address field in the EVPN route type 5 NLRI was not used. By default, the NLRI advertisement included the EVPN gateway IP address of zero, which was represented as 0.0.0.0 for IPv4 and :: for IPv6. This resulted in the withdrawal of all prefixes one by one in the event of a failure, leading to traffic loss. The feature introduces these changes: **CLI:** • **set advertise-evpn-gw-ip** • **advertise gateway-ip-disable**

EVPN route type 5 or IP prefix route is used for IP prefix advertisement. For more information on EVPN route types, see EVPN Route Types, on page 5.

Previously, the gateway IP address field in the EVPN route type 5 network layer reachability information (NLRI) wasn't used and had the default value of 0.0.0.0 for IPv4 and :: for IPv6 addresses. This resulted in a scenario where multiple prefixes were advertised using the default gateway IP address, and subsequently, during a network failure, withdrawing each prefix individually led to traffic loss and delayed traffic convergence.

Starting from Cisco IOS XR Release 7.10.1, the Virtual Network Forwarders (VNFs) IP address can be designated as the gateway IP address for EVPN type 5 routes. When you set the gateway IP address, prefix independent convergence is obtained due to the withdrawal of gateway IP, resulting in a faster traffic switchover. The gateway IP address is a 32-bit field for IPv4 or a 128-bit field for IPv6.

To set the gateway IP address manually, use **set advertise-evpn-gw-ip** command.

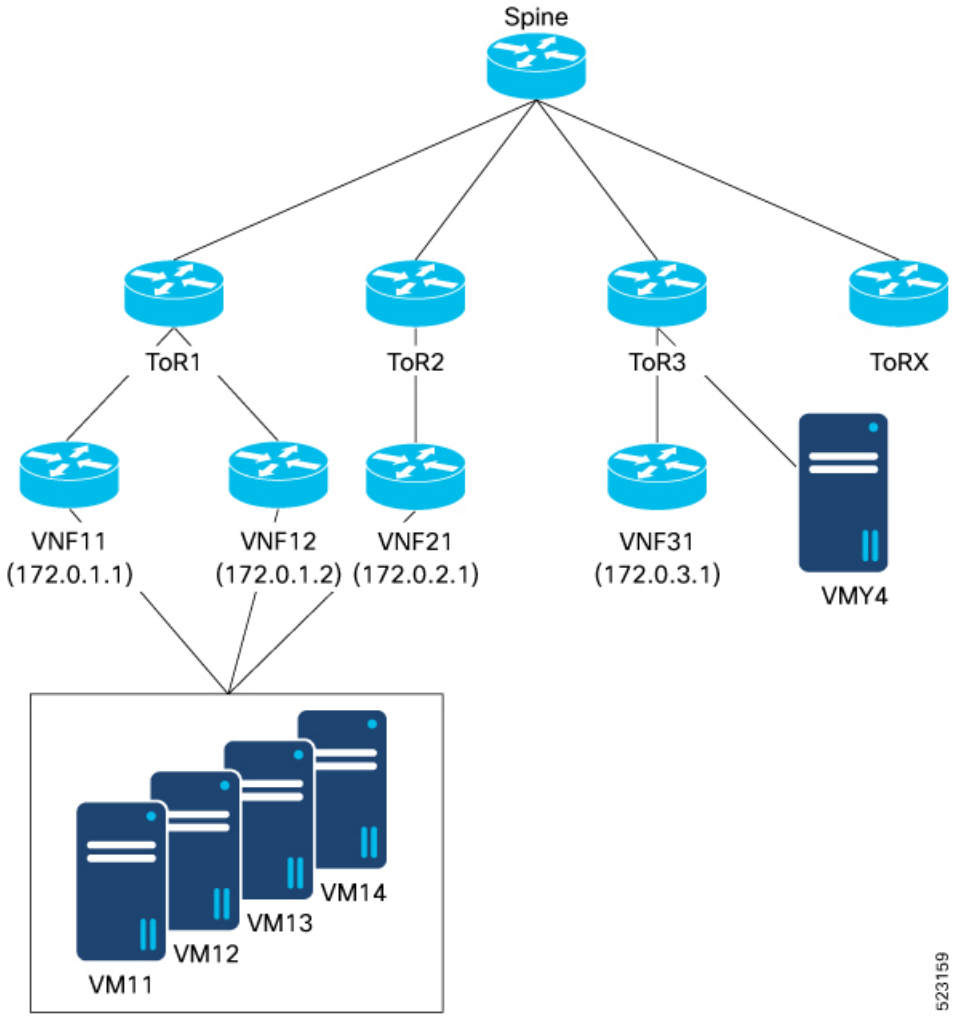
Guidelines and Limitations

- Only per-vrf mode is supported for EVPN MAC/IP. If the gateway IP resolution is based on MAC/IP, then only the per-vrf resolution takes effect.
- To configure the ToRs to advertise the non-zero gateway IP address, use the **set advertise-evpn-gw-ip** command. However, if legacy peers can't process the gateway IP address, you can disable the non-zero gateway IP address using the **advertise gateway-ip-disable** command under the neighbor EVPN address-family configuration mode.
- The **set advertise-evpn-gw-ip** command flaps the specified peer session as gracefully as possible. The remote peer triggers a graceful restart if the peer supports this capability. When the session is reestablished, the local peer advertises EVPN route type 5 with gateway IP address set or with the gateway IP address as zero depending on whether the **set advertise-evpn-gw-ip** command has been used. This command is not enabled by default, and the gateway IP address is set to zero.

  If route refresh is not supported, then a hard reset of the session is required for the EVPN gateway IP address to take effect on a change. Otherwise, route refresh will be triggered, and the EVPN gateway policy change will be executed.

Topology

Let’s understand how this feature works using this sample topology.



In this topology:

- VNF (VNF11, VNF 12, and VNF21), sends and receives prefixes from VMs (VM11, VM12, VM13, and VM14).
- VNF peers with ToRs use eBGP to advertise VM prefixes.
- ToRs distribute the VM prefixes across the VNFs using EVPN route-type 5 with the gateway IP address.
- Multiple ToRs advertise the same VM prefixes to achieve proportional multipath to the VMs.
- The EVPN route type 5 advertises the VNF IP address as the gateway to the remote ToR, which is ToR3 allowing it to select the appropriate VNF to send traffic to.
- EVPN type-5 routes are then imported into the VRF table on the receiving ToR, (ToR3 in this example) for which the next-hop is set to the VNF IP address based on the gateway IP address.
- The actual next-hops are advertised as part of the gateway IP address field in the EVPN type-5 routes.

When the gateway IP address isn't set and has the default value 0.0.0.0, the ToR3 next-hop are ToR1 and ToR2 and not the VNFs.

For example, consider VNF11 advertises 1000 prefixes to ToR1 using route type 5 without setting the gateway IP address. When the link from VNF11 to ToR1 goes down, all 1000 prefixes need to be withdrawn individually, resulting in traffic disruption and an increase in convergence time. However, when the gateway IP address is set to the VNF11 IP address, a single IP prefix route withdrawal is sufficient for ToR3 to send traffic toward VNF12.

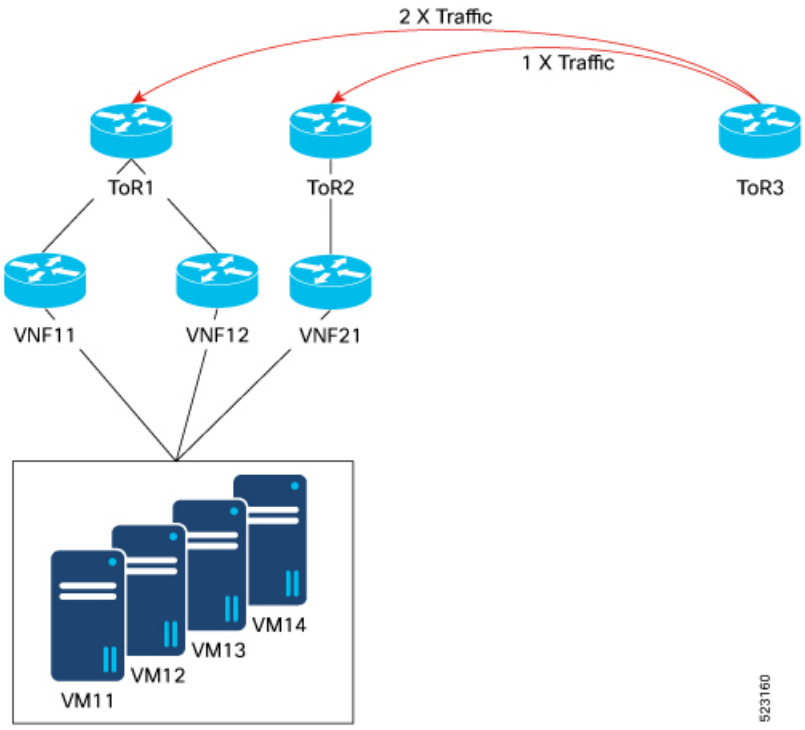
When you set the gateway IP address to the actual VNF IP address, you can:

- Achieve proportional multipath
- Reduce control plane updates when VNF or VM moves

Proportional Multipath

Proportional multipath refers to the equal distribution of traffic across all available Virtual Network Forwarders (VNFs). Proportional multipath enables the advertisement of all available next hops to a destination network, and the router considers all paths to a given route as equal-cost multipath (ECMP), allowing traffic to be forwarded using all available links across multiple ToRs. When you set the VNF IP address as the gateway IP address, multiple ToRs advertise the same VM prefixes to achieve proportional multipath to the VMs.

Figure 16: Proportional Multipath



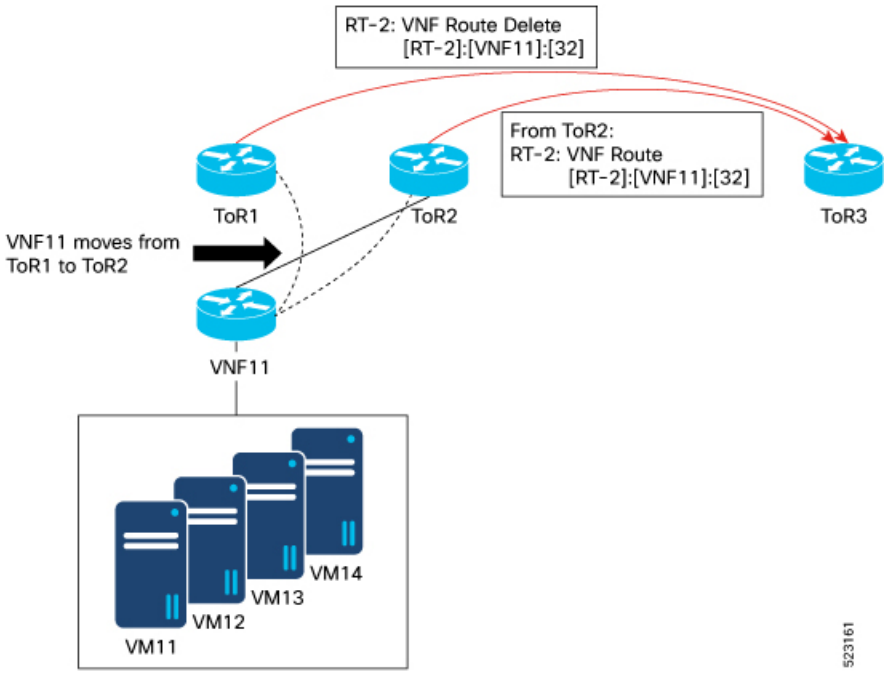
In this topology, traffic is distributed proportionally among multiple VNFs: VNF11, VNF12, and VNF21. Traffic from the remote ToR3 is hashed equally to the three VNFs, meaning ToR1 receives twice the traffic compared to ToR2. Because the ToR3 receives two paths from ToR1 and one path from ToR2, proportional ECMP can be achieved based on the number of paths available.

Reduce Control Plane Updates When VNF or VM Moves

In a data center environment, when VNFs or VMs are moved to different ToRs, it can lead to many updates in the EVPN fabric. For every VM move, a separate update is generated resulting in N number of updates for each VM.

When you set the VNF IP address as the gateway IP address and group multiple VMs under a single VNF, only one update is required for the entire workload when a VNF is moved to a different ToR reducing the number of control plane updates.

For example, VNF11 forms eBGP sessions with both ToR1 and ToR2. When VNF11 is moved from ToR1 to ToR2, only a single MAC-IP update is generated for the VNF, and this update is sufficient for the remote ToRs to start sending traffic to ToR2 for all VM prefixes associated with that VNF.



Configure EVPN Gateway IP Address in EVPN Route Type 5 NLRI

Perform this task to configure the EVPN gateway IP address in EVPN route type 5 NLRI.

Configuration Example

```
Router(config)# route-policy gw
Router(config-rpl)# set advertise-evpn-gw-ip use-next-hop
Router(config-rpl)# end-policy
Router(config)# vrf VRF1
Router(config-vrf)# address-family ipv4 unicast
Router(config-vrf-af)# import route-target
Router(config-vrf-import-rt)# 10:10
Router(config-vrf-import-rt)# exit
Router(config-vrf-af)# export route-policy gw
Router(config-vrf-af)# export route-target
Router(config-vrf-export-rt)# 10:10
Router(config-vrf-export-rt)#exit
```

```
Router(config-vrf-af)#exit
Router(config-vrf)# address-family ipv6 unicast
Router(config-vrf-af)# import route-target
Router(config-vrf-import-rt)# 10:10
Router(config-vrf-import-rt)# exit
Router(config-vrf-af)# export route-policy gw6
Router(config-vrf-af)# export route-target
Router(config-vrf-export-rt)# 10:10
Router(config-vrf-export-rt)#commit
```

Running Configuration

This section shows the running configuration of EVPN gateway IP address in EVPN route type 5 NLRI.

```
route-policy gw
  set advertise-evpn-gw-ip use-next-hop
end-policy
!
vrf VRF1
address-family ipv4 unicast
  import route-target
   10:10
  !
  export route-policy gw
  export route-target
   10:10
  !
!

address-family ipv6 unicast
  import route-target
   10:10
  !
  export route-policy gw6
  export route-target
   10:10
  !
!
!
```

Verification

Verify that the EVPN gateway IP address is same as the the next-hop IP address.

For example, you can see that the next-hop IP address is same as the EVPN gateway IP address which is 5.5.5.5.

EVPN Link Bandwidth for Proportional Multipath on VNF

Table 12: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Link Bandwidth for Proportional Multipath on VNF	Release 7.10.1	You can now use the EVPN link bandwidth to set proportional multipath on Virtual Network Forwarders (VNFs) connected to Top of Racks (ToRs). You can advertise the link bandwidth extended community attribute for each path in a network. When you enable EVPN link bandwidth on multiple paths, the bandwidth values of these paths are aggregated and the cumulative bandwidth is advertised across the VNFs. The load metrics is installed in Routing Information Base (RIB) and the RIB redistributes nexthop prefixes to the paths to achieve proportional multipath. This allows distribution of traffic proportional to the capacity of the links across all the available Virtual Network Forwarders (VNFs) that facilitates optimal traffic load balancing across the VNFs. The feature introduces these changes: **CLI:** • **evpn-link-bandwidth** • **set extcommunity evpn-link-bandwidth** • **delete extcommunity evpn-link-bandwidth**

EVPN link bandwidth enables multipath load balancing for external links with unequal bandwidth capacity. In a network, virtual machines (VMs) are connected to ToRs through VNFs. The EVPN link bandwidth extended community attribute is used for advertising the link bandwidth for each path to achieve proportional ECMP, leading to distribution of traffic proportional to the capacity of the links across all the available VNFs connected to ToRs.

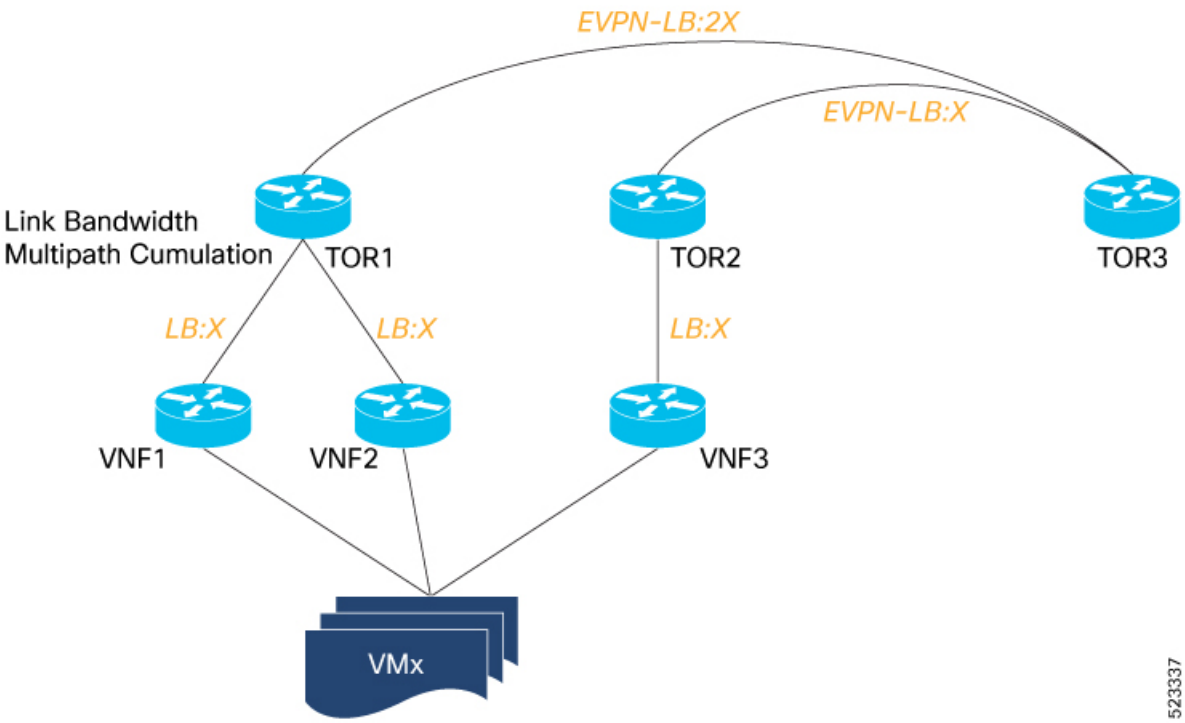
When you enable EVPN link bandwidth on multiple paths, the bandwidth values of these paths are aggregated and the cumulative bandwidth is advertised across the VNFs. The load metrics is installed in Routing Information Base (RIB) and the RIB redistributes nexthop prefixes to the paths to achieve proportional multipath.

To enable EVPN link bandwidth, use the **evpn-link-bandwidth** command.

Topology

The following sample topology shows advertising EVPN link bandwidth for each path in the network. The VMs are connected to ToRs through VNFs.

Figure 17: EVPN Link Bandwidth



In this network:

- VNF1 and VNF2 are connected to TOR1. VNF 3 is connected to TOR2.
- TOR1 performs link bandwidth multipath cumulation of the paths from VNF1 and VNF2.
- The link bandwidth sent from TOR1 to TOR3 is twice (LB:2X) compared to the link bandwidth sent from TOR2 (LB:X).
- The load distribution in TOR3 is proportional to the capacity of the links and traffic is distributed accordingly across the VNFs.

Support for DHCPv4 and DHCPv6 Client over BVI

The Support for DHCPv4 and DHCPv6 Client over the BVI feature allows you to configure DHCPv4 and DHCPv6 client on the Bridged Virtual Interface (BVI). You can configure a BVI, and request DHCP IPv4 or IPv6 address on the BVI. This allows your customer's device to have initial connectivity to your network without user intervention in the field. After the device is connected to your network, the customer devices can push a node-specific configuration with static IP addresses on a different BVI for customer deployment.

Configure DHCPv4 and DHCPv6 Client over BVI

Perform the following tasks to configure DHCPv4 and DHCPv6 client over BVI:

- Configure AC interface
- Configure L2VPN
- Configure BVI

Configuration Example

```
/* Configure AC interface */
Router# configure
Router(config)# interface tenGigE 0/5/0/1/1
Router(config-if)# bundle id 1 mode on
Router(config-if)# exit
Router(config)# interface Bundle-Ether1
Router(config-if)# no shut
Router(config-if)# exit
Router(config)# interface bundle-ether 1.100 l2transport
Router(config-l2vpn-subif)# encapsulation dot1q 100
Router(config-l2vpn-subif)# rewrite ingress tag pop 1 symmetric
Router(config-l2vpn-subif)# commit

/* Configure L2VPN */
Router # configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group BVI
Router(config-l2vpn-bg)# bridge-domain bvi
Router(config-l2vpn-bg-bd)# interface Bundle-Ether1.100
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)# routed interface BVI1
Router(config-l2vpn-bg-bd-bvi)# commit

/* Configure BVI */
Router# configure
Router(config)# interface BVI1
Router(config-if)# ipv4 address dhcp
Router(config-if)# ipv6 address dhcp
Router(config-if)# commit
```

Running Configuration

This section shows the DHCPv4 and DHCPv6 client over BVI running configuration.

```
interface TenGigE0/5/0/1/1
bundle id 1 mode on
!
interface Bundle-Ether1
!
interface Bundle-Ether1.100 l2transport
encapsulation dot1q 100
rewrite ingress tag pop 1 symmetric
!
l2vpn
bridge group BVI
  bridge-domain bvi
   interface Bundle-Ether1.100
```

```
   !
   routed interface BVI1
   !
  !
!
interface BVI1
ipv4 address dhcp
ipv6 address dhcp
!
```

Verification

The show output given in the following section display the details of DHCPv4 and DHCPv6 client over BVI configuration.

```

Configure DHCPv6 Client Options

You can configure different DHCPv6 client options to differentiate between clients as required. Configure different DHCPv6 client options to differentiate how a DHCPv6 client communicates with a DHCPv6 server. The different DHCPv6 client options that you can configure are:

- **DUID:** If the DUID DHCPv6 client option is configured on an interface, DHCPv6 client communicates with the DHCPv6 server through the link layer address.
- **Rapid Commit:** If the Rapid Commit DHCPv6 client option is configured on an interface, DHCPv6 client can obtain configuration parameters from the DHCPv6 server through a rapid two-step exchange (solicit and reply) instead of the default four-step exchange (solicit, advertise, request, and reply).
- **DHCP Options:** The various other DHCPv6 options that can be configured on a DHCPv6 client are:
  - **Option 15:** Option 15 is also known as the User Class option and it is used by a DHCPv6 client to identify the type or category of users or applications it represents.

- **Option 16:** Option 16 is also known as the Vendor ID option and it is used by a DHCPv6 a client to identify the vendor that manufactured the hardware on which the client is running.
- **Option 23:** Option 23 is also known as the Domain name Server (DNS) option provides a list of one or more IPv6 addresses of DNS recursive name servers to which a client's DNS resolver can send DNS queries.
- **Option 24:** Option 24 is also known as the Domain List option and it specifies the domain search list that the client uses to resolve hostnames with the DNS.

- **DHCP Timers:** This option is used to set different timer value for DHCP client configurations. The various DHCP timer options are:
  - **Release-timeout:** It is used to set retransmission timeout value for the initial release message.
  - **Req-max-rt:** It is used to set the maximum retransmission timeout value for the request message.
  - **Req-timeout:** It is used to set the initial request timeout value of the request message.
  - **Sol-max-delay:** It is used to set the maximum delay time of the first solicit message.
  - **Sol-max-rt:** It is used to set the maximum solicit retransmission time.
  - **Sol-time-out:** It is used to set the intial timeout value of the solicit message.

Configuration Example

Perform this task to configure DHCPv6 client options on a BVI interface.

```
Router# configure
Router(config)# interface BVI 10
Router(config-if)# ipv6 address dhcp-client-options
Router(config-dhcpv6-client)# duid linked-layer-address
Router(config-dhcpv6-client)# rapid-commit
Router(config-dhcpv6-client)# timers release-timeout 3
Router(config-dhcpv6-client)# timers sol-max-delay 1
Router(config-dhcpv6-client)# timers sol-time-out 1
Router(config-dhcpv6-client)# timers sol-max-rt 120
Router(config-dhcpv6-client)# timers req-max-rt 30
Router(config-dhcpv6-client)# timers req-timeout 1
Router(config-dhcpv6-client)# commit
```

Verification

To verify the DHCPv6 client options, use the **show dhcp ipv6 client BVI10 detail** command.

```
Router# show dhcp ipv6 client BVI10 detail

Layer 2 fast reroute

Table 13: Feature History Table

Feature Name	Release Information	Feature Description

Layer 2 Fast Reroute	Release 7.3.1	In the event of a link failure, this feature enables the router to switch traffic quickly to a precomputed loop-free alternative (LFA) path by allocating a label to the incoming traffic. This minimizes the traffic loss ensuring fast convergence. This feature introduces the **convergence reroute** command.

The L2 FRR feature safeguards against traffic loss when a PE-CE link fails before the remote PE receives the mass withdraw message indicating the link is down. On the PE router with the failed link to the CE, traffic is redirected through a backup path to its EVPN Multi-home (MH) peer router, which then forwards the traffic to the CE.

In the control plane, the MAC address remains associated with the local bridge port ESI, but in the data-path L2FRR activates the backup path for the MAC address which has been pre-populated on the AC segment.

As a consequence, **show** commands keep displaying the MAC address - bridge port association even after the AC is down.

Through this permanent association of hosts (or MAC addresses) to an AC or bridge port, the L2 MAC-IP routes are retained on PE1 even on failure. In addition to displaying the retained MAC address - bridge port association, the **show** commands on PE1 continues to display the retained ARP entries and L2 MAC-IP routes. The AC service state displays the **Down** state.

Managing MAC on layer 2 FRR-enabled attachment circuits (AC)

MAC addresses remain intact when a layer 2 FRR-enabled attachment circuit goes down.

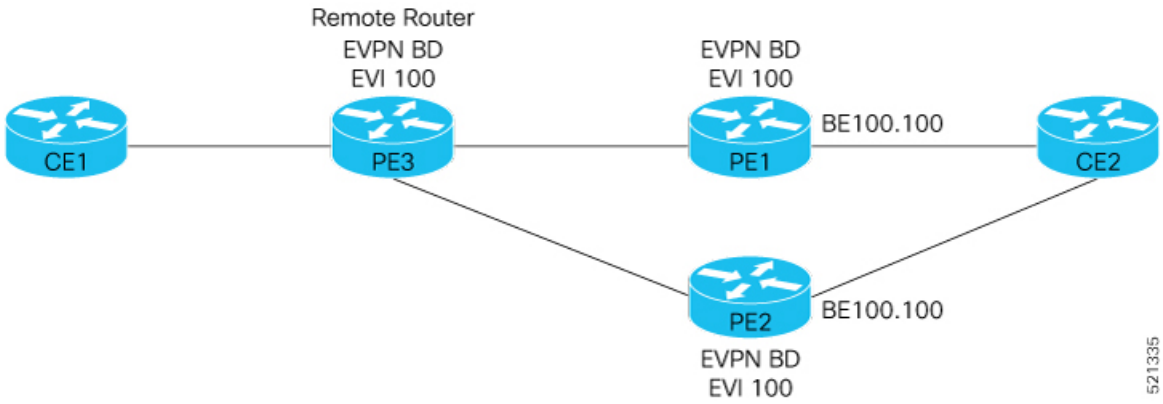
In ELAN configurations, retaining locally learned MAC addresses on layer 2 FRR-enabled circuits during downtime is crucial. This allows for quick identification and redirection of unicast traffic to the customer edge (CE) through MAC lookup.

Benefits

This feature provides fast and predictable convergence:

- Fast and predictable convergence.
- Manual configuration for predictable failover behavior.
- No need to change the topology.

Figure 18: Layer 2 Fast Reroute



In this topology:

- CE2 is multi-homed to PE1 and PE2.
- PE1 and PE2 are in EVPN active-active or single-active mode. They are connected to a remote router PE3 over the MPLS core network.
- CE1 is connected to PE3.
- Both PE1 and PE2 are enabled with L2 FRR. An FRR label is added per EVI for the backup path.

Consider a traffic flow from CE1 to CE2 in a regular scenario:

- The traffic is sent from CE1 to PE3.
- PE3 distributes the traffic over PE1 and PE2.
- PE1 and PE2 send the traffic to CE2.

When the PE3, CE2 traffic over PE1 takes the PE2 path which is PE1-PE2 backup path the traffic is forwarded to CE2. This traffic redirect lasts until PE3 updates the routes and sends to PE2.

- When L2FRR is enabled on PE1 and PE2, both PE1 and PE2 have the FRR labels. The logical backup path is pre-programmed in the hardware. When PE1 detects a failure on the access side (CE2), instead of sending traffic to CE2, PE1 sends the traffic over the pre-programmed backup path to PE2.
- All incoming traffic to PE1 is redirected to PE2 using this FRR label.
- PE1 encapsulates all the traffic with the FRR label of PE2 and forwards the traffic to PE2.
- Upon receiving the FRR label, PE2 forwards the traffic to CE2 through the attachment circuit (AC), even if the AC is in a blocking state.

Associated Commands

- **convergence reroute**
- **show evpn ethernet-segment**
- **show evpn evi**
- **show evpn evi ead private**

Restrictions for layer 2 fast reroute

This feature is supported on:

- BGP MPLS-based EVPN E-LAN.
- PE devices in EVPN active-active or single-active mode.
- Unicast traffic.
- This feature is not supported on BUM traffic.

Configure layer 2 fast reroute for E-LAN service

Configure L2 FRR on a PE router in the E-LAN EVPN multi-homing network.

Procedure

Step 1 Associate the Ethernet segment with the bundle interface and enable L2 FRR using the **convergence reroute** command. Configure this command on both PE1 and PE2 with in the specified topology map to enable L2FRR.

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group bg1
Router(config-l2vpn-bg)# bridge-domain bd1
Router(config-l2vpn-bg-bd)# interface Bundle-Ether4.1
Router(config-l2vpn-bg-bd-ac)#exit
Router(config-l2vpn-bg-bd)# evi 1
Router(config-l2vpn-bg-bd-evi)# exit
Router(config-l2vpn-bg-bd)# exit
Router(config-l2vpn-bg)# exit
Router(config-l2vpn)# bridge group bg2
Router(config-l2vpn-bg)# bridge-domain bd2
Router(config-l2vpn-bg-bd)# interface Bundle-Ether4.2
Router(config-l2vpn-bg-bd-ac)# exit
Router(config-l2vpn-bg-bd)# evi 2
Router(config-l2vpn-bg-bd-evi)# exit
Router(config-l2vpn-bg-bd)# exit
Router(config-l2vpn-bg)# exit
Router(config-l2vpn)#
```

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 1
Router(config-evpn-instance)# advertise-mac
Router(config-evpn-instance-mac)# exit
Router(config-evpn-instance)# exit
Router(config-evpn)# evi 2
Router(config-evpn-instance)# advertise-mac
Router(config-evpn-instance-mac)# exit
Router(config-evpn-instance)# exit
Router(config-evpn)# interface Bundle-Ether4
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 40.00.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode single-active
Router(config-evpn-ac-es)# convergence
Router(config-evpn-ac-es-conv)# reroute
Router(config-evpn-ac-es)# exit
```

```
Router(config-evpn-ac# exit
Router(config-evpn)# exit
Router(config)# exit
```

Step 2 Verify the L2 FRR configuration.

```

Layer 2 fast reroute for E-Line services

Layer 2 fast reroute (FRR) for E-Line service is a network capability that, in the event of a link or node failure,

- provides rapid traffic rerouting,
- improves network reliability,
- enhances service continuity, and
- ensures minimal disruption by pre-establishing backup paths.

Table 14: Feature History Table

Feature Name	Release Information	Feature Description
Layer 2 fast reroute for E-Line services	Release 25.1.1	You can now ensure faster convergence and uninterrupted service by redirecting the traffic using the EVPN pseudowire (PW) in an E-Line configuration when a dual-homing link fails.

The Layer 2 Fast Reroute (L2 FRR) feature minimizes traffic loss and ensures rapid convergence by redirecting traffic through a backup path when a primary link fails. It protects the Provider Edge-Customer Edge (PE-CE) connection by rerouting traffic to a peer PE if a local link failure occurs, allowing the peer PE to forward the traffic to the CE. In an E-Line (E-Line) service, an EVPN pseudowire provides a point-to-point Layer 2 connection over an IP/MPLS network using Ethernet VPN (EVPN), with all traffic redirected to the CE, excluding MAC address involvement.

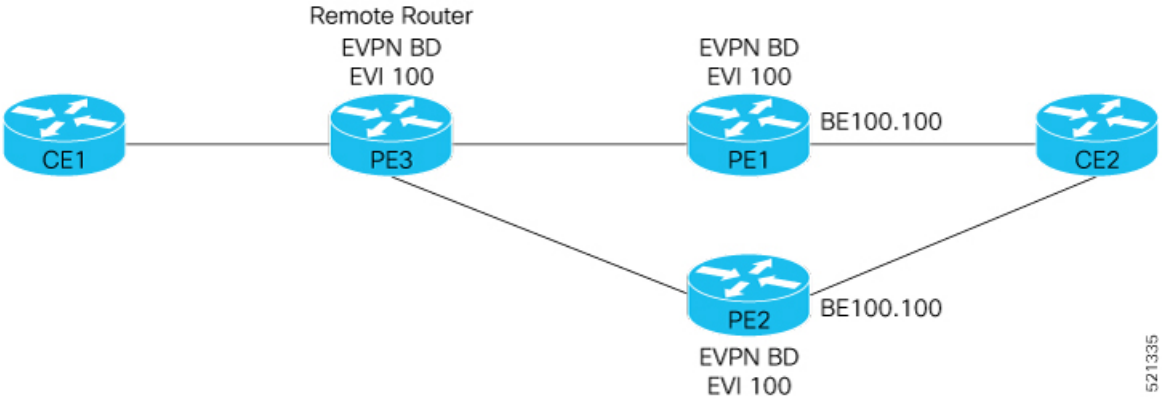
Benefits of L2 FRR on E-Line service

- Fast convergence with a 50 ms target time.
- You can use the same topology since no changes are needed.

Multi-homing topology for L2 FRR on E-Line service

Consider a sample topology with EVPN multi-homing for E-Line service.

Figure 19: Layer 2 FRR multi-homing topology



In this topology:

- CE2 is connected to both PE1 and PE2 as a multi-homed device.
- PE1 and PE2 operate either in EVPN active-active or single-active mode and connect to a remote router, PE3, over the MPLS core network.
- PE3 is connected to CE1.
- PE1 and PE2 are enabled with layer 2 FRR. A FRR label is assigned per EVI for the backup path.

Traffic flow from CE1 to CE2 in a regular scenario:

- Traffic is sent from CE1 to PE3.
- PE3 distributes the traffic over PE1 and PE2, provided PE1 is the Designated Forwarder (DF) router.
- PE1 and PE2 forward the traffic to CE2.

Traffic flow from CE1 to CE2 in a failover scenario:

The failover scenario occurs when the link between PE1 and CE2 is down.

The traffic is redirected from PE3 to CE2 through the PE1-PE2 backup path until PE3 updates the routes to PE2.

- When the layer 2 FRR is enabled on PE1 and PE2, both are assigned FRR labels, and a logical backup path is pre-programmed in the hardware. If PE1 detects a failure on the access side (CE2), it redirects traffic over the backup path to PE2 instead of sending it to CE2.
- PE1 encapsulates all incoming traffic with PE2's FRR label and forwards it to PE2.

- Upon receiving the FRR label, PE2 forwards the traffic to CE2 through the attachment circuit (AC), even if the AC is in a blocking state.

Restrictions for layer 2 fast reroute

This feature is supported on:

- BGP MPLS-based EVPN E-LAN.
- PE devices in EVPN active-active or single-active mode.
- Unicast traffic.
- This feature is not supported on BUM traffic.

Configure layer 2 fast reroute for E-Line service

Configure L2 FRR on a PE router in the E-LINE EVPN multi-homing network.

Procedure

Step 1 EVPN E-Line configuration.

```
Router(config)# evpn
Router(config-evpn)# evi 1
Router(config-evpn-instance)# exit
Router(config-evpn)# evi 2
Router(config-evpn-instance)# exit
Router(config-evpn)# interface Bundle-Ether4
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 40.00.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode single-active
Router(config-evpn-ac-es)# convergence
Router(config-evpn-ac-es-conv)# reroute
Router(config-evpn-ac-es-conv)# exit
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# exit
Router(config-evpn)# exit
Router(config)#
```

Step 2 View the L2 FRR EVPN E-LINE running configuration for single-active mode.

```

EVPN Preferred Nexthop

Table 15: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Preferred Nexthop	Release 7.3.1	With this feature, you can set an active and backup path, in a dual-homed mode based on the nexthop IP address, thereby allowing greater control over traffic patterns. If you are unable to use single-active mode due to hardware, topology, or technological limitations, this feature enables you to direct traffic to a specific remote PE. This feature introduces the **preferred nexthop** command.

The EVPN Preferred Nexthop feature allows you to choose a primary nexthop and backup nexthop among the remote PE devices in dual-homed mode. By default, in an all-active dual-homed topology, traffic is load balanced using ECMP across both remote PE devices.

Configure the **preferred-nexthop** command when you want to direct traffic to one specific remote PE, and you are unable to use single-active mode due to hardware, topology, or technological limitations. The router allocates an internal label and will not allocate or consume ECMP FEC. The internal label enables fast switchover to backup PE when the primary link fails.

When remote PEs are operating in EVPN all-active mode, configure the **preferred-nexthop** command per EVI to choose an active and backup path based on the nexthop IP address. You can set the highest IP address as primary, which results in the lower IP address as a backup or vice versa.This feature provides you greater control over traffic patterns, that is to achieve symmetric traffic flow, and to allow support when a topology cannot support an all-active remote PE. Preferred nexthop is supported for native EVPN, EVPN VPWS, and EVPN PWHE. This feature supports a topology that has only two remote nexthops.

Configure EVPN Preferred Nexthop

Perform the following task to configure EVPN preferred nexthop.

Configuration Example

This example shows the configuration of highest IP address as the preferred nexthop.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
```

```
Router(config-evpn-evi)# preferred-nexthop highest-ip
Router(config-evpn-evi)# commit
```

This example shows the configuration of lowest IP address as the preferred nexthop.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-evi)# preferred-nexthop lowest-ip
Router(config-evpn-evi)# commit
```

This example shows the configuration of preferred nexthop using the **modulo** keyword.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 100
Router(config-evpn-evi)# preferred-nexthop modulo
Router(config-evpn-evi)# commit
```

Running Configuration

This section shows the EVPN preferred nexthop running configuration.

```
/* Configuration of highest IP address as the preferred nexthop */
evpn
 evi 100
  preferred-nexthop highest-ip
!

/* Configuration of lowest IP address as the preferred nexthop */
evpn
 evi 100
  preferred-nexthop lowest-ip
!

/* Configuration of preferred nexthop using the modulo keyword */
evpn
 evi 100
  preferred-nexthop modulo
```

Verification

The output shows that the Highest IP is selected as primary (P) and the lowest IP as backup (B). The path selection is programmed in CEF.

EVPN Access-Driven DF Election

Table 16: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Access-Driven DF Election	Release 7.3.1	This feature enables the access network to control EVPN PE devices by defining the backup path much before the event of a link failure, thereby reducing the traffic loss. The following keywords are added to the **service-carving** command: • **preference-based** • **access-driven**

This feature includes a preference-based and access-driven DF election mechanism.

In a preference-based DF election mechanism, the weight decides which PE is the DF at any given time. You can use this method for topologies where interface failures are revertive. However, for topologies where an access-PE is directly connected to the core PE, use the access-driven DF election mechanism.

When access PEs are configured in a non-revertive mode, the access-driven DF election mechanism allows the access-PE to choose which PE is the DF.

Consider an interface in an access network that connects PE nodes running Multichassis Link Aggregation Control Protocol (mLACP) and the EVPN PE in the core. When this interface fails, there may be a traffic loss for a longer duration. The delay in convergence is because the backup PE is not chosen before failure occurs.

The EVPN Access-Driven DF Election feature allows the EVPN PE to preprogram a backup PE even before the failure of the interface. In the event of failure, the PE node will be aware of the next PE that will take over. Thereby reducing the convergence time. Use the *preference df weight* option for an Ethernet segment identifier (ESI) to set the backup path. By configuring the weight for a PE, you can control the DF election, thus define the backup path.

Restrictions

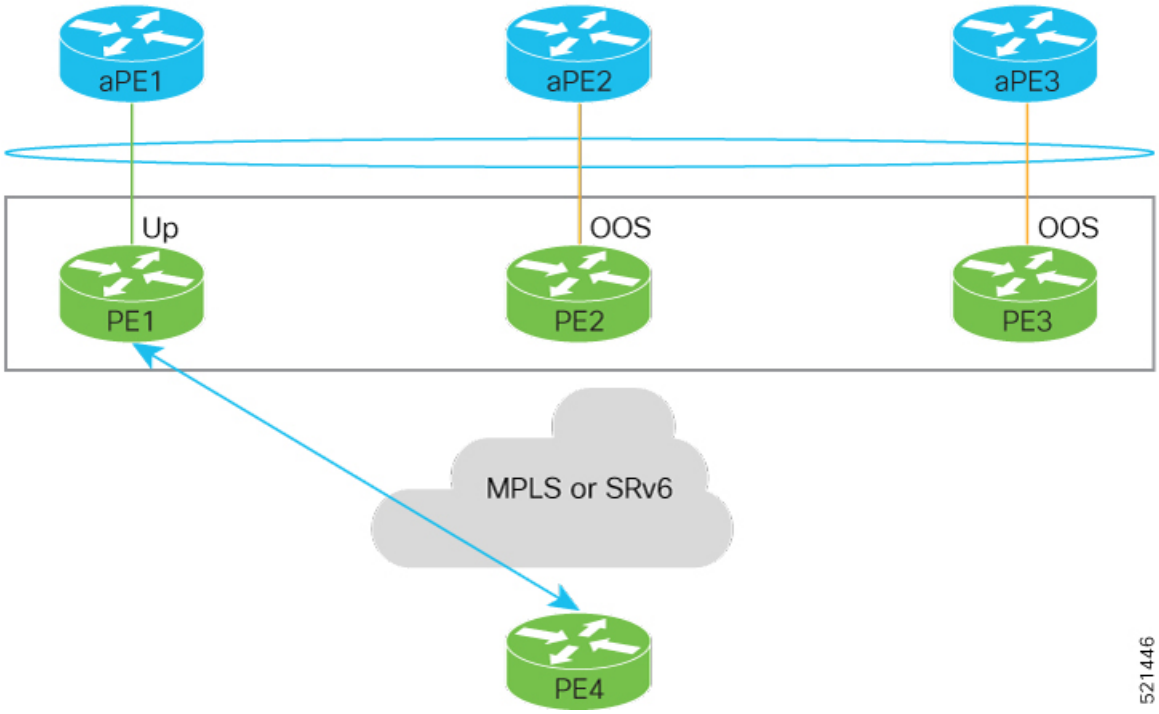
- The feature is supported only in an EVPN-VPWS scenario where EVPN PEs are in the port-active mode.
- The bundle attached to the ethernet segment must be configured with **lacp mode active**.

  LACP mode on is not supported.

Topology

Let's understand the feature on how the backup path is precomputed with the following topology.

Figure 20: EVPN Access-Driven DF Election

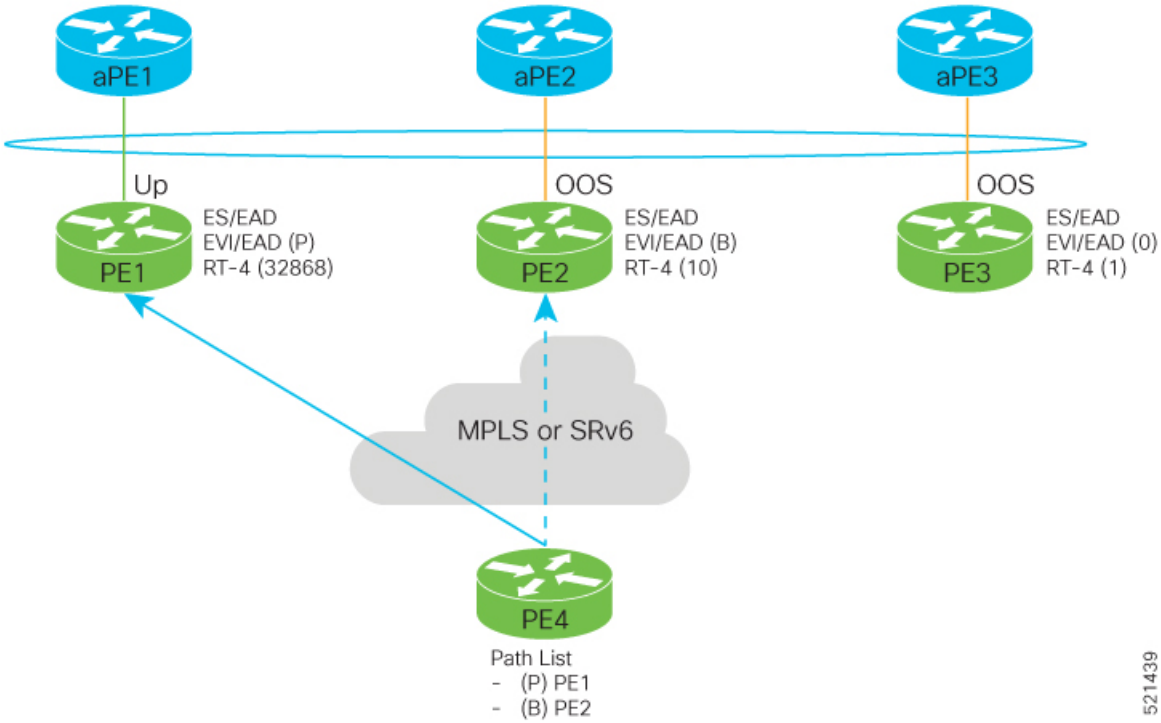


- PE1, PE2, and PE3 are PEs for the EVPN core network.
- aPE1, aPE2, and aPE3 are their access PE counterparts and configured in a multichassis link aggregation group (MCLAG) redundancy group. Only one link among the three is active at any given time. aPE1, aPE2, and aPE3 are in a non-revertive mode.
- PE1 is directly connected to aPE1, PE2 to aPE2, and PE3 to aPE3. EVPN VPWS is configured on the PE devices in the core.
- All PE devices are attached to the same bundle and shares the same ethernet segment identifier.

- PE1, PE2, and PE3 are configured with a weight of 100, 10, and 1 respectively.

Traffic Flow

In this example, consider a traffic flow from a host connected to PE4 to the host connected to the access PE.



- aPE1-PE1 interface state is up. The aPE2-PE2 and aPE3-PE3 remains in OOS state.
- The traffic is sent from PE4 to aPE1 through PE1 as the PE1 is configured with a highest weight of 100.
- The highest weight is modified by adding 32768 to the configured weight. For example, the weight of PE1 is 100, 32768 is added to this weight. Hence, 32868 is advertised to the peer PEs.
- The highest weight is advertised as P-bit, which is primary. The next highest weight is advertised as B-bit, which is secondary. The lowest weight as non-DF (NDF).
- When the EVPN PE devcies are of same weight, the traffic is sent based on the IP address. Lowest IP address takes the precedence.
- Only one PE indicates that the state of the bundle for the Ethernet Segment is up. For all other PEs, the Ethernet Segment is standby and the bundle is in OOS state.
- All PE devices are aware of the associated next hop and weights of their peers.

Failure and Recovery Scenarios

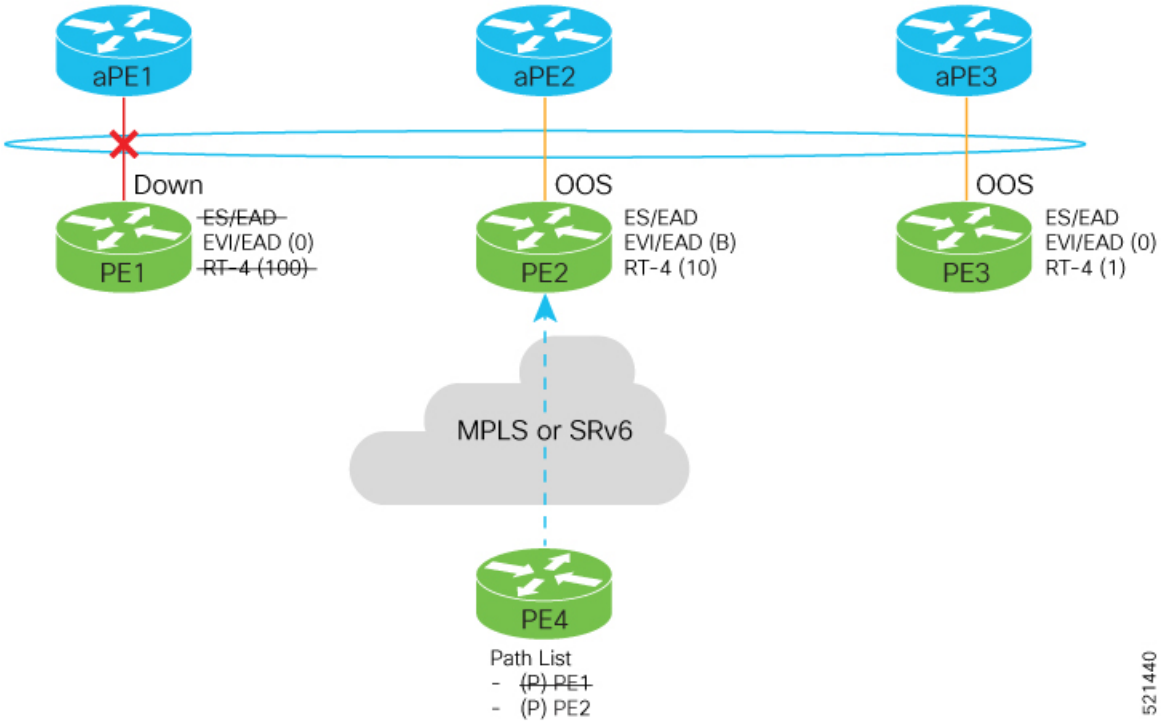
The weights configured on the EVPN PE devices cascade in the same order as the protection mechanism on the access side PEs:

- During the network failure, the redundancy ordering for the access PEs is aPE1, aPE2, aPE3.
- The weights of PE1 through PE3 are weight of PE1 > weight of PE2 > weight of PE3.

- If this ordering is not satisfied, the network will eventually converge, but it will not be as efficient as if the weights are ordered correctly.

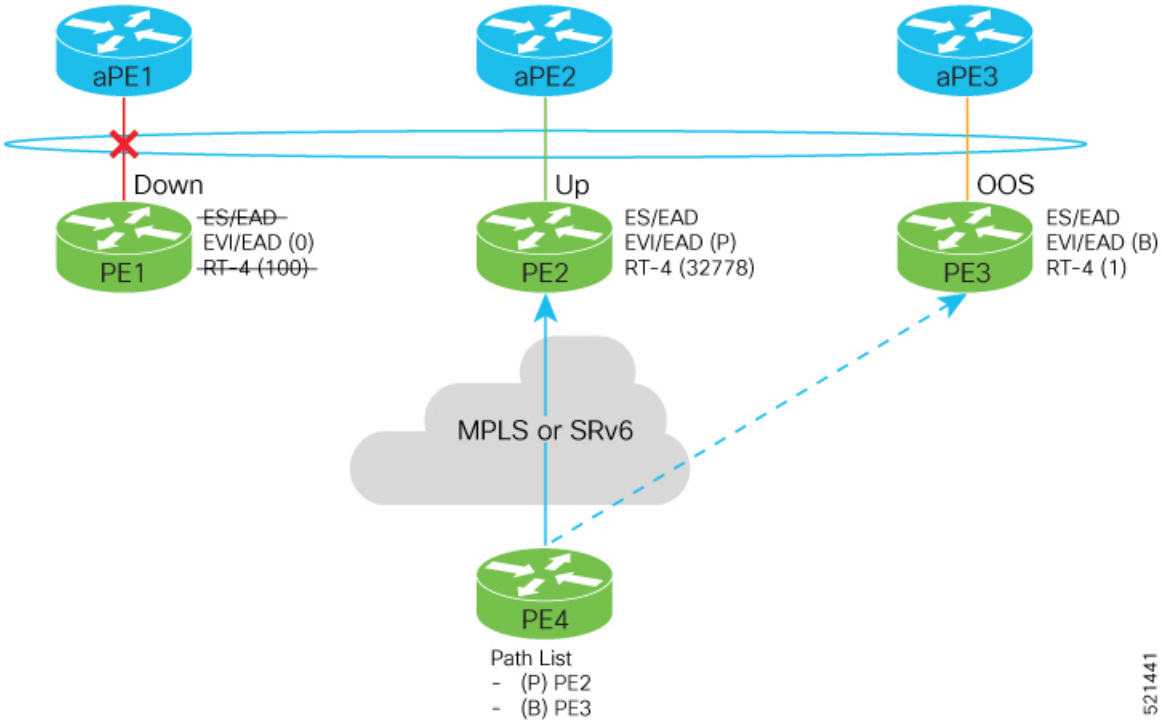
Scenario - 1

Consider a scenario where the aPE1-PE1 interface is down.



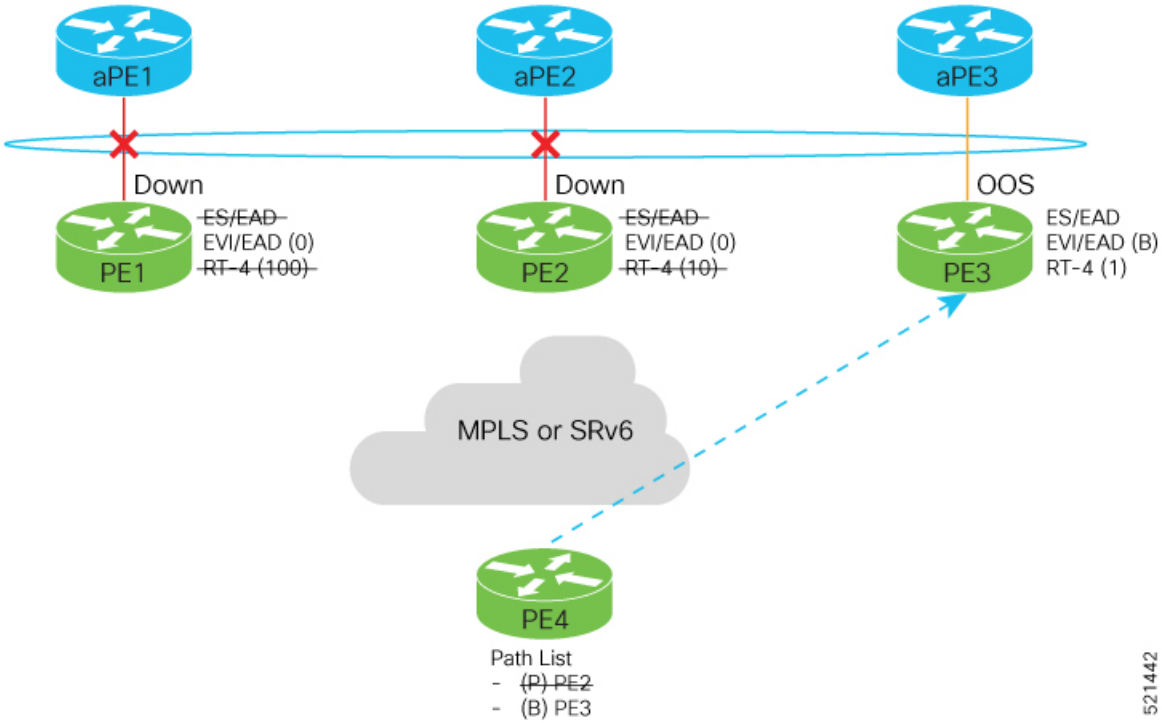
When aPE1-PE1 interface is down, the PE1 withdraws the EAD/ES route, and the traffic is sent through the backup path, which is PE2.

The aPE2-PE2 becomes the primary with a weight of 32778, and aPE3-PE3 becomes the backup. The aPE2-PE2 advertises P-bit to PE4. aPE3-PE3 advertises the B-bit to PE4.

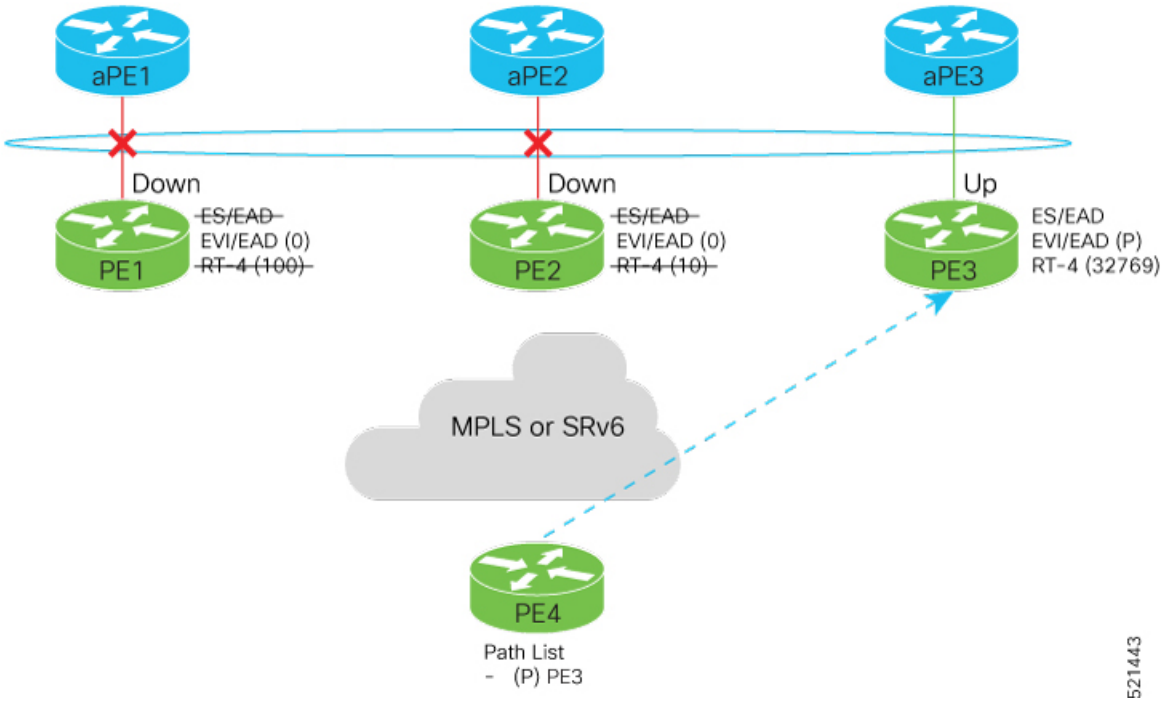


Scenario - 2

Consider a scenario where aPE2-PE2 interface is also down.

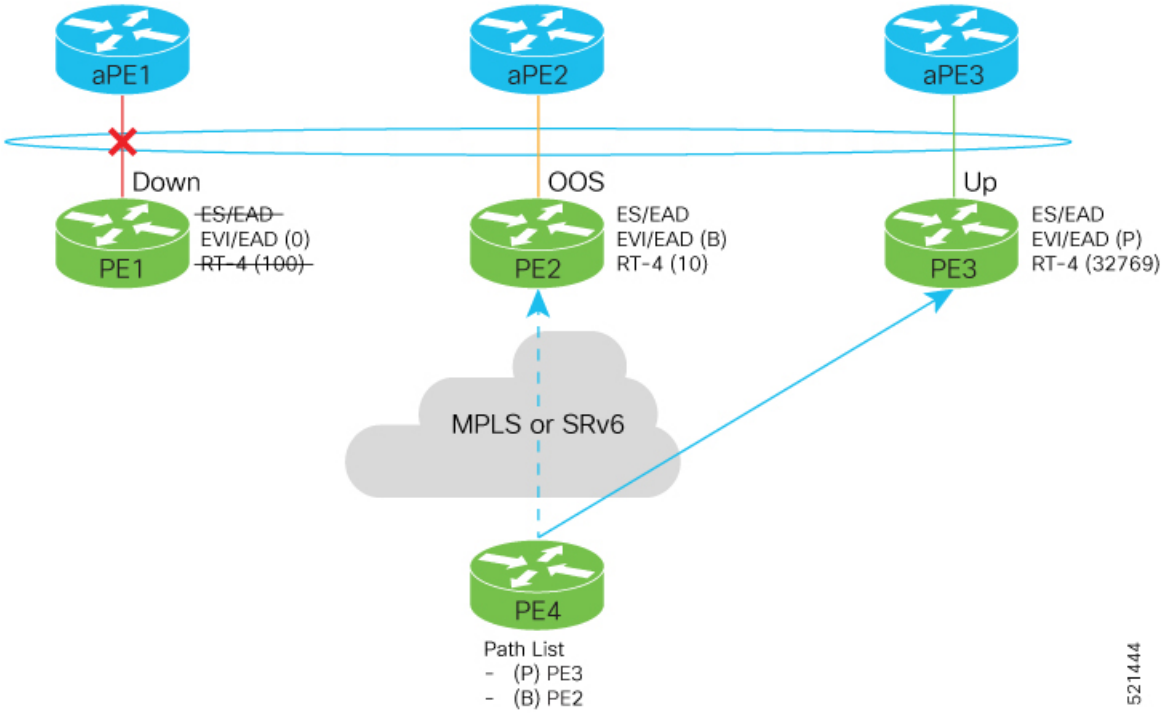


When the aPE2-PE2 interface is also down, the traffic is sent through aPE3-PE3 link. aPE3-PE3 becomes the primary path with a weight of 32769.



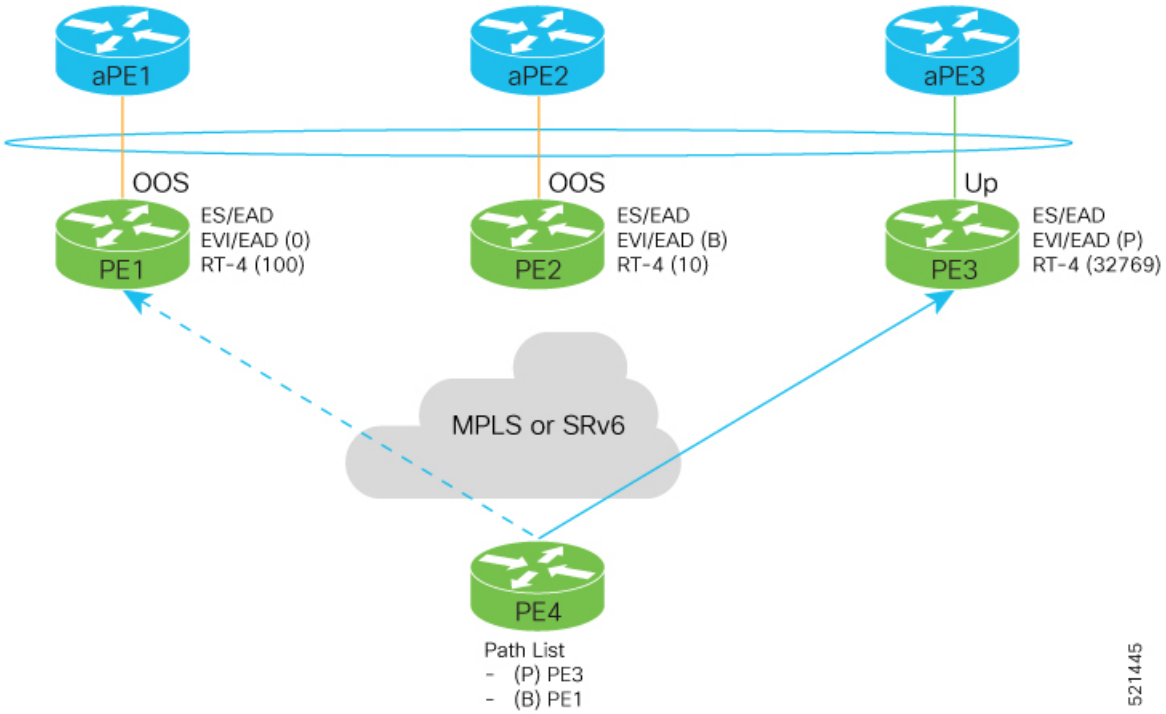
Scenario - 3

When the aPE2-PE2 interface comes up, the aPE3-PE3 link still remains the primary path. aPE2-PE2 interface becomes the backup path with a weight of 10.



Scenario - 4

When the aPE1-PE1 interface comes up, the aPE3-PE3 link remains the primary path with a weight of 32769. aPE1-PE1 interface becomes the backup path with a weight of 100. The aPE2-PE2 interface becomes NDF with a weight of 10.



Configure EVPN Access-Driven DF Election

Perform the following tasks to configure EVPN Access-Driven DF Election feature:

- Configure EVPN access-driven DF election on PE1, PE2, and PE3
- Configure LACP on aPE1, aPE2, and aPE3
- Configure EVPN-VPWS for PE1, PE2, and PE3

  See the *EVPN Virtual Private Wire Service (VPWS)* chapter on how to configure EVPN-VPWS.

Configuration Example

- All PE devices are configured with different weights. PE1, PE2, and PE3 are configured with a weight of 100, 10, and 1 respectively.
- The bundle attached to the ethernet segment is configured with **lacp mode active**.
- EVPN VPWS is configured on the PE devices.

```
/* Configure EVPN access-driven DF election on PE1, PE2, and PE3 */

/*  PE1 Configuration */
Router#configure
Router(config)#evpn
```

```
Router(config-evpn)#interface Bundle-Ether1
Router(config-evpn-ac)#ethernet-segment
Router(config-evpn-ac-es)#identifier type 0 01.11.00.00.00.00.00.00.01
Router(config-evpn-ac-es)#load-balancing-mode port-active
Router(config-evpn-ac-es)#service-carving preference-based
Router(config-evpn-ac-es-sc-pref)#weight 100
Router(config-evpn-ac-es-sc-pref)#access-driven
Router(config-evpn-ac-es-sc-pref)#commit

/* PE2 Configuration */
Router#configure
Router(config)#evpn
Router(config-evpn)#interface Bundle-Ether1
Router(config-evpn-ac)#ethernet-segment
Router(config-evpn-ac-es)#identifier type 0 01.11.00.00.00.00.00.00.01
Router(config-evpn-ac-es)#load-balancing-mode port-active

EVPN Non-Revertive Designated Forwarder Election

Table 17: Feature History Table

Feature Name	Release Information	Feature Description
EVPN Non-Revertive Designated Forwarder Election	Release 24.1.1	In a preference-based Designated Forwarder (DF) election, non-revertive mode prevents the traffic disruption that occurs during the recovery of a node in a port-active multihoming network. While recovering from a link failure, an EVPN ethernet-segment (ES) performs DF re-election and re-carves the services among the multihomed nodes, which causes traffic interruption and interface flapping, leading to traffic loss. In the non-revertive mode, the EVPN ES does not re-carve the services after the recovery, thus avoiding the traffic disruption. The feature introduces these changes: **CLI**: • **non-revertive** • **revert** • The **ethernet-segment interface** *interface-name* **revert** keyword is introduced in the **l2vpn evpn** command. **YANG Data Model**: • `Cisco-IOS-XR-evpn-oper.yang` • `Cisco-IOS-XR-l2vpn-cfg.yang` (see GitHub, YANG Data Models Navigator)

In a preference-based Designated Forwarder (DF) election mechanism, each PE router is assigned with a weight. The PE configured with the highest weight is selected as the DF, which forwards traffic to the customer devices on a particular Ethernet Segment (ES).

A link failure triggers the DF election process which involves the following:

- The DF goes down and becomes the non-Designated Forwarder (NDF).
- The PE with the next highest weight becomes the DF and transitions to active mode.

During the recovery of a link, the re-election of DF and the re-carving of services are triggered. When the Ethernet Segment is configured with more number of services, the time taken for service re-carving and the process of transferring the DF role to the PE with highest weight leads to traffic interruption and traffic loss.

To prevent traffic disruption during DF re-election and service re-carving, you can now configure the non-revertive mode of DF election. In the non-revertive mode, the weight of the PEs is adjusted so that the PE, which has become the DF during link failure, remains as the DF after the recovery. The service re-carving is not triggered.

Use the **non-revertive** command to enable the non-revertive mode.

Restrictions for EVPN Non-Revertive DF Election

Non-reverting mode of EVPN DF election is supported for:

- Preference-based DF election.
- Physical and bundle interfaces.
- EVPN port-active multihoming mode.

Non-reverting mode of EVPN DF election is not supported for:

- Access-driven DF election.
- Virtual interfaces like virtual Ethernet segment (vES), network virtualization endpoint (NVE), and pseudowire headend (PWHE) .
- Segment routing over IPv6 (SRv6).

Configure EVPN Non-Revertive DF Election

Prerequisites

It is recommended to configure the non-revertive mode of DF election on all the nodes in the network.

Configuration Example

1. Configure Ethernet-Segment in port-active load-balancing mode on peering PEs for a specific interface, using the **load-balancing-mode port-active** command.
2. Configure the service carving mode as preference-based using the **service-carving preference-based** command. The DF election happens based on the highest preference, that is the weight of the PE.
3. Configure the non-revertive mode of DF election using the **non-revertive** command, to enable the non-revertive mode on the PEs.
4. Configure the PE devices with different weights, using the **weight** command.

In the following example, PE1 and PE2 are configured with a weight of 100 and 10 respectively.

- After the DF election, PE1 is selected as the DF.
- When there is a link failure, PE1 goes down, and the next PE with the highest weight, PE2, becomes the DF.
- By default, the DF election happens during the recovery, and PEl becomes the DF again. Transferring the DF role from PE2 to PE1 leads to traffic disruption.
- When the non-revertive mode is enabled, the weight of the PE1 is adjusted so that PE2 remains the DF. This prevents the traffic disruption incurred due to the DF election.

```
/* Configuration on PE1 */

Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 01.11.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# service-carving preference-based
Router(config-evpn-ac-es-sc-pref)# non-revertive
Router(config-evpn-ac-es-sc-pref)# weight 100
Router(config-evpn-ac-es-sc-pref)# commit

/* Configuration on PE2 */

Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 01.11.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# service-carving preference-based
Router(config-evpn-ac-es-sc-pref)# non-revertive
Router(config-evpn-ac-es-sc-pref)# weight 10
Router(config-evpn-ac-es-sc-pref)# commit
```

Running Configuration

```
/* PE1 Configuration */

evpn
 interface Bundle-Ether1
  ethernet-segment
   identifier type 0 01.11.00.00.00.00.00.00.01
   load-balancing-mode port-active
   service-carving preference-based
    non-revertive
    weight 100

/* PE2 Configuration */

evpn
 interface Bundle-Ether1
  ethernet-segment
   identifier type 0 01.11.00.00.00.00.00.00.01
   load-balancing-mode port-active
   service-carving preference-based
    non-revertive
    weight 10
```

Verification

The following output shows that non-revertive mode is enabled.

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 private

…
  Topology          :
     Operational    : SH
     Configured     : Port-Active

     192.168.0.3 [PREF:DP:7fff:T][2]
```

Configure to Return to Revertive Mode

In the non-revertive mode, the DF election does not happen during the recovery from a link failure. If you want to return to the default behavior, which is the revertive mode, use one of the following methods.

Configure Revert Timer

When you configure a revert timer on the PEs enabled with non-revertive mode, the timer starts once the nodes have recovered from link failure. Once the timer expires, the PEs return to the revertive mode and DF election happens in the network. The timer is configured in seconds.

```
/* Configure non-revertive mode on an interface and configure revert timer on the interface
 */

Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 01.11.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# service-carving preference-based
Router(config-evpn-ac-es-sc-pref)# non-revertive
Router(config-evpn-ac-es-sc-pref)# weight 100
Router(config-evpn-ac-es-sc-pref)# exit
Router(config-evpn-ac-es)# exit
Router(config-evpn-ac)# timers
Router(config-evpn-ac-timers)# revert 300
Router(config-evpn-ac-es)# commit
```

You can also configure the revert timer globally.

```
Router(config)# evpn
Router(config-evpn)# timers
Router(config-evpn-timers)# revert 300
Router(config-evpn-timers)# commit
```

Running Configuration

```
/* Revert Timer Configuration on Interface */
evpn
```

```
 interface Bundle-Ether1
  ethernet-segment
   identifier type 0 01.11.00.00.00.00.00.00.01
   load-balancing-mode port-active
   service-carving preference-based
    non-revertive
  !
   timers
    revert 300

/* Global Configuration of Revert Timer */
evpn
  timers
   revert 300
```

Verification

The following output shows non-revertive mode enabled along with the configured revert timer.

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 private

 …
  Topology          :
     Operational    : SH
     Configured     : Port-Active

  HRW Reset timer   : 5 sec [not running]
  AC Debounce timer : 3000 msec [not running]
```

In the following example, the revert timer has expired and the non-revertive mode is inactive.

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 private

 …
  Topology          :
     Operational    : SH
     Configured     : Port-Active
  Service Carving   : Preferential
     Config Weight  : 100
     Oper Weight    : 100
     Non-Revertive  : Enabled, Inactive
```

```
   Access Driven  : Disabled
   SRG Driven     : Disabled
   Multicast      : Disabled
Convergence       :
Peering Details   : 0 Nexthops
Service Carving Synchronization:
   Mode           : NONE
   Peer Updates   :
Service Carving Results:
   Forwarders     : 0
   Elected        : 0
   Not Elected    : 0
EVPN-VPWS Service Carving Results:
   Primary        : 0
   Backup         : 0
   Non-DF         : 0
MAC Flush msg     : STP-TCN
Peering timer     : 3 sec [not running]
Recovery timer    : 30 sec [not running]
Carving timer     : 0 sec [not running]
Revert timer      : 0 sec [not running]
HRW Reset timer   : 5 sec [not running]
AC Debounce timer : 3000 msec [not running]
```

Disable Non-Revertive Mode

Use the following action command to disable the non-revertive behavior. The revert timer, if configured, is cancelled and DF election is performed again in the network.

```
Router# l2vpn evpn ethernet-segment interface Bundle-Ether1 revert
```

EVPN Port-Active Hot Standby on Bundle Interfaces

Table 18: Feature History Table

Feature Name	Release Information	Feature Description

EVPN Port-Active Hot Standby on Bundle Interfaces	Release 7.10.1	The EVPN port-active mode configuration is now modified to support hot standby. In a hot standby bundle interface, the main and subinterfaces remain up. This functionality ensures fast convergence of standby to active transition. Previously, the interfaces in a standby node would be down. During the failure and recovery of active node, the standby node transitions through the Out-of-Service (OOS) state to the Up state. If you still want the nodes to transition through the OOS state, use the **access-signal out-of-service** command to revert to the previous behavior. The feature introduces these changes: **CLI**: • **access-signal out-of-service** **YANG Data Model**: • New XPaths for `Cisco-IOS-XR-l2vpn-cfg.yang` (see GitHub, YANG Data Models Navigator)

In earlier releases, when you configure EVPN port-active mode, one of the PEs is in active mode and other PEs are in standby mode at the port level. Only the PE, which is in active mode, sends and receives the traffic. The other PE remains in the standby mode. The PEs use the Designated Forwarder (DF) election mechanism using BGP Route-Type 4 (Ethernet-Segment route) exchange, to determine which PE must be in the active mode and which must be in the standby mode.

In a normal network, the PEs remain in the following state:

- The DF is in active mode, with the Bundle-Ethernet interface in Up state.
- The non-Designated Forwarder (NDF) is in standby mode, with the Bundle-Ethernet interface in OOS or Down state.

During the failure and recovery, the transitions happen as follows:

- When failure occurs on DF, Ethernet Segment (ES) route is withdrawn and the NDF becomes DF. The Bundle-Ethernet interface on NDF transitions from OOS/Down to Up state.
- During the recovery, ES route is signalled and DF transitions to NDF. The Bundle-Ethernet interface on peer node transitions from Up to OOS or Down state.

For more information, see the following references:

- EVPN Access-Driven DF Election, on page 146

Configure EVPN Port-Active Hot Standby on Bundle Interfaces

To achieve EVPN port-active mode with hot standby mode, configure Ethernet-Segment (ES) in port-active load-balancing mode on peering PEs for a specific interface.

```
/* PE1 and PE2 Configuration */
```

```
Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 01.00.01.00.01.09.01.00.09
Router(config-evpn-ac-es)# load-balancing-mode port-active
Router(config-evpn-ac-es)# commit
```

Verification

The following examples show output from the active and standby nodes.

As PE1 is the DF in active mode, the status is UP with active links.

The following example shows ES state as UP.

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 private
...
Ethernet Segment Id      Interface                         Nexthops

Bundle-Ether1                    7          FORWARDING   N
Bundle-Ether1                    8          FORWARDING   N
Bundle-Ether1                    9          FORWARDING   N
Bundle-Ether1                    10         FORWARDING   N
Bundle-Ether1                    11         FORWARDING   N
Bundle-Ether1                    12         FORWARDING   N
Bundle-Ether1                    13         FORWARDING   N
Bundle-Ether1                    14         BLOCKED      N
```

The following output shows that the bundle interface is Up with local active member.

```
Router# show bundle bundle-ether 1
…
Bundle-Ether1
  Status:                                  Up
  Local links <active/standby/configured>:   1 / 0 / 1
…
  Port                  Device           State        Port ID         B/W, kbps
  --------------------  ---------------  -----------  --------------  ----------
```

```
  Gi0/0/0/3             Local            Active       0x8005, 0x9001     1000000
      Link is Active
```

As PE2 is the NDF in standby mode, the status is standby and the link is in hot standby state.

The following output shows ES in Standby state:

```
Router# show evpn ethernet-segment interface Bundle-Ether 1 detail
...
Ethernet Segment Id      Interface                         Nexthops

EVPN BUM Flood Traffic Optimization

Table 19: Feature History Table

Feature Name	Release Information	Feature Description
EVPN BUM Flood Traffic Optimization	Release 7.10.1	You can save network bandwidth consumption by preventing the replication of Broadcast, Unknown unicast, and Multicast (BUM) traffic towards EVPN core and attachment circuits (AC). This feature not only prevents the replication of BUM traffic but also ensures that only the designated router receives the BUM traffic. The feature introduces these changes: **CLI** • **hw-module l2-replication core-optimized** • **flood mode ac-shg-optimized** **YANG Data Model:** • New XPaths for `Cisco-IOS-XR-um-hw-module-profile-cfg.yang` (see GitHub, YANG Data Models Navigator)

When you do not know the exact network address, the EVPN traffic is transmitted to multiple destinations in the network by using one of the following methods:

- Broadcast traffic: Transmits the network traffic to all the reachable destinations in the network.
- Unknown unicast traffic: When a unicast packet intended for a destination consists of unknown MAC address, the packets are flooded to all the ports.
- Multicast traffic: Transmits the network traffic to a group of devices in the network.

In EVPN operations, the PE routers automatically discover each other when connected on the same Ethernet segment and select a Designated Forwarder (DF) responsible for forwarding BUM traffic. The DF forwards the BUM traffic received from the core toward the access-facing interface.

BUM Traffic Replication

Each bridge domain uses an ingress multicast ID (MCID) and an egress MCID to replicate the BUM traffic. You can use the **hw-module l2-replication core-optimized** command to allocate two consecutive ingress MCIDs each bridge domain. This reduces the bridge domain scale by half and prevents the replication of BUM traffic.

When the network consists of a large number of PE devices on the bridge domain, you can optimize the consumption of recycle bandwidth due to the core-to-core and AC-to-AC replications using one of the following methods:

- Avoid Core-to-Core Replications
- Avoid AC-to-AC Replications

Restrictions for EVPN BUM Flood Traffic Optimization

- When BUM traffic optimization is enabled, two ingress MCIDs are used per bridge domain. This reduces the bridge domain scale by half.
- Access pseudowire is not supported.
- EVPN unknown unicast flooding suppression is not supported.
- BVI is not supported on a bridge domain enabled with split horizon group.
- The router must be reloaded after enabling the **hw-module l2-replication core-optimized** command for it to take effect.
- Multicast features are not supported when the **hw-module l2-replication core-optimized** command is activated.

Configure EVPN BUM Flood Traffic Optimization

The following configuration examples show how to enable BUM traffic optimization that avoids replication of BUM traffic towards core and ACs.

Avoid core-to-core replication for EVPN

```
Router# configure
Router(config)# hw-module l2-replication core-optimized
```

Note You must manually reload the router to activate the **hw-module l2-replication core-optimized** command.

Avoid AC-to-AC replication in a Split-Horizon Group

Prerequisites:

- Ensure that all the ACs are available in a split-horizon group (SHG). For more information on configuring SHG, see the *Configure Point-to-Point Layer 2 Services* chapter in the *L2VPN and Ethernet Services Configuration Guide for Cisco NCS 560 Series Routers*.
- Ensure that you have already configured the **hw-module l2-replication core-optimized** command and restarted the router to activate the command.

Note The **flood mode ac-shg-optimized** command works only after you configure the **hw-module l2-replication core-optimized** command and restart the router.

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group bg0
Router(config-l2vpn-bg)# bridge-domain bd0
Router(config-l2vpn-bg-bd)# flood mode ac-shg-optimized
```
