

Implementing Layer-3 Multicast Routing

Multicast routing allows a host to send packets to a subset of all hosts as a group transmission rather than to a single host, as in unicast transmission, or to all hosts, as in broadcast transmission. The subset of hosts is known as group members and are identified by a single multicast group address that falls under the IP Class D address range from 224.0.0.0 through 239.255.255.255.

The multicast environment consists of senders and receivers. Any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group receive the message.

The following protocols are supported to implement multicast routing:

- IGMP—IGMP is used between hosts on a network (for example, LAN) and the routers on that network to track the multicast groups of which hosts are members.
- PIM SSM— Protocol Independent Multicast in Source-Specific Multicast (PIM-SSM) has the ability to report interest in receiving packets from specific source addresses (or from all but the specific source addresses), to an IP multicast address.

Prerequisites for Implementing Multicast Routing

- You must install and activate the multicast RPM package.
- You must be familiar with IPv4 multicast routing configuration tasks and concepts.
- Unicast routing must be operational.

Enabling Multicast

Configuration Example

Enables multicast routing and forwarding on all new and existing interfaces.

```
Router#config
Router(config)#multicast-routing
Router(config-mcast)#address-family ipv4
Router(config-mcast-default-ipv4)#interface all enable
*/In the above command, you can also indicate a specific interface (For example, interface
TenGigE0/11/0/0)
for enabling multicast only on that interface/*
Router(config-mcast-default-ipv4)#commit
```

Running Configuration

```
Router#show running multicast routing
multicast-routing
  address-family ipv4
  interface all enable
  !
```

Verification

Verify that the Interfaces are enabled for multicast.

```
Router#show mfib interface location 0/RP0/cpu0
Interface : FINT0/RP0/cpu0 (Enabled)
SW Mcast pkts in : 0, SW Mcast pkts out : 0
TTL Threshold : 0
Ref Count : 2
Interface : TenGigE0/11/0/0 (Enabled)
```

```
SW Mcast pkts in : 0, SW Mcast pkts out : 0
TTL Threshold : 0
Ref Count : 3
Interface : TenGigE0/11/0/1 (Enabled)
SW Mcast pkts in : 0, SW Mcast pkts out : 0
TTL Threshold : 0
Ref Count : 13
Interface : Bundle-Ether1 (Enabled)
SW Mcast pkts in : 0, SW Mcast pkts out : 0
TTL Threshold : 0
Ref Count : 4
Interface : Bundle-Ether1.1 (Enabled)
SW Mcast pkts in : 0, SW Mcast pkts out : 0
TTL Threshold : 0
```

Supported Multicast Features

- Hardware Offloaded BFD for PIMv4 is supported.
- IPv4 and IPV6 static groups for both IGMPv2/v3 and MLDv1/v2 are supported.
- Protocol Independent Multicast in Source-Specific Multicast (PIM-SSM) mapping is supported.
- PIMv4 SSM over Bundle sub-interface is supported with the exception of PIMv6 SSM over Bundle sub-interface.
- MFIB stats (source, group) or (S,G) are supported.
- Loadbalancing for multicast traffic for ECMP links and bundles is supported.
- Router needs to be reloaded to recover, if TCAM space is exceeded.
- Multicast MAC and multicast IP address should be matched for both Layer 2 and Layer 3 traffic, else traffic may be dropped by ASIC. L2 flooding is not supported.
- Multicast traffic fragmentation in hardware is not supported.
- Multicast traffic without Spanning-Tree protocol is supported at Layer 2 for multicast traffic without snooping enabled.
- IPv6 multicast MLD joins are subjected to hop by hop LPTS punt policer. Tweaking this policer to a higher value achieves convergence at higher scale.

Also, adjust the ICMP control traffic LPTS hardware policer to a higher value for optimal convergence at higher scale.

IGMP Snooping Features

Supported Features

- IGMP Snooping on bridge domain is supported
- Multicast on BVI is supported.
- EVPN IGMP State Sync using IGMP snooping profile is supported.

Restrictions for Implementing Multicast Routing

- PIM SM is not supported for any of the supported MLDP profiles.
- DATA MDT with rate based or policy based switchover is not supported.
- Auto RP is not supported.
- Effective Cisco IOS-XR 7.4.1, Multicast VPN (mVPN) Profile 0 is supported. For more information, see [Configure mVPN Profiles within Cisco IOS-XR](#).

Protocol Independent Multicast

Protocol Independent Multicast (PIM) is a multicast routing protocol used to create multicast distribution trees, which are used to forward multicast data packets.

Proper operation of multicast depends on knowing the unicast paths towards a source or an RP. PIM relies on unicast routing protocols to derive this reverse-path forwarding (RPF) information. As the name PIM implies, it functions independently of the unicast protocols being used. PIM relies on the Routing Information Base (RIB) for RPF information. Protocol Independent Multicast (PIM) is designed to send and receive multicast routing updates.

PIM on Bundle-Ethernet subinterface is supported.

PIM BFD Overview

The BFD Support for Multicast (PIM) feature, also known as PIM BFD, registers PIM as a client of BFD. PIM can then utilize BFD's fast adjacency failure detection. When PIM BFD is enabled, BFD enables faster failure detection without waiting for hello messages from PIM.

At PIMs request, as a BFD client, BFD establishes and maintains a session with an adjacent node for maintaining liveness and detecting forwarding path failure to the adjacent node. PIM hellos will continue to be exchanged between the neighbors even after BFD establishes and maintains a BFD session with the neighbor. The behavior of the PIM hello mechanism is not altered due to the introduction of this feature. Although PIM depends on the Interior Gateway Protocol (IGP) and BFD is supported in IGP, PIM BFD is independent of IGP's BFD.

Protocol Independent Multicast (PIM) uses a hello mechanism for discovering new PIM neighbors between adjacent nodes. The minimum failure detection time in PIM is 3 times the PIM Query-Interval. To enable faster failure detection, the rate at which a PIM hello message is transmitted on an interface is configurable. However, lower intervals increase the load on the protocol and can increase CPU and memory utilization and cause a system-wide negative impact on performance. Lower intervals can also cause PIM neighbors to expire frequently as the neighbor expiry can occur before the hello messages received from those neighbors are processed. When PIM BFD is enabled, BFD enables faster failure detection without waiting for hello messages from PIM.

Configure PIM BFD

Note PIM BFD for IPv6 is not supported.

This section describes how you can configure PIM BFD

```
Router# configure
Router(config)# router pim address-family ipv4
Router(config-pim-default-ipv4)# interface HundredGigE0/9/0/0
Router(config-pim-ipv4-if)# bfd minimum-interval 10
Router(config-pim-ipv4-if)# bfd fast-detect
Router(config-pim-ipv4-if)# bfd multiplier 3
Router(config-pim-ipv4)# exit
Router(config-pim-default-ipv4)# interface TenGigE0/11/0/0
Router(config-pim-ipv4-if)# bfd minimum-interval 50
Router(config-pim-ipv4-if)# bfd fast-detect
Router(config-pim-ipv4-if)# bfd multiplier 3
Router(config-pim-ipv4-if)# exit
```

Running Configuration

```
router pim
 address-family ipv4
   interface HundredGigE 0/9/0/0
     bfd minimum-interval 10
     bfd fast-detect
     bfd multiplier 3
   !
   interface TenGigE 0/11/0/0
     bfd minimum-interval 50
     bfd fast-detect
     bfd multiplier 3
   !
 !
 !
 !
 !
```

Verification

The show outputs given in the following section display the details of the configuration of the PIM BFD, and the status of their configuration.

```
Router# show bfd session

```

Reverse Path Forwarding

Reverse-path forwarding (RPF) is an algorithm used for forwarding multicast datagrams. It functions as follows:

- If a router receives a datagram on an interface it uses to send unicast packets to the source, the packet has arrived on the RPF interface.
- If the packet arrives on the RPF interface, a router forwards the packet out the interfaces present in the outgoing interface list of a multicast routing table entry.
- If the packet does not arrive on the RPF interface, the packet is silently discarded to prevent loops.

PIM uses both source trees and RP-rooted shared trees to forward datagrams; the RPF check is performed differently for each, as follows:

- If a PIM router has an (S,G) entry present in the multicast routing table (a source-tree state), the router performs the RPF check against the IP address of the source for the multicast packet.
- If a PIM router has no explicit source-tree state, this is considered a shared-tree state. The router performs the RPF check on the address of the RP, which is known when members join the group.

Sparse-mode PIM uses the RPF lookup function to determine where it needs to send joins and prunes. (S,G) joins (which are source-tree states) are sent toward the source. (*,G) joins (which are shared-tree states) are sent toward the RP.

Setting the Reverse Path Forwarding Statically

Configuration Example

The following example configures the static RPF rule for IP address 10.0.0.1:

```

Router#configure
Router(config)#multicast-routing
Router(config-mcast)#address-family ipv4

```

```
Router(config-mcast)#static-rpf 10.0.0.1 32 TenGigE 0/0/0/1 192.168.0.2
Router(config-mcast)#commit
```

Running Configuration

```
multicast-routing
  address-family ipv4
    static-rpf 10.10.10.2 32 TenGigE0/0/0/1 192.168.0.2
```

Verification

Verify that RPF is chosen according to the static RPF configuration for 10.10.10.2

```
Router#show pim rpf
Table: IPv4-Unicast-default
* 10.10.10.2/32 [0/0]
  via GigabitEthernet0/0/0/1 with rpf neighbor 192.168.0.2
```

RPF Vector Encoding Using IETF Standard

RPF vector is a PIM proxy that lets core routers without RPF information forward join and prune messages for external sources (for example, a MPLS-based BGP-free core, where the MPLS core router is without external routes learned from BGP). The RPF vector encoding is now compatible with the new IETF encoding. The new IETF standard encodes PIM messages using PIM Hello option 26.

Configuring RPF Vector (IETF Standard Encoding)

This example shows how to enable RPF encoding using IETF standard:

```
(config)# router pim
(config-pim-default-ipv4)# address-family ipv4
(config-pim-default-ipv4)# rpf-vector use-standard-encoding
!
(config)# multicast-routing
(config-mcast)# interface TenGigE 0/11/0/0
(config-mcast)# interface TenGigE 0/11/0/1
```

Verification

```
Router#show pim neighbor
Tue Apr 17 10:15:40.961 PDT
```

```
PIM neighbors in VRF default
Flag: B - Bidir capable, P - Proxy capable, DR - Designated Router,
      E - ECMP Redirect capable
      * indicates the neighbor created for this router
```

Neighbor Address	Interface	Uptime	Expires	DR pri	Flags
25.25.25.1	TenGigE 0/11/0/0	1w3d	00:01:36	1	B P
25.25.25.2*	TenGigE 0/11/0/0	1w3d	00:01:41	1 (DR)	B P E
32.32.32.2*	TenGigE 0/11/0/1				
1w4d	00:01:40	1			B P E
32.32.32.3	TenGigE 0/11/0/1				
1w4d	00:01:42	1			(DR) B P

In the above output, you can see "P" tag on the multicast enabled interfaces.

PIM Bootstrap Router

The PIM bootstrap router (BSR) provides a fault-tolerant, automated RP discovery and distribution mechanism that simplifies the Auto-RP process. This feature is enabled by default allowing routers to dynamically learn the group-to-RP mappings.

PIM uses the BSR to discover and announce RP-set information for each group prefix to all the routers in a PIM domain. This is the same function accomplished by Auto-RP, but the BSR is part of the PIM specification. The BSR mechanism interoperates with Auto-RP on Cisco routers.

To avoid a single point of failure, you can configure several candidate BSRs in a PIM domain. A BSR is elected among the candidate BSRs automatically.

Candidates use bootstrap messages to discover which BSR has the highest priority. The candidate with the highest priority sends an announcement to all PIM routers in the PIM domain that it is the BSR.

Routers that are configured as candidate RPs unicast to the BSR the group range for which they are responsible. The BSR includes this information in its bootstrap messages and disseminates it to all PIM routers in the domain. Based on this information, all routers are able to map multicast groups to specific RPs. As long as a router is receiving the bootstrap message, it has a current RP map.

Configuring PIM Bootstrap Router

Configuration Example

Configures the router as a candidate BSR with a hash mask length of 30:

```
Router#config
Router(config)#router pim
Router(config-pim-default-ipv4)#bsr candidate-bsr 1.1.1.1 hash-mask-len 30 priority 1
Router(config-pim-default-ipv4-if)#commit
```

Configures the router to advertise itself as a candidate rendezvous point to the BSR in its PIM domain. Access list number 4 specifies the prefix associated with the candidate rendezvous point address 1.1.1.1. This rendezvous point is responsible for the groups with the prefix 239.

```
Router#config
Router(config)#router pim
Router(config-pim-default-ipv4)#bsr candidate-rp 1.1.1.1 group-list 4 priority 192 interval 60
```

```
Router(config-pim-default-ipv4)#exit
Router(config)#ipv4 access-list 4
Router(config-ipv4-acl)#permit ipv4 any 239.0.0.0 0.255.255.255
Router(config-ipv4-acl)#commit
```

Running Configuration

```
Router#show run router pim
router pim
  address-family ipv4
    bsr candidate-bsr 1.1.1.1 hash-mask-len 30 priority 1
    bsr candidate-rp 1.1.1.1 group-list 4 priority 192 interval 60
```

Verification

```

Router#show pim rp mapping
PIM Group-to-RP Mappings
Group(s) 239.0.0.0/8
  RP 1.1.1.1 (?), v2
    Info source: 1.1.1.1 (?), elected via bsr, priority 192, holdtime 150
    Uptime: 00:02:50, expires: 00:01:54

Router#show pim bsr candidate-rp

Cand-RP      mode  scope priority uptime      group-list
1.1.1.1      BD    16     192      00:04:06    4

Router#show pim bsr election
PIM BSR Election State
Cand/Elect-State  Uptime  BS-Timer  BSR                                C-BSR
Elected/Accept-Pref 00:03:49 00:00:25 1.1.1.1 [1, 30]                   1.1.1.1 [1, 30]

```

PIM-Source Specific Multicast

When PIM is used in SSM mode, multicast routing is easier to manage. This is because RPs (rendezvous points) are not required and therefore, no shared trees (*,G) are built.

There is no specific IETF document defining PIM-SSM. However, RFC4607 defines the overall SSM behavior.

In the rest of this document, we use the term PIM-SSM to describe PIM behavior and configuration when SSM is used.

PIM in Source-Specific Multicast operation uses information found on source addresses for a multicast group provided by receivers and performs source filtering on traffic.

- By default, PIM-SSM operates in the 232.0.0.0/8 multicast group range for IPv4 and FF3x::/32 for IPv6. To configure these values, use the **ssm range** command.
- If SSM is deployed in a network already configured for PIM-SM, only the last-hop routers must be upgraded with Cisco IOS XR Software that supports the SSM feature.
- No MSDP SA messages within the SSM range are accepted, generated, or forwarded.
- SSM can be disabled using the **ssm disable** command.
- The **ssm allow-override** command allows SSM ranges to be overridden by more specific ranges.

In many multicast deployments where the source is known, protocol-independent multicast-source-specific multicast (PIM-SSM) mapping is the obvious multicast routing protocol choice to use because of its simplicity. Typical multicast deployments that benefit from PIM-SSM consist of entertainment-type solutions like the ETTH space, or financial deployments that completely rely on static forwarding.

In SSM, delivery of data grams is based on (S,G) channels. Traffic for one (S,G) channel consists of datagrams with an IP unicast source address S and the multicast group address G as the IP destination address. Systems receive traffic by becoming members of the (S,G) channel. Signaling is not required, but receivers must subscribe or unsubscribe to (S,G) channels to receive or not receive traffic from specific sources. Channel subscription signaling uses IGMP to include mode membership reports, which are supported only in Version 3 of IGMP (IGMPv3).

To run SSM with IGMPv3, SSM must be supported on the multicast router, the host where the application is running, and the application itself. Cisco IOS XR Software allows SSM configuration for an arbitrary subset of the IP multicast address range 224.0.0.0 through 239.255.255.255.

When an SSM range is defined, existing IP multicast receiver applications do not receive any traffic when they try to use addresses in the SSM range, unless the application is modified to use explicit (S,G) channel subscription.

Benefits of PIM-SSM over PIM-SM

PIM-SSM is derived from PIM-SM. However, whereas PIM-SM allows for the data transmission of all sources sending to a particular group in response to PIM join messages, the SSM feature forwards traffic to receivers only from those sources that the receivers have explicitly joined. Because PIM joins and prunes are sent directly towards the source sending traffic, an RP and shared trees are unnecessary and are disallowed. SSM is used to optimize bandwidth utilization and deny unwanted Internet broadcast traffic. The source is provided by interested receivers through IGMPv3 membership reports.

IGMPv2

To support IGMPv2, SSM mapping configuration must be added while configuring IGMP to match certain sources to group range.

Configuring Example

Configures the access-list (mcl):

```
Router#configure
Router(config)#ipv4 access-list mcl
Router(config-ipv4-acl)#permit ipv4 any 232.1.1.0 0.0.0.255
Router(config-ipv4-acl)#commit
```

Configures the multicast source (1.1.1.1) as part of a set of sources that map SSM groups described by the specified access-list (mcl):

```
Router#configure
Router(config)#router igmp
Router(config-igmp)#ssm map static 1.1.1.1 mcl
Router(config-igmp)#commit
```

Running Configuration

```
Router#show run router igmp
router igmp
ssm map static 1.1.1.1 mcl
```

Multipath Option

The multipath option is available under `router pim` configuration mode. After multipath option is enabled, SSM selects different path to reach same destination instead of choosing common path. The multipath option helps load balance the SSM traffic.

Configuring Multipath Option

```
Router#configure
Router(config)#router pim address-family ipv4
```

```
Router(config-pim-default-ipv4)#multipath hash source
Router(config-pim-default-ipv4)#commit
```

Running Configuration

```
Router#show running router pim
router pim
  address-family ipv4
    dr-priority 100
    multipath hash source /*SSM traffic takes different path to reach same destination
based on source hash value.*/
```

Verification

The Bundle-Ether132 and TenGigE0/11/0/1.132 are two paths to reach the destination router Turin-56. Since we have enabled multipath option, the source has two IP addresses 50.11.30.12 and 50.11.30.11. The Multicast traffic from two sources take two different paths Bundle-Ether132 and TenGigE0/11/0/1.132 to reach same destination.

This show run output shows that Bundle-Ether132 and TenGigE0/11/0/1.132 are connected to same destination router Turin-56:

```
Router#show run int TenGigE0/11/0/2.132
interface TenGigE0/1/11/2/3.132
  description Connected to Turin-56 ten0/11/0/1.132
  ipv4 address 13.0.2.1 255.255.255.240
  ipv6 address 2606::13:0:2:1/120
  encapsulation dot1q 132
!
```

```
Router#show run int bel32
interface Bundle-Ether132
  description Bundle between Fretta-56 and Turin-56
  ipv4 address 28.0.0.1 255.255.255.240
  ipv6 address 2606::28:0:0:1/120
  load-interval 30
```

```
Router#show mrib route 50.11.30.11 detail
```

```

Configuring PIM-SSM

Configuration Example

Configures SSM service for the IPv4 address range defined by access list 4.

```

Router#config
Router(config)#ipv4 access-list 4
Router(config-ipv4-acl)#permit ipv4 any 224.2.151.0 0.0.0.255
Router(config-ipv4-acl)#exit
Router(config)#multicast-routing
Router(config-mcast)#address-family ipv4
Router(config-mcast-default-ipv4)#ssm range 4
Router(config-mcast-default-ipv4)#commit
Router(config-mcast-default-ipv4)#end

```

Running Configuration

```

Router#show running multicast-routing
multicast-routing
address-family ipv4
ssm range 4
interface all enable
!

```

Verification

Verify if the SSM range is configured according to the set parameters:

```

Router#show access-lists 4
ipv4 access-list 4
 10 permit ipv4 any 224.2.151.0 0.0.0.255

*/Verify if the SSM is configured for 224.2.151.0/24/*:

Router#show pim group-map
IP PIM Group Mapping Table
(* indicates group mappings being used)
Group Range          Proto Client  Groups RP address      Info
224.0.1.39/32*      DM    perm     1     0.0.0.0
224.0.1.40/32*      DM    perm     1     0.0.0.0
224.0.0.0/24*       NO    perm     0     0.0.0.0
224.2.151.0/24*     SSM   config   0     0.0.0.0

```

Configuring PIM Parameters

To configure PIM-specific parameters, the router pim configuration mode is used. The default configuration prompt is for IPv4 and will be seen as config-pim-default-ipv4. To ensure the election of a router as PIM DR on a LAN segment, use the **dr-priority** command. The router with the highest DR priority will win the election. By default, at a preconfigured threshold, the last hop router can join the shortest path tree to receive multicast traffic. To change this behavior, use the command **spt-threshold infinity** under the router pim configuration mode. This will result in the last hop router permanently joining the shared tree. The frequency at which a router sends PIM hello messages to its neighbors can be configured by the hello-interval command. By default, PIM hello messages are sent once every 30 seconds. If the hello-interval is configured under router pim configuration mode, all the interfaces with PIM enabled will inherit this value. To change the hello interval on the interface, use the **hello-interval** command under interface configuration mode, as follows:

Configuration Example

```

Router#configure
Router(config)#router pim
Router(config-pim-default)#address-family ipv4
Router(config-pim-default-ipv4)#dr-priority 2
Router(config-pim-default-ipv4)#spt-threshold infinity
Router(config-pim-default-ipv4)#interface TenGigE0/11/0/1
Router(config-pim-ipv4-if)#dr-priority 4
Router(config-pim-ipv4-if)#hello-interval 45
Router(config-pim-ipv4-if)#commit

```

Running Configuration

```

Router#show run router pim
router pim
 address-family ipv4
  dr-priority 2
  spt-threshold infinity
  interface TenGigE0/11/0/1
  dr-priority 4
  hello-interval 45

```

Verification

Verify if the parameters are set according to the configured values:

```

Router#show pim interface te0/11/0/1
PIM interfaces in VRF default
Address                Interface                PIM  Nbr  Hello  DR    DR Count  Intvl

```

```
Prior
100.1.1.1          TenGigE0/11/0/1      on 1    45    4    this system
```

Multicast Source Discovery Protocol

Multicast Source Discovery Protocol (MSDP) is a mechanism to connect multiple PIM sparse-mode domains. MSDP allows multicast sources for a group to be known to all rendezvous points (RPs) in different domains. Each PIM-SM domain uses its own RPs and need not depend on RPs in other domains.

An RP in a PIM-SM domain has MSDP peering relationships with MSDP-enabled routers in other domains. Each peering relationship occurs over a TCP connection, which is maintained by the underlying routing system.

MSDP speakers exchange messages called Source Active (SA) messages. When an RP learns about a local active source, typically through a PIM register message, the MSDP process encapsulates the register in an SA message and forwards the information to its peers. The message contains the source and group information for the multicast flow, as well as any encapsulated data. If a neighboring RP has local joiners for the multicast group, the RP installs the S, G route, forwards the encapsulated data contained in the SA message, and sends PIM joins back towards the source. This process describes how a multicast path can be built between domains.

Note Although you should configure BGP or Multiprotocol BGP for optimal MSDP interdomain operation, this is not considered necessary in the Cisco IOS XR Software implementation. For information about how BGP or Multiprotocol BGP may be used with MSDP, see the MSDP RPF rules listed in the Multicast Source Discovery Protocol (MSDP), Internet Engineering Task Force (IETF) Internet draft.

Interconnecting PIM-SM Domains with MSDP

To set up an MSDP peering relationship with MSDP-enabled routers in another domain, you configure an MSDP peer to the local router.

If you do not want to have or cannot have a BGP peer in your domain, you could define a default MSDP peer from which to accept all Source-Active (SA) messages.

Finally, you can change the Originator ID when you configure a logical RP on multiple routers in an MSDP mesh group.

Before you begin

You must configure MSDP default peering, if the addresses of all MSDP peers are not known in BGP or multiprotocol BGP.

SUMMARY STEPS

1. **configure**
2. **interface** *type interface-path-id*
3. **ipv4 address** *address mask*
4. **exit**
5. **router msdp**
6. **default-peer** *ip-address [prefix-list list]*

7. **originator-id** *type interface-path-id*
8. **peer** *peer-address*
9. **connect-source** *type interface-path-id*
10. **mesh-group** *name*
11. **remote-as** *as-number*
12. **commit**
13. **show msdp [ipv4] globals**
14. **show msdp [ipv4] peer [peer-address]**
15. **show msdp [ipv4] rpf rpf-address**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	
Step 2	interface <i>type interface-path-id</i> Example: <pre>RP/0/RP0/CPU0:router(config)# interface loopback 0</pre>	(Optional) Enters interface configuration mode to define the IPv4 address for the interface. Note This step is required if you specify an interface type and number whose primary address becomes the source IP address for the TCP connection.
Step 3	ipv4 address <i>address mask</i> Example: <pre>RP/0/RP0/CPU0:router(config-if)# ipv4 address 10.0.1.3 255.255.255.0</pre>	(Optional) Defines the IPv4 address for the interface. Note This step is required only if you specify an interface type and number whose primary address becomes the source IP address for the TCP connection. See optional for information about configuring the connect-source command.
Step 4	exit Example: <pre>RP/0/RP0/CPU0:router(config-if)# end</pre>	Exits interface configuration mode.
Step 5	router msdp Example: <pre>RP/0/RP0/CPU0:router(config)# router msdp</pre>	Enters MSDP protocol configuration mode.
Step 6	default-peer <i>ip-address [prefix-list list]</i> Example: <pre>RP/0/RP0/CPU0:router(config-msdp)# default-peer 172.23.16.0</pre>	(Optional) Defines a default peer from which to accept all MSDP SA messages.

	Command or Action	Purpose
Step 7	originator-id <i>type interface-path-id</i> Example: <pre>RP/0/RP0/CPU0:router(config-msdp)# originator-id /1/1/0</pre>	(Optional) Allows an MSDP speaker that originates a (Source-Active) SA message to use the IP address of the interface as the RP address in the SA message.
Step 8	peer <i>peer-address</i> Example: <pre>RP/0/RP0/CPU0:router(config-msdp)# peer 172.31.1.2</pre>	Enters MSDP peer configuration mode and configures an MSDP peer. <ul style="list-style-type: none"> • Configure the router as a BGP neighbor. • If you are also BGP peering with this MSDP peer, use the same IP address for MSDP and BGP. You are not required to run BGP or multiprotocol BGP with the MSDP peer, as long as there is a BGP or multiprotocol BGP path between the MSDP peers.
Step 9	connect-source <i>type interface-path-id</i> Example: <pre>RP/0/RP0/CPU0:router(config-msdp-peer)# connect-source loopback 0</pre>	(Optional) Configures a source address used for an MSDP connection.
Step 10	mesh-group <i>name</i> Example: <pre>RP/0/RP0/CPU0:router(config-msdp-peer)# mesh-group internal</pre>	(Optional) Configures an MSDP peer to be a member of a mesh group.
Step 11	remote-as <i>as-number</i> Example: <pre>RP/0/RP0/CPU0:router(config-msdp-peer)# remote-as 250</pre>	(Optional) Configures the remote autonomous system number of this peer.
Step 12	commit	
Step 13	show msdp [ipv4] globals Example: <pre>RP/0/RP0/CPU0:router# show msdp globals</pre>	Displays the MSDP global variables.
Step 14	show msdp [ipv4] peer [peer-address] Example:	Displays information about the MSDP peer.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router# show msdp peer 172.31.1.2	
Step 15	show msdp [ipv4] rpf rpf-address Example: RP/0/RP0/CPU0:router# show msdp rpf 172.16.10.13	Displays the RPF lookup.

Controlling Source Information on MSDP Peer Routers

Your MSDP peer router can be customized to control source information that is originated, forwarded, received, cached, and encapsulated.

When originating Source-Active (SA) messages, you can control to whom you will originate source information, based on the source that is requesting information.

When forwarding SA messages you can do the following:

- Filter all source/group pairs
- Specify an extended access list to pass only certain source/group pairs
- Filter based on match criteria in a route map

When receiving SA messages you can do the following:

- Filter all incoming SA messages from an MSDP peer
- Specify an extended access list to pass certain source/group pairs
- Filter based on match criteria in a route map

In addition, you can use time to live (TTL) to control what data is encapsulated in the first SA message for every source. For example, you could limit internal traffic to a TTL of eight hops. If you want other groups to go to external locations, you send those packets with a TTL greater than eight hops.

By default, MSDP automatically sends SA messages to peers when a new member joins a group and wants to receive multicast traffic. You are no longer required to configure an SA request to a specified MSDP peer.

SUMMARY STEPS

1. **configure**
2. **router msdp**
3. **sa-filter {in | out} [list access-list-name] [rp-list access-list-name]**
4. **cache-sa-state [list access-list-name] [rp-list access-list-name]**
5. **ttl-threshold ttl-value**
6. **exit**
7. **ipv4 access-list name [sequence-number] permit source [source-wildcard]**
8. **commit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	
Step 2	router msdp Example: RP/0/RP0/CPU0:router(config)# router msdp	Enters MSDP protocol configuration mode.
Step 3	sa-filter {in out} [list access-list-name] [rp-list access-list-name] Example: RP/0/RP0/CPU0:router(config-msdp)# sa-filter out list 100	Configures an incoming or outgoing filter list for messages received from the specified MSDP peer. <ul style="list-style-type: none"> • If you specify both the list and rp-list keywords, all conditions must be true to pass any source, group (S, G) pairs in outgoing Source-Active (SA) messages. • You must configure the ipv4 access-list command in Step 7, on page 19. • If all match criteria are true, a permit from the route map passes routes through the filter. A deny filters routes.
Step 4	cache-sa-state [list access-list-name] [rp-list access-list-name] Example: RP/0/RP0/CPU0:router(config-msdp)# cache-sa-state list 100	Creates and caches source/group pairs from received Source-Active (SA) messages and controls pairs through access lists.
Step 5	ttl-threshold ttl-value Example: RP/0/RP0/CPU0:router(config-msdp)# ttl-threshold 8	(Optional) Limits which multicast data is sent in SA messages to an MSDP peer. <ul style="list-style-type: none"> • Only multicast packets with an IP header TTL greater than or equal to the <i>ttl-value</i> argument are sent to the MSDP peer specified by the IP address or name. • Use this command if you want to use TTL to examine your multicast data traffic. For example, you could limit internal traffic to a TTL of 8. If you want other groups to go to external locations, send those packets with a TTL greater than 8. • This example configures a TTL threshold of eight hops.
Step 6	exit Example:	Exits the current configuration mode.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router(config-msdp)# exit	
Step 7	<p>ipv4 access-list <i>name</i> [<i>sequence-number</i>] permit <i>source</i> [<i>source-wildcard</i>]</p> <p>Example:</p> <pre>RP/0/RP0/CPU0:router(config)# ipv4 access-list 100 20 permit 239.1.1.1 0.0.0.0</pre>	<p>Defines an IPv4 access list to be used by SA filtering.</p> <ul style="list-style-type: none"> • In this example, the access list 100 permits multicast group 239.1.1.1. • The ipv4 access-list command is required if the keyword list is configured for SA filtering in Step 3, on page 18.
Step 8	commit	

PIM-Sparse Mode

Typically, PIM in sparse mode (PIM-SM) operation is used in a multicast network when relatively few routers are involved in each multicast. Routers do not forward multicast packets for a group, unless there is an explicit request for traffic. Requests are accomplished using PIM join messages, which are sent hop by hop toward the root node of the tree. The root node of a tree in PIM-SM is the rendezvous point (RP) in the case of a shared tree or the first-hop router that is directly connected to the multicast source in the case of a shortest path tree (SPT). The RP keeps track of multicast groups, and the sources that send multicast packets are registered with the RP by the first-hop router of the source.

As a PIM join travels up the tree, routers along the path set up the multicast forwarding state so that the requested multicast traffic is forwarded back down the tree. When multicast traffic is no longer needed, a router sends a PIM prune message up the tree toward the root node to prune (or remove) the unnecessary traffic. As this PIM prune travels hop by hop up the tree, each router updates its forwarding state appropriately. Ultimately, the forwarding state associated with a multicast group or source is removed. Additionally, if prunes are not explicitly sent, the PIM state will timeout and be removed in the absence of any further join messages.

This image shows IGMP and PIM-SM operating in a multicast environment.

Figure 1: Shared Tree and Source Tree (Shortest Path Tree)

In PIM-SM, the rendezvous point (RP) is used to bridge sources sending data to a particular group with receivers sending joins for that group. In the initial set up of state, interested receivers receive data from senders to the group across a single data distribution tree rooted at the RP. This type of distribution tree is called a shared tree or rendezvous point tree (RPT) as illustrated in Figure 4: Shared Tree and Source Tree (Shortest Path Tree), above. Data from senders is delivered to the RP for distribution to group members joined to the shared tree.

Unless the command is configured, this initial state gives way as soon as traffic is received on the leaf routers (designated router closest to the host receivers). When the leaf router receives traffic from the RP on the RPT, the router initiates a switch to a data distribution tree rooted at the source sending traffic. This type of distribution tree is called a shortest path tree or source tree. By default, the Cisco IOS XR Software switches to a source tree when it receives the first data packet from a source.

The following process describes the move from shared tree to source tree in more detail:

1. Receiver joins a group; leaf Router C sends a join message toward RP.
2. RP puts link to Router C in its outgoing interface list.
3. Source sends data; Router A encapsulates data in Register and sends it to RP.
4. RP forwards data down the shared tree to Router C and sends a join message toward Source. At this point, data may arrive twice at the RP, once encapsulated and once natively.
5. When data arrives natively (unencapsulated) at RP, RP sends a register-stop message to Router A.
6. By default, receipt of the first data packet prompts Router C to send a join message toward Source.
7. When Router C receives data on (S,G), it sends a prune message for Source up the shared tree.
8. RP deletes the link to Router C from outgoing interface of (S,G). RP triggers a prune message toward Source.
9. Join and prune messages are sent for sources and RPs. They are sent hop by hop and are processed by each PIM router along the path to the source or RP. Register and register-stop messages are not sent hop

by hop. They are exchanged using direct unicast communication between the designated router that is directly connected to a source and the RP for the group.

Note The **spt-threshold infinity** command lets you configure the router so that it never switches to the shortest path tree (SPT).

The following are some of the known limitations of PIM-SM:

- Supports IPv4 addresses only.
- Supports native mcast profile (Static RP configuration and BSR) only.
- Starting from Release 7.5.1, supports MVPN Profile 14 (only static RP).

Multicast IRB

Multicast IRB provides the ability to route multicast packets between a bridge group and a routed interface using a bridge-group virtual interface (BVI). It can be enabled with multicast-routing. THE BVI is a virtual interface within the router that acts like a normal routed interface. For details about BVI, refer *Interface and Hardware Component Configuration Guide for Cisco NCS 560 Series Routers*

BV interfaces are added to the existing VRF routes and integrated with the replication slot mask. After this integration, the traffic coming from a VRF BVI is forwarded to the VPN.

Supported Bridge Port Types

- Bundles
- EFPs (physical, vlans, etc)

Restrictions

- Supported only on Ethernet line cards and enhanced ethernet line cards.
- Support only for IPv4

Example

The CE-PE is collapsed into 1 router (IRB) and IGMP snooping is enabled on the BVIs.

BVI type is included in a multicast VRF. After the BVI slot mask is included in the VRF route slot mask, the traffic from the VRF BVI is forwarded to the VPN/ core.

Designated Routers

Cisco routers use PIM to forward multicast traffic and follow an election process to select a designated router (DR) when there is more than one router on a LAN segment.

The designated router is responsible for sending PIM register and PIM join and prune messages toward the RP to inform it about host group membership.

If there are multiple PIM routers on a LAN, a designated router must be elected to avoid duplicating multicast traffic for connected hosts. The PIM router with the highest IP address becomes the DR for the LAN unless you choose to force the DR election by use of the **dr-priority** command. The DR priority option allows you to specify the DR priority of each router on the LAN segment (default priority = 1) so that the router with the highest priority is elected as the DR. If all routers on the LAN segment have the same priority, the highest IP address is again used as the tiebreaker.

Note DR election process is required only on multi access LANs. The last-hop router directly connected to the host is the DR.

The figure "Designated Router Election on a Multiaccess Segment", below illustrates what happens on a multi access segment. Router A (10.0.0.253) and Router B (10.0.0.251) are connected to a common multi access Ethernet segment with Host A (10.0.0.1) as an active receiver for Group A. As the Explicit Join model is used, only Router A, operating as the DR, sends joins to the RP to construct the shared tree for Group A. If Router B were also permitted to send (*,G) joins to the RP, parallel paths would be created and Host A would receive duplicate multicast traffic. When Host A begins to source multicast traffic to the group, the DR's responsibility is to send register messages to the RP. Again, if both routers were assigned the responsibility, the RP would receive duplicate multicast packets.

Figure 2: Designated Router Election on a Multiaccess Segment

If the DR fails, the PIM provides a way to detect the failure of Router A and to elect a failover DR. If the DR (Router A) were to become inoperable, Router B would detect this situation when its neighbor adjacency with

Router A timed out. Because Router B has been hearing IGMP membership reports from Host A, it already has IGMP state for Group A on this interface and immediately sends a join to the RP when it becomes the new DR. This step reestablishes traffic flow down a new branch of the shared tree using Router B. Additionally, if Host A were sourcing traffic, Router B would initiate a new register process immediately after receiving the next multicast packet from Host A. This action would trigger the RP to join the SPT to Host A, using a new branch through Router B.

Note Two PIM routers are neighbors if there is a direct connection between them. To display your PIM neighbors, use the `show pim neighbor` command in EXEC mode.

- They are not used for unicast routing but are used only by PIM to look up an IPv4 next hop to a PIM source.
- They are not published to the Forwarding Information Base (FIB).
- When multicast-intact is enabled on an IGP, all IPv4 destinations that were learned through link-state advertisements are published with a set equal-cost mcast-intact next-hops to the RIB. This attribute applies even when the native next-hops have no IGP shortcuts.
- In IS-IS, the max-paths limit is applied by counting both the native and mcast-intact next-hops together. (In OSPFv2, the behavior is slightly different.)

Configuration Example

Configures the router to use DR priority 4 for TenGigE interface 0/11/0/1, but other interfaces will inherit DR priority 2:

```
Router#configure
Router(config)#router pim
Router(config-pim-default)#address-family ipv4
Router(config-pim-default-ipv4)#dr-priority 2
Router(config-pim-default-ipv4)#interface TenGigE0/11/0/1
Router(config-pim-ipv4-if)#dr-priority 4
Router(config-ipv4-acl)#commit
```

Running Configuration

```
Router#show run router pim
router pim
address-family ipv4
dr-priority 2
spt-threshold infinity
interface TenGigE0/11/0/1
dr-priority 4
hello-interval 45
```

Verification

Verify if the parameters are set according to the configured values:

```
Router#show pim interface
PIM interfaces in VRF default
Address          Interface          PIM Nbr  Hello  DR    DR Count Intvl  Prior
100.1.1.1        TenGigE0/11/0/1  on   1      45    4     this system
```

Designated Router Election Using StickyDR

Table 1: Feature History Table

Feature Name	Release Information	Feature Description
Designated Router Election Using StickyDR	Release 7.4.1	<p>With this feature, the router sends a PIM <i>hello</i> message with a special PIM DR priority value on a multi-access LAN. The router with this special DR priority value is always elected as the designated router. The traffic now flows in the same path even when a new router is added.</p> <p>This feature introduces the sticky-dr command.</p>

When you enable PIM on an interface or reload a router, router periodically sends the PIM Hello messages on each interface. PIM Hello messages allow a router to learn neighboring PIM routers on each interface and elects a Designated Router (DR) based on the DR Priority. The DR election avoids duplicating multicast traffic for connected hosts.

Each time the DR is reelected, the multicast control tree sets up a new path and the multicast traffic flows in different direction.

With Sticky DR feature, the designated router remains the same and doesn't allow any other router to become the designated router. The multicast control tree does not set up a new path and the multicast traffic flows in same direction, thus avoids traffic loss. DR election isn't based on DR priority.

After you enable the sticky DR feature, the elected DR no longer advertises configured DR. Instead the router sends PIM Hello message with special PIM DR priority value which is reserved for Sticky PIM DR.

Restrictions

- The Sticky DR priority value is 4294967294. You must not configure DR priority with the value 4294967294 or any number greater than this value.

Topology

In this topology, PE1, PE2, PE3 are three PIM routers connected on a LAN. PE3 has the maximum priority and hence PE3 is elected as DR.

Now, when you configure PE1 with DR priority 1000, DR election process is re-initiated and PE1 becomes the new DR.

Every time a new DR is elected, the control tree computes a new path for traffic flow.

Now if you enable sticky DR on PE3, the PE3 remains the designated router irrespective of the DR priority of the PE devices.

In this example, the sticky DR is configured on PE3 and PE3 always remains as the DR.

Configuration

Let's configure sticky DR on PE3. To configure sticky DR on an interface, perform the following task:

```
Router# configure
Router(config)# router pim
Router(config-pim-default)# address-family ipv4
Router(config-pim-default-ipv4)# interface bundle-ether 72.1
Router(config-pim-ipv4-if)# sticky-dr
Router(config-ipv4-acl)# commit
```

Verification

The following output specifies that the Sticky DR is enabled on the interface and active:

```
Router# show pim interface bundle-ether 72.1 detail

PIM interfaces in VRF default
IP PIM Multicast Interface State
Flag: B - Bidir enabled, NB - Bidir disabled

Disable Sticky DR

To disable the sticky DR feature, perform the following task:

```

Router# configure
Router(config)# router pim
Router(config-pim-default)# address-family ipv4
Router(config-pim-default-ipv4)# interface bundle-ether 72.1
Router(config-pim-ipv4-if)# no sticky-dr
Router(config-ipv4-acl)# commit

```

To clear the DR stickiness and force the DR reelection, use the following command:

```

Router# clear pim interface bundle-ether 72.1 sticky-dr

```

Internet Group Management Protocol

Cisco IOS XR Software provides support for Internet Group Management Protocol (IGMP) over IPv4.

IGMP provides a means for hosts to indicate which multicast traffic they are interested in and for routers to control and limit the flow of multicast traffic throughout the network. Routers build state by means of IGMP messages; that is, router queries and host reports.

A set of routers and hosts that receive multicast data streams from the same source is called a multicast group. Hosts use IGMP messages to join and leave multicast groups.

Note IGMP messages use group addresses, which are Class D IP addresses. The high-order four bits of a Class D address are 1110. Host group addresses can be in the range 224.0.0.0 to 239.255.255.255. The address is guaranteed not to be assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

Restrictions

IGMP snooping under VPLS bridge domain is not supported.

Functioning of IGMP Routing

The following image "IGMP Signaling", illustrates two sources, 10.0.0.1 and 10.0.1.1, that are multicasting to group 239.1.1.1.

The receiver wants to receive traffic addressed to group 239.1.1.1 from source 10.0.0.1 but not from source 10.0.1.1.

The host must send an IGMPv3 message containing a list of sources and groups (S, G) that it wants to join and a list of sources and groups (S, G) that it wants to leave. Router C can now use this information to prune traffic from Source 10.0.1.1 so that only Source 10.0.0.1 traffic is being delivered to Router C.

Figure 3: IGMP Signaling

Configuring Maximum IGMP Per Interface Group Limit

The IGMP Per Interface States Limit sets a limit on creating OIF for the IGMP interface. When the set limit is reached, the group is not accounted against this interface but the group can exist in IGMP context for some other interface.

- If a user has configured a maximum of 20 groups and has reached the maximum number of groups, then no more groups can be created. If the user reduces the maximum number of groups to 10, the 20 joins will remain and a message of reaching the maximum is displayed. No more joins can be added until the number of groups has reached less than 10.
- If a user already has configured a maximum of 30 joins and add a max of 20, the configuration occurs displaying a message that the maximum has been reached. No state change occurs and also no more joins can occur until the threshold number of groups is brought down below the maximum number of groups.

Configuration Example

Configures all interfaces with 4000 maximum groups per interface except TenGigE interface 0/11/0/0, which is set to 3000:

```
Router#config
Router(config)#router igmp
Router(config-igmp)#maximum groups-per-interface 4000
Router(config-igmp)#interface TenGigE0/11/0/0
Router(config-igmp-default-if)#maximum groups-per-interface 3000
Router(config-igmp-default-if)#commit
```

Running Configuration

```
router igmp
 interface TenGigE0/11/0/0
   maximum groups-per-interface 3000
 !
 maximum groups-per-interface 4000
 !
```

Verification

```
Router#show igmp summary

SSM Static Source Mapping

Configure a source (1.1.1.1) as part of a set of sources that map SSM groups described by the specified access-list (4).

Configuration Example

```

Router#configure
Router(config)#ipv4 access-list 4
Router(config-ipv4-acl)#permit ipv4 any 229.1.1.0 0.0.0.255
Router(config-ipv4-acl)#exit
Router(config)# multicast-routing
Router(config-mcast)#address-family ipv4
Router(config-mcast-default-ipv4)#ssm range 4
Router(config-mcast-default-ipv4)#exit
Router(config-mcast)#exit
Router(config)#router igmp
Router(config-igmp)#ssm map static 1.1.1.1 4
*/Repeat the above step as many times as you have source addresses to include in the set
for SSM mapping/*
Router(config-igmp)#interface TenGigE0/11/0/3
Router(config-igmp-default-if)#static-group 229.1.1.1
Router(config-igmp-default-if)#commit

```

Running Configuration

```

Router#show run multicast-routing
multicast-routing
  address-family ipv4
    ssm range 4
  interface all enable
!
!
Router#show access-lists 4
ipv4 access-list 4
  10 permit ipv4 any 229.1.1.0 0.0.0.255

Router#show run router igmp
router igmp
  interface TenGigE0/11/0/3
  static-group 229.1.1.1
!
  ssm map static 1.1.1.1 4

```

Verification

Verify if the parameters are set according to the configured values:

IPv6 Multicast for Multiple Sources

Multicast Route Statistics

Multicast route statistic feature provides information about the multicast routes. The multicast statistics information includes the rate at which packets are received.

Before enabling multicast route statistics, you must configure an ACL to specify which of the IP route statistics to be captured.

Restrictions for Implementing Multicast Route Statistics Feature

These are the points that you should consider before implementing multicast route statistics feature:

- Multicast route statistics are available for <S,G> routes only. The statistics for <*,G> routes are not available.
- IPv6 multicast route statistics are not supported.
- Multicast route statistics for egress direction is not supported.
- Multicast route statistics for egress direction is supported only for phy intf, phy sub-intf, bundle intf, and bundle sub-intf. Rate is not supported for egress stats.
- When ACL is mapped with **hw-module router-stats** configuration, you can't modify the ACL. To modify ACLs that are mapped with router-stats, remove the existing **hw-module router-stats** configuration and update the ACL entries. Then, configure the **hw-module router-stats** again.

This feature supports only:

- L3 Multicast traffic.
- Default VRFs.

Configure Multicast Route Statistics

Table 2: Feature History Table

Feature Name	Release Information	Description
YANG Data Models for Multicast Interface Counters	Release 7.4.1	This feature introduces YANG data model support for multicast packets, in and out bytes per interface and sub-interface. With this feature, you can programmatically retrieve the operational details of multicast interfaces. You can access the data models from the Github repository.

Configuring multicast route statistics includes these main tasks:

- Configuring an ACL
- Enabling multicast route statistics for the configured ACLs

```
RP0/0/RP0/CPU0:router# configure

/* Configure an ACL matching the (S,G) routes for which statistics have to be captured:*/
RP0/0/RP0/CPU0:router(config)# ipv4 access-list mcast-counter
RP0/0/RP0/CPU0:router(config-acl)# 10 permit ipv4 host 10.1.1.2 host 224.2.151.1
RP0/0/RP0/CPU0:router(config-acl)# 30 permit ipv4 10.1.1.0/24 232.0.4.0/22
RP0/0/RP0/CPU0:router(config-acl)# 50 permit ipv4 192.168.0.0/24 232.0.4.0/22
RP0/0/RP0/CPU0:router(config-acl)#commit
RP0/0/RP0/CPU0:router(config-acl)#exit

/* Enable multicast route statistics for the configured ACL on the default VRF. */
RP0/0/RP0/CPU0:router(config)# hw-module route-stats l3mcast vrf default ipv4 egress
mcast-router
RP0/0/RP0/CPU0:router(config)# hw-module route-stats l3mcast vrf default ipv4 ingress
mcast-router
```

Note

- If you are enabling the route stats for a router on the global table, use **vrf default**. If you are enabling the route stats for specific vrf, use the **vrf vrfname** option.
- In case, you want to enable route stats for all tables, do not use the **vrf**.

For example:

```
RP0/0/RP0/CPU0:router(config)#hw-module route-stats l3mcast ipv4 mcast-counter
```

- If you configure **hw-module route-stats** on both vrf default and vpn routes for either IPv4 or IPv6 ACLs, then to switch vrf default to other VRF, remove the configuration of the existing **hw-module route-stats** and commit it, and then configure the hw-module stats with the required vrf and commit it.

Verification

Use the **show mfib route rate** command to verify if the multicast route information is captured for the traffic that matches the ACL:

Note The ingress stats are always per S, G.

```
RP0/0/RP0/CPU0:router# show mfib route rate
Thu Aug 16 18:04:47.312 PDT

IP Multicast Forwarding Rates
(Source Address, Group Address)
  Incoming rate:
    Node: (Incoming node) : pps/bps
  Outgoing rate:
    Node: (Outgoing node) : pps/bps

(10.1.1.2,232.0.0.1)
  Incoming rate :
    Node : 0/0/CPU0 : 4593 / 18153671
  Outgoing rate :
    Node : 0/0/CPU0 : 0 / 0
```

The above output shows that the multicast source **10.1.1.2** is sending packets to multicast group **232.0.0.1** and is received at **4593** pps.

For the information on the interface accounting stats, use the show interface accounting command. The following show command displays interface accounting stats for ingress:

```
Router# show int tenGigE 0/0/0/15 accounting
Mon Nov 12 10:26:20.592 UTC
TenGigE0/0/0/15
  Protocol          Pkts In      Chars In      Pkts Out      Chars Out
  IPV6_MULTICAST    22125711958  1814308380556 0              0
  IPV6_ND           0            0              1243          128960
```

Cisco IOS XR Release 7.4.1 and later support YANG data model for multicast interface counters.

- Cisco-IOS-XR-infra-statsd-oper:infra-statistics/interfaces/interface/protocols/protocol
- Cisco-IOS-XR-infra-statsd-oper:infra-statistics/interfaces/interface[interface-name=TenGigE0/0/0/18]/protocols/protocol

Note The YANG model does not support ingress and egress multicast route stats.

The following show command displays interface accounting stats for egress:

```
Router# show interfaces bundle-ether 100.1001 accounting rates
Mon Aug 26 15:56:41.738 IST
Bundle-Ether100.1001

          Ingress
Protocol  Bits/sec  Pkts/sec  Egress  Bits/sec  Pkts/sec
IPV4_MULTICAST  0         0         11455000  990
IPV6_MULTICAST  0         0         11455000  990
ARP        0         0         0         0
IPV6_ND     0         0         0         0
```

Bundle Member Selection

Table 3: Feature History Table

Feature Name	Release Information	Feature Description
Bundle Member Selection	Release 7.3.1	<p>This feature enables selecting a bundle member in the control plane to steer the L2 and L3 multicast traffic traversing over bundle at the egress NP.</p> <p>This feature helps optimize fabric bandwidth as the member selection is performed in the control plane.</p>

This feature enables selecting a bundle member in the control plane to steer the L2 and L3 multicast traffic traversing over bundle at the egress NP.

This feature brings following benefits:

- Optimizes fabric bandwidth as the member selection is performed in the control plane
- Reduces NP bandwidth and processing as number of OLE replications are less
- Supports bundle member change in MVPN head node with local receiver

Multicast Over IPV4 Unicast GRE Tunnels

Table 4: Feature History Table

Feature Name	Release Information	Feature Description
Support for Multicast Over IPV4 Unicast GRE Tunnels	Release 7.4.1	This feature allows encapsulation of multicast packets using GRE tunnels, thereby enabling transport of multicast packets securely between source and destination routers located in different IP clouds.

Use IPV4 unicast GRE tunnels to transport multicast traffic securely over the network.

Generic Routing Encapsulation (GRE) is a tunneling protocol that encapsulates and transport packets of one protocol over another protocol.

If you want to send multicast packets from a source to destination router configured with a different routing protocol, you can encapsulate the packets using GRE unicast tunnels. The encapsulated packets are forwarded like any other IPv4 unicast packet to the destination endpoint of the tunnel. The destination router then de-encapsulates the packet to retrieve the multicast packets.

For more information [Configuring GRE Tunnels](#).

Restriction

- Only SSM V4 and V6 address family traffic is supported.
- Supports up to 500 GRE tunnels
- Only up to 16 unique source IP addresses are supported for the tunnel source
- Multicast over GRE tunnel is supported only with 2-pass GRE tunnel configuration.
- Configurable MTU is not supported on Single-pass GRE interface, but supported on 2-pass GRE interface.
- This is a native Multicast over GRE feature and not Multicast VPN (mVPN) Profile 0 or Rosen GRE.

Configuration

In this topology, the multicast source (198.10.1.2) is connected to R4. The multicast receivers are connected to R5 and is configured to receive multicast packets. Separating the source (R4) and receiver (R5) is an IP cloud, which is not configured for multicast routing.

Multicast packets are encapsulated with GRE headers and transported via GRE tunnel (tunnel-ip14).

Configuration Example

```
R4
interface TenGigE0/0/0/32.1
  ipv4 address 198.10.1.1 255.255.255.0

Verification

In this example, Router R4 receives joins for group 232.1.0.0 from source 198.10.1.2 connected to R4. PIM joins are traversed from R5 to R4, as shown in the **show PIM topology** command output. The joins are learnt on Router R4 via tunnel-ip, as it acts as the transport layer.

```
RP/0/RP0/CPU0:R4# show pim topology 232.1.0.0 198.10.1.2
```

```
IP PIM Multicast Topology Table

Use Case: Video Streaming

In today's broadcast video networks, proprietary transport systems are used to deliver entire channel line-ups to each video branch office. IP based transport network would be a cost efficient/convenient alternative to deliver video services combined with the delivery of other IP based services. (Internet delivery or business services)

By its very nature, broadcast video is a service well-suited to using IP multicast as a more efficient delivery mechanism to reach end customers.

The IP multicast delivery of broadcast video is explained as follows:

1. Encoding devices in digital primary headends, encode one or more video channels into a Moving Pictures Expert Group (MPEG) stream which is carried in the network via IP multicast.
2. Devices at video branch office are configured by the operator to request the desired multicast content via IGMP joins.
3. The network, using PIM-SSM as its multicast routing protocol, routes the multicast stream from the digital primary headend to edge device receivers located in the video branch office. These edge devices could be edge QAM devices which modulate the MPEG stream for an RF frequency, or CMTS for DOCSIS.

Figure 4: Video Streaming

Multicast Label Distribution Protocol (MLDP) for Core

Multicast Label Distribution Protocol (MLDP) provides extensions to the Label Distribution Protocol (LDP) for the setup of point-to-multipoint (P2MP) and multipoint-to-multipoint (MP2MP) Label Switched Paths (LSPs) in Multiprotocol Label Switching (MPLS) networks.

MLDP eliminates the use of native multicast PIM to transport multicast packets across the core. In MLDP multicast traffic is label switched across the core. This saves a lot of control plane processing effort.

Characteristics of MLDP Profiles on Core

The following MLDP profiles are supported when the router is configured as a core router:

- Profile 5—Partitioned MDT - MLDP P2MP - BGP-AD - PIM C-mcast Signaling
- Profile 6—VRF MLDP - In-band Signaling
- Profile 7—Global MLDP In-band Signaling
- Profile 12—Default MDT - MLDP - P2MP - BGP-AD - BGP C-mcast Signaling
- Profile 14—Partitioned MDT - MLDP P2MP - BGP-AD - BGP C-mcast Signaling
- Profile 17—Default MDT - MLDP - P2MP - BGP-AD - PIM C-mcast Signaling

Point-to-Multipoint Profiles on Core and Edge Routers

The following profiles are supported when the router is configured as a core router and edge router for p2mp:

- Profile 8—Global P2MP-TE
- Profile 10—VRF Static-P2MP-TE with BGP AD

Overriding VRFs in IGMP Interfaces

Table 5: Feature History Table

Feature Name	Release Information	Feature Description
Support for IGMP VRF Override in Multicast Routers	Release 7.5.1	<p>Using this feature, you can configure a multicast router interface to override the configuration specified in the local VRF table. When an IGMP client sends a join message to the multicast router, it performs a Reverse-path Forwarding (RPF) lookup for the IGMP join in the local VRF table. If the local VRF table does not have the information, the feature extends the lookup to the default (global) VRF table.</p> <p>This ensures that the interface in a specific VRF table is part of the outgoing list of interfaces in the global routing table for a multicast route.</p>

All unicast traffic on the user-to-network interfaces of next-generation aggregation or core networks must be mapped to a specific VRF. They must then be mapped to an MPLS VPN on the network-to-network side. This requires the configuration of a physical interface in this specific VRF.

This feature allows mapping of IGMP packets entering through a user-to-user interface to the multicast routes in the global multicast routing table. This ensures that the interface in a specific VRF can be part of the outgoing list of interfaces in the table for a multicast route.

IGMP packets entering through a non-default VRF interface in the default (global) VRF are processed, with IGMP later distributing the interface-related multicast state (route/interface) to MRIB. This occurs through the default VRF rather than through the VRF to which the interface belongs. MRIB, PIM, MSDP, and MFIB then process the multicast state for this interface through the default VRF.

When an IGMP join for a specific (S, G) is received on the configured interface, IGMP stores this information in its VRF-specific databases. But, when sending an update to MRIB, IGMP sends this route through the default VRF. MRIB then programs this (S, G) along with this interface as an OLIST member in the default multicast routing table.

Similarly, when PIM requests information about IGMP routes from MRIB, MRIB sends this update to PIM in the context of the default VRF.

This feature specifically supports:

- Mapping of IGMP requests on an interface in a non-default VRF to the default VRF multicast routing table.
- Enabling and disabling of VRF override functionality at run time.
- Routing policy configuration at the global (default) VRF level, because routing policy configuration cannot be done at the granularity of an individual interface.
- Enablement and disablement of an IGMP VRF override on all Layer- 3 and Layer- 2 interface types, including physical Ethernet, VLAN sub-interface, bundles and VLANs over bundles.
- The same scale of multicast routes and OLIST interfaces currently supported by the platform even when VRF override functionality is operational.

Configuring IGMP VRF Override

This process consists of the following tasks:

Specifying VRF definition

SUMMARY STEPS

1. **configure**
2. **vrf *vrf-name***
3. **address-family ipv4 unicast**
4. **import route-target 1:1**
5. **export route-target 1:1**
6. **commit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	
Step 2	vrf <i>vrf-name</i> Example: RP/0/RP0/CPU0:router(config)# vrf name1	Enters the VRF configuration sub mode.
Step 3	address-family ipv4 unicast Example: RP/0/RP0/CPU0:router(config-vrf)# address-family	AFI configuration for IPv4. This is supported on unicast topologies only.

	Command or Action	Purpose
	<code>ipv4 unicast</code>	
Step 4	import route-target 1:1 Example: <pre>RP/0/RP0/CPU0:router(config-vrf-af)# import route-target 1:1</pre>	Enables VRF import.
Step 5	export route-target 1:1 Example: <pre>RP/0/RP0/CPU0:router(config-vrf-af)# export route-target 1:1</pre>	Enables VRF export.
Step 6	commit	

Enabling Multicast Routing on default and non-default VRFs

This task enables multicast routing and forwarding on all new and existing interfaces. For the VRF override feature, multicast routing needs to be enabled on both, the default and the non-default VRFs.

SUMMARY STEPS

1. **configure**
2. **multicast-routing vrf** [*vrf-name* / *default*]
3. **interface** {*type interface-path-id* | **all**} **enable**
4. **commit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	
Step 2	multicast-routing vrf [<i>vrf-name</i> / <i>default</i>] Example: <pre>RP/0/RP0/CPU0:router(config)# multicast-routing vrf green</pre>	Enters multicast configuration mode for the specified VRF. Note that the default configuration mode for multicast routing is default vrf (if the non-default VRF name is not specified).
Step 3	interface { <i>type interface-path-id</i> all } enable Example: <pre>RP/0/RP0/CPU0:router(config-mcast-green)# interface all enable</pre>	Enables multicast routing and forwarding on one or on all new and existing interfaces.

	Command or Action	Purpose
Step 4	commit	

Configuring an Interface for a Non-default VRF Instance

SUMMARY STEPS

1. **configure**
2. **interface** *type interface-path-id*
3. **vrf** *vrf-name*
4. **ipv4 address** *address mask*
5. **commit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	
Step 2	interface <i>type interface-path-id</i> Example: RP/0/RP0/CPU0:router(config)# interface tengige 0/1/0/0	Enters PIM address-family IPv4 submode.
Step 3	vrf <i>vrf-name</i> Example: RP/0/RP0/CPU0:router(config-if)# vrf name1	Sets the VRF for the interface.
Step 4	ipv4 address <i>address mask</i> Example: RP/0/RP0/CPU0:router(config-if)# ipv4 address 10.1.1.1 255.0.0.0	Sets the IPv4 address for the interface.
Step 5	commit	

Configuring route-policy

SUMMARY STEPS

1. **configure**
2. **route-policy** *policy-name*
3. **set rpf-topology vrf default**

4. **end-policy**
5. **commit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	
Step 2	route-policy <i>policy-name</i> Example: RP/0/RP0/CPU0:router(config)# route-policy policy1	Defines a route policy.
Step 3	set rpf-topology vrf default Example: RP/0/RP0/CPU0:router(config-rpl)# set rpf-topology vrf default	Sets the PIM RPF topology attributes for the default VRF.
Step 4	end-policy Example: RP/0/RP0/CPU0:router(config-rpl)# end-policy	Ends the route-policy definition configuration.
Step 5	commit	

Associating a route policy to PIM configuration for the VRF receiving IGMP reports

SUMMARY STEPS

1. **configure**
2. **router pim vrf** *vrf-name* **address-family ipv4**
3. **rpf-topology route-policy** *policy-name*
4. **commit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	
Step 2	router pim vrf <i>vrf-name</i> address-family ipv4	Enters PIM address-family IPv4 submode.
Step 3	rpf-topology route-policy <i>policy-name</i> Example:	Associates a previously defined route-policy with the non-default VRF that receives the IGMP reports.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router(config-rpl)# rpf-topology route-policy policy1	
Step 4	commit	

Configure MVPN using Draft-Rosen (Profile 0)

Table 6: Feature History Table

Feature Name	Release Information	Feature Description
Draft-Rosen Multicast VPN (Profile 0)	Release 7.4.1	Draft-Rosen (profile 0) is a widely used MVPN model and uses GRE tunnels to securely transmit multicast traffic between the PE routers. It also enables ease of deployment by using the Protocol-Independent Multicast (PIM) protocol between edge routers (PE) and hosts (CE), and between PE routers that are running in VRF mode.

Draft-Rosen Multicast VPN (Profile 0) uses Generic Routing Encapsulation (GRE) as an overlay protocol. All multicast packets are encapsulated inside GRE. Profile 0 has PIM as the multicast routing protocol between the edge routers (PE) and hosts (CE), and between the PE routers in the VRF mode. The PE routers directly connect using a Default Multicast Distribution Tree (MDT) formed between the PE routers. The PE routers connect to each other as PIM neighbors across the Default MDT.

Benefits

- Profile 0 is a widely used model and fairly easy to deploy as Profile 0 uses the native multicast in the core and does not require any additional configuration on customers routers and in the core.

Restriction

- PIM SM is not supported in core and under VRF. Only PIM SSM is supported.
- BVI is not supported in the core.
- IPv6 routes in the VRF are not supported.
- Auto-RP is not supported.
- If there is an IPv4 Unicast GRE tunnel configured in your network, the Maximum Transmission Unit (MTU) size of the configured Unicast GRE tunnel impacts the MTU of the Profile-0 MDT multicast. Ensure that the Profile-0 MDT multicast packet size does not exceed the MTU value of the IPv4 unicast GRE tunnel. If the multicast packet size value exceeds the MTU value of the tunnel, then the packet is dropped.

Configuration Example

Perform the following steps to configure Profile 0 on the PE devices:

```

Router# configure
Router(config)# route-policy rosen-gre
Router(config-rpl)# set core-tree pim-default
Router(config-rpl)# end-policy

Router(config)# multicast-routing
Router(config-mcast)# vrf vpn101
Router(config-mcast-vpn101)# address-family ipv4
Router(config-mcast-vpn101-ipv4)# mdt source Loopback0
Router(config-mcast-vpn101-ipv4)# mdt default ipv4 232.100.0.1
Router(config-mcast-vpn101-ipv4)# mdt data 232.101.0.1/24
Router(config-mcast-vpn101-ipv4)# interface all enable

Router(config)# router pim
Router(config-pim)# address-family ipv4
Router(config-pim-default-ipv4)# vrf vpn101
Router(config-pim-vpn101)# address-family ipv4
Router(config-pim-vpn101-ipv4)# rpf topology route-policy rosen-gre
Router(config-pim-vpn101-ipv4)# exit
Router(config-pim-vpn101-ipv4)# commit

```

Label Switched Multicast (LSM) Multicast Label Distribution Protocol (mLDP) based Multicast VPN (mVPN) Support

Label Switch Multicast (LSM) is MPLS technology extensions to support multicast using label encapsulation. Next-generation MVPN is based on Multicast Label Distribution Protocol (mLDP), which can be used to build P2MP and MP2MP LSPs through a MPLS network. These LSPs can be used for transporting both IPv4 and IPv6 multicast packets, either in the global table or VPN context.

When router is positioned as the core router running mLDP, it only supports the Profiles 5, 6, 7, 12, 14, and 17 irrespective of the profiles supported on the edge router.

When router is positioned as the edge router running mLDP, it only supports the Profiles 6 and 7.

Note IPv6 is not supported for profile 10. Also IPv4 SM is not supported for mLDP profiles on an edge router.

For more information about the characteristics of each of the mLDP Profiles,

Benefits of LSM MLDP based MVPN

LSM provides these benefits when compared to GRE core tunnels that are currently used to transport customer traffic in the core:

- It leverages the MPLS infrastructure for transporting IP multicast packets, providing a common data plane for unicast and multicast.
- It applies the benefits of MPLS to IP multicast such as Fast ReRoute (FRR) and
- It eliminates the complexity associated PIM.

Configuring MLDP MVPN

The MLDP MVPN configuration enables IPv4 multicast packet delivery using MPLS. This configuration uses MPLS labels to construct default and data Multicast Distribution Trees (MDTs). The MPLS replication is used as a forwarding mechanism in the core network. For MLDP MVPN configuration to work, ensure that the global MPLS MLDP configuration is enabled. To configure MVPN extranet support, configure the source multicast VPN Routing and Forwarding (mVRF) on the receiver Provider Edge (PE) router or configure the receiver mVRF on the source PE. MLDP MVPN is supported for both intranet and extranet.

Note When a Cisco NCS560 Series Router is positioned as terminal node, it drops the IPv6 traffic that it receives from Cisco ASR 9000 Series Router which is acting as a head node since EXP NULL label is sent at the Bottom of stack (BOS) over MLDP tunnel for IPV6 traffic.

Figure 5: MLDP based MPLS Network

Packet Flow in mLDP-based Multicast VPN

For each packet coming in, MPLS creates multiple out-labels. Packets from the source network are replicated along the path to the receiver network. The CE1 router sends out the native IP multicast traffic. The Provider Edge1 (PE1) router imposes a label on the incoming multicast packet and replicates the labeled packet towards the MPLS core network. When the packet reaches the core router (P), the packet is replicated with the appropriate labels for the MP2MP default MDT or the P2MP data MDT and transported to all the egress PEs. Once the packet reaches the egress PE, the label is removed and the IP multicast packet is replicated onto the VRF interface.

Realizing a mLDP-based Multicast VPN

There are different ways a Label Switched Path (LSP) built by mLDP can be used depending on the requirement and nature of application such as:

- P2MP LSPs for global table transit Multicast using in-band signaling.
- P2MP/MP2MP LSPs for MVPN based on MI-PMSI or Multidirectional Inclusive Provider Multicast Service Instance (Rosen Draft).
- P2MP/MP2MP LSPs for MVPN based on MS-PMSI or Multidirectional Selective Provider Multicast Service Instance (Partitioned E-LAN).

The router performs the following important functions for the implementation of MLDP:

1. Encapsulating VRF multicast IP packet with Label and replicating to core interfaces (imposition node).
2. Replicating multicast label packets to different interfaces with different labels (Mid node).
3. Decapsulate and replicate label packets into VRF interfaces (Disposition node).

Multicast MLDP for Edge Router

The following MLDP and P2MP-TE profiles are supported when the router is configured as an edge router:

- Profile 6—VRF MLDP - In-Band Signaling
- Profile 7—Global MLDP In-band Signaling
- Profile 8—Global Static - P2MP-TE
- Profile 10—VRF Static - P2MP TE - BGP-AD
- Profile 14—MLDP Partitioned MDT P2MP with BGP AD and BGP-C Multicast Signaling

Multicast MLDP Profile 14 support on an Edge Router

Table 7: Feature History Table

Feature Name	Release Information	Feature Description
MLDP Profile 14 support on an Edge Router	Release 7.3.1	This feature is now supported on Cisco NCS 560 routers.

The MLDP Profile 14 is supported when the router is configured as an edge router.

IP based transport network is a cost efficient and convenient alternative to deliver video services combined with the delivery of other IP based services. To deliver IPTV content MLDP Profile 14 also called as the partitioned MDT, is supported when a router is configured as an edge router.

These are the characteristics of the profile 14:

- Customer traffic is SSM.
- Inter-AS Option A, B and C is supported.
- All PEs must have a unique BGP Route Distinguisher (RD) value.

Configuration Example for mLDP Profile 14 on Edge Routers

Flexible Algorithm for MLDP

Table 8: Feature History Table

Feature Name	Release Information	Feature Description
Flexible Algorithm for Multicast VPN profiles	Release 7.5.2	Flexible Algorithm is now available for the following profiles: <ul style="list-style-type: none"> • Profile 12: Default MDT - MLDP - P2MP - BGP-AD - BGP C-Mcast Signaling • Profile 14: Partitioned MDT - MLDP P2MP - BGP-AD - BGP C-Mcast Signaling

Feature Name	Release Information	Feature Description
Flexible Algorithm for MLDP	Release 7.5.1	This feature gives you the flexibility to customize the metrics that IGP uses to route traffic for MLDP tunnels. With this feature, your router can generate two multicast streams for the same feed, thus ensuring low latency and high availability of multicast traffic. This feature introduces the keyword.

IGP determines the shortest path to send traffic through MLDP tunnels. However, at times, you may require to choose a path other than the shortest one. For instance, when you want to achieve low latency or want to send the traffic on a specific path to avoid a set of links or build totally two or more disjoint paths.

Multipoint LDP (mLDP) flexible algorithm allows you to customize the IGP path computation based on the business needs.

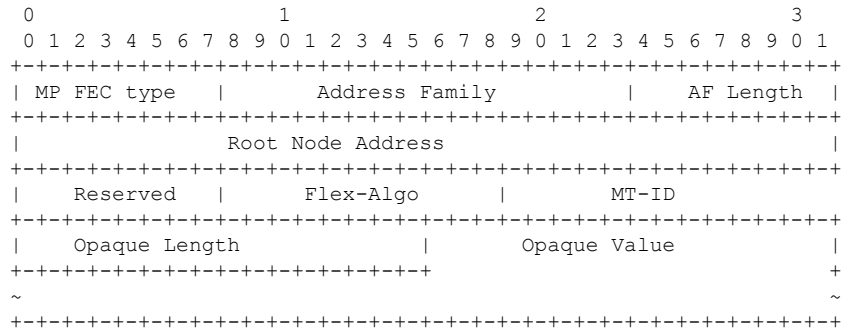

With this feature, you can get disjoint paths for two multicast streams. Each stream carries traffic within a separate network and helps reduce a connection loss or delay ensuring low latency and high availability of multicast traffic. This feature allows you to segregate multicast traffic to specific regions.

mLDP flexible algorithm is based on Segment Routing flexible algorithm that allows operators to customize IGP shortest path computation according to their own needs. For more information, see [Enabling Segment Routing Flexible Algorithm](#).

To compute two different paths, the mLDP flexible algorithm uses a 2-tuple hash algorithm, which includes MPLS Multi-Topology Identifier (MT-ID) and IGP algorithm.

MPLS multi topology Identifier (MT-ID) is a unique identifier that is used to associate an LSP with multi topology. This identifier is part of the mLDP FEC encoding so that LDP peers are able to set up an MP LSP through their own defined policy and avoid conflicting policies for the same mLDP FEC. The MT-ID and IGP Algorithm must be part of the FEC so that different values result in unique MP-LSP FEC elements.

mLDP flexible algorithm is stored in IGP Algorithm (IPA) Registry field. A 16-bit reserved field is included and out of which 8 bits are used for flexible algorithm. The root is an IP address identifying the Root of an MLDP-P2MP tree. Only IPv4 address is supported.

For example, two flexible algorithms are required to implement a disjoint-paths scenario.

Leafs belonging to the first plane are associated with flexible algorithm 130 and leafs belonging another plane are associated with flexible algorithm 128.

Restrictions

The following features are not supported with flexible algorithm:

- PIM BiDir in the core
- Carrier supporting carrier (CSC)
- Inter-AS
- Extranet
- Default MDT
- MVPN profiles except profile-14

How to configure mLDP Flexible Algorithm?

Configure partitioned MDT with flexible algorithm MVPN profile:

```
Router #configure
Router(config)# multicast-routing
Router(config-mcast)# vrf red
Router(config-mcast-red)# address-family ipv4
Router(config-mcast-red-ipv4)# mdt partitioned mldp ipv4 p2mp flex-algo 128
```

Configure data MDT with flexible algorithm:

```
Router# configure
Router(config)# multicast-routing
Router(config-mcast)# vrf red
Router(config-mcast-red)# address-family ipv4
Router(config-mcast-red-ipv4)# mdt data mldp 10 flex-algo 130
```

Configure route policy for Data MDT with flexible algorithm:

```
Router # configure
Router(config)# multicast-routing vrf red address-family ipv4
Router(config-mcast-red-ipv4)# mdt data mldp 10 route-policy rpl-for-red flex-algo 130
```

Note We recommend having 1:1 allocation of Data MDTs with number of flows. However, you can configure less Data MDTs than the number of flows. But you may not see the expected results. You cannot modify the flexible algorithm configuration without removing the MDT configuration. You must reconfigure MDT with the new flexible algorithm. Other combinations like no flexible algorithm to flexible algorithm are not supported.

Configuration Example

The route-policy and flexible algorithm are configured on Data MDT CLI.

In this example,

- Multicast groups 232.1.1.1 and 232.1.1.2 match the route policy it uses the Data MDT created with flexible algorithm 128.
- Multicast groups 232.1.1.3 and 232.1.1.4 also match the route-policy it uses the Data MDT created with flexible algorithm 129.

All other groups do not match the route-policy so it uses the Data MDT created with flexible algorithm 130 which is configured in Data MDT CLI.

```
route-policy c1-data-mdt
  if destination in (232.1.1.1, 232.1.1.2) then
    set flex-algo 128
  elseif destination in (232.1.1.3, 232.1.1.4) then
    set flex-algo 129
  endif
end-policy
!
multicast-routing
  vrf red
    address-family ipv4
      mdt partitioned mldp ipv4 p2mp flex-algo 131
      mdt data mldp 100 route-policy c1-data-mdt flex-algo 130
    !
  !
!
```

In the following example, route-policy is configured on Data MDT CLI but without flexible algorithm.

```
route-policy c1-data-mdt
  if destination in (232.1.1.1, 232.1.1.2) then
    set flex-algo 128
  elseif destination in (232.1.1.3, 232.1.1.4) then
    set flex-algo 129
  endif
end-policy
!
multicast-routing
  vrf red
    address-family ipv4
      mdt partitioned mldp ipv4 p2mp flex-algo 131
      mdt data mldp 100 route-policy c1-data-mdt
    !
  !
!
```

Flexible algorithm is configured on Data MDT CLI and all groups uses the Data MDT created with flexible algorithm 130.

```
multicast-routing
  vrf red
    address-family ipv4
      mdt partitioned mldp ipv4 p2mp flex-algo 131
      mdt data mldp 100 flex-algo 130
```

In the following example, flexible algorithms are configured in Partitioned MDT. All groups use the Data MDT created with Flexible Algorithm 131 which is configured in Partitioned MDT CLI.

```
multicast-routing
  vrf red
    address-family ipv4
```

```

mdt partitioned mldp ipv4 p2mp flex-algo 131
mdt data mldp 100

```

Verification

```
Router# show mvpn vrf red context private
```

```
MVPN context information for VRF red (0xa99dbf8)
```

```

P2MP-TE and MLDP Scale Number

The following table lists the scaling numbers for MLDP and P2MP-TE:

Feature	Scale
OLE Scale (Egress replication) per P2MP tree	250 (with packet size of 128)
Number of P2MP Trees	100
Maximum (S,G) flows	00 (S,G) flows distributed among max 100 VRFs
Maximum OLE scale per system	64 * 250 = 16000
VLAN interfaces in Egress	400
Number of Active ISIS interfaces	400
Number of ISIS Peers	400
Number of iBGP v4 Peers	400
Number of iBGP v6 Peers	400

Configure VRF MLDP In-Band Signaling on Edge Routers

To configure VRF MLDP in-band signaling (Profile 6) on edge routers, you must complete the following tasks:

1. Assign a route policy in PIM to select a reverse-path forwarding (RPF) topology.
2. Configure route policy to set the Multicast Distribution Tree (MDT) type to MLDP inband.
3. Enable MLDP-inband signaling in multicast routing.
4. Enable MPLS for MLDP.

Configuration

/ Assign a route policy in PIM to select a reverse-path forwarding (RPF) topology */*

```
RP/0/RP0/CPU0:router(config)#router pim
RP/0/RP0/CPU0:router(config-pim)#vrf one
RP/0/RP0/CPU0:router(config-pim-one)#address-family ipv4
RP/0/RP0/CPU0:router(config-pim-one-ipv4)#rpf topology route-policy rpf-vrf-one
```

/ Configure route policy to set the MDT type to MLDP inband */*

```
RP/0/RP0/CPU0:router(config)#route-policy rpf-vrf-one
RP/0/RP0/CPU0:router(config-rpl)#set core-tree mldp-inband
RP/0/RP0/CPU0:router(config-rpl)#end-policy
```

/ Enable MLDP-inband signaling in multicast routing */*

```
RP/0/RP0/CPU0:router(config)#multicast-routing
RP/0/RP0/CPU0:router(config-mcast)#vrf one
```

```
RP/0/RP0/CPU0:router(config-mcast-one)#address-family ipv4
RP/0/RP0/CPU0:router(config-mcast-one-ipv4)#mdt source loopback 0
RP/0/RP0/CPU0:router(config-mcast-one-ipv4)#mdt mldp in-band-signaling ipv4
RP/0/RP0/CPU0:router(config-mcast-one-ipv4)#interface all enable

/* Enable MPLS MLDP */

RP/0/RP0/CPU0:router(config)#mpls ldp
RP/0/RP0/CPU0:router(config-ldp)#mldp
```

Configure Global MLDP In-band Signaling on Edge Routers

To configure global MLDP in-band signaling (Profile 7) on edge routers, you must complete the following tasks:

1. Assign a route policy in PIM to select a reverse-path forwarding (RPF) topology.
2. Configure route policy to set the MDT type to MLDP Inband.
3. Enable MLDP inband signaling in multicast routing.
4. Enable MPLS MLDP.

Configuration

```
/* Assign a route policy in PIM to select a reverse-path forwarding (RPF) topology */

RP/0/RP0/CPU0:router(config)#router pim
RP/0/RP0/CPU0:router(config-pim)#address-family ipv4
RP/0/RP0/CPU0:router(config-pim-default-ipv4)#rpf topology route-policy rpf-global
RP/0/RP0/CPU0:router(config-pim-default-ipv4)#interface TenGigE 0/11/0/1
RP/0/RP0/CPU0:router(config-pim-ipv4-if)#enable

/* Configure route policy to set the MDT type to MLDP inband */

RP/0/RP0/CPU0:router(config)#route-policy rpf-global
RP/0/RP0/CPU0:router(config-rpl)#set core-tree mldp-inband
RP/0/RP0/CPU0:router(config-rpl)#end-policy

/* Enable MLDP-inband signaling in multicast routing */

RP/0/RP0/CPU0:router(config)#multicast-routing
RP/0/RP0/CPU0:router(config-mcast)#address-family ipv4
RP/0/RP0/CPU0:router(config-mcast-default-ipv4)#interface loopback 0
RP/0/RP0/CPU0:router(config-mcast-default-ipv4-if)#enable
RP/0/RP0/CPU0:router(config-mcast-default-ipv4-if)#exit
RP/0/RP0/CPU0:router(config-mcast-default-ipv4)#mdt source loopback 0
RP/0/RP0/CPU0:router(config-mcast-default-ipv4)#mdt mldp in-band-signaling ipv4
RP/0/RP0/CPU0:router(config-mcast-default-ipv4)#interface all enable

/* Enable MPLS MLDP */

RP/0/RP0/CPU0:router(config)#mpls ldp
RP/0/RP0/CPU0:router(config-ldp)#mldp
```

Restrictions for MVPN Profiles

The following restriction applies to the configuration of MVPN profile:

- A router being RR and PE at that same time for BGP mVPN implementation is not supported, a type 7 and type 6 IPv4 mVPN route is not advertised by a RR, which is also a PE router, if the PE router has the VRF locally configured and when there is a local receiver.

Use full mesh for iBGP mVPN address-family or elect any core (P) router to be the RR.

Configuration Examples for Inband mLDP Profiles on Edge Routers

Running Configuration for VRF MLDP In-Band Signaling (Profile 6)

```
router pim
vrf one
address-family ipv4
  rpf topology route-policy rpf-vrf-one

route-policy rpf-vrf-one
  set core-tree mldp-inband
end-policy

multicast-routing
vrf one

```

Verification of MLDP Configuration on Edge Routers

Use the following commands to verify the MLDP configuration on edge routers.

To check the MLDP neighbors, use the **show mpls mldp neighbor** command.

```
RP/0/RP0/CPU0:Head# show mpls mldp neighbors
mLDP neighbor database
MLDP peer ID      : 2.2.2.2:0, uptime 07:47:59 Up,
  Capabilities    : GR, Typed Wildcard FEC, P2MP, MP2MP
  Target Adj      : No
  Upstream count  : 1
  Branch count    : 1
  LDP GR          : Enabled
                  : Instance: 1
  Label map timer : never
  Policy filter in :
  Path count      : 1
  Path(s)         : 12.1.1.2          TenGigE0/11/0/1 LDP
  Adj list        : 12.1.1.2          TenGigE0/11/0/1
  Peer addr list  : 2.25.32.2
                  : 2.2.2.2
                  : 11.1.1.1
                  : 12.1.1.2
                  : 13.10.1.1
```

To display the contents of the Label Information Base (LIB), use the **show mpls mldp bindings** command.

```
RP/0/RP0/CPU0:Head#show mpls mldp bindings
mLDP MPLS Bindings database

LSP-ID: 0x00001 Paths: 7 Flags:

```

To display the MLDP event traces, use the **show mpls mldp trace** command.

```
RP/0/RP0/CPU0:Head#show mpls mldp trace
