BFD Overview

Bidirectional Forwarding Detection (BFD) provides low-overhead, short-duration detection of failures in the path between adjacent routers. BFD allows a single mechanism to be used for failure detection over any media and at any protocol layer, with a wide range of detection times and overhead. The fast detection of failures provides immediate reaction to failure in the event of a failed link or neighbor.

Tip You can programmatically configure BFD and retrieve operational data using `openconfig-bfd.yang` OpenConfig data model. To get started with using data models, see the *Programmability Configuration Guide*.

Features Unsupported

- BFD echo mode and encryption are not supported.
- BFD over MPLS tunnel interfaces is not supported.
- Dampening extensions for BFD are not supported.
- BFD down dampening is not supported.
- BFD IPv6 Dampening is not supported.
- SNMP traps are not supported for multipath BFD sessions.
- BFD Over GRE is not supported.

- BFD over PWHE is not supported.
- Seamless BFD is not supported.
- BFD over Satellite interface is not supported.
- BFD Authentication is not supported.

Supported Functionalities

- BFD hardware offload is supported for both IPv4 and IPv6.
- Starting from IOS XR Release 6.3.2, BFD dampening for IPv4 is supported.
- BFD is only supported in IP core. It cannot coexist with Label distribution Protocol, or Segment Routing, or Traffic Engineering in the core. This is applicable for releases prior to IOS XR Release 7.1.1.
- BFD over Bundle (BoB) over IPv6 is not supported with dynamically configured link-local address. It must be statically configured.
- Dampening extensions for BFD are not supported.
- Egress IPv4 ACLs block all traffic, including router-generated traffic for the following routers and line cards:
 - NC57-24DD
 - NC57-18DD-SE
 - NC57-36H-SE
 - NC57-36H6D-S
 - NC57-MOD-S
 - NCS-57B1-6D24-SYS
 - NCS-57B1-5DSE-SYS

For all other routers and line cards, egress IPv4 ACLs do not block certain router-generated traffic, such as ICMP messages.

BFD Packet Injection

BFD enables egress packet processing injection which results in egress feature processing and ACL processing. The manner in which the egress ACL processes the locally generated BFD packets is different from how the routing protocol processes them. Routing protocols use TX inject to inject packets from the IOS-XR software stack where most locally-generated packets are not subject to egress ACL.

The router injects the source IP address 0.0.0.0 with tunnel encapsulation. The BFD programmable editor overwrites the source IP address with the actual IP address using tunnel encapsulation in the egress transmit packet processor (ETPP). However, as this occurs after the egress IPv4 ACL processing, the egress ACL processing is aware of the SRC IP address of 0.0.0.0. This could result in unexpected matches. A bearing condition monitoring (BCM) limitation causes the aforesaid unexpected mismatches because operations, administration, maintenance, and provisioning (OAMP) supports only 16 different SRC IP addresses. To overcome this limitation, you need to permit BFD packets specifically.

To know more about protecting locally originated BFD packets, see [Protecting Locally Originated BFD Packets](#).

Feature Limitations

- Egress ACL with drop rule for src-ip equal to 0.0.0.0 will drop BFD-V4 Tx packets on that interface. This is because, BFD-V4 packets generated by OAMP will have src.ip 0.0.0.0 due to its limitation. And the actual source IP value is filled in ETPP block in pipeline before sending the packet. Since egress ACL is applied before ETPP, the BFD packets are dropped.
- BFD over Bundle (BOB) uses two entries in the MAC address table for each of IPv4 and IPv6, regardless of the number of BOB sessions on the Network Processing Unit (NPU). This MAC table is shared with other features such as Bridge Virtual Interface (BVI), Hot Standby Router Protocol (HSRP), Virtual Router Redundancy Protocol (VRRP), and DHCP, all of which also consume entries from the same MAC table. The MAC table has a limited capacity of 16 entries. If the MAC address for BOB cannot be programmed because the table is full with other MAC entries, the BOB session will fail to establish. This limitation means that the MAC table resource must be managed carefully to ensure successful BOB session establishment.
- BOB feature is supported only in IETF mode.
- If peer routers have mismatched BFD configurations, with one router configured with **bundle coexistence bob-blb logical** command and the other not, the BFD session may behave unexpectedly.

Note The **bundle coexistence bob-blb logical** command is specific to Cisco IOS XR. Therefore, for consistent BFD behaviour, this command must be configured identically across all peer nodes.

- The **bfd interface type interface-path-id disable** command is not supported.

BFD Timers

Note If the timer is configured below the minimum timer supported, some undesirable behavior can be seen in BFD. customers some time will configure 3 msec as timer and will miss the minimum timer of 4 msec.

Note The router uses six unique timer profiles. Four timers profiles are available when you configure BFD over Bundle (BoB). Up to five timers profiles are available when you configure BoB.

Table 1: IPv4 BFD Timers

Type of BFD Session	Minimum Timer Supported	Minimum Multipliers Value	Supported Minimum-Interval Value (Up to 6 Unique Timers Profiles)
Single Hop	4ms	3	Any
BFD over Bundle Members (BoB)	4ms	3	Any
BFD over Logical bundle (BLB)	100ms (starting Release 24.3.1) 300ms (prior to Release 24.3.1)	3	Any
BGP Multi Hop	50ms	3	Any
BFD Over BVI	50ms	3	Any

Table 2: IPv6 BFD Timers

Type of BFD Session	Minimum Timer Supported	Minimum Multipliers Value	Supported Timer Profile (Up to 6 unique timer profiles)	Maximum Scale depending on Minimum Interval
Single Hop	4ms	3	Any	150 (with 8ms and above, all 256 sessions are configurable)
BFD over Bundle Members (BoB)	4ms	3	Any	150ms (with 8ms and above, all 256 sessions are configurable)
BFD over Logical bundle (BLB)	100ms (starting Release 24.3.1) 300ms (prior to Release 24.3.1)	3	Any	256
BGP Multi Hop	50ms	3	Any	256
BFD Over BVI	50ms	3	Any	250 or Max MP scale- whichever is lower

Enable and Disable IPv6 Checksum Calculations for BFD on a Router

Perform the following steps to configure IPv6 checksum calculations for BFD on a Router.

```
RP/0/RP0/CPU0:router(config)# bfd
RP/0/RP0/CPU0:router(config-bfd-if)# ipv6 checksum disable
RP/0/RP0/CPU0:router(config-bfd-if)# commit
```

Configure BFD Under a Dynamic Routing Protocol or Use a Static Route

To establish a BFD neighbor, complete at least one of the following procedures to configure BFD under a dynamic routing protocol or to use a static route:

Enable BFD for OSPF on an Interface

Perform the following steps to configure BFD for Open Shortest Path First (OSPF) on an interface. The steps in the procedure are common to the steps for configuring BFD on IS-IS; only the command mode differs.

Note BFD per interface configuration is supported for OSPF and IS-IS only.

```
Router# configure

/* Enter OSPF configuration mode to configure the OSPF routing process. */
Router(config)# router ospf 0

/* Set the BFD minimum interval. The range is from 15 to 30000 milliseconds. */
Router(config-ospf)# bfd minimum-interval 6500

/* Set the BFD multiplier. */
Router(config-ospf)# bfd multiplier 7

/* Configure an Open Shortest Path First (OSPF) area. */
Router(config-ospf)# area 0

/* Enter interface configuration mode. */
Router(config-ospf-ar)# interface gigabitEthernet 0/3/0/1

/* Enable BFD to detect failures in the path between adjacent forwarding engines. */
Router(config-ospf-ar-if)# bfd fast-detect
```

Running Configuration

```
configure
router ospf 0
bfd minimum-interval 6500
bfd multiplier 7
area 0
interface gigabitEthernet 0/3/0/1
bfd fast-detect
```

Verification

Verify that BFD is enabled on the appropriate interface.

```
Router(config-ospf-ar-if)# show run router ospf

router ospf 0
bfd minimum-interval 6500
bfd multiplier 7
area 0
interface gigabitEthernet 0/3/0/1
bfd fast-detect

/* Verify the details of the IPv4 BFD session in the source router. */

Router# show bfd session
```

Interface	Dest Addr	Local det	time(int*mult)	State	Echo	Async	H/W	NPU
Te0/0/0/0	10.23.1.2	0s(0s*0)	300ms(100ms*3)	UP	Yes			0/RP0/CPU0
BE3739	10.23.1.2	n/a	n/a	UP	No	n/a		

Enable BFD over BGP

Perform the following steps to configure BFD over BGP. The following example shows how to configure BFD between autonomous system 65000 and neighbor 192.168.70.2:

```
Router# configure
Router(config)# router bgp 65000
Router(config-bgp)# bfd multiplier 2
Router(config-bgp)# bfd minimum-interval 20
Router(config-bgp)# neighbor 192.168.70.24
Router(config-bgp-nbr)# remote-as 2
Router(config-bgp-nbr)# bfd fast-detect
Router(config-bgp-nbr)# commit
Router(config-bgp-nbr)# end
```

Running Configuration

```
router bgp 65000
bfd multiplier 2
bfd minimum-interval 20
neighbor 192.168.70.24
remote-as 2
bfd fast-detect
commit
end
```

Verification

Verify that BFD has been enabled over BGP.

```
Router# show run router bgp
router bgp 65000
bfd multiplier 2
bfd minimum-interval 20
neighbor 192.168.70.24
remote-as 2
bfd fast-detect
```

Enable BFD on an IPv4 Static Route

The following procedure shows how to enable BFD on an IPv4 static route.

```
RP/0/RSP0/CPU0:router# configure

/*Enter static route configuration mode to configure static routing. */
RP/0/RSP0/CPU0:router(config)# router static

/* Enable BFD fast-detection on the specified IPV4 unicast destination address prefix and
on the forwarding next-hop address.*/
RP/0/RSP0/CPU0:router(config-static)# address-family ipv4 unicast 10.2.2.0/24 10.6.0.1 bfd
fast-detect minimum-interval 1000 multiplier 5

RP/0/RSP0/CPU0:router(config-static)# commit
```

Running Configuration

```
configure
router static
address-family ipv4 unicast 10.2.2.0/24 10.6.0.1 bfd fast-detect minimum-interval 1000
multiplier 5
commit
```

Verification

Verify that BFD is enabled on the appropriate interface.

```
RP/0/RSP0/CPU0:router# show run router static address-family ipv4 unicast

router static
address-family ipv4 unicast
10.2.2.0/24 10.6.0.1 bfd fast-detect minimum-interval 1000 multiplier 5
commit
!
!
```

Enable BFD on an IPv6 Static Route

The following procedure describes how to enable BFD on a IPv6 static route.

```
RP/0/RP0/CPU0:router# configure

/* Enter static route configuration mode to configure static routing. */
RP/0/RP0/CPU0:router(config)# router static

/* Enable BFD fast-detection on the specified IPv6 unicast destination address prefix and
on the forwarding next-hop address. */
/* BFD sessions are established with the next hop 2001:0DB8:D987:398:AE3:B39:333:783 when
it becomes reachable. */

RP/0/RP0/CPU0:router(config-static)# address-family ipv6 unicast 2001:0DB8:C18:2:1::F/64
2001:0DB8:D987:398:AE3:B39:333:783 bfd fast-detect minimum-interval 150 multiplier 4

RP/0/RP0/CPU0:router(config-static-vrf)# commit
```

Running Configuration

```
configure
router static
address-family ipv6 unicast 2001:0DB8:C18:2:1::F/64 2001:0DB8:D987:398:AE3:B39:333:783
```

```
bfd fast-detect minimum-interval 150 multiplier 4
commit
```

Verification

Verify that BFD is enabled on the appropriate interface.

```
RP/0/RP0/CPU0:router# show run router static address-family ipv6 unicast

configure
router static
address-family ipv6 unicast 2001:0DB8:C18:2:1::F/64 2001:0DB8:D987:398:AE3:B39:333:783 bfd
fast-detect minimum-interval 150 multiplier 4
commit
```

Clear and Display BFD Counters

The following procedure describes how to display and clear BFD packet counters. You can clear packet counters for BFD sessions that are hosted on a specific node or on a specific interface.

```
RP/0/RP0/CPU0:router# show bfd counters all packet location 0/RP0/CPU0
RP/0/RP0/CPU0:router# clear bfd counters all packet location 0/RP0/CPU0
RP/0/RP0/CPU0:router# show bfd counters all packet location 0/RP0/CPU0
```

BFD Session Types

There are two types of BFD sessions:

- [Single Path Sessions](#)
- [Multipath Sessions](#)

BFD Singlepath Sessions

BFD over Bundle

BFD Over Bundle (BoB) (RFC 7130) has a BFD session on each bundle member. BOB verifies the ability for each member link to be able to forward Layer 3 packets.

The BoB feature enables BFD sessions to monitor the status of individual bundle member links. BFD notifies the bundle manager immediately when one of the member links goes down, and reduces the bandwidth used by the bundle.

For BoB, the BFD client is bundlemgr. When BFD detects a failure on a bundle member, bundlemgr removes that member from the bundle. If there are not enough members to keep the bundle up, then the main Bundle-Ether interface will go down so that all routing protocols running on the main bundle interface or a subinterface will detect an interface down.

BoB does not provide a true Layer 3 check and is not supported on subinterfaces. However, subinterfaces will go down at the same time as the main interface.

Limitations and Restrictions for BFD over Bundle

The following are the limitations and restrictions in using BoB feature:

- Each BoB session must use a unique destination IP address. If multiple BoB sessions across different bundles share the same destination IP address, BFD should not be enabled.
- It is only supported in IETF mode.
- It is only supported on the main bundle interface; it is not supported on bundle subinterfaces.
- It is not supported on routing protocols, such as OSPF, ISIS, and BGP.
- When the BFD timer is configured to 4 ms, which is the most aggressive timer, 256 sessions can be brought up.
- BFD echo mode and encryption is not supported.

Configure BFD over Bundle

Configuring BFD over bundle involves the following steps:

- Specify the mode, BFD packet transmission intervals, and failure detection times on a bundle.

Note Repeat the same configuration steps in the destination router.

```
/* Enable and Disable IPv6 checksum calculations for BFD on a router. */

Router(config-if)# bfd
Router(config-bfd-if)# dampening disable
Router(config-bfd-if)# commit

/* Specify the mode, BFD packet transmission intervals, and failure detection times on a
bundle */

Router(config)# interface Bundle-Ether 3739
Router(config-if)# bfd mode ietf
Router(config-if)# bfd address-family ipv4 multiplier 3
Router(config-if)# bfd address-family ipv4 destination 10.23.1.2
Router(config-if)# bfd address-family ipv4 fast-detect
Router(config-if)# bfd address-family ipv4 minimum-interval 100
Router(config-if)# bfd address-family ipv6 multiplier 3
Router(config-if)# bfd address-family ipv6 destination 2001:DB8:1::2
Router(config-if)# bfd address-family ipv6 fast-detect
Router(config-if)# bfd address-family ipv6 minimum-interval 100
Router(config-if)# ipv4 address 10.23.1.1 255.255.255.252
Router(config-if)# ipv6 address 2001:DB8:1::2/120
Router(config-if)# load-interval 30
Router(config-if)# commit
Router(config)# interface TenGigE 0/0/0/0
Router(config-if)# bundle id 3739 mode active
```

Running Configuration

```
bfd
```

```

dampening disable!
!

interface Bundle-Ether3739
bfd mode ietf
bfd address-family ipv4 multiplier 3
bfd address-family ipv4 destination 10.23.1.2
bfd address-family ipv4 fast-detect
bfd address-family ipv4 minimum-interval 100
bfd address-family ipv6 multiplier 3
bfd address-family ipv6 destination 2001:DB8:1::2
bfd address-family ipv6 fast-detect
bfd address-family ipv6 minimum-interval 100
ipv4 address 10.23.1.1 255.255.255.252
ipv6 address 2001:DB8:1::2/120
load-interval 30
!

interface TenGigE 0/0/0/0
bundle id 3739 mode active

```

Verification

The following show command outputs displays the status of BFD sessions on bundle members:

```
/* Verify the details of the IPv4 BFD session. */
```

```
Router# show bfd all session
```

Interface	Dest Addr	Local det	time(int*mult)	State	Echo	Async	H/W	NPU
-----	-----	-----	-----	-----	-----	-----	---	---
Te0/5/0/6	10.10.10.1	0s	450ms (150ms*3)	UP	Yes	0/RP0/CPU0		
Te0/5/0/6	10.10.10.1	0s (0s*0)	450ms (150ms*3)	UP	Yes	0/RP1/CPU0		
BE5	10.10.10.1	n/a	n/a	UP	No	n/a		

```
/* Verify the details of the IPv6 BFD session. */
```

```
Router# show bfd all session
```

Interface	Dest Addr	Local det	time(int*mult)	State	Echo	Async	H/W	NPU
-----	-----	-----	-----	-----	-----	-----	---	---
Te0/5/0/6	10:10::10:1	0s	450ms (150ms*3)	UP	Yes	0/RP0/CPU0		
Te0/5/0/6	10:10::10:1	0s (0s*0)	450ms (150ms*3)	UP	Yes	0/RP1/CPU0		
BE5	10:10::10:1	n/a	n/a	UP	No	n/a		

Enabling BFD on a BGP Neighbor

BFD can be enabled per neighbor, or per interface. This task describes how to enable BFD for BGP on a neighbor router.

Procedure

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters mode.

	Command or Action	Purpose
Step 2	router bgp <i>autonomous-system-number</i> Example: RP/0/RP0/CPU0:router(config)# router bgp 120	Enters BGP configuration mode, allowing you to configure the BGP routing process.
Step 3	neighbor <i>ip-address</i> Example: RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.168.40.24	Places the router in neighbor configuration mode for BGP routing and configures the neighbor IP address as a BGP peer. This example configures the IP address 172.168.40.24 as a BGP peer.
Step 4	remote-as <i>autonomous-system-number</i> Example: RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 2002	Creates a neighbor and assigns it a remote autonomous system. This example configures the remote autonomous system to be 2002.
Step 5	bfd fast-detect Example: RP/0/RP0/CPU0:router(config-bgp-nbr)# bfd fast-detect	Enables BFD between the local networking devices and the neighbor whose IP address you configured to be a BGP peer in Step 3. In the example in Step 3, the IP address 172.168.40.24 was set up as the BGP peer. In this example, BFD is enabled between the local networking devices and the neighbor 172.168.40.24.
Step 6	bfd minimum-interval <i>milliseconds</i> Example: RP/0/RP0/CPU0:router(config-bgp-nbr)# bfd minimum-interval 6500	Sets the BFD minimum interval. Range is 4-30000 milliseconds.
Step 7	bfd multiplier <i>multiplier</i> Example: RP/0/RP0/CPU0:router(config-bgp-nbr)# bfd multiplier 7	Sets the BFD multiplier. This is optional, the minimum is 3 and by default the multiplier will be 3 for all protocols
Step 8	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes.

	Command or Action	Purpose
		• Cancel —Remains in the configuration session, without committing the configuration changes.

Enabling BFD for OSPF on an Interface

The following procedures describe how to configure BFD for Open Shortest Path First (OSPF) on an interface. The steps in the procedure are common to the steps for configuring BFD on IS-IS ; only the command mode differs.

Procedure

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters mode.
Step 2	router ospf process-name Example: RP/0/RP0/CPU0:router(config)# router ospf 0	Enters OSPF configuration mode, allowing you to configure the OSPF routing process. Note To configure BFD for IS-IS, enter the corresponding configuration mode.
Step 3	area area-id Example: RP/0/RP0/CPU0:router(config-ospf)# area 0	Configures an Open Shortest Path First (OSPF) area. Replace <i>area-id</i> with the OSPF area identifier.
Step 4	interface type interface-path-id Example: RP/0/RP0/CPU0:router(config-ospf-ar)# interface TengigabitEthernet 0/3/0/1	Enters interface configuration mode and specifies the interface name.
Step 5	bfd fast-detect Example: RP/0/RP0/CPU0:router(config-ospf-ar-if)# bfd fast-detect	Enables BFD to detect failures in the path between adjacent routers.
Step 6	bfd minimum-interval milliseconds Example:	Sets the BFD minimum interval. Range is 4-30000 milliseconds.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router(config-ospf-ar-if)# bfd minimum-interval 6500	This example sets the BFD minimum interval to 6500 milliseconds.
Step 7	bfd multiplier multiplier Example: RP/0/RP0/CPU0:router(config-ospf-ar-if)# bfd multiplier 7	Sets the BFD multiplier. This is optional, the minimum is 3 and by default the multiplier will be 3 for all protocols. This example sets the BFD multiplier to 7.
Step 8	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

Enabling BFD on a Static Route

The following procedure describes how to enable BFD on a static route.

Procedure

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters mode.
Step 2	router static Example: RP/0/RP0/CPU0:router(config)# router static	Enters static route configuration mode, allowing you to configure static routing.
Step 3	address-family ipv4 unicast address nexthop Example: RP/0/RP0/CPU0:router(config-static)# address-family ipv4 unicast 10.2.2.0/24	Enables BFD fast-detection on the specified IPv4 unicast destination address prefix and on the forwarding next-hop address.

	Command or Action	Purpose
	10.6.0.2	
Step 4	interface <i>type interface-path-id</i> Example: <pre>RP/0/RP0/CPU0:router(config-static)# interface TengigabitEthernet 0/3/0/1</pre>	Enters interface configuration mode and specifies the interface name.
Step 5	bfd fast-detect Example: <pre>RP/0/RP0/CPU0:router(config-static-if)# bfd fast-detect</pre>	Enables BFD to detect failures in the path between adjacent forwarding engines.
Step 6	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

Enabling BFD Sessions on Bundle Members

To enable BFD sessions on bundle member links, complete these steps:

Procedure

	Command or Action	Purpose
Step 1	configure Example: <pre>RP/0/RP0/CPU0:router# configure</pre>	Enters mode.
Step 2	interface Bundle-Ether <i>bundle-id</i> Example: <pre>RP/0/RP0/CPU0:router(config)# interface Bundle-Ether 1</pre>	Enters interface configuration mode for the specified bundle ID.

	Command or Action	Purpose
Step 3	bfd address-family ipv4 fast-detect Example: <pre>RP/0/RP0/CPU0:router(config-if)# bfd address-family ipv4 fast-detect</pre>	Enables IPv4 BFD sessions on bundle member links.
Step 4	bfd mode ietf Example: <pre>RP/0/RP0/CPU0:router(config-if)# bfd mode ietf</pre>	Enables IETF mode for BFD over bundle for the specified bundle.
Step 5	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

Specifying the BFD Destination Address on a Bundle

To specify the BFD destination address on a bundle, complete these steps:

Procedure

	Command or Action	Purpose
Step 1	configure Example: <pre>RP/0/RP0/CPU0:router# configure</pre>	Enters mode.
Step 2	interface Bundle-Ether bundle-id Example: <pre>RP/0/RP0/CPU0:router(config)# interface Bundle-Ether 1</pre>	Enters interface configuration mode for the specified bundle ID.
Step 3	bfd address-family ipv4 destination ip-address	Specifies the primary IPv4 address assigned to the bundle interface on a connected remote

	Command or Action	Purpose
	Example: RP/0/RP0/CPU0:router(config-if)# bfd address-family ipv4 destination 10.20.20.1	system, where <i>ip-address</i> is the 32-bit IP address in dotted-decimal format (A.B.C.D).
Step 4	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

Configuring the Minimum Thresholds for Maintaining an Active Bundle

The bundle manager uses two configurable minimum thresholds to determine whether a bundle can be brought up or remain up, or is down, based on the state of its member links.

- Minimum active number of links
- Minimum active bandwidth available

Whenever the state of a member changes, the bundle manager determines whether the number of active members or available bandwidth is less than the minimum. If so, then the bundle is placed, or remains, in DOWN state. Once the number of active links or available bandwidth reaches one of the minimum thresholds, then the bundle returns to the UP state.

To configure minimum bundle thresholds, complete these steps:

Procedure

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters mode.
Step 2	interface Bundle-Ether <i>bundle-id</i> Example: RP/0/RP0/CPU0:router(config)# interface Bundle-Ether 1	Enters interface configuration mode for the specified bundle ID.

	Command or Action	Purpose
Step 3	bundle minimum-active bandwidth <i>kbps</i> Example: <pre>RP/0/RP0/CPU0:router(config-if)# bundle minimum-active bandwidth 580000</pre>	Sets the minimum amount of bandwidth required before a bundle can be brought up or remain up. The range is from 1 through a number that varies depending on the platform and the bundle type.
Step 4	bundle minimum-active links <i>links</i> Example: <pre>RP/0/RP0/CPU0:router(config-if)# bundle minimum-active links 2</pre>	Sets the number of active links required before a bundle can be brought up or remain up. The range is from 1 to 32. Note When BFD is started on a bundle that is already active, the BFD state of the bundle is declared when the BFD state of all the existing active members is known.
Step 5	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

Configuring BFD Packet Transmission Intervals and Failure Detection Times on a Bundle

BFD asynchronous packet intervals and failure detection times for BFD sessions on bundle member links are configured using a combination of the **bfd address-family ipv4 minimum-interval** and **bfd address-family ipv4 multiplier** interface configuration commands on a bundle.

The BFD control packet interval is configured directly using the **bfd address-family ipv4 minimum-interval** command. The failure detection times are determined by a combination of the interval and multiplier values in these commands.

To configure the minimum transmission interval and failure detection times for BFD asynchronous mode control packets on bundle member links, complete these steps:

Procedure

	Command or Action	Purpose
Step 1	configure Example:	Enters mode.

	Command or Action	Purpose
	RP/0/RP0/CPU0:router# configure	
Step 2	interface Bundle-Ether <i>bundle-id</i> Example: RP/0/RP0/CPU0:router(config)# interface Bundle-Ether 1	Enters interface configuration mode for the specified bundle ID.
Step 3	bfd address-family ipv4 minimum-interval <i>milliseconds</i> Example: RP/0/RP0/CPU0:router(config-if)#bfd address-family ipv4 minimum-interval 2000 Note Specifies the minimum interval, in milliseconds, for asynchronous mode control packets on IPv4 BFD sessions on bundle member links. The range is from 4 to 30000.	
Step 4	bfd address-family ipv4 multiplier <i>multiplier</i> Example: RP/0/RP0/CPU0:router(config-if)#bfd address-family ipv4 multiplier 30	Specifies a number that is used as a multiplier with the minimum interval to determine BFD control packet failure detection times and transmission intervals for IPv4 BFD sessions on bundle member links. The range is from 2 to 50. The default is 3. Note Although the command allows you to configure a minimum of 2, the supported minimum is 3.
Step 5	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

Configuring BFD over Bundle per Member Mode

Procedure

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters mode.
Step 2	bfd bundle per-member mode ietf Example: RP/0/RP0/CPU0:router(config)# bfd bundle per-member mode ietf	Enables IETF mode for BFD over per-bundle member link.
Step 3	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

Configure BFD over Bundles IETF Mode Support on a Per Bundle Basis

To configure BFD over Bundles IETF mode support on a per bundle basis use these steps:

Procedure

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters mode.
Step 2	interface Bundle-Ether <i>bundle-id</i> Example: RP/0/RP0/CPU0:router(config)# interface Bundle-Ether 1	Enters interface configuration mode for the specified bundle ID.

	Command or Action	Purpose
Step 3	bfd mode ietf Example: <pre>RP/0/RP0/CPU0:router(config-if)# bfd mode ietf</pre>	Enables IETF mode for BFD over bundle for the specified bundle.
Step 4	bfd address-family ipv4 fast-detect Example: <pre>RP/0/RP0/CPU0:router(config-if)# bfd address-family ipv4 fast-detect</pre>	Enables IPv4 BFD sessions on the specified bundle.
Step 5	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.
Step 6	show bundle bundle-ether <i>bundle-id</i>	Displays the selected bundle mode.

BoB Configuration for IPv4 and IPv6

Table 3: Feature History

Feature Name	Release Information	Feature Description
BFD v6 - HW Offload and IPv6 BFD/BoB (Bundle over Bundle)	Release 7.5.1	The Bidirectional Forwarding detection (BFD) Hardware Offload feature enables the offload of a BFD session in an IPv6 network. With this feature, each bundle member link with IPv6 address runs its own BFD session. This feature improves scale and reduces the overall network convergence time by sending rapid failure detection packets to the routing protocols for recalculating the routing table.

The Bidirectional Forwarding detection (BFD) Hardware Offload feature enables the offload of a BFD session to the network processing units of the line cards, in an IPv4 network. BFD hardware offload improves scale and reduces the overall network convergence time by sending rapid failure detection packets to the routing protocols for recalculating the routing table.

Restrictions

BFD over Bundle (BOB) over IPv6 is not supported with dynamically configured link-local address. It must be statically configured.

Configuration Example

Configuration example for IPv4

```
/* Configure BFD over Bundle(BOB) for hardware offload. */
Router# config
Router(config)# interface Bundle-Ether 1
Router(config-if)# bfd mode ietf
Router(config-if)# bfd address-family ipv4 multiplier 3
Router (config-if)# bfd address-family ipv4 destination 10.20.20.1
Router (config-if)# bfd address-family ipv4 fast-detect
Router(config-if)# bfd address-family ipv4 minimum-interval 2000
Router(config-if)# ipv4 address 10.20.20.2/30
```

Configuration example for IPv6

```
/* Configure BFD over Bundle(BOB) for hardware offload. */
Router# config
Router(config)# interface Bundle-Ether 1
Router(config-if)# bfd mode ietf
Router(config-if)# bfd address-family ipv6 multiplier 3
Router (config-if)# bfd address-family ipv6 destination 10.20:20::1
Router (config-if)# bfd address-family ipv6 fast-detect
Router(config-if)# bfd address-family ipv6 minimum-interval 2000
Router(config-if)# ipv6 address 10:20:20::2/64
```

Configuration Verification

Configuration example for IPv4

Use the **show bfd ipv4 session** command to verify the BoB Configuration for IPv4:

```
Router#show bfd ipv4 session
```

Interface	Dest Addr	Local det time(int*mult)		State	
		Echo	Async	H/W	NPU
Hu0/0/0/22	10.20.20.1	0s(0s*0)	6s(2s*3)	Yes	0/0/CPU0
BE1	10.20.20.1	n/a	n/a	No	UP n/a

Configuration example for IPv6

Use the **show bfd ipv6 session** command to verify the BoB Configuration for IPv6:

```
Router#show bfd ipv6 session
```

Interface	Dest Addr	Local det time(int*mult)		State
		Echo	Async	
Hu0/0/0/1	10.20:20::1	0s(0s*0)	6s(2s*3)	UP
Yes	0/0/CPU0			

BE1	10.20:20::1			
No	n/a	n/a	n/a	UP

BFD Hardware Offload Support for IPv6

Table 4: Feature History

Feature Name	Release Information	Feature Description
BFD v6 - HW Offload and IPv6 BFD/BoB (Bundle over Bundle)	Release 7.5.1	The Bidirectional Forwarding detection (BFD) Hardware Offload feature enables the offload of a BFD session in an IPv6 network. With this feature, each bundle member link with IPv6 address runs its own BFD session. This feature improves scale and reduces the overall network convergence time by sending rapid failure detection packets to the routing protocols for recalculating the routing table.

The Bidirectional Forwarding detection (BFD) Hardware Offload feature enables the offload of a BFD session to the network processing units of the line cards, in an IPv6 network. BFD hardware offload feature improves scale and reduces the overall network convergence time by sending rapid failure detection packets to the routing protocols for recalculating the routing table.

Restrictions

- This feature is not supported over MPLS LDP interface and VRRP interface.
- This feature is not supported over MPLS TE or RSVP tunnel.
- BFD Dampening is not supported for BFD over IPv6.
- BFD over Bundle (BOB) over IPv6 is not supported with dynamically configured link-local address. It must be statically configured.
- BFD multihop will flap if underlay paths that consist of multiple bundle VLANs flap.

Configuration Example

```

/* Configure BFD over Bundle(BOB) for hardware offload. */
Router# config
Router(config)# interface Bundle-Ether 1
Router(config-if)# bfd mode ietf
Router(config-if)# bfd address-family ipv6 multiplier 3
Router (config-if)# bfd address-family ipv6 destination 10.20:20::1
Router (config-if)# bfd address-family ipv6 fast-detect
Router(config-if)# bfd address-family ipv6 minimum-interval 2000
Router(config-if)# ipv6 address 10:20:20::2/64

/* To define the line card to host BLB and BFD multihop sessions. */
Router(config)# bfd
Router(config-bfd)# multipath include location 0/0/CPU0

```

```

/* Configure BFD with a static route. */
Router(config)# router static
Router(config-static)# address-family ipv6 unicast 1011:17e4::1/128 ab11:15d2::2 bfd
fast-detect minimum-interval 50 multiplier 3

/* Configure BFD with IS-IS. */
Router(config)# router isis 65444
Router(config-isis)# address-family ipv6 unicast
Router(config-isis)# exit
Router(config-isis)# interface gigabitEthernet 0/3/0/1
Router(config-isis-if)# bfd minimum-interval 6500
Router(config-isis-if)# bfd multiplier 7
Router(config-isis-if)# bfd fast-detect ipv6
Router(config-isis-if)# address-family ipv6 unicast

/* Configure BFDv6 with OSPFv3. */
Router(config)# router ospfv3 main
Router(config-ospfv3)# area 0
Router(config-ospfv3-ar)# interface gigabitEthernet 1/0/0/1
Router(config-ospfv3-ar-if)# bfd multiplier 7
Router(config-ospfv3-ar-if)# bfd fast-detect
Router(config-ospfv3-ar-if)# bfd minimum-interval 6500

/* Configuring BFD over BGP. */
Router(config)# router bgp 120
Router(config-bgp)# neighbor 2001:DB8:1::1
Router(config-bgp-nbr)# bfd fast-detect
Router(config-bgp-nbr)# bfd multiplier 7
Router(config-bgp-nbr)# bfd minimum-interval 6500

```

Verification

Use the **show bfd ipv6 session** command to verify the configuration:

```

Router# show bfd ipv6 session
Interface          Dest Addr
-----
H/W                NPU          Echo          Async          State
-----
BE7.2              fe80::28a:96ff:fed6:9cdb
Yes                0/0/CPU0      0s(0s*0)      900ms(300ms*3)  UP
BE7.4              fe80::28a:96ff:fed6:9cdb
Yes                0/0/CPU0      0s(0s*0)      900ms(300ms*3)  UP

```

BFD over Bundle with IPv4 Unnumbered Interfaces

BFD over Bundle with IPv4 Unnumbered Interfaces feature enables BFD to run on IP unnumbered interfaces, which take the IP address from the loopback address. The same loopback address is used on multiple interfaces. This saves IP addresses space or range.

BFD creates a session on the unnumbered interface for which the BFD clients provide the source and destination IP address along with the interface index. BFD establishes the session on the Layer 3 unnumbered link to which the interface index corresponds. The source address is derived from the Loopback interface at the source. The destination node also uses IP unnumbered interface with loopback address and that is used as destination IP address.

BFD sends control packets to the unnumbered interfaces. These control packets are the regular IP BFD packets. Address Resolution Protocol (ARP) resolves the destination loopback IP address to the destination node's router MAC address.

Restriction

Only Asynchronous mode is supported.

Configure BFD over Bundle with IPv4 Unnumbered Interface

- Configure loopback address
- Add physical interface to bundle
- Configure BOB session on an unnumbered interface

Configure Loopback Address

```
Router(config)# interface loopback 1
Router(config-if)# ipv4 address 10.1.1.1 255.255.255.0
```

Add Physical Interface to Bundle

```
Router(config)# interface HundredGigE0/0/1/0
Router(config-if)# bundle id 1 mode on
```

Configure a BFD over Bundle Session on an Unnumbered Interface

```
Router(config)# interface Bundle-Ether1
Router(config-if)# bfd address-family ipv4 destination 10.2.2.2
Router(config-if)# bfd address-family ipv4 fast-detect
Router(config-if)# ipv4 point-to-point
Router(config-if)# ipv4 unnumbered Loopback1
```

Running Configuration

```
interface Loopback1
ipv4 address 10.1.1.1 255.255.255.0
!
interface HundredGigE0/0/1/0
bundle id 1 mode on
!
interface Bundle-Ether1
bfd address-family ipv4 destination 10.2.2.2
bfd address-family ipv4 fast-detect
ipv4 point-to-point
ipv4 unnumbered Loopback1
```

Configuration Verification

```
show bfd session
```

Interface	Dest Addr	Local det time(int*mult)			State
		Echo	Async	H/W	
Hu0/0/1/0	10.2.2.2	0s (0s*0)	450ms (150ms*3)	Yes	UP
BE1	10.2.2.2	n/a	n/a	No	UP

BFD Multipath Sessions

BFD can be applied over virtual interfaces such as GRE tunnel interfaces, PWHE interfaces, or between interfaces that are multihops away as described in the IPv4 Multihop BFD section. These types of BFD sessions are referred to BFD Multipath sessions.

As long as one path to the destination is active, these events may or may not cause the BFD Multipath session to fail as it depends on the interval negotiated versus the convergence time taken to update forwarding plane:

- Failure of a path
- Online insertion or removal (OIR) of a line card which hosts one or more paths
- Removal of a link (by configuration) which constitutes a path
- Shutdown of a link which constitutes a path

You must configure **bfd multipath include location** *location_id* command to enable at least one line card for the underlying mechanism that can be used to send and receive packets for the multipath sessions.

If a BFD multipath session is hosted on a line card that is being removed from the **bfd multipath include** configuration, online removed, or brought to maintenance mode, then BFD attempts to migrate all BFD Multipath sessions hosted on that line card to another one. In that case, static routes are removed from RIB and then the BFD session is established again and included to RIB.

In case of BFD multipath sessions, the input and output interface may change based on the routing table updates. If the multipath session BFD packets must get preferential treatment, then a QoS policy must be configured on the entire path, including the possible input and output interfaces of the router.

Note The CLI **bfd multipath include location** *location* is a mandatory configuration to download BFD sessions on a given location.

Bidirectional Forwarding Detection over Logical Bundle

BFD over Logical Bundle

The BLB feature implements and deploys BFD over bundle interfaces based on RFC 5880. In the BLB, the bundle interface is a single interface, whereas, in BOB, BFD is implemented per member link. BLB is a multipath (MP) single-hop session so at least one line card must be configured under the **bfd multipath include location** *location* command before a BLB session can come up. Because BFD treats the bundle as a single big interface, BLB requires limited knowledge of the bundle interfaces on which the sessions run. BLB requires information about IP addresses, interface types, and caps on bundle interfaces only. Information such as a list of bundle members, member states, and configured minimum or maximum bundle managers are not required. In the case of BLB, the BFD client is not the bundle manager, but protocols running over the bundle manager. BLB is supported on IPv4 address, IPv6 global address, and IPv6 link-local address.

Configuration Example

1. Configure multipath capability under BFD

2. Create VLAN subinterface under bundle interface
3. Enable BFD on a static route
4. Enable BFD on IS-IS
5. Enable BFD for OSPF on an interface
6. Enable BFD on a BGP neighbor

```
/* Configure a specific LC (or LCs) to host BLB sessions. The BLB sessions and bundle member
links need not be configured on the same LC. For example, you can configure the bundle
member links on LC slot 2 and slot 3 while you configure BLB sessions to be hosted on LC
slot 5. */
```

```
Router(config)# bfd
Router(config-bfd)# multipath include location 0/6/CPU0
Router(config-bfd)# multipath include location 0/2/CPU0
```

```
/* Create VLAN subinterface under bundle interface */
```

```
Router# configure
Router(config)# interface Bundle-Ether 2.1
Router(config-if)# ipv4 address 10.1.1.1 255.255.255.0
Router(config-if)# encapsulation dot1q 1
Router(config-if)# end
```

```
/* Enable BFD on a static route. */
```

```
Router# configure
Router(config)# router static
Router(config-static)# address-family ipv4 unicast
Router(config-static)# 10.158.3.13/32 10.1.1.2 bfd fast-detect minimum-interval 300 multiplier
3
```

```
/* Enable BFD on IS-IS. */
```

```
Router# configure
Router(config)# router isis cybi
Router(config-isis)# interface Bundle-Ether 2.1
Router(config-isis-if)# bfd minimum-interval 300
Router(config-isis-if)# bfd multiplier 3
Router(config-isis-if)# bfd fast-detect ipv4
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# end
```

```
/* Enable BFD for OSPF on an interface. */
```

```
Router# configure
Router(config)# router ospf cybi
Router(config-ospf)# area 0
Router(config-ospf)# interface Bundle-Ether 2.1
Router(config-ospf-if)# bfd fast-detect
Router(config-ospf-if)# bfd minimum-interval 300
Router(config-ospf-if)# bfd multiplier 3
Router(config-ospf-if)# end
```

```
/* Enable BFD on a BGP neighbor.*/
```

```
Router# configure
Router(config)# router bgp 4787
Router(config-bgp)# neighbor 10.158.1.1
Router(config-bgp-nbr)# remote-as 4787
Router(config-bgp-nbr)# update-source Bundle-Ether 2.1
Router(config-bgp-nbr)# bfd fast-detect
Router(config-bgp-nbr)# bfd minimum-interval 300
Router(config-bgp-nbr)# bfd multiplier 3
Router(config-bgp-nbr)# address-family ipv4 unicast
```

```
Router(config-bgp-nbr-af)# exit
Router(config-bgp-nbr)# commit
```

Configuration Verification

Configuration verification for OSPF:

```
Router# show bfd all session
Interface          Dest Addr          Local det time(int*mult)  State
                  Echo          Async    H/W    NPU
-----
BE2.1              10.1.1.2           0s (0s*0)                300ms (100ms*3)         UP
                                      Yes    0/6/CPU0
```

Configuration verification for IS-IS:

```
Router# show bfd all session
Interface          Dest Addr          Local det time(int*mult)  State
                  Echo          Async    H/W    NPU
-----
BE2.1              10.1.1.2           0s (0s*0)                900ms (300ms*3)         UP
                                      Yes    0/6/CPU0
```

Configuration verification for BGP:

```
Router# show bfd all session
Interface          Dest Addr          Local det time(int*mult)  State
                  Echo          Async    H/W    NPU
-----
BE2.1              10.158.1.1         0s (0s*0)                900ms (300ms*3)         UP
                                      Yes    0/6/CPU0
```

Configuration verification for Static:

```
Router# show bfd all session
Interface          Dest Addr          Local det time(int*mult)  State
                  Echo          Async    H/W    NPU
-----
BE2.1              10.1.1.2           0s (0s*0)                900ms (300ms*3)         UP
                                      Yes    0/6/CPU0
```

Configuration

Perform the following tasks to configure the BLB feature.

1. Configure multipath capability under BFD
2. Create VLAN sub-interface under bundle interface
3. Enable BFD on a static route
4. Enable BFD on IS-IS
5. Enable BFD for OSPF on an interface
6. Enable BFD on a BGP neighbor

Configure multipath capability under BFD

Configure an interface module to host BLB session on the router.

```
Router(config)# bfd
Router(config-bfd)# multipath include location 0/14/CPU0
```

Create VLAN sub-interface under bundle interface

```
Router# configure
Router(config)# interface Bundle-Ether 2.1
Router(config-if)# ipv4 address 10.1.1.1 255.255.255.0
Router(config-if)# encapsulation dot1q 1
Router(config-if)# end
```

Enable BFD on a static route.

```
Router# configure
Router(config)# router static
Router(config-static)# address-family ipv4 unicast
Router(config-static)# 10.158.3.13/32 10.1.1.2 bfd fast-detect minimum-interval 300
multiplier 3
```

Enable BFD on IS-IS.

```
Router# configure
Router(config)# router isis cybi
Router(config-isis)# interface Bundle-Ether 2.1
Router(config-isis-if)# bfd minimum-interval 300
Router(config-isis-if)# bfd multiplier 3
Router(config-isis-if)# bfd fast-detect ipv4
Router(config-isis-if)# address-family ipv4 unicast
Router(config-isis-if-af)# end
```

Enable BFD for OSPF on an interface.

```
Router# configure
Router(config)# router ospf cybi
Router(config-ospf)# area 0
Router(config-ospf)# interface Bundle-Ether 2.1
Router(config-ospf-if)# bfd fast-detect
Router(config-ospf-if)# bfd minimum-interval 300
Router(config-ospf-if)# bfd multiplier 3
Router(config-ospf-if)# end
```

Enable BFD on a BGP neighbor.

```
Router# configure
Router(config)# router bgp 4787
Router(config-bgp)# neighbor 10.158.1.1
Router(config-bgp-nbr)# remote-as 4787
Router(config-bgp-nbr)# update-source Bundle-Ether 2.1
Router(config-bgp-nbr)# bfd fast-detect
Router(config-bgp-nbr)# bfd minimum-interval 300
Router(config-bgp-nbr)# bfd multiplier 3
Router(config-bgp-nbr)# address-family ipv4 unicast
Router(config-bgp-nbr-af)# exit
Router(config-bgp-nbr)# commit
```

Running Configuration

This section shows the BFD over logical bundle configuration.

```
interface Bundle-Ether2.1
  ipv4 address 10.1.1.1 255.255.255.0
  encapsulation dot1q 1
!
```

```

Verification

The show outputs given in the following section display the details of the configuration of the BLB feature, and the status of their configuration.

```
/* Verify the BFD session summary information. */
```

```
RP/0/RSP0/CPU0:router# show bfd session
```

Interface H/W NPU	Dest Addr	Local det time(int*mult)	State	Echo	Async
-----	-----	-----	-----	-----	-----
----	----	----	----	----	----
BE2.1 0/14/CPU0	10.158.1.2	0s (0s*0) 900ms (300ms*3)	UP	Yes	
BE2.2 0/14/CPU0	10.158.2.2	0s (0s*0) 900ms (300ms*3)	UP	Yes	

```

/* Verify the BFD session detail information for the specified interface. */

RP/0/RSP0/CPU0:router# show bfd session detail interface Bundle-Ether 2.1

BFD over BVI

Table 5: Feature History

Feature Name	Release Information	Feature Description
BFD on BVI	Release 7.5.1	BFD can be configured on Bridge group Virtual Interface (BVI). BVI is a virtual interface within the router that acts like a normal routed interface that does not support bridging but represents the bridge group for the bridged physical interfaces. BFD detects the Layer3 fault over the BVI much quicker and informs the same to routing protocols.

In order for a VLAN to span a router, the router must be capable of forwarding frames from one interface to another, while maintaining the VLAN header. If the router is configured for routing a Layer 3 (network layer) protocol, it will terminate the VLAN and MAC layers at the interface on which a frame arrives. The MAC layer header can be maintained if the router bridges the network layer protocol. However, even regular bridging terminates the VLAN header.

Using the Integrated Routing Bridging (IRB) feature, a router can be configured for routing and bridging the same network layer protocol, on the same interface. This allows the VLAN header to be maintained on a frame while it transits a router from one interface to another. IRB provides the ability to route between a bridged domain and a routed domain with the Bridge Group Virtual Interface (BVI). The BVI is a virtual interface within the router that acts like a normal routed interface that does not support bridging, but represents the comparable bridge group to routed interfaces within the router. The interface number of the BVI is the number of the bridge group that the virtual interface represents. This number is the link between the BVI and the bridge group.

Because the BVI represents a bridge group as a routed interface, it must be configured only with Layer 3 (L3) characteristics, such as network layer addresses. Similarly, the interfaces configured for bridging a protocol must not be configured with any L3 characteristics.

BFD over IRB is a multipath single-hop session. BFD over IRB is supported on IPv4 address, IPv6 global address, and IPv6 link-local address. The BFD over IRB is supported only in asynchronous mode and does not support echo mode.

IPv4 Multihop BFD

IPv4 Multihop BFD is a BFD session between two addresses that are several hops away. An example of this feature is a BFD session between PE and CE loopback addresses or BFD sessions between routers that are several TTL hops away. The applications that support IPv4 Multihop BFD are external and internal BGP. IPv4 Multihop BFD feature supports BFD on arbitrary paths, which can span multiple networks hops.

A Virtual Routing and Forwarding (VRF) instance is a logical separation of a router's routing table. VRF allows you to have multiple routing tables on a single router, each with its own set of routes.

The default VRF is the first VRF that is created on a router. It is the VRF that is used by default for all routing protocols and interfaces.

Non-default VRFs must be explicitly configured.

The IPv4 Multihop BFD feature provides subsecond forwarding failure detection for a destination more than one hop, and up to 255 hops, away. IPv4 Multihop BFD feature is supported on all currently supported media-type for BFD single hop.

You can set up a BFD multihop session between a unique source-destination address pair that is provided by the client. You can set up a session two endpoints that have IP connectivity.

Multihop BFD feature runs on both default and non-default VRF.

Configure IPv4 Multihop BFD

This section describes how you can configure IPv4 Multihop BFD feature.

```
Router# configure
Router(config)# bfd
Router(config)# multipath include location 0/7/CPU0
Router(config)# router bgp 100
Router(config-bgp)# neighbor 209.165.200.225
Router(config-bgp-nbr)# remote-as 2000
Router(config-bgp-nbr)# update-source loopback 1
Router(config-bgp-nbr)# bfd fast-detect
Router(config-bgp-nbr)# bfd multiplier 3
Router(config-bgp-nbr)# bfd minimum-interval 300
Router(config-bgp-nbr-af)# commit
```

Running Configuration

```
bfd
 multipath include location 0/7/CPU0
router bgp 100
 neighbor 209.165.200.225
  remote-as 2000
  update-source loopback 1
  bfd fast-detect
  bfd multiplier 3
  bfd minimum-interval 300
 address-family ipv4 unicast
```

Configure Multihop BFD on IPv4 Non-default VRFs

Configure multihop BFD on IPv4 or IPv6 non-default VRFs:

- Configure BGP with the Autonomous System Number (ASN) on the router.
- Define a BGP neighbor with the specified IPv4 or IPv6 address.
- Associate the neighbor with a non-default VRF named "vrf1."
- Assign a route distinguisher value to create a routing and forwarding table for a VRF.
- Configure the redistribution of connected routes.
- Establish and configure an eBGP session with the specified IPv4 or IPv6 neighbor.
- Configure the remote ASN.

- Enable BFD for fast link failure detection.
- Set the BFD detection time parameters.
- Configure eBGP sessions.
- Specify the primary IP address from a particular interface as the local address when forming an eBGP session with a neighbor.
- Apply a route-policy for both inbound and outbound traffic.

Configure the following steps to configure Multihop BFD on IPv4 nondefault VRF:

```
Router(config)# router bgp 100
Router(config-bgp)# neighbor 209.165.200.225
Router(config-bgp-nbr)# vrf vrfl
Router(config-bgp-nbr-vrf)# exit
Router(config-bgp-nbr)# rd auto
Router(config-bgp-nbr)# address-family ipv4 unicast
Router(config-bgp-nbr-af)# redistribute connected
Router(config-bgp-nbr-af)# exit
Router(config-bgp)# neighbor 209.165.200.225
Router(config-bgp-nbr)# remote-as 2000
Router(config-bgp-nbr)# bfd fast-detect
Router(config-bgp-nbr)# bfd multiplier 3
Router(config-bgp-nbr)# bfd minimum-interval 50
Router(config-bgp-nbr)# ebgp-multihop 255
Router(config-bgp-nbr)# update-source loopback 1
/* You can configure any interface here, including loopback or bvi */
Router(config-bgp-nbr)# address-family ipv4 unicast
Router(config-bgp-nbr-af)# route-policy pass-all in
Router(config-bgp-nbr-af)# route-policy pass-all out
Router(config-bgp-nbr-af)# commit
```

Running Configuration

```
router bgp 100
 neighbor 209.165.200.225
  vrf vrfl
  exit
  rd auto
  address-family ipv4 unicast
  redistribute connected
  exit
  neighbor 209.165.200.225
  remote-as 2000
  bfd fast-detect
  bfd multiplier 3
  bfd minimum-interval 50
  ebgp-multihop 255
  update-source loopback 1
  address-family ipv4 unicast
  route-policy pass-all in
  route-policy pass-all out
```

Verification

Coexistence Between BFD over Bundle and BFD over Logical Bundle

The coexistence between BFD over Bundle (BoB) and BFD over Logical Bundle (BLB) feature allows you to monitor either physical bundle member for BOB, or logical interface for BLB, or both. This feature enables BFD to converge fast.

Difference between BoB and BLB

BFD over Bundle (BoB) (RFC 7130) has a BFD session on each bundle member. The client is the bundle manager. If a BFD session goes down on a specific member link, the whole bundle interface goes down. That is, when the member link goes down, the number of available links falls below the required minimum. Hence the routing session is brought down.

BFD over Logical Bundle (BLB) (RFC 5880) treats a bundle interface with all its members as a single interface. BLB is a multipath (MP) single-hop session. If BLB is configured on a bundle there is only one single BFD session that is active. This implies that only one bundle member is being monitored by BFD at any given time. The client is one of the routing protocols. When BFD detects a failure, the client brings down the routing session.

The mode (BoB or BLB) is determined by how you configure BFD:

- You can enable BoB by configuring BFD under a Bundle-Ether interface.
- You can enable BLB by configuring BFD under a Bundle-Ether interface on a routing client.

Coexistence modes for BoB and BLB

Logical coexistence mode:

When BoB and BLB coexistence is configured in logical mode, only BLB sessions using the main bundle interface's IPv4 address are inherited from the BoB session. BLB sessions configured on bundle sub-interfaces, each with a unique IPv4 address, will establish independent sessions. BLB sessions on loopback interfaces associated with the bundle also operate separately from the main bundle interface.

Inherit Coexistence Mode

In inherit mode, the system does not initiate a standalone BLB session on either the main interface or the sub-interfaces if BoB is not configured on the bundle. In this situation, the BLB session stays in a virtual *Down* state until a corresponding BoB session becomes available. In inherit mode, the BLB session always depends on the inherited BoB session and does not establish its own BFD session with real packets unless BoB is enabled on the bundle. Therefore, without BoB configured on the bundle interfaces, no BLB session will operate in inherit mode.

Functionality Comparison

Logical mode provides greater flexibility by allowing BLB sessions to be established independently on sub-interfaces or loopback interfaces. Inherit mode restricts BLB to inherit only from existing BoB sessions and does not allow independent BLB session establishment.

Note

- Use logical mode when independent BLB sessions per sub-interface or loopback are required.
- Use inherit mode when BLB session activation must be strictly dependent on the presence of a BoB session on the corresponding interface.

Configuration Example

Configure one or more linecards to allow hosting of MP BFD sessions. If no linecards are included, linecards groups are not formed, and consequently no BFD MP sessions are created. For default settings of group size and number, you must add at least two lines with the **bfd multiple-paths include location node-id** command and valid line cards to the configuration for the algorithm to start forming groups and BFD MP sessions to be established.

```
Router(config)# bfd multipath include location 0/0/CPU0
Router(config)# bfd multipath include location 0/1/CPU0

/* Configure inherited coexistence mode */
Router(config)# bfd
Router(config-bfd)# bundle coexistence bob-blb inherit

/* Configure logical coexistence mode */
Router(config)# bfd
Router(config-bfd)# bundle coexistence bob-blb logical
```

Running Configuration

Running configuration for inherited coexistence:

```
bfd
bundle coexistence bob-blb inherit
```

Running configuration for logical mode:

```
bfd
bundle coexistence bob-blb logical
```

Verification

Verify BOB and BLB coexistence inherited mode.

```
Router# show bfd session

BFD CPU Offload Support for IPv6

Table 6: Feature History Table

Feature Name	Release Information	Feature Description
BFD CPU offload support for IPv6	Release 26.1.1	You can now enable CPU offloading for IPv6 BFD sessions, allowing the CPU to handle packet transmission and reception directly. This feature provides you the flexibility to choose between hardware-offloaded and CPU-offloaded IPv6 BFD sessions based on your requirements. This feature introduces these changes: • hw-module profile bfd offload disable-v6
BFD CPU offload support for IPv6		You can now enable CPU offloading for IPv6 BFD sessions, allowing the CPU to handle packet transmission and reception directly. This feature provides you the flexibility to choose between hardware-offloaded and CPU-offloaded IPv6 BFD sessions based on your requirements. This feature introduces these changes: CLI: • hw-module profile bfd offload disable-v6

The BFD CPU offload support for IPv6 feature enables the offload of a BFD session to the CPU, in an IPv6 network.

You can enable CPU offload for IPv6 BFD sessions by using the command **hw-module profile bfd offload disable-v6** and then restarting the router. When CPU offload functionality is enabled, the CPU directly handles BFD sessions, managing packet transmission and reception without offloading the sessions to hardware. If you do not enable CPU offload, BFD sessions are offloaded to the hardware by default.

Benefits of BFD CPU Offload Support for IPv6

The BFD CPU Offload Support for IPv6 feature provides the following benefit:

- **Flexibility:** Supports both hardware and CPU offloaded sessions, providing you with the flexibility to choose between hardware-offloaded and CPU-offloaded IPv6 BFD sessions based on your requirements.

Note IPv6 BFD sessions can be either hardware-offloaded or CPU-offloaded, but both types cannot exist simultaneously.

Limitations for BFD CPU offload support for IPv6

Review these limitations before you use BFD CPU offload support for IPv6.

- In Release 24.4.1, the feature supported only select variants of NCS 5500 fixed port routers and NCS 540 routers, where IPv6 BFD sessions were hosted on the ARM processor. From Release 26.1.1, Cisco extends support to all NCS 5500 fixed port routers, as well as the NCS 540 and NCS 560 routers.
- In Release 24.4.1, only BFD over physical or VLAN interfaces was supported in CPU mode. From Release 26.1.1, BFD over Bundle (BoB), BFD over logical bundle (BLB), Bridge-Group Virtual Interface (BVI), and multihop (MH) sessions are supported.
- Scale limits must be managed to ensure that the rate does not exceed 640 packets per second (PPS). You can check the actual PPS using the **show bfd summary** command.
- For single-path sessions, the minimum-interval value must be greater than or equal to 100 milliseconds.
- The maximum supported scale is 64 IPv6 BFD sessions.
- The BFD agent process is responsible for handling packets. If it crashes or restarts, it can cause BFD sessions to flap.
- When you configure **hw-module profile offload** to prioritize route download or performance-monitoring hardware offload along with Bsync, the router does not support BFD CPU offload sessions.

Configure BFD CPU Offload Support for IPv6

Follow these steps to enable CPU offload for BFD IPv6 sessions:

Procedure

Step 1 Enable CPU Offload.

Example:

```
Router# configure
Router(config)# hw-module profile bfd offload disable-v6
```

Note

Restart the router for the **hw-module** command configuration to take effect.

Step 2 Verify if CPU offload is enabled by using the **show bfd ipv6 session** command.

Example:

```
Router# show bfd ipv6 session
```

Interface	Dest Addr	Local det	time(int*mult)	State
H/W	NPU	Echo	Async	
Te0/0/0/0.501	2001:DB8::1:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP
Te0/0/0/0.502	2001:DB8::2:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP
Te0/0/0/0.503	2001:DB8::3:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP

Te0/0/0/0.504	2001:DB8::4:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP
Te0/0/0/0.505	2001:DB8::5:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP
Te0/0/0/0.506	2001:DB8::6:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP
Te0/0/0/0.507	2001:DB8::7:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP
Te0/0/0/0.508	2001:DB8::8:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP
Te0/0/0/0.509	2001:DB8::9:2			
No	n/a	0s (0s*0)	300ms (100ms*3)	UP

In this sample output, **No** indicates that CPU offload is enabled and hardware offload is disabled.

BFD Object Tracking

Object Tracking is enhanced to support BFD to track the reachability of remote IP addresses. This will enable complete detection and HSRP switch over to happen within a time of less than one second as BFD can perform the detection in the order of few milliseconds

Configuring BFD Object Tracking:

Procedure

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters mode.
Step 2	track track-name Example: RP/0/RP0/CPU0:router(config)# track track1	Enters track configuration mode. <i>track-name</i>—Specifies a name for the object to be tracked.
Step 3	type bfdtr rate tx-rate Example: RP/0/RP0/CPU0:router(config-track)# type bfdtr rate 4	tx_rate - time in msec at which the BFD should probe the remote entity
Step 4	debouncedebounce Example: RP/0/RP0/CPU0:router(config-if)# debounce 10	debounce - count of consecutive BFD probes whose status should match before BFD notifies OT

	Command or Action	Purpose
Step 5	interface <i>if-name</i> Example: <pre>RP/0/RP0/CPU0:router(config-track-line-prot)# interface GigabitEthernet0/0/0/4</pre>	if_name - interface name on the source to be used by BFD to check the remote BFD status.
Step 6	destaddress <i>dest_addr</i> Example: <pre>RP/0/RP0/CPU0:router(config-if)#destaddress 1.2.3.4</pre>	dest_addr - IPV4 address of the remote BFD entity being tracked.
Step 7	Use the commit or end command.	commit —Saves the configuration changes and remains within the configuration session. end —Prompts user to take one of these actions: • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes. • Cancel —Remains in the configuration session, without committing the configuration changes.

BFD Transparency

Bidirectional Forwarding Detection(BFD) protocol is a simple hello mechanism that detects failures in a network in less than one second, depending on the timer value configured.

Both endpoints of a BFD Session periodically send Hello packets to each other. If a number of those packets are not received, the session is considered down. BFD provides fast BFD peer failure detection times independently of all media types, encapsulations, topologies, and routing protocols BGP, IS-IS, and OSPF.

BFD Transparency feature enables you to configure BFD Sessions between customer edge devices connected over an L2VPN network. These BFD sessions are transparent to the core. For example, BFD packets being exchanged between CEs are neither dropped on any router in the core, nor punted on any core device.

In this section, you will learn how to configure BFD Transparency in Ethernet VPN (EVPN) Virtual Private Wire Service (VPWS).

Ethernet VPN Virtual Private Wire Service

EVPN VPWS (Ethernet VPN Virtual Private Wire Service) is a BGP control plane solution for point-to-point services. It implements signaling and encapsulation techniques for establishing an EVPN instance between a pair of provider edge devices.

EVPN VPWS supports both single-homing and multi-homing.

Configuration

The following sections describes the procedure for configuring IP Fast Reroute with Remote LFA.

- Configure L2VPN on the provide edge router
- Configure BFD on the customer edge router

Configure L2VPN on the Provide Edge Router

```
/* Enable IS-IS and configure routing level for an area. */
RP/0//CPU0:router# configure
RP/0//CPU0:router(config)# interface tengige 0/0/0/2.1
RP/0//CPU0:router(config-subif)# exit
RP/0//CPU0:router(config)# router isis
RP/0//CPU0:router(config-isis)# is-type level-2-only
RP/0//CPU0:router(config-isis)# net 49.1234.2222.2222.2222.00
RP/0//CPU0:router(config-isis)# nsr
RP/0//CPU0:router(config-isis)# nsf cisco
RP/0//CPU0:router(config-isis)# address-family ipv4 unicast
RP/0//CPU0:router(config-isis-af)# metric style wide
RP/0//CPU0:router(config-isis)# end
RP/0//CPU0:router(config)# interface Bundle-Ether 199
RP/0//CPU0:router(config-if)# address-family ipv4 unicast
RP/0//CPU0:router(config-if)# end
RP/0//CPU0:router(config)# interface Loopback 0
RP/0//CPU0:router(config-if)# end
RP/0//CPU0:router(config-if)# address-family ipv4 unicast
RP/0//CPU0:router(config-if)# exit

/* Configure L2VPN EVPN address family. */
RP/0//CPU0:router(config)# router bgp 100
RP/0//CPU0:router(config-bgp)# bgp router-id 10.10.10.1
RP/0//CPU0:router(config-bgp)# address-family l2vpn evpn
RP/0//CPU0:router(config-bgp)# neighbor 192.0.2.1
RP/0//CPU0:router(config-bgp-nbr)# remote-as 100
RP/0//CPU0:router(config-bgp-nbr)# update-source Loopback 0
RP/0//CPU0:router(config-bgp-nbr)# address-family l2vpn evpn

/* Configure MPLS LDP for the physical core interface. */
RP/0//CPU0:router(config-bgp-nbr-af)# mpls ldp
RP/0//CPU0:router(config-bgp-nbr-af)# exit
RP/0//CPU0:router(config-bgp-nbr)# exit
RP/0//CPU0:router(config-bgp)# exit
RP/0//CPU0:router(config)# interface Bundle-Ether 199
RP/0//CPU0:router(config-if)# exit

/* Configure L2VPN Xconnect. */
RP/0//CPU0:router(config)# l2vpn
RP/0//CPU0:router(config-l2vpn)# router-id 10.10.10.1
RP/0//CPU0:router(config-l2vpn)# xconnect group bfdtr

BFD Dampening

Table 7: Feature History Table

Feature Name	Release	Description
IPv6 BFD dampening on Cisco 5700 routers	Release 25.1.1	Introduced in this release on: NCS 5700 fixed port routers; NCS 5700 line cards [Mode: Compatibility; Native] You can now prevent excessive network instability and connectivity fluctuations by enabling BFD dampening on IPv6 sessions. With extending support for IPv6 in addition to IPv4, notifications on unnecessary routing updates and traffic disruptions during link flapping are minimized. This mechanism helps in overall network stability and improves router performance.

Bidirectional Forwarding Detection (BFD) is a mechanism used by routing protocols to quickly realize and communicate the reachability failures to their neighbors. When BFD detects a reachability status change of a client, its neighbors are notified immediately. Sometimes it might be critical to minimize changes in routing tables so as not to impact convergence, in case of a micro failure. An unstable link that flaps excessively can cause other devices in the network to consume substantial processing resources, and that can cause routing protocols to lose synchronization with the state of the flapping link.

The BFD Dampening feature introduces a configurable exponential delay mechanism. This mechanism is designed to suppress the excessive effect of remote node reachability events flapping with BFD. The BFD Dampening feature allows the network operator to automatically dampen a given BFD session to prevent excessive notification to BFD clients, thus preventing unnecessary instability in the network. Dampening the

notification to a BFD client suppresses BFD notification until the time the session under monitoring stops flapping and becomes stable.

Configuring the BFD Dampening feature, especially on a high-speed interface with routing clients, improves convergence time and stability throughout the network. BFD dampening can be applied to all types of BFD sessions, including IPv4/single-hop, Multiprotocol Label Switching-Transport Profile (MPLS-TP), and Pseudo Wire (PW) Virtual Circuit Connection Verification (VCCV).

BFD Session Dampening

You can configure the BFD Dampening feature at the BFD template level (single-hop template). Dampening is applied to all the sessions that use the BFD template. If you choose not to have a session to be dampened, you should use a new BFD template without dampening for a new session.

Configuration Verification

```
/* Verify if the BFD session is up, and the timers are configured. */
RP/0//CPU0:router# show bfd session
Thu Jan 4 03:07:15.529 UTC
Interface Dest Addr Local det time(int*mult) State Echo Async H/W NPU
-----
Te0/0/0/16.1 172.16.0.1 0s(0s*0) 200ms(100ms*2) UP Yes
