

# Configuring Traffic Mirroring

This module describes the configuration of the traffic mirroring feature. Traffic mirroring is sometimes called port mirroring, or switched port analyzer (SPAN). You can then pass this traffic to a destination port on the same router.

## Feature Release History

Release	Modification
Release 7.2.1	File Mirroring was introduced.

- [Introduction to Traffic Mirroring, on page 1](#)
- [SPAN Types, Supported Features, and Configurations, on page 6](#)
- [Troubleshoot Traffic Mirroring, on page 21](#)

## Introduction to Traffic Mirroring

Traffic mirroring, also referred to as Port mirroring or Switched Port Analyzer (SPAN), is a Cisco proprietary feature that enables you to monitor network traffic passing in or out of a set of ports on a router. You can then mirror this traffic to a remote destination or a destination port on the same router.

Traffic mirroring copies traffic from one or more source ports and sends the copied traffic to one or more destinations for analysis by a network analyzer or other monitoring devices. Traffic mirroring does not affect the flow of traffic on the source interfaces or sub-interfaces. It allows the mirrored traffic to be sent to a destination interface or sub-interface.

For example, you can attach a traffic or network analyzer to the router and capture the ethernet traffic that is sent by host A to host B.

Figure 1: Traffic Mirroring Operation

## Traffic Mirroring Terminology

- Ingress Traffic — Traffic that comes into the router.
- Egress Traffic — Traffic that goes out of the router.
- Source port—A port that is monitored with the use of traffic mirroring. It is also called a monitored port.
- Destination port—A port that monitors source ports, usually where a network analyzer is connected. It is also called a monitoring port.
- Monitor session—A designation for a collection of SPAN configurations consisting of a single destination and, potentially, one or many source ports.

## Traffic Mirroring Types

These are the supported traffic mirroring types.

- Local SPAN
- [Remote SPAN](#)
- [SPAN on Subinterfaces](#)
- ACL-based SPAN
- ERSPAN
- File Mirroring

## Characteristics of Source Port

A source port, also called a monitored port, is a routed port that you monitor for network traffic analysis. In a single traffic mirroring session, you can monitor source port traffic. The Cisco NCS540 Series routers support a maximum of up to 800 source ports.

A source port has these characteristics:

- It can be any data port type, such as Bundle Interface, 100 Gigabit Ethernet physical port, or 10 Gigabit Ethernet physical port.

- Each source port can be monitored in only one traffic mirroring session.
- When a port is used as a source port, the same port cannot be used as a destination port.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor local traffic mirroring. Remote traffic mirroring is supported both in the ingress and egress directions. For bundles, the monitored direction applies to all physical ports in the group.

## Characteristics of Monitor Session

A monitor session is a collection of traffic mirroring configurations consisting of a single destination and, potentially, many source interfaces. For any given monitor session, the traffic from the source interfaces (called *source ports*) is sent to the monitoring port or destination port. If there are more than one source port in a monitoring session, the traffic from the several mirrored traffic streams is combined at the destination port. The result is that the traffic that comes out of the destination port is a combination of the traffic from one or more source ports.

Monitor sessions have these characteristics:

- A single monitor session can have only one destination port.
- A single destination port can belong to only one monitor session.
- A monitor session can have a maximum of 800 source ports. This maximum limit is applicable only when the maximum number of source ports from all monitoring sessions does not exceed 800.

## Characteristics of Destination Port

Each session must have a destination port or file that receives a copy of the traffic from the source ports.

A destination port has these characteristics:

- A destination port cannot be a source port.
- A destination port must reside on the same router as the source port for local traffic mirroring. For remote mirroring, the destination is always a GRE tunnel.
- For remote mirroring, the destination is a GRE tunnel.
- A destination port for local mirroring can be any Ethernet physical port, EFP, GRE tunnel interface, or bundle interface. It can be a Layer 2 or Layer 3 transport interface.
- A destination port on router cannot be a VLAN subinterface.
- At any time, a destination port can participate in only one traffic mirroring session. A destination port in one traffic mirroring session cannot be a destination port for a second traffic mirroring session. In other words, no two monitor sessions can have the same destination port.

# Supported Scale

## Restrictions

### Generic Restrictions

The following are the generic restrictions related to traffic mirroring:

- Partial mirroring and sampled mirroring are not supported.
- Sub-interface configured as source interface is not supported on SPAN.
- The destination bundle interfaces flap when:
  - both the mirror source and destination are bundle interfaces in the Link Aggregation Control Protocol (LACP) mode.
  - mirror packets next-hop is a router or a switch instead of a traffic analyzer.

This behavior is observed due to a mismatch of LACP packets on the next-hop bundle interface due to the mirroring of LACP packets on the source bundle interface.

- Bridge group virtual interfaces (BVI) are not supported as source ports or destination ports.
- Bundle members cannot be used as destination ports.
- Fragmentation of mirror copies is not handled by SPAN when SPAN destination MTU is less than the packet size. Existing behaviour if the MTU of destination interface is less than the packet size is as below:

Platforms	Rx SPAN	Tx SPAN
NCS 5500	Mirror copies are not fragmented. Receives whole packets as mirror copies.	Mirror copies are fragmented.

You can configure the SPAN destination with an MTU which is greater than the packet size.

- SPAN only supports port-level source interfaces.
- SPAN counters are not supported.

### ACL-based SPAN Restrictions

The following restrictions apply to SPAN-ACL:

- **Table 1: SPAN-ACL Support**

Platforms	Rx Direction	Tx Direction
NCS 5500	Supported at the port level, that is, in the ingress direction for IPv4 or IPv6 ACLs.	Not supported.

- MPLS traffic cannot be captured with SPAN-ACL.

- ACL for any MPLS traffic is not supported.
- Traffic mirroring counters are not supported.
- ACL-based traffic mirroring is not supported with Layer 2 (ethernet-services) ACLs.
- Main interface as span source interface and ACL with the **capture** keyword on same main interface's sub-interface are not supported.
- If a SPAN session with the **acl** keyword is applied on an interface with no ACL rule attached to that interface, SPAN happens without any filtering.
- Configure one or more ACLs on the source interface to avoid default mirroring of traffic. If a Bundle interface is a source interface, configure the ACL on the bundle interface (not bundle members). Also, ensure that the ACL configured is a UDK (with capture field) and of the same protocol type and direction as the SPAN configuration. For example, if you configure SPAN with ACL for IPv4 or IPv6, configure an ingress IPv4 UDK (with capture) or IPv6 UDK (with capture) on that network processing unit respectively.
- Configure one or more ACLs on the source interface or any interface on the same network processing unit as the source interface, to avoid default mirroring of traffic. If a Bundle interface is a source interface, configure the ACL on any interface on the same network processing unit as all active bundle-members. Bundle members can be on multiple NPUs. Also, ensure that the ACLs configured are of the same protocol type and direction as the SPAN configuration. For example, if you configure SPAN with ACL for IPv4 or IPv6, configure an ingress IPv4 or IPv6 ACL on that network processing unit respectively.

### ERSPAN Restrictions

This section provides the restrictions that apply to ERSPAN and multiple ERSPAN sessions.

The following restrictions apply to ERSPAN:

- The value of ERSPAN session-ID is always zero. IOS XR command for configuring ERSPAN is not available.
- ERSPAN next-hop must have ARP resolved. Any other traffic or protocol will trigger ARP.
- ERSPAN packets with outgoing interface having MPLS encapsulation are not supported.
  - Additional routers may encapsulate in MPLS.
- ERSPAN sessions can be created only on physical interfaces. The sessions cannot be created on sub-interfaces.
- ERSPAN tunnel statistics is not supported.
- ERSPAN decapsulation is not supported.
- ERSPAN does not work if the GRE next hop is reachable over sub-interface. For ERSPAN to work, the next hop must be reachable over the main interface.
- ERSPAN decapsulation is not supported. Tunnel destination should be network analyzer.

### Multiple ERSPAN Restrictions

- All sessions under the source port should have SPAN access control list (ACL) enabled.

- A few sessions with SPAN ACL and a few without SPAN ACLs in the same source interface are not supported.
- No two sessions should have the same ACL in the same source interface. Each session should have a different ACL.
- Multiple sessions without ACL in the same interface are not supported.
- Multi-SPAN ACL does not support the **Deny** action.
- One SPAN session with the keyword ACL (use security acl as the keyword) and other SPAN sessions with the keyword SPAN ACL are not supported.
- At a time, you can make only one mirror copy of a packet.
- Capturing keywords is not required.
- Multiple sessions under the same interface cannot have a combination of directions. Only RX is supported.

### File Mirroring Restrictions

The following restrictions apply to file mirroring:

- Supported only on Dual RP systems.
- Supports syncing only from active to standby RP. If files are copied into standby `/harddisk:/mirror` location, it won't be synced to active RP.
- A slight delay is observed in `show mirror` command output when mirror checksum configuration is enabled.
- Not supported on multichassis systems.

### Forward-Drop Packets Mirroring Restrictions

These are some restrictions for Forward-Drop packets mirroring:

- Only one global forward-drop session can be configured on a router.
- When traffic-class is configured under monitor-session for forward-drop, the type of service (ToS) byte of the outgoing ERSPAN packet is overwritten with the configured traffic-class value.
- In-band traffic destined to router management interface cannot be captured using this functionality.

# SPAN Types, Supported Features, and Configurations

## Local SPAN

This is the most basic form of traffic mirroring. The network analyzer or sniffer is attached directly to the destination interface. In other words, all monitored ports are located on the same router as the destination port.

# Remote SPAN

## Configure Remote Traffic Mirroring

### Procedure

---

**Step 1**     **configure****Example:**

```
RP/0/RP0/CPU0:router# configure
```

Enters global configuration mode.

**Step 2**     **monitor-session *session-name*****Example:**

```
RP/0/RP0/CPU0:router(config)# monitor-session mon1 ethernet
RP/0/RP0/CPU0:router(config-mon)#
```

Defines a monitor session and enters monitor session configuration mode.

**Step 3**     **destination interface *subinterface*****Example:**

```
RP/0/RP0/CPU0:router(config-mon)# destination interface TenGigE 0/2/0/4.1
```

Specifies the destination subinterface to which traffic is replicated.

**Step 4**     **exit****Example:**

```
RP/0/RP0/CPU0:router(config-mon)# exit
RP/0/RP0/CPU0:router(config)#
```

Exits monitor session configuration mode and returns to global configuration mode.

**Step 5**     **interface *type number*****Example:**

```
RP/0/RP0/CPU0:router(config)# interface HundredGigE 0/0/1/0
```

Enters interface configuration mode for the specified source interface. The interface number is entered in *rack/slot/module/port* notation. For more information about the syntax for the router, use the question mark (?) online help function.

**Step 6**     **monitor-session *session-name* ethernet direction rx-onlyport-only****Example:**

```
RP/0/RP0/CPU0:router(config-if)# monitor-session mon1 ethernet
direction rx-only port-only
```

Specifies the monitor session to be used on this interface. Use the **direction** keyword to specify that only ingress or egress traffic is mirrored.

### Step 7 **end** or **commit**

#### Example:

```
RP/0/RP0/CPU0:router(config-if)# end
```

or

```
RP/0/RP0/CPU0:router(config-if)# commit
```

Saves configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:

```
Uncommitted changes found, commit them before exiting (yes/no/cancel)?
[cancel]:
```

- Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
- Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
- Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.
- Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.

Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.

### Step 8 **show monitor-session [session-name] status [detail] [error]**

#### Example:

```
RP/0/RP0/CPU0:router# show monitor-session
```

Displays information about the traffic mirroring session.

#### Example

This example shows the basic configuration for traffic mirroring with physical interfaces.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# monitor-session ms1
RP/0/RP0/CPU0:router(config-mon)# destination interface HundredGigE0/2/0/15
RP/0/RP0/CPU0:router(config-mon)# commit

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface TenGigE0/2/0/19
RP/0/RP0/CPU0:router(config-if)# monitor-session ms1 port-level
RP/0/RP0/CPU0:router(config-if)# commit
```

```

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface TenGigE0/2/0/19
RP/0/RP0/CPU0:router(config-if)# monitor-session ms1 direction rx-only port-level
RP/0/RP0/CPU0:router(config-if)# commit

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface TenGigE0/2/0/19
RP/0/RP0/CPU0:router(config-if)# monitor-session ms1 direction tx-only port-level
RP/0/RP0/CPU0:router(config-if)# commit

```

This example shows sample output of the show monitor-session command with the status keyword:

```

RP/0/RSP0/CPU0:router# show monitor-session status
Monitor-session cisco-rtpl
Destination interface HundredGigE 0/5/0/38
=====
Source Interface Dir Status
-----
TenGigE0/5/0/4 Both Operational

-----
Gi0/0/0/4 < Error: FULL Error Details >

```

## SPAN on Subinterfaces

### VLAN Subinterface as Source for Traffic Mirroring

VLAN subinterface provides the flexibility to monitor ingress or egress, or both ingress/egress traffic from all the active subinterfaces of the source VLAN. The active subinterfaces in the source VLAN are considered as source subinterfaces. When subinterfaces are added or removed from the source VLAN, the corresponding traffic is added or removed from the monitoring sources.

### VLAN Interface as Source for Traffic Mirroring

#### Configuration Example

```
Router# configure
Router(config)# monitor-session mon1 ethernet
Router(config-mon)# destination interface tunnel-ip 3
Router(config-mon)# exit
Router(config)# interface HundredGigE 0/1/0/1.10
Router(config-subif)#
Router(config-if-mon)# commit
```

#### Running Configuration

```
Router# show run monitor-session mon1
monitor-session mon1 ethernet
  destination interface tunnel-ip3
!

Router# show run interface HundredGigE 0/1/0/1.10
interface HundredGigE0/1/0/1.10
  encapsulation dot1q 10
  ipv4 address 101.1.2.1 255.255.255.252
  monitor-session mon1 ethernet
  !
!
!
```

#### Verification

```
Router# show monitor-session status
Monitor-session mon1
Destination interface tunnel-ip3
=====
Source Interface Dir Status
-----
HundredGigE 0/1/0/1.10 Operational
```

### VLAN Interface as Source for Traffic Mirroring

#### Configuration Example

```
Router# configure
Router(config)# controller optics 0/0/0/1
Router(config-Optics)# mode etm
Router(config-Optics)# exit
```

```
Router(config)# interface HundredGigE 0/1/0/1.10
Router(config-subif)#
Router(config-if-mon)# commit
```

### Running Configuration

```
Router# show run monitor-session mon1
monitor-session mon1 ethernet
destination interface tunnel-ip3
!

Router# show run interface HundredGigE 0/1/0/1.10
interface HundredGigE0/1/0/1.10
 encapsulation dot1q 20
  ipv4 address 102.1.2.1 255.255.255.252
  monitor-session mon1 ethernet
  !
  !
  !
```

### Verification

```
Router# show monitor-session status
Monitor-session mon1
Destination interface tunnel-ip3
=====
Source Interface Dir Status
-----
HundredGigE 0/1/0/1.10 Operational
```

## Monitoring Traffic Mirroring on a Layer 2 Interface

This section describes the configuration for monitoring traffic on a Layer 2 interface.

### Configuration

To monitor traffic mirroring on a Layer 2 interface, configure the monitor under `l2transport` sub-config of the interface:

```
RP/0/RP0/CPU0:router(config)# interface TenGigE0/0/0/42
RP/0/RP0/CPU0:router(config-if)# l2transport
RP/0/RP0/CPU0:router(config-if-l2)# monitor-session EASTON ethernet port-level
```

### Verification

```
RP/0/RP0/CPU0:router# show monitor-session status
Thu Aug 29 21:42:22.829 UTC
Monitor-session EASTON
Destination interface TenGigE0/0/0/20
=====
Source Interface      Dir      Status
-----
Te0/0/0/42 (port)    Both    Operational
```

## ACL-based SPAN

Traffic is mirrored based on the configuration of the interface ACL.

You can mirror traffic based on the definition of an interface access control list. When you mirror Layer 3 traffic, the ACL is configured using the **ipv4 access-list** or the **ipv6 access-list** command with the **capture** option. The **permit** and **deny** commands determine if the packets in the traffic are permitted or denied. The **capture** option designates the packet is to be mirrored to the destination port, and it is supported only on permit type of Access Control Entries (ACEs).

**Note** Prior to Release 6.5.1, ACL-based traffic mirroring required the use of UDK (User-Defined TCAM Key) with the **enable-capture** option so that the **capture** option can be configured in the ACL.

## Configuring Security ACLs for Traffic Mirroring

This section describes the configuration for creating security ACLs for traffic mirroring.

In ACL-based traffic mirroring, traffic is mirrored based on the configuration of the interface ACL. You can mirror traffic based on the definition of an interface access control list. When you're mirroring Layer 3 or Layer 2 traffic, the ACL is configured using the **ipv4 access-list** or the **ipv6 access-list** command with the **capture** option. The **permit** and **deny** commands determine the behavior of the regular traffic.

### Configure an IPv4 ACL for Traffic Mirroring

Use the following steps to configure ACLs for traffic mirroring.

```
/* Create an IPv4 ACL (TM-ACL) for traffic mirroring */
Router(config)# ipv4 access-list TM-ACL
Router(config-ipv4-acl)# 10 permit udp 10.1.1.0 0.0.0.255 eq 10 any capture
Router(config-ipv4-acl)# 20 permit udp 10.1.1.0 0.0.0.255 eq 20 any
Router(config-ipv4-acl)# exit
Router(config)# commit

/* Validate the configuration */
Router(config)# show run
Thu May 17 11:17:49.968 IST
Building configuration...
!! IOS XR Configuration 0.0.0
!! Last configuration change at Thu May 17 11:17:47 2018 by user
...
ipv4 access-list TM-ACL
 10 permit udp 10.1.1.0 0.0.0.255 eq 10 any capture
 20 permit udp 10.1.1.0 0.0.0.255 eq 20 any
!
```

You have successfully configured an IPv4 ACL for traffic mirroring.

## Configuring UDF-Based Security ACL for Traffic Mirroring

### Before you begin

This section describes the configuration steps for UDF-based security ACLs for traffic mirroring.

## Procedure

### Step 1

**configure**

**Example:**

```
RP/0/RP0/CPU0:router# configure
```

Enters global configuration mode.

### Step 2

**udf** *udf-name* **header** {**inner** | **outer**} {**12** | **13** | **14**} **offset** *offset-in-bytes* **length** *length-in-bytes*

**Example:**

```
RP/0/RP0/CPU0:router(config)# udf udf3 header outer 14 offset 0 length 1
(config-mon)#
```

**Example:**

```
RP/0/RP0/CPU0:router(config)# udf udf3 header inner 14 offset 10 length 2
(config-mon)#
```

**Example:**

```
RP/0/RP0/CPU0:router(config)# udf udf3 header outer 14 offset 50 length 1
(config-mon)#
```

Configures individual UDF definitions. You can specify the name of the UDF, the networking header from which offset, and the length of data to be extracted.

The **inner** or **outer** keywords indicate the start of the offset from the unencapsulated Layer 3 or Layer 4 headers, or if there is an encapsulated packet, they indicate the start of offset from the inner L3/L4.

**Note** The maximum offset allowed, from the start of any header, is 63 bytes

The **length** keyword specifies, in bytes, the length from the offset. The range is from 1 to 4.

### Step 3

**ipv4 access-list** *acl-name*

**Example:**

```
RP/0/RP0/CPU0:router(config)# ipv4 access-list acl1
```

Creates ACL and enters IP ACL configuration mode. The length of the *acl-name* argument can be up to 64 characters.

### Step 4

**permit** *regular-ace-match-criteria* **udf** *udf-name1 value1 ... udf-name8 value8*

**Example:**

```
RP/0/RP0/CPU0:router(config-ipv4-acl)# 10 permit ipv4 any any udf udf1 0x1234 0xffff udf3
0x56 0xff capture
RP/0/RP0/CPU0:router(config-ipv4-acl)# 30 permit ipv4 any any dscp af11 udf udf5 0x22 0x22
capture
```

Configures ACL with UDF match.

### Step 5

**exit**

**Example:**

```
RP/0/RP0/CPU0:router(config-ipv4-acl)# exit
```

Exits IP ACL configuration mode and returns to global configuration mode.

**Step 6** *interfacetype number***Example:**

```
RP/0/RP0/CPU0:router(config)# interface HundredGigE 0/0/1/0
```

Configures interface and enters interface configuration mode.

**Step 7** *ipv4 access-group acl-name ingress***Example:**

```
RP/0/RP0/CPU0:router(config-if)# ipv4 access-group acl1 ingress
```

Applies access list to an interface.

**Step 8** *commit***Example:**

```
RP/0/RP0/CPU0:router(config-if)# commit
```

Applies access list to an interface.

**Verifying UDF-based Security ACL**

Use the **show monitor-session status detail** command to verify the configuration of UDF on security ACL.

```
RP/0/RP0/CPU0:leaf1# show monitor-session 1 status detail
```

```
Fri May 12 19:40:39.429 UTC
Monitor-session 1
  Destination interface tunnel-ip3
  Source Interfaces
  -----
  TenGigE0/0/0/15
    Direction: Rx-only
    Port level: True
    ACL match: Enabled
    Portion: Full packet
    Interval: Mirror all packets
    Status: Not operational (destination not active)
```

**Attaching the Configurable Source Interface****Procedure****Step 1** *configure***Example:**

```
RP/0/RP0/CPU0:router# configure
```

Enters global configuration mode.

**Step 2**     **interface** *type number*

**Example:**

```
RP/0/RP0/CPU0:router(config)# interface HundredGigE 0/0/1/0
```

Enters interface configuration mode for the specified source interface. The interface number is entered in *rack/slot/module/port* notation. For more information about the syntax for the router, use the question mark (?) online help function.

**Step 3**     **ipv4 access-group** *acl-name* {**ingress** | **egress**}

**Example:**

```
RP/0/RP0/CPU0:router(config-if)# ipv4 access-group acl1 ingress
```

Controls access to an interface.

**Step 4**     **monitor-session** *session-name* **ethernet direction rx-only port-level acl**

**Example:**

```
RP/0/RP0/CPU0:router(config-if)# monitor-session mon1 ethernet direction rx-only port-level
acl
RP/0/RP0/CPU0:router(config-if-mon)#
```

Attaches a monitor session to the source interface and enters monitor session configuration mode.

**Note**    **rx-only** specifies that only ingress traffic is replicated.

**Step 5**     **acl**

**Example:**

```
RP/0/RP0/CPU0:router(config-if-mon)# acl
```

Specifies that the traffic mirrored is according to the defined ACL.

**Note**    If an ACL is configured by name, then this step overrides any ACL that may be configured on the interface.

**Step 6**     **exit**

**Example:**

```
RP/0/RP0/CPU0:router(config-if-mon)# exit
RP/0/RP0/CPU0:router(config-if)#
```

Exits monitor session configuration mode and returns to interface configuration mode.

**Step 7**     **end** or **commit**

**Example:**

```
RP/0/RP0/CPU0:router(config-if)# end
```

or

```
RP/0/RP0/CPU0:router(config-if)# commit
```

Saves configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:

```
Uncommitted changes found, commit them before exiting (yes/no/cancel)?
[cancel]:
```

- Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.
- Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.

#### Step 8 **show monitor-session [session-name] status [detail] [error]**

**Example:**

```
RP/0/RP0/CPU0:router# show monitor-session status
```

Displays information about the monitor session.

## ERSPAN

Encapsulated Remote Switched Port Analyzer (ERSPAN) transports mirrored traffic over an IP network. The traffic is encapsulated at the source router and is transferred across the network. The packet is decapsulated at the destination router and then sent to the destination interface.

Encapsulated Remote SPAN (ERSPAN) enables generic routing encapsulation (GRE) for all captured traffic and allows it to be extended across Layer 3 domains.

ERSPAN involves mirroring traffic through a GRE tunnel to a remote site. For more information on configuring the GRE tunnel that is used as the destination for the monitor sessions, see the chapter *Configuring GRE Tunnels*.

**Note** A copy of every packet includes the Layer 2 header if the ethernet keyword is configured. As this renders the mirrored packets unroutable, the end point of the GRE tunnel must be the network analyzer.

## Introduction to ERSPAN Egress Rate Limit

With ERSPAN egress rate limit feature, you can monitor traffic flow through any IP network. This includes third-party switches and routers.

ERSAPN operates in the following modes:

- ERSPAN Source Session – box where the traffic originates (is SPANned).
- ERSPAN Termination Session or Destination Session – box where the traffic is analyzed.

This feature provides rate limiting of the mirroring traffic or the egress traffic. With rate limiting, you can limit the amount of egress traffic to a specific rate, which prevents the network and remote ERSPAN destination traffic overloading. Be informed, if the egress rate-limit exceeds then the system may cap or drop the monitored traffic.

You can configure the QoS parameters on the traffic monitor session.

- Traffic Class (0 through 7)
  - Traffic class 0 has the lowest priority and 7 the highest.
  - The default traffic class is the same as that of the original traffic class.
- The Discard Class (0 through 2):
  - The default is 0.
  - The discard class configuration is used in WRED.

### Benefits

With ERSPAN Egress rate limit feature, you can limit the egress traffic or the mirrored and use the mirrored traffic for data analysis.

### Topology

*Figure 2: Topology for ERSPAN Egress Rate Limit*

The encapsulated packet for ERSPAN is in ARPA/IP format with GRE encapsulation. The system sends the GRE tunneled packet to the destination box identified by an IP address. At the destination box, SPAN-ASIC decodes this packet and sends out the packets through a port. ERSPAN egress rate limit feature is applied on the router egress interface to rate limit the monitored traffic.

The intermediate switches carrying ERSPAN traffic from source session to termination session can belong to any L3 network.

### Configure ERSPAN Egress Rate Limit

Use the following steps to configure ERSPAN egress rate limit:

```

monitor-session ERSPAN ethernet
destination interface tunnel-ip1
!

RP/0/RP0/CPU0:pyke-008#sh run int tunnel-ip 1
  
```

```

interface tunnel-ip1
ipv4 address 4.4.4.1 255.255.255.0
tunnel mode gre ipv4
tunnel source 20.1.1.1
tunnel destination 20.1.1.2
!

RP/0/RP0/CPU0:pyke-008#sh run int hundredGigE 0/0/0/16

interface HundredGigE0/0/0/16
ipv4 address 215.1.1.1 255.255.255.0
ipv6 address 3001::2/64
monitor-session ERSPAN ethernet direction rx-only port-level
    acl
!
ipv4 access-group ACL6 ingress

```

### Running Configuration

```

!! Policy-map to be used with the ERSPAN Destination (egress interface)
!! Traffic class is set to 5. For packets in this class, apply shaping
!! as well as WRED.
class-map match-any TC5
    match traffic-class 5
end-class-map
!
policy-map shape-foo
    class TC5
        random-detect discard-class 0 10000 bytes 40000 bytes
        random-detect discard-class 1 40000 bytes 80000 bytes
        random-detect discard-class 2 80000 bytes 200000 bytes
        shape average percent 15
    !
    class class-default
    !
end-policy-map
!
!!GRE Tunnel Interface
interface Loopback49
    ipv4 address 49.49.49.49 255.255.255.255
!
interface tunnel-ip100
    ipv4 address 130.100.1.1 255.255.255.0
    tunnel mode gre ipv4
    tunnel source 49.49.49.49
    tunnel destination 10.8.1.2
!
!!ERSPAN Monitor Session with GRE tunnel as the Destination Interface, and with QoS
configuration
monitor-session FOO ethernet
    destination interface tunnel-ip100
    traffic-class 5
    discard-class 1
!
!!ERSPAN Source Interface
interface TenGigE0/6/0/4/0
    description connected to TGEN 9/5
    ipv4 address 10.4.90.1 255.255.255.0
    monitor-session FOO ethernet port-level
!
!
!!ERSPAN Destination ip-tunnel100's underlying interface, with egress policy-map shape-foo
attached
interface TenGigE0/6/0/9/0

```

```
service-policy output shape-foo
ipv4 address 10.8.1.1 255.255.255.0
```

## Verification

```
RP/0/RP0/CPU0:ios#show monitor-session FOO status detail

## File Mirroring

Prior to Cisco IOS XR Software Release , the router did not support file mirroring from active RP to standby RP. Administrators had to manually perform the task or use EEM scripts to sync files across active RP and standby RP. Starting with Cisco IOS XR Software Release , the file mirroring feature enables the router to copy files or directories automatically from `/harddisk:/mirror` location in active RP to `/harddisk:/mirror` location in standby RP or RSP without user intervention or EEM scripts.

Two new CLIs have been introduced for the file mirroring feature:

- **mirror enable**

The `/harddisk:/mirror` directory is created by default, but file mirroring functionality is only enabled by executing the `mirror enable` command from configuration terminal. Status of the mirrored files can be viewed with `show mirror status` command.

- **mirror enable checksum**

The `mirror enable checksum` command enables MD5 checksum across active to standby RP to check integrity of the files. This command is optional.

## Configure File Mirroring

File mirroring has to be enabled explicitly on the router. It is not enabled by default.

```
RP/0/RSP0/CPU0:router#show run mirror
```

```

Thu Jun 25 10:12:17.303 UTC
mirror enable
mirror checksum

```

Following is an example of copying running configuration to `harddisk:/mirror` location:

```

RP/0/RSP0/CPU0:router#copy running-config harddisk:/mirror/run_config
Wed Jul  8 10:25:51.064 PDT
Destination file name (control-c to abort): [/mirror/run_config]?
Building configuration..
32691 lines built in 2 seconds (16345)lines/sec
[OK]

```

### Verification

To verify the syncing of file copied to mirror directory, use the `show mirror` command.

```

RP/0/RSP0/CPU0:router#show mirror
Wed Jul  8 10:31:21.644 PDT
% Mirror rsync is using checksum, this show command may take several minutes if you have
many files. Use Ctrl+C to abort
MIRROR DIR: /harddisk:/mirror/
% Last sync of this dir ended at Wed Jul  8 10:31:11 2020
Location      |Mirrored |MD5 Checksum                               |Modification Time
-----
run_config |yes      |76fc1b906bec4fe08ecda0c93f6c7815 |Wed Jul  8 10:25:56 2020

```

If checksum is disabled, `show mirror` command displays the following output:

```
RP/0/RSP0/CPU0:router#show mirror
Wed Jul 8 10:39:09.646 PDT
MIRROR DIR: /harddisk:/mirror/
% Last sync of this dir ended at Wed Jul 8 10:31:11 2020
Location |Mirrored |Modification Time
-----
run_config |yes |Wed Jul 8 10:25:56 2020
```

If there is a mismatch during the syncing process, use `show mirror mismatch` command to verify.

```
RP/0/RP0/CPU0:router# show mirror mismatch
Wed Jul 8 10:31:21.644 PDT
MIRROR DIR: /harddisk:/mirror/
% Last sync of this dir ended at Wed Jul 8 10:31:11 2020
Location |Mismatch Reason |Action Needed
-----
test.txt |newly created item. |send to standby
```

## Troubleshoot Traffic Mirroring

When you encounter any issue with traffic mirroring, begin troubleshooting by checking the output of the **show monitor-session status** command. This command displays the recorded state of all sessions and source interfaces:

```
# show monitor-session status
Monitor-session 5
rx destination interface tunnel-ip5
tx destination is not specified
=====
Source Interface Dir Status
-----
Te0/0/0/23 (port) Rx Operational
```

In the preceding example, the line marked as `<Session status>` can indicate one of these configuration errors:

Session Status	Explanation
Session is not configured globally	The session does not exist in global configuration. Review the command output and ensure that a session with a correct name is configured.
Destination interface <intf> (<down-state>)	The destination interface is not in Up state in the Interface Manager. You can verify the state using the <b>show interfaces</b> command. Check the configuration to determine what might be keeping the interface from coming up (for example, a sub-interface needs to have an appropriate encapsulation configured).

The `<Source interface status>` can report these messages:

Source Interface Status	Explanation
Operational	Everything appears to be working correctly in traffic mirroring. If you are still having issues, follow up with the platform teams in the first instance, if mirroring is not operating as expected.

Source Interface Status	Explanation
Not operational (Session is not configured globally)	The session does not exist in global configuration. Check the <b>show</b> command output to ensure that a session with the right name has been configured.
Not operational (destination not known)	The session exists, but it either does not have a destination interface specified or the destination interface named for the session does not exist. For example, if the destination is a sub-interface that has not been created.
Not operational (source same as destination)	The session exists, but the destination and source are the same interface. Traffic mirroring does not work.
Not operational (destination not active)	The destination interface is not in the Up state. See the corresponding <i>status</i> error messages for suggested resolution.
Not operational (source state <down-state>)	The source interface is not in the Up state. You can verify the state of the interface with the <b>show interfaces</b> command. Check the configuration to see whether you are keeping the interface from coming up (for example, a sub-interface that does not have an appropriate encapsulation configured).
Error: see detailed output for explanation	Traffic mirroring has encountered an error. Run the <b>show monitor-session status detail</b> command to display more information.

The **show monitor-session status detail** command displays full details of the configuration parameters and any errors encountered. For example:

```
RP/0/RP0/CPU0:router show monitor-session status detail
```

```
Monitor-session sess1
