

Configuring Manageability

This module describes the configuration required to enable the Extensible Markup Language (XML) agent services. The XML Parser Infrastructure provides parsing and generation of XML documents with Document Object Model (DOM), Simple Application Programming Interface (API) for XML (SAX), and Document Type Definition (DTD) validation capabilities:

- DOM allows customers to programmatically create, manipulate, and generate XML documents.
- SAX supports user-defined functions for XML tags.
- DTD allows for validation of defined document types.

Information about XML Manageability

The Cisco IOS XR Extensible Markup Language (XML) API provides a programmable interface to the router for use by external management applications. This interface provides a mechanism for router configuration and monitoring utilizing XML formatted request and response streams. The XML interface is built on top of the Management Data API (MDA), which provides a mechanism for Cisco IOS XR components to publish their data models through MDA schema definition files.

Cisco IOS XR software provides the ability to access the router via XML using a dedicated TCP connection, Secure Socket Layer (SSL), or a specific VPN routing and forwarding (VRF) instance.

How to Configure Manageability

Configuring the XML Agent

This explains how to configure the XML agent.

Procedure

	Command or Action	Purpose
Step 1	xml agent [<i>ssl</i>] Example: RP/0/RP0/CPU0:router(config)# xml agent ssl	Enables Extensible Markup Language (XML) requests over a dedicated TCP connection and enters XML agent configuration mode. Use the ssl keyword to enable XML requests over Secure Socket Layer (SSL).
Step 2	iteration on size <i>iteration-size</i> Example: RP/0/RP0/CPU0:router(config-xml-agent)# iteration on size 500	Configures the iteration size for large XML agent responses in KBytes. The default is 48.
Step 3	session timeout <i>timeout</i> Example: RP/0/RP0/CPU0:router(config-xml-agent)# session timeout 5	Configures an idle timeout for the XML agent in minutes. By default, there is no timeout.
Step 4	throttle { <i>memory size</i> <i>process-rate tags</i> } Example: RP/0/RP0/CPU0:router(config-xml-agent)# throttle memory 300	Configures the XML agent processing capabilities. <ul style="list-style-type: none"> Specify the memory size in Mbytes. Values can range from 100 to 600. In IOS XR 64 bit, the values range from 100 to 1024. The default is 300. Specify the process-rate as the number of tags that the XML agent can process per second. Values can range from 1000 to 30000. By default the process rate is not throttled.
Step 5	vrf { <i>vrfname</i> <i>default</i> } [<i>ipv4 access-list access-list-name</i>] Example: RP/0/RP0/CPU0:router(config-xml-agent)# vrf vrf1	Configures the dedicated agent or SSL agent to receive and send messages via the specified VPN routing and forwarding (VRF) instance.

Configuration Examples for Manageability

Enabling VRF on an XML Agent: Example

The following example shows how to configure the XML SSL agent to receive and send messages through VRF1, VRF2, and the default VRF:

```
RP/0/RP0/CPU0:router(config)# xml agent ssl
RP/0/RP0/CPU0:router(config-xml-ssl)# vrf VRF1
RP/0/RP0/CPU0:router(config-xml-ssl-vrf)# vrf VRF2
```

The following example removes access for VRF2 from the dedicated XML agent:

```
RP/0/RP0/CPU0:router(config)# xml agent ssl  
RP/0/RP0/CPU0:router(config-xml-ssl)# no vrf VRF2
```
