

# What is Smart Licensing?

Smart Licensing is a cloud-based, flexible software licensing model that enables you to activate and manage Cisco software licenses across their organization. Smart Licensing solution allows you to easily track the status of your license and software usage trends. Cisco Smart Licensing establishes a pool of licenses or entitlements that can be used across the entire organization in a flexible and automated manner. Smart Licensing helps simplify four core functions:

- **Purchase**—Creates a Smart Account (and optionally, your Virtual Account). Licenses are added to your Smart Account and are immediately available for use.
- Install—Register your product with your Smart Account using an account-based Registration Token. Thereafter, the entire process is automatic. Product Activation Keys (PAKs) and license files are no longer needed.
- Management—Make changes to license consumption by updating your configuration; any license change is automatically reflected in your Smart Account. You can share licenses in your Virtual Account through the license pooling option. License pools (logical grouping of licenses) can reflect your organization structure. Smart Licensing solution also offers Cisco Smart Software Manager, a centralized portal that enables you to manage all your Cisco software licenses from one centralized website.
- Visibility and Asset Management—Cisco Smart Software Manager (CSSM) portal offers an integrated view of the licenses you own and have deployed. You can use this data to make better purchase decisions, based on your consumption.
- What is Flexible Consumption Model?, on page 1
- How Does Smart Licensing Work?, on page 3
- What is Cisco Smart Software Manager?, on page 4
- Configuring Smart Licensing, on page 6
- Registering and Activating Your Router, on page 12
- Verifying the Smart Licensing Configuration, on page 17

# What is Flexible Consumption Model?

The Flexible Consumption Model (FCM) provides the capability and flexibility to purchase software capacity as needed. FCM delivers the following:

• Pay-as-you-grow—Enables you to lower initial costs and add more capacity over time.

- Simplify operations—FCM delivers the carrier-class IOS-XR software feature set with two software suites, Essentials and Advantage, that simplifies license management.
- Utilize capital efficiently—License pooling enables an efficient way to share licenses across the network.

Note

FCM is enabled by default for Cisco IOS XR Release 7.1.2 and later.

To enable Flexible Consumption model licensing on routers running Cisco IOS XR Releases 7.1.1 and earlier:

Router(config) # license smart flexible-consumption enable
Router(config) # commit

To verify the Flexible Consumption Model configuration:

Device# show running-config license smart flexible-consumption enable

The following tables provide information about FCM licenses for NCS 540 routers:

#### Table 1: Flexible Consumption Licensing Model Usage Pattern

Flexible Consumption Model Licenses	Consumption Pattern
Essential Licenses: • ESS-AC-10G-RTU-1	License consumption checks are performed on the chassis.
Advantage Licenses:  • ADV-AC-10G-RTU-1	
Hardware Tracking Licenses that support the chassis:  • N540-24Z8Q2C-TRK  • N540X-24Z8Q2C-TRK  • N540-16-TRK	Licensing consumption is checked on every chassis. For example, the N540-24Z8Q2C-TRK license is tracked on the chassis that has this line card.

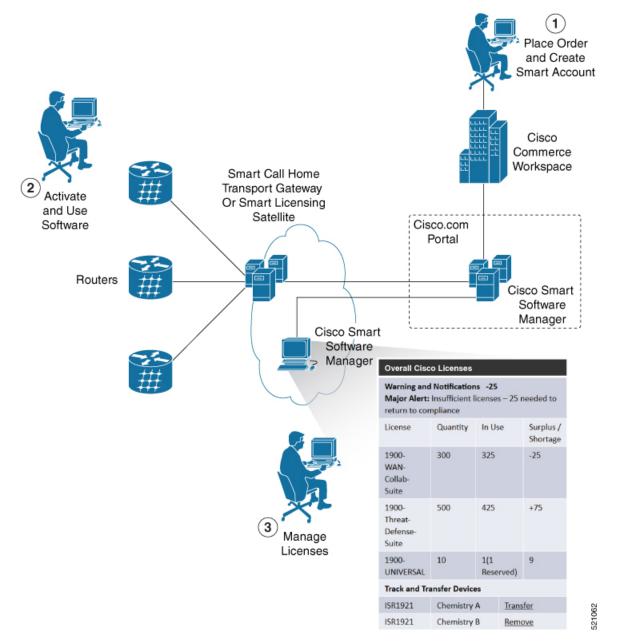

Note

L3VPN requires the following licenses:

- ESS-AC-10G-RTU-1 license if less than (or equal to) 8 VRF tables are configured. It is also applicable for the VRF-lite implementation.
- ADV-AC-10G-RTU-1 license if more than 8 VRF tables are configured. It is also applicable for the VRF-lite implementation.

# **How Does Smart Licensing Work?**

Figure 1: Smart Licensing - Workflow

- 1. Place Order and Create Smart Account—You must have a Smart Account to set up Smart Licensing.
  - **a.** Go to https://software.cisco.com/.
  - b. Under the Administration section, click Get a Smart Account or Request Access to an Existing Smart Account.
  - c. Verify or enter your Cisco.com profile details to complete creating a Smart Account.

- **2.** Activate and Use Software—Register your product. For more information, see the *Registering your Router* section. You can use either of the following options to communicate with the CSSM:
  - Smart Call Home—The Smart Call Home feature is automatically configured. Smart Call Home is
    used by Smart Licensing as a medium for communication with the CSSM. You can use this feature
    to page a network support engineer, email a Network Operations Center, or use Cisco Smart Call
    Home services to generate a case with the Technical Assistance Center. The Call Home feature can
    deliver alert messages containing information about diagnostics and environmental faults and events.
    For more information on Smart Call Home feature, see the Smart Call Home Deployment Guide.
  - Smart Licensing CSSM On-Prem—The Smart licensing on-premise option provides an on-premises
    collector that can be used to consolidate and manage Smart license usage, as well as facilitate
    communications back to the CSSM at Cisco.com.
- **3.** Manage Licenses—You can manage and view reports about your overall license usage in the Smart Software Manager portal.

# What is Cisco Smart Software Manager?

Cisco Smart Software Manager enables you to manage all of your Cisco Smart software licenses from one centralized website. With Cisco Smart Software Manager, you organize and view your licenses in groups called virtual accounts (collections of licenses and product instances). The Cisco Smart Software Manager allows you to:

- Create, manage, or view virtual accounts
- Create and manage Product Instance Registration Tokens
- Transfer licenses between virtual accounts or view licenses
- Transfer, remove, or view product instances
- Run reports against your virtual accounts
- · Modify your email notification settings
- View overall account information

To access the Cisco Smart Software Manager:

- Go to https://software.cisco.com.
- Under the License section, click Smart Software Licensing.

### **Smart Licensing Deployment Options**

The following illustration shows the various options available for deploying Smart Licensing:

Your Software  $(\mathbf{1})$ Usage **HTTPs** Cisco Product Cisco.com Your Software (2) Usage Transport Gateway or Cisco Product HTTPs Proxy Cisco.com Your Cisco Software (3) Usage Smart Cisco Product Cisco.com Software Manager On-Prem File Transfer Your Cisco Software **(4**) Usage **HTTPs** Smart Cisco Product Cisco.com Software 356271 Manager On-Prem

Figure 2: Smart Licensing Deployment Options

- 1. Direct cloud access—In this method, Cisco products send usage information directly over the internet to CSSM on <a href="http://www.cisco.com">http://www.cisco.com</a>; no additional components are needed for deployment.
- 2. Direct cloud access through an HTTPs proxy—In direct cloud access through an HTTPs proxy deployment method, Cisco products send usage information over the internet through a proxy server—either a Smart Call Home Transport Gateway or off-the-shelf Proxy (such as Apache) to CSSM on <a href="http://www.cisco.com">http://www.cisco.com</a>.
- 3. Mediated access through an on-premises collector-connected—In mediated access through an on-premises collector-connected deployment method, Cisco products send usage information to a locally connected collector, which acts as a local license authority. Periodically, the information is exchanged to keep the databases in synchronization.
- **4.** Mediated access through an on-premises collector-disconnected—In the mediated access through an on-premises collector-disconnected deployment method, Cisco products send usage information to a local disconnected collector, which acts as a local license authority. Exchange of human-readable information is performed occasionally (once a month) to keep the databases in synchronization.

Options 1 and 2 provide easy deployment options, whereas options 3 and 4 provide secure environment deployment options.

Note

Smart Software On-Premise provides support for options 3 and 4.

The communication between Cisco devices and CSSM is facilitated by the Smart Call Home software.

# **Configuring Smart Licensing**

### **Prerequisites for Configuring Smart Licensing**

Ensure that you have completed the following activities on Cisco Smart Software Manager:

- Set up a Cisco Smart Account. For more information, see the *How Smart Licensing Works* section in this document.
- Set up Virtual Account or accounts. For more information, see the Virtual Accounts section in the Smart Software Manager Help.
- Create user roles in the **Users** tab in the **Manage Smart Account** page. Provide the appropriate user access rights.
- Accept the Smart Software Licensing Agreement on Cisco Smart Software Manager to register your router.
- Have a layer 3 connection set up on your router.
- Configure a valid DNS and proper time on the router to connect CSSM or CSSM On-Prem.

## **Setting up the Router for Smart Licensing**

Table 2: Three-step Roadmap to Set up the Router for Smart Licensing

Activity	Communication Connection Options			
Step 1—Configure Communications	See the Configuring a Direct Cloud Connection section.  See the Configuring a Connection through a HTTP Proxy section.  See the Connecting to CSSM On-Premise section.			
Step 2—Register and Activate	See the Registering and Activating your Router section.			
Step 3—Verify the Configuration	See the Verifying your Smart Licensing Configuration section.			

# Configuring a Communications Connection Between the Router and Cisco Smart Software Manager

### **Configuring a Direct Cloud Connection**

In this deployment option, the **configure call-home profile** is configured by default. Use the **show call-home profile** all command to check the profile status.

Call Home service provides email-based and web-based notification of critical system events to Cisco Smart Software Manager.

To configure and enable Call Home service:

	Command or Action	Purpose	
Step 1	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 2	call-home	Enters Call Home configuration mode.	
	Example:		
	Router(config)# call-home		
Step 3	service active	Activates Call Home service.	
	Example:		
	Router(config-call-home) # service active		
Step 4	contact-email-addr email-address	Assigns the provided email address. You car	
	Example:	enter up to 200 characters in email addre	
	Router(config-call-home)#	format.	
	contact-email-addr username@example.com	Note Spaces are not allowed in the email address.	
Step 5	profile CiscoTAC-1	Enables the CiscoTAC-1 profile to be used	
	Example:	with the Call Home service. By default, the	
	Router(config-call-home) # profile	CiscoTAC-1 profile is disabled.	
	CiscoTAC-1		
Step 6	destination transport-method http	Enables the Call Home service through an	
	Example:	HTTP connection.	
	Router(config-call-home-profile) # destination transport-method http		
Step 7	destination address http url	Connects the router to the Cisco Smart	
•	Example:	Software Manager.	

	Command or Action	Purpose
	Router(config-call-home-profile)# destination address http https://tools.cisco.com/its/service/cdibe/services/IDEService	
Step 8	active	Enables the destination profile.
	Example:	
	Router(config-call-home-profile) # active	
Step 9	no destination transport-method email	Disables the email option for the Call Home
	Example:	service.
	Router(config-call-home-profile) # no destination transport-method email	
Step 10	commit	Commits the configuration.
	Example:	
	Router(config-call-home-profile)# commit	
Step 11	exit	Exits the Call Home destination profile
	Example:	configuration mode and returns to the Call Home configuration mode.
	Router(config-call-home-profile)# exit	Home configuration mode.
Step 12	exit	Exits the Call Home configuration mode and
	Example:	returns to the global configuration mode.
	Router(config-call-home) # exit Router(config) #	

### **Configuring a Connection Through an HTTP Proxy**

The Call Home service can be configured through an HTTPs proxy server.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 2	call-home	Enters Call Home configuration mode.
	Example:	
	Router(config)# call-home	
Step 3	service active	Enables the Call Home feature.
	Example:	
	Router(config-call-home) # service active	

	Command or Action	Purpose
Step 4	contact-email-address email-address	Configures the default email address.
	Example:	
	Router(config-call-home)# contact-email-addr	
	sch-smart-licensing@cisco.com	
Step 5	http-proxy proxy-address port port-number	Provides the proxy server information to the
	Example:	Call Home service.
	Router(config-call-home) # http-proxy 198.51.100.10 port 3128	
Step 6	profile CiscoTAC-1	Enables the CiscoTAC-1 profile to be used
	Example:	with the Call Home service. By default, the CiscoTAC-1 profile is disabled.
	Router(config-call-home) # profile CiscoTAC-1	ciscome is disasted.
Step 7	no destination transport-method email	Disables the email option for the Call Home
	Example:	service.
	Router(config-call-home-profile)# no destination transport-method email	
Step 8	exit	Exits the Call Home destination profile
	Example:	configuration mode and returns to the Call Home configuration mode.
	<pre>Router(config-call-home-profile)# exit Router(config-call-home)#</pre>	
Step 9	profile profile-name	Enters the Call Home destination profile
	Example:	configuration mode for the specified destination profile name. If the specified
	Router(config-call-home) # profile test1	destination profile does not exist, it is created.
Step 10	reporting smart-licensing-data	Enables data sharing with the Call Home
	Example:	service through the configured transport method, in this case, HTTP.
	Router(config-call-home-profile)# reporting smart-licensing-data	inculou, in this case, 11111.
Step 11	destination transport-method http	Enables the HTTP message transport method.
	Example:	
	Router(config-call-home-profile)# destination transport-method http	
Step 12	destination address http url	Connects the router to the Cisco Smart
	Example:	Software Manager.
	Router(config-call-home-profile) # destination address http https://tools.cisos.com/its/service/odde/services/DDEService	

	Command or Action	Purpose		
Step 13	active	Enables the destination profile.		
	Example:			
	Router(config-call-home-profile) # active			
Step 14	exit	Exits the Call Home destination profile		
	Example:	configuration mode and returns to the Call Home configuration mode.		
	Router(config-call-home-profile)# exit			
Step 15	exit	Exits the Call Home configuration mode and		
	Example:	returns to the global configuration mode.		
	Router(config-call-home) # exit Router(config) #			
Step 16	commit	Commits the configuration.		
	Example:			
	Router(config)# commit			

### **Connecting to CSSM On-Premise**

This section describes how to configure the Call Home service for on-premise smart software through connected or disconnected mode.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 2	call-home	Enters Call Home configuration mode.
	Example:	
	Router(config)# call-home	
Step 3	profile profile-name	Enters the Call Home destination profile
	Example:	configuration mode for the specified
	Router(config-call-home) # profile test1	destination profile name. If the specified destination profile does not exist, it is created.
Step 4	reporting smart-licensing-data	Enables data sharing with the Call Home
	Example:	service through the configured transport
	Router(config-call-home-profile)# reporting smart-licensing-data	method, in this case, HTTP.
Step 5	destination transport-method http	Enables the HTTP message transport method.
	Example:	

	Command or Action	Purpose
	Router(config-call-home-profile)# destination transport-method http	
Step 6	destination address http <i>url</i> Example:	Configures the destination URL (CSSM) to which Call Home messages are sent.
	Router(config-call-home-profile)# destination address http http://209.165.201.15/Trasportgatesay/services/TeviceRequestHardler Or	the IP address or the FQDN as configured for the <b>Host Name</b>
	Router(config-call-home-profile) # destination address http https://209.165.201.15/hasportgatevas/services/haviosRequestHardler	on the CSSM On-Prem.
Step 7	no destination address http url	Removes the default destination address.
	Example:	
	Router(config-call-home-profile) # no destination address http https://tools.cisco.com/its/service/cdde/services/DDEService	
Step 8	destination preferred-msg-format {long-text   short-text   xml}	(Optional) Configures a preferred message format. The default message format is XML.
	<pre>Example: Router(config-call-home-profile)#</pre>	
<u> </u>	destination preferred-msg-format xml	
Step 9	active	Enables the destination profile.
	Example: Router(config-call-home-profile) # active	
Step 10	exit	Exits the Call Home destination profile
	Example:	configuration mode and returns to the Call
	Router(config-call-home-profile)# exit	Home configuration mode.
Step 11	exit	Exits the Call Home configuration mode and
	Example:	returns to the global configuration mode.
	<pre>Router(config-call-home)# exit Router(config)#</pre>	
Step 12	http client source-interface ip-version interface-type interface-number	Configures a source interface for the HTTP client.
	Example:  Router(config) # http client source-interface ipv4 Vlan100	Note This command is mandatory for a VRF interface.

	Command or Action	Purpose	
Step 13	crypto ca trustpool policy crl optional  Example:  Router(config) # crypto ca trustpool policy crl optional	(Optional) Bypasses the Certificate Revocation Lists (CRLs) check and establishes the connection. By default, the CRLs check is mandatory while establishing a TLS connection. We recommend this step when the smart licensing-enabled router is within a network and can rely on the License server to check the certificate status without retrieving and caching each CRL for every peer.	
Step 14	commit	Commits the configuration.	
	<pre>Example: Router(config)# commit</pre>		
Step 15	end	Returns to the global configuration mode.	
	Example: Router(config)# end		

### **Installing CSSM On-Premise**

For information on installation instructions, see the Smart Software Manager On-Prem Installation Guide.

# **Registering and Activating Your Router**

Product registration securely associates a device with the Smart Account and the Virtual Account of your choice. It also establishes trust between the end product and the CSSM. Tokens are used to register a product with the appropriate Virtual Account on CSSM Cloud (on Cisco.com) or CSSM On-Premise.

Note

When the router is in an unregistered state, the licenses are in EVAL (evaluation) mode. Evaluation period will last for 90 days.

#### A Registration Token:

- Can be either used once or reused multiple times. You can set a limit to the number of times a token can be reused when you create the token.
- Can be created and revoked at any time.
- Expires after a period of time (default is 30 days; minimum is one day; maximum is 365 days)

#### A Registration Token is not:

- Product specific: The same Registration Token can be used on different product types.
- A license, key, or PAK.
- Stored on the Cisco device and they are not persistent.

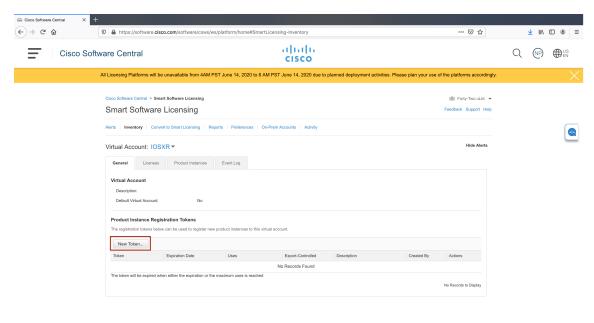

• Required after the product is registered. Token expiration has no effect on previously registered products; it simply means that that token can no longer be used to register a new product.

### **Generating a New Token from CSSM**

#### **Procedure**

- **Step 1** If you choose the direct cloud access deployment option, log in to CSSM from https://software.cisco.com/#.

  If you chose the mediated access deployment option, log in to CSSM On-Prem from https://son-prem-ip-address>:8443.
- **Step 2** Select the **Inventory** tab.
- **Step 3** From the Virtual Account drop-down list, choose the virtual account to which you want to register your product.
- **Step 4** Select the **General** tab.
- Step 5 Click New Token.

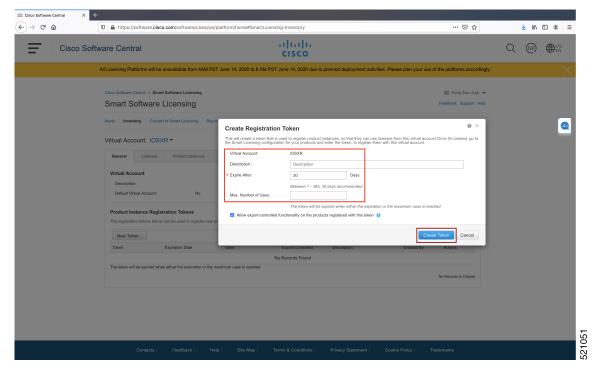

The Create Registration Token window is displayed.

**Step 6** In the **Description** field, enter the token description.

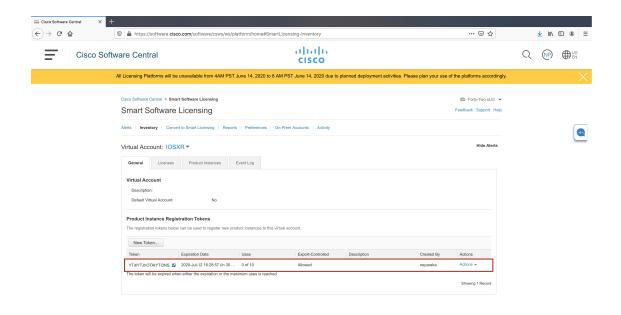

In the **Expire After** field, enter the number of days the token must be active. The default value is 30 days. In the **Max. Number of Uses** field, enter the maximum number of uses allowed after which the token expires.

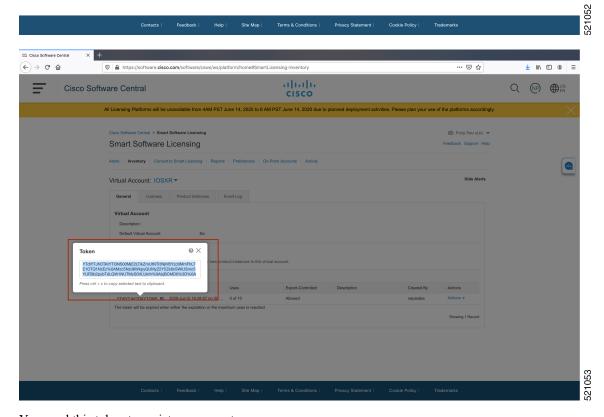

Select the **Allow export-controlled functionality on the products registered with this token** checkbox to ensure Cisco compliance with US and country-specific export policies and guidelines. For more information, see <a href="https://www.cisco.com/c/en/us/about/legal/global-export-trade.html">https://www.cisco.com/c/en/us/about/legal/global-export-trade.html</a>.

Click Create Token.

**Step 7** After the token is created, select and copy the token to a text file.

You need this token to register your router.

#### What to do next

See the *Registering Your Device With the Token* section.

### **Registering Your Device With the Token**

#### **Procedure**

	Command or Action	Purpose
Step 1	license smart register idtoken token-ID	Registers Smart Licensing on the router using
	Example: license smart register idtoken \$114UytiNMPzEsId&WeUTWEC5ahrZJCFDalFwbVRa%QAblFMbz0%3D%QA	the registration token created in the CSSM. On successful registration, the product instance is created in the CSSM virtual account and its license usage is displayed on the CSSM.

### **Renewing Your Smart Licensing Registration**

Your registration is automatically renewed every six months. To find the status of the license, use the **license smart renew auth** command.

As long as the license is in an 'Authorized' or 'Out-of-compliance' (OOC) state, the authorization period is renewed. Grace period starts when an authorization period expires. During the grace period or when the grace period is in the 'Expired' state, the system continues to try to renew the authorization period. If a retry is successful, a new authorization period starts.

Note

If the smart license renewal fails, then the product instance goes to an unidentified state and starts consuming the evaluation period.

#### Before you begin

Ensure that the following conditions are met to renew your smart license:

- · Smart licensing is enabled.
- The router is registered.

	Command or Action	Purpose
•	license smart renew {auth   id}	Renews your token ID or authorization with
	Example:	Cisco smart licensing.
	Router# license smart renew auth	

### **Deregistering Your Router from CSSM**

When a router is taken off the inventory, shipped elsewhere for redeployment, or returned to Cisco for replacement, you can deregister that router.

#### Before you begin

Ensure that a Layer 3 connection to CSSM is available to successfully deregister the device.

#### **Procedure**

	Command or Action	Purpose
Step 1	license smart deregister  Example: Router# license smart deregister	Cancels the registration of the router and sends the router into evaluation mode. All smart licensing entitlements and certificates on the corresponding platform are removed. The product instance of the router stored on CSSM is also removed.

# **Verifying the Smart Licensing Configuration**

Use the following **show** commands to verify the default Smart Licensing configuration. If any issue is detected, take corrective action before making further configurations.

	Command or Action	Purpose
Step 1	show license status	Displays the compliance status of Smart Licensing. Following are the possible status:
	Example:	
	Router# show license status	Waiting—Indicates that the initial state after your device has made a license entitlement request. The device establishes communication with Cisco and successfully registers itself with the Cisco license manager.
		• Authorized—Indicates that your device is able to communicate with the Cisco license manager, and is authorized to initiate requests for license entitlements.
		• Out-Of-Compliance—Indicates that one or more of your licenses are out-of-compliance. Buy more licenses, or renew the existing licenses.
		• Eval Period—Indicates that Smart Licensing is consuming the evaluation period. Register the device with the Cisco

	Command or Action	Purpose
		Licensing manager, else your license expires.
		Repetitive 'Smart Licensing evaluation expired' warning messages are displayed on the console every hour, but there is no functionality impact on the device. To stop these repetitive messages, register the device again with new a registration token.
		• <b>Disabled</b> —Indicates that Smart Licensing is disabled.
		• <b>Invalid</b> —Indicates that Cisco does not recognize the entitlement tag as the tag is not in the database.
Step 2	show license all	Displays all entitlements in use. The output also
	Example: Router# show license all	displays the associated licensing certificates, compliance status, Unique Device Identifier (UDI), and other details.
Step 3	show license status	Displays the status of all entitlements in use.
	Example:	
	Router# show license status	
Step 4	show license udi	Displays the Unique Device Identifier (UDI) information.
	Example:	information.
	Router# show license udi	
Step 5	show license summary	Displays a summary of all entitlements in use.
	Example:	
	Router# show license summary	
Step 6	show license platform summary	Displays the registration status and provides detailed information about the essential,
	Example: Router# show license platform summary	advantage without essentials, advantage with essentials, and tracking license consumption in generic or vortex license model.
Step 7	show license platform detail	Displays detailed information about:
	Example: Router# show license platform detail	Licenses that can be consumed on a platform in both, generic and vortex models

e model, whether generic or odel	
nt against and the next	
ion count of a license	
Displays statistics of the communication between the Smart Licensing manager and the Cisco back-end using Smart Call Home.  Note If the communication fails or drops, check your call home configuration for any errors.	

### **Smart Licensing Configuration Examples**

### **Example: Viewing the Call Home Profile**

To display the http Call Home profile or the On-Prem Call Home profile, use the show call-home profile all command.

```
Router# show call-home profile all
Mon Jul 6 07:12:03.728 UTC
Profile Name: CiscoTAC-1
   Profile status: ACTIVE
   Profile mode: Full Reporting
   Reporting Data: Smart Call Home, Smart Licensing
   Preferred Message Format: xml
   Message Size Limit: 3145728 Bytes
   Transport Method: http
   HTTP address(es): https://tools.cisco.com/its/service/oddce/services/DDCEService
   Other address(es): default
   Periodic configuration info message is scheduled every 5 day of the month at 9:51
   Periodic inventory info message is scheduled every 5 day of the month at 9:36
   Alert-group
                            Severity
