Preface

The Cisco Elastic Services Controller Install and Upgrade Guide describes the installation requirements, the installation procedures, and the upgrade procedures for Cisco Elastic Services Controller.

This preface contains the following sections:

- Audience, page 1
- Terms and Definitions, page 1
- Obtaining Documentation Request, page 2

Audience

This guide is for network administrators who are installing, provisioning, configuring, and monitoring Virtual Network Functions (VNFs). ESC can be deployed on OpenStack, VMware vCenter, and KVM. The administrator must be familiar with the VIM layer, VMware, and OpenStack resources, and the commands used.

Terms and Definitions

The below table defines the terms used in this guide.

Table 1: Terms and Definitions

<table>
<thead>
<tr>
<th>Terms</th>
<th>Definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>HA</td>
<td>ESC High Availability (HA) is a solution for preventing single points of ESC failure and achieving minimum ESC downtime.</td>
</tr>
<tr>
<td>KPI</td>
<td>Key Performance Indicator (KPI) measures performance management. KPIs specify what, how and when parameters are measured. KPI incorporates information about source, definitions, measures, calculations for specific parameters.</td>
</tr>
<tr>
<td>NFV</td>
<td>Network Function Virtualization (NFV) is the principle of separating network functions from the hardware they run on by using virtual hardware abstraction.</td>
</tr>
</tbody>
</table>
NFV Orchestrator (NFVO) is a functional block that manages the Network Service (NS) lifecycle and coordinates the management of NS lifecycle, VNF lifecycle (supported by the VNFM) and NFVI resources (supported by the VIM) to ensure an optimized allocation of the necessary resources and connectivity.

Cisco Network Services Orchestrator (NSO) is an orchestrator for service activation which supports pure physical networks, hybrid networks (physical and virtual) and NFV use cases.

A Service consists of single or multiple VNFs.

The Virtualized Infrastructure Manager (VIM) adds a management layer for the data center hardware. Its northbound APIs are consumed by other layers to manage the physical and virtual resources for instantiation, termination, scale in and out procedures, and fault & performance alarms.

A Virtual Machine (VM) is an operating system OS or an application installed on a software, which imitates a dedicated hardware. The end user has the same experience on a virtual machine as they would have on dedicated hardware.

A Virtual Network Function (VNF) consists of a single or a group of VMs with different software and processes that can be deployed on a Network Function Virtualization (NFV) Infrastructure.

Virtual Network Function Manager (VNFM) manages the life cycle of a VNF.

Cisco vMS is a Network Functions Virtualization (NFV) orchestration platform that enables fast deployment of cloud-based networking services.

Obtaining Documentation Request

Subscribe to What's New in Cisco Product Documentation, which lists all new and revised Cisco technical documentation, as an RSS feed and deliver content directly to your desktop using a reader application. The RSS feeds are a free service.
