Managing VNF Lifecycle Using ETSI API

Managing VNF Lifecycle Using ETSI API

The NFVO communicates with ESC using the ETSI MANO API for lifecycle management of a VNF. A configuration template, the Virtual Network Function Descriptor (VNFD) file describes the deployment parameters and operational behaviors of a VNF type. The VNFD is used in the process of deploying a VNF and managing the lifecycle of a VNF instance.

The lifecycle operations of a VNF instance is as follows:

1. **Create a VNF Identifier**—ESC generates a new VNF Instance Id (a universally unique identifier) that is subsequently used as a handle to reference the instance upon which to execute further operations.
2. **Instantiate / Deploy VNF**—As part of VNF instantiation, ESC instantiates a new VNF instance in the VIM. ESC receives a request to instantiate a VNF instance from NFVO. The instantiate request contains resource requirements, networking and other service operational behaviors. All these requirements along with the VNFD and the grant information provides all the necessary information to instantiate the VNF.
3. **Operate VNF**—ESC allows you to start and stop a VNF instance. The resources are not released or changed, but the VNF instance in the VIM is toggled between these two states.
4. **Query VNF**—To query one or more VNF instances known to ESC. To query one or more VNF instances known to ESC. This is a specific REST end point that can be filtered to find specific instances. The instances can be filtered using the VNF Instance Id.

   Also, a separate REST end point allows the NFVO to query the status of one or more lifecycle operation occurrences associated with a VNF. The lifecycle operations can be filtered using a specific occurrence identifier.
5. **Modify VNF**—ESC allows you to modify the properties of a single VNF instance. The instantiated VNF is updated, and the lifecycle management operation occurrence sends notification to the NFVO about the status of the VNF.
6. **Scale and Scale to Level VNF**—ESC allows you to scale VNFs in two ways. You can scale a VNF incrementally, or to a specific level.
7. **Heal VNF**—ESC heals the VNF when there is a failure.

8. **Terminate / Undeploy VNF**—To terminate the VNF instance in the VIM. The resources themselves remain reserved for the VNF instance, however the VNF itself is undeployed.
9. **Delete VNF Identifier**—The resources are fully released in the VIM and in ESC and the associated VNF instance identifer is also released.

For VNF lifecycle operations using REST and NETCONF APIs, see Configuring Deployment Parameters.

VNF Lifecycle Operations Using ETSI API

Prerequisites

The following prerequisites must be met for VNF lifecycle operations:

- The resource definitions must be created out of band and must be available before VNF instantiation.
- The VIM connector specifies the VIM used. The VIM connector information must be available before instantiating the VNF. ESC must contain a valid, and authenticated default OpenStack VIM connector to deploy the VNFs.
- The VNF to be instantiated has to be onboarded to the NFVO within an ETSI compliant VNF Package.
  - The NFVO must provide ETSI compliant VNF Packages to ESC.
  - The VNF package must contain a VNF Descriptor (VNFD) file.

  The ETSI MANO NFV specifications supports /vnf_packages API to allow access to the package artifacts.See chapter 10 in the *ETSI GS NFV-SOL 003 V2.4.1* specification on the ETSI website.

  The properties file provides details about the NFVO to the ETSI VNFM service.

  The properties file, *etsi-production.properties* exists under: `/opt/cisco/esc/esc_database/`

  The single property *nfvo.apiRoot* allows specification of the NFVO host and port. For example, `nfvo.apiRoot=localhost:8280`.

Note The initial implementation of the ETSI MANO API supports only a single VIM. The tenant/project is currently specified using the resourceGroupId.

For notes on ESC in HA mode, enabled with ETSI service, see the Cisco Elastic Services Controller Install and Upgrade Guide.

Creating the VNF Identifier

Creating the VNF Identifier is the first request for any VNF instance. This identifier is used for all further LCM operations executed by the ETSI API. Resources are neither created nor reserved at this stage.

ESC sends a POST request to create VNF instances:

Method Type:

`POST`

VNFM Endpoint:

```
 /vnf_instances/
```

HTTP Request Headers:

```
 Content-Type:application/json
```

Request Payload (ETSI data structure: CreateVnfRequest):

```
{
    "vnfInstanceName": "Test-VNf-Instance",
    "vnfdId": "vnfd-88c6a03e-019f-4525-ae63-de58ee89db74"
}
```

Response Headers:

```
HTTP/1.1 201
X-Content-Type-Options: nosniff
X-XSS-Protection: 1; mode=block
Cache-Control: no-cache, no-store, max-age=0, must-revalidate
Pragma: no-cache
Expires: 0
X-Frame-Options: DENY
Strict-Transport-Security: max-age=31536000 ; includeSubDomains
X-Application-Context: application:8250
Accept-Ranges: none
Location: http://localhost:8250/vnflcm/v1/vnf_instances/14924fca-fb10-45da-bcf5-59c581d675d8
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Thu, 04 Jan 2018 12:18:13 GMT
```

Response Body (ETSI Data structure:VnfInstance)

```
{
    "_links": {
        "instantiate": {
            "href":
"http://localhost:8250/vnflcm/v1/vnf_instances/14924fca-fb10-45da-bcf5-59c581d675d8/instantiate"

        },
        "self": {
            "href":
"http://localhost:8250/vnflcm/v1/vnf_instances/14924fca-fb10-45da-bcf5-59c581d675d8"
        }
    },
    "id": "14924fca-fb10-45da-bcf5-59c581d675d8",
    "instantiationState": "NOT_INSTANTIATED",
    "onboardedVnfPkgInfoId": "vnfpkg-bb5601ef-cae8-4141-ba4f-e96b6cad0f74",
    "vnfInstanceName": "Test-VNf-Instance",
    "vnfProductName": "vnfd-1VDU",
    "vnfProvider": "",
    "vnfSoftwareVersion": "not-implemented",
    "vnfdId": "vnfd-88c6a03e-019f-4525-ae63-de58ee89db74",
    "vnfdVersion": ""
}
```

Instantiating Virtual Network Functions

The instantiation request triggers a number of message exchanges, which allows the call flow to be completed in order to instantiate a VNF instance. The resources are allocated when the VNF instance is instantiated. It requires the VNF instance identifier, returned by the create VNF request, encoded into the URL to which the request is posted.

The instatiation request sub-tasks within the flow include:

1. Requesting permission from the NFVO (bi-directional Grant flow). For more information see, Requesting Grant Permission.
2. Retrieving the VNF Descriptor template from the NFVO.
3. Requesting the VNF resources to be allocated to the instance from the VIM.

Typically, the request permission, and retrieve messages are customized for the NFVO.

Method type:

```
POST
```

VNFM Endpoint:

```
/vnf_instances/{vnfInstanceId}/instantiate
```

HTTP Request Header:

```
Content-Type:application/json
```

Request Payload (ETSI data structure: InstantiateVNFRequest)

```
{
    "flavourId": "vdu_node1",
    "extManagedVirtualLinks": [
        {
           "id": "esc-net",
            "resourceId": "RES1",
            "virtualLinkDescId": "VLD1"
        }
    ],
    "vimConnectionInfo": [
        {
            "accessInfo": {
                "resourceGroupId": "tenantName"
            },
            "id": "vimConnId",
            "vimType": "Openstack"
        }
    ]
}
```

The flavourId value must be same as the flavour_id specified in the VNFD file under properties.

Response Headers:

```
HTTP/1.1 202
X-Content-Type-Options: nosniff
X-XSS-Protection: 1; mode=block
Cache-Control: no-cache, no-store, max-age=0, must-revalidate
Pragma: no-cache
Expires: 0
X-Frame-Options: DENY
Strict-Transport-Security: max-age=31536000 ; includeSubDomains
X-Application-Context: application:8250
Accept-Ranges: none
Location: http://localhost:8250/vnflcm/v1/vnf_lcm_op_occs/457736f0-c877-4e07-8055-39dd406c616b
Content-Length: 0
Date: Thu, 04 Jan 2018 12:20:40 GMT
```

Response Body:

```
not applicable.
```

You can customize the VNF before instantiation by adding variables to the VNFD template. Specify the variables in the *additionalParams* field of the LCM request. The variables are name-value pairs, where the value can be either string, numeric or boolean. In the example below, the *cpus*, and *mem_size additionalParams* are defined in the VNFD template using the get_input: <VARIABLE_NAME>.

Method type:

```
POST
```

VNFM Endpoint:

```
/vnf_instances/{vnfInstanceId}/instantiate
```

HTTP Request Header:

```
Content-Type:application/json
```

Request Payload (ETSI data structure: InstantiateVNFRequest)

```
{
    "flavourId": "default",
    "additionalParams": {
        "CPUS": 2,
        "MEM_SIZE": "512 MB"
    }
}'
```

When this template is submitted to the VNFM, the variables are merged into the same VNF instance.

The *additionalParams* variables are merged with the VNF variables, and actual values for the variables are provided only during instantiation.

The *cpus*, and *mem_size* variables are merged with the VNF variables in the example below.

```
node_templates:
    my_server:
      type: tosca.nodes.Compute
      capabilities:
        host:
          properties:
            num_cpus: { get_input CPUS }
            mem_size: { get_input MEM_SIZE }
            disk_size: 10 GB

topology_template:
inputs:
CPUS
description: Number of CPUs
MEM_SIZE
description: Memory size
```

If further LCM requests with *additionalParams* variables are submitted for the same VNF, then the new variables overwrite the existing variables. The VNFM uses the new variables for instantiation.

Note The additional variables must be initially defined in the VNFD template, so that it can be used during instantiation, else the submission will fail.

ESC supports internal virtual links while instantiating a VNF using the TOSCA VNFD template.

Example for Virtual Internal Links from a TOSCA VNFD template:

```
   esc-test-net:
      type: tosca.nodes.nfv.VnfVirtualLinkDesc
      properties:
        connectivity_type:
          layer_protocol: ipv4
        description: VDU Internal Network VL

    EtsiTestInternalVL-Net-1:
      type: tosca.nodes.nfv.VnfVirtualLinkDesc
      properties:
        connectivity_type:
          layer_protocol: ipv4
        description: VDU Internal Network VL
        externally_managed: false
```

Requesting Grant Permission

The ETSI API requests for permission from the NFVO for lifecycle management operations to complete the operations in progress for the VNF instance resources.

```
{
  "vnfInstanceId":"b9909dde-e21e-45ec-9cc0-9e9ae413eee0",
  "vnfLcmOpOccId":"d1409dde-f23e-61fh-9dc4-9e9eg667egb7",

}
```

Querying Virtual Network Functions

Querying VNFs does not affect the state of any VNF instance. This operation simply queries ESC for all the VNF instances it knows about, or a specific VNF isntance.

Method Type:

```
GET
```

VNFM Endpoint:

```
/vnf_instances/vnf_instances/{vnfInstanceId}
```

HTTP Request Header:

```
Content-Type: application/json
```

Request Payload:

```
not applicable.
```

Response Headers:

```

Modifying Virtual Network Functions

You can modify or update the properties of a VNF instance using the modify VNF lifecycle operation. ESC receives a PATCH request from NFVO to modify a single VNF instance.

A JSON merge algorithm is applied from the input payload against the stored data to modify the VNF instance.

Note Modifying VNF operation updates only the properties, but not the functionality of the VNF.

The VNF is instantiated and deployed within ESC. The modify VNF operation does not affect the VIM.

The following properties of an existing VNF instance can be modified:

- vnfInstanceName
- vnfInstanceDescription
- onboardedVnfPkgInfoId (null value is not allowed)
- vnfConfigurableProperties
- metadata
- extensions
- vimConnectionInfo

Method Type

```
PATCH
```

VNFM Endpoint

```
/vnf_instances/{vnfInstanceId}
```

HTTP Request Header

```
Content-Type: application/merge-patch+json
If-Match: ETag value
```

Note **If-Match:** is optional. If specified, its value is validated against the ETag value stored against the VNF (and returned from a single VNF query).

Request Payload (ETSI data structure: VnfInfoModifications)

```
{
    "vnfInstanceName": "My NEW VNF Instance Name",
    "vnfInstanceDescription": "My NEW VNF Instance Description",
    "vnfPkgId": "pkg-xyzzy-123",
    "vnfConfigurableProperties": {
        "isAutoscaleEnabled": "true"
    },
    "metadata": {
        "serialRange": "ab123-cc331",
        "manufacturer": "Cisco"
    },
    "extensions": {
        "testAccess": "false",
        "ipv6Interface": "false"
    },
    "vimConnectionInfo": [
        {
            "id": "vci1",
            "vimType": "openstack",
            "interfaceInfo": {
                "uri": "http://10.51.14.27:35357/v3"
            },
            "accessInfo": {
                "domainName": "default",
                "projectName": "admin",
                "userName": "default"
            }
        }
    ]
}
```

Response Header: NA

Response Body: NA

When the PATCH operation is complete, the VNF instance is modified, and the details are sent to the NFVO through the notification.

Operating Virtual Network Functions

You can start or stop a VNF instance using the operate lifecycle management operation. The VNF instance can be stopped gracefully or forcefully.

Note The OpenStack API supports only forceful stop.

The *changeStateTo* field must have the value STARTED or STOPPED in the request payload, to start or stop a VNF instance.

Permission is also required from the NFVO (bi-directional Grant flow) for this operation. See Requesting Grant Permission for more informaiton.

Method Type:

```
POST
```

VNFM Endpoint:

```
 /vnf_instances/{vnfInstanceId}/operate
```

HTTP Request Headers:

```
Content-Type:application/json
```

Request Payload:

```
{
    "additionalParams": {
        "username": "user1"
    },
    "changeStateTo": "STOPPED",
    "stopType": "FORCEFUL"
}
```

Response Headers:

```
HTTP/1.1 202
X-Content-Type-Options: nosniff
X-XSS-Protection: 1; mode=block
Cache-Control: no-cache, no-store, max-age=0, must-revalidate
Pragma: no-cache
Expires: 0
X-Frame-Options: TEST
Strict-Transport-Security: max-age=31536000 ; includeSubDomains
X-Application-Context: application:8250
Accept-Ranges: none
Location: http://localhost:8250/vnflcm/v1/vnf_lcm_op_occs/e775aad5-8683-4450-b260-43656b6b13e9
Content-Length: 0
Date: Thu, 04 Jan 2018 12:40:27 GMT
```

Response Body:

```
not applicable.
```

Scaling VNFs Using ETSI API

ESC can scale VMs using the ETSI API. The scaling workflow begins when the VNF instance is in the instantiated state. The scaling details are defined in the VNFD by the NFVO.

Scaling of a VNF instance can be achieved in two ways:

- Scale
- Scale to level

As part of scaling,

- Add VM instances to the VNF to scale out.
- Remove VM instances from the VNF to scale in.

Note Currently, ETSI supports only manual scaling.

Scale

ESC can scale a VNF incrementally. The *numberOfSteps* attribute determines the increment by which you can scale the VNF instance. By default, the number of steps is set to 1.

Method type:

```
POST
```

VNFM Endpoint:

```
/vnf_instances/{vnfInstanceId}/scale
```

HTTP Request Header:

```
Content-Type:application/json
```

Request Payload (ETSI data structure: ScaleVnfRequest)

```
{
  "type":"SCALE_OUT",
  "aspectId":"processing",
  "numberOfSteps":"1",
}
```

Response Headers:

```
not applicable.
```

Response Body:

```
not applicable.
```

Scale to Level

Allows ESC to scale the VNF to a specified level.

Method type:

```
POST
```

VNFM Endpoint:

```
/vnf_instances/{vnfInstanceId}/scale_to_level
```

HTTP Request Header:

```
Content-Type:application/json
```

Request Payload (ETSI data structure: ScaleVnfRequest)

```
{
/* "instantiationLevelId":"id111", */
"scaleInfo": [
{ "aspectId":"processing", "scaleLevel":"3" },
{ "aspectId":"database", "scaleLevel":"2" }
]
"additionalParams": {
"password": "pass1234",
"username": "admin"
```

```
}
}
```

Response Headers:

```
not applicable.
```

Response Body:

```
not applicable.
```

Healing VNFs Using ETSI API

As part of the VNF lifecycle management, ESC heals the VNFs when there is a failure. ETSI API heals a VNF instance based on the instructions from the NFVO.

Note Currently, ETSI supports only manual healing.

Method Type:

```
POST
```

VNFM Endpoint:

```
/vnf_instances/{vnfInstanceId}/heal
```

HTTP Request Headers:

```
Content-Type:application/json
```

Request Payload (ETSI data structure: HealVnfRequest):

```
{
"cause":"b9909dde-e21e-45ec-9cc0-9e9ae413eee0",
"additionalParams": {
"password": "pass1234",
"username": "admin"
}
}
```

Response Headers:

```
not applicable.
```

Response Body:

```
not applicable.
```

Manual Recovery of a Deployment

Currently, ETSI supports recovery of a complete deployment.

REST API to heal a complete deployment is as follows:

```
{http_scheme}://{restapi_root}:8080/ESCAPI/#!/Recovery_VM_Operations/handleOperation

/v0/{internal_tenant_id}/deployments/service/{internal_deployment_id}
```

payload:

```
Content-Type: application/xml
Accept: application/json
Callback: http://{etsi-vnfm-callback-endpoint}:{etsi-vnfm-callback-port}/
Callback-ESC-Events: http://127.0.0.1:9010/
 <service_operation xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
   <operation>recover</operation>
</service_operation>
```

where,

internal_tenant_id—is the system admin tenant ID or the tenant name.

internal_deployment_id—is the deployment name.

Both ids are encoded into the URL.

Manual healing of the complete deployment is supported when the deployment (service) is in the following states:

Table 1: VM and Deployment States

VM state	Deployment or service state	recovery-vm-action
error	error	supported
error	active	supported

Terminating Virtual Network Functions

The terminating VNF request terminates a VNF instance. The resources are deallocated but remain reserved for this instance until it is deleted. Permission is required from the NFVO (bi-directional Grant flow) for this operation. The VNF instance can be decommissioned gracefully or forcefully.

Note The OpenStack API supports only forceful termination.

As per the Instantiate VNF Request, the terminate VNF request requires the VNF instance identifier encoded into the URL to which the request is posted.

Method Type:

```
 POST
```

VNFM Endpoint:

```
/vnf_instances/{vnfInstanceId}/terminate
```

HTTP Request Headers:

```
Content-Type:application/json
```

Request Payload (ETSI data structure: TerminateVnfRequest)

```
{
  "terminationType":"FORCEFUL",
```

```
  "additionalParams": {
    "password": "pass1234",
    "username": "admin"
  }
}
```

Response Headers:

```
HTTP/1.1 202
X-Content-Type-Options: nosniff
X-XSS-Protection: 1; mode=block
Cache-Control: no-cache, no-store, max-age=0, must-revalidate
Pragma: no-cache
Expires: 0
X-Frame-Options: TEST
Strict-Transport-Security: max-age=31536000 ; includeSubDomains
X-Application-Context: application:8250
Accept-Ranges: none
Location: http://localhost:8250/vnflcm/v1/vnf_lcm_op_occs/dae25dbc-fcde-4ff9-8fd6-31797d19dbc1
Content-Length: 0
Date: Thu, 04 Jan 2018 12:45:59 GMT
```

Response Body:

```
not applicable.
```

Deleting Virtual Network Functions

Deleting VNF operation releases the VIM resources reserved for the VNF instance as well as deletes the VNF instance identifier. Upon deletion, the VNF instance identifier is no longer available. So, no further lifecycle management operations are possible using this identifier.

Method Type:

```
DELETE
```

VNFM Endpoint:

```
/vnf_instances/{vnfInstanceId}
```

HTTP Request Headers:

```
Content-Type:application/json
```

Request Payload:

```
not applicable.
```

Response Headers:
