

Configuring Deployment Parameters

• Deployment Parameters, on page 1

Deployment Parameters

A VNF deployment is initiated as a service request through the northbound interface or the ESC portal. The service request comprises of templates that consist of XML payloads and deployment parameters. Deployment parameters are rules, policies or day 0 configuration that determine properties of the VNF and its lifecycle. The table below lists the complete list of deployment parameters and how they interoperate on OpenStack or VMware vCenter:

Deployment Parameters	OpenStack	VMware vCenter	VMware vCloud Director
Day 0 Configuration	Day 0 configuration is done in one of the following ways: • NETCONF API • REST API • ESC Portal	in one of the following ways: • NETCONF API • REST API • ESC Portal	• NETCONF API • REST API • ETSI API
Deploying VNFs	Configuration of Individual and Composite VNFs is done in one of the following ways: • NETCONF API • REST API • ESC Portal (You can deploy using the Deployment Template.)	Configuration of Individual and Composite VNFs is done in one of the following ways: • NETCONF API • REST API • ESC Portal (You can configure the VNF settings through the Deployment Form, or the Deployment Template.)	Configuration of Individual and Composite VNFs is done in one of the following ways: • NETCONF API • REST API • ETSI API

Deployment Parameters	OpenStack	VMware vCenter	VMware vCloud Director
Undeploy Virtual Network Functions	Undeploying is done in one of the following ways:	in one of the following ways:	Undeploying VNFs is done in one of the following ways:
	• NETCONF API • REST API	• NETCONF API • REST API	• NETCONF API • REST API
	• ESC Portal	• ESC Portal	• ETSI API
Affinity and anti-affinity Rule	Creating and deleting affinity and anti-affinity rule definitions is done in one of the following ways: • NETCONF API • REST API	Creating and deleting affinity rule definition in one of the following ways: • NETCONF API • REST API • ESC Portal (You can set up affinity and anti-affinity using the Deployment Form.)	Creating and deleting affinity and anti-affinity rule definitions is done in one of the following ways: • NETCONF API • REST API • ETSI API
VNF Operations	VNF Operations are done in one of the following ways:	VNF Operations are done in one of the following ways:	VNF Operations are done in one of the following ways:
	• REST API	• REST API	• REST API
	NETCONF API FOR Partial	NETCONF API FSG Postal	NETCONF API ETGLADI
	• ESC Portal	• ESC Portal For more information, see the Elastic Services Controller Portal.	• ETSI API
Multi Cluster	Not applicable	Multi Cluster configuration is done in one of the following ways: • REST API • ESC Portal For more information, see the	Not applicable
		Deploying VNFs on VMware vCenter using ESC Portal.	
Multiple Virtual Datacenter (Multi VDC)	Not applicable	Multiple Virtual Datacenter selection is done in one of the following ways: • REST API	Not applicable
		• ESC Portal	

Deployment Parameters	OpenStack	VMware vCenter	VMware vCloud Director
Hardware Acceleration	Hardware Acceleration is supported in one of the following ways: • NETCONF API • REST API For more information, see the Hardware Acceleration Support (OpenStack Only) in the Cisco Elastic Services Controller Administration Guide.	Not applicable	Not applicable
Single Root I/O Virtualization	I/O Virtualization is done in	Configuration of Single Root I/O Virtualization is done in one of the following ways: • NETCONF API • REST API	Not applicable

This chapter describes the procedures to configure the deployment customization. For more information on VNF deployment, see Deploying Virtual Network Functions on OpenStack.
