

Cisco Virtualized Infrastructure Manager Release Notes, 2.4.6

First Published: 2018-10-31

Last Modified: 2018-12-04

Introduction

Cisco Network Function Virtualization Infrastructure (Cisco NFVI) provides the virtual layer and hardware environment in which virtual network functions (VNFs) operate. VNFs provide a well-defined network function that offers routing, intrusion, detection, Domain Name Service (DNS), caching, Network Address Translation (NAT), and other network functions. While the network functions required a tight integration between a network software and hardware in the past, VNFs decouple the software from the underlying hardware.

Cisco NFVI is based on the Newton release of OpenStack, an open source cloud operating system that controls large pools of compute, storage, and networking resources. The Cisco version of OpenStack is Cisco Virtualized Infrastructure Manager (CVIM). Cisco VIM manages the OpenStack compute, network, and storage services, and all Cisco NFVI build and control functions.

Key roles of Cisco NFVI pods are:

- Control (including Networking)
- Computes
- Storage
- Management, logging, and monitoring

Hardware that is used to create the Cisco NFVI pods include:

- Cisco UCS® C240 M4 or C240 M5 or C220 M5—Performs management and storage functions, and services. Includes dedicated Ceph (UCS 240-M4 or UCS 240-M5) distributed object store and the file system. (Only Red Hat Ceph is supported).
- Cisco UCS C220/240 M4 or M5 —Performs control and compute services.
- HP DL 360 Gen9: Supports as a third-party Compute, where the control plane is still Cisco UCS servers.
- Cisco UCS B200 M4 blades—It can be used instead of the UCS C220 for compute and control services. The B200 blades and C240 Ceph server are joined with redundant Cisco Fabric Interconnects that are managed by UCS Manager.
- Combination of M5 series servers are supported in micro-pod and VIC/NIC (40G) based Hyper-converged and Micro-pod offering.

The UCS C240 and C220 servers are M4/M5 Small Form Factor (SFF) models where the operating systems boots from HDD for control nodes, from HDD/SSD for compute nodes, and from internal SSD for Ceph nodes. Each UCS C240, C220, and B200 have two 10 GE Cisco UCS Virtual Interface Cards.

Software applications that manage Cisco NFVI hosts and services include:

- Red Hat Enterprise Linux 7.4 with OpenStack Platform 10.0—Provides the core operating system with OpenStack capability. RHEL 7.4 and OSP 10.0 are installed on all Cisco NFVI UCS servers.
- Cisco VIM—An OpenStack orchestration system that helps to deploy and manage an OpenStack cloud offering from bare metal installation to OpenStack services, considering the hardware and software redundancy, security, and monitoring. Cisco VIM includes the OpenStack Newton release with more features and usability enhancements that are tested for functionality, scale, and performance.
- Cisco Unified Management—Deploys, provisions, and manages Cisco VIM on Cisco UCS servers. Also, provides UI to manage multiple pods when installed in standalone mode.
- Cisco UCS Manager—Used to perform certain management functions when UCS B200 blades are installed.
- Cisco Integrated Management Controller (IMC)—When installing Cisco VIM 2.4, Cisco IMC 2.0(13i) or later is supported but certain IMC versions are recommended and listed in the below table.

For the Cisco IMC 2.0 lineup, the recommended version information is as follows:

UCS-M4 servers	Recommended: Cisco IMC 2.0(13n) or later.
----------------	---

For the Cisco IMC 3.x lineup, the recommended version is as follows:

UCS-M4 servers	Cisco IMC versions are 3.0(3a) or later, except for 3.0(4a). Recommended: Cisco IMC 3.0(4d). Extended support of 4.0(1a) and 4.0(1b).
UCS-M5 servers	Recommended to stay with Cisco IMC 3.1(2b). Ensure that you do not use 3.1(3c) through 3.1(3h).

- Cisco Virtual Topology System (VTS)— VTS is a standard-based, open, overlay management and provisioning system for data center networks. It automates DC overlay fabric provisioning for physical and virtual workloads.
- Cisco Virtual Topology Forwarder (VTF)—Includes VTS, VTF leverages Vector Packet Processing (VPP) to provide high performance Layer 2 and Layer 3 VXLAN packet forwarding.

Layer 2 networking protocols include:

- VXLAN supported using Linux Bridge
- VTS VLAN supported using ML2/VPP
- VLAN supported using OpenVSwitch (OVS) & ML2/VPP (including SRIOV with Intel NIC 710 NIC)
- VLAN supported using ML2/ACI

For pods that are based on UCS B-Series pods, and pods based on C-series with Intel NIC Single Root I/O Virtualization (SRIOV), the SRIOV allows a single physical PCI Express to be shared on a different virtual environment. The SRIOV offers different virtual functions to different virtual components, for example, network adapters, on a physical server.

You can use any connection protocol unless you install UCS B200 blades with the UCS Manager plugin, in which case, only OVS over VLAN can be used.

Features of Cisco VIM 2.4.6

Cisco VIM is the only standalone fully automated cloud lifecycle manager offered from Cisco for the private cloud. The current version of Cisco VIM, integrates with Cisco C or B-series UCS servers and Cisco or Intel NIC. This document and its accompanying administrator and install guides help the cloud administrators to set up and manage the private cloud.

The following are the features of Cisco VIM:

Feature Name	Comments
OpenStack Version	RHEL 7.4 with OSP 10 (Newton)
Hardware Support Matrix	<ul style="list-style-type: none"> • UCS C220/B200 M4 controller or compute with Intel V3 (Haswell) • UCS C240/220 M4 controller or compute + Intel V4 (Broadwell) • UCS C240/220 M4 controller or compute + Intel V4 (Skylake) • HP DL360 Gen 9 • UCS C220/240 M5 in a Micropod environment, with an option to add up to 16 220/240-M5 computes. • UCS C240/220 M5 controller or compute + Intel X710 NIC and SR-IOV
NIC support	<ul style="list-style-type: none"> • Cisco VIC: VIC 1227, 1240, 1340, 1380 • Intel NIC: X710, 520, XL710

<p>POD Type</p>	<ul style="list-style-type: none"> • Dedicated control, compute and storage (C-Series) node running on Cisco VIC or Intel X710 (full on) with Cisco Nexus 9000 or Cisco NCS 5500 series switch (only for Intel NIC based pod and VPP as mechanism driver) as ToR. • Dedicated control, compute, and storage (C-series) node running on Cisco VIC and Intel NIC (full on) with Cisco Nexus 9000 as ToR. SRIOV is supported on Intel NIC only. <p>Support of Intel X520 (with 2 NIC cards/compute) on M4 pods or XL710 (2 or 4 NIC cards/compute) on M4/M5 pods for SRIOV cards. Few computes can run with/without SRIOV in a given pod.</p> <p>For M4 pods, VIC/NIC computes running XL710 and X520 can reside in the same pod.</p> <ul style="list-style-type: none"> • Dedicated control, compute, and storage (B-Series) node running on Cisco NIC • Micropod: Integrated (AIO) control, compute and storage (C-series) node running on Cisco VIC, or Intel 710 X or VIC/NIC combo. Micro pod can be optionally expanded to accommodate for more computes running with the same NIC type. This can be done as a day-0 or day-1 activity. Support for HDD or SSD-based M5 micropod; Intel NIC-based Micropod supports SRIOV, with the M5-based Micropod supporting XL710 as an option for SRIOV. • Hyper-Converged on M4 (UMHC): Dedicated control and compute nodes, with all storage acting as compute (C-series) nodes, running on a combination of 1-Cisco VIC (1227) and 2x10GE 520 or 2x40GE 710XL Intel NIC with an option to migrate from one to another. • Hyper-Converged (NGENAHC): Dedicated control and compute nodes, with all storage acting as compute (C-series) nodes, running on a combination of 1-Cisco VIC (1227) for the control plane, and 1x10GE 710X (2 port) Intel NIC for the Data plane (over VPP). • Hyper-Converged on M5: Dedicated control and compute nodes, with all storage acting as compute (C-series) nodes, running on a combination of 1-Cisco VIC (40G) and 2x40GE 710XL Intel NIC. <p>Note In a full-on (VIC based) or UMHC M4 pod, computes can either have a combination of 1-Cisco VIC (1227) and (2x10GE 520/2x40GE 710XL Intel NIC) or 1-CiscoVIC (1227). The compute running pure Cisco VIC does not run SR-IOV. In Cisco VIM 2.4, we support HP DL360 Gen9 as a third party compute.</p> <p>A mix of computes from different vendors is not supported.</p>
-----------------	---

ToR and FI support	<ul style="list-style-type: none"> • For VTS-based installation, use the following Nexus version 7.0.3.I7.2 and 9.2 (1). • For the mechanism driver other than VTS, use the following Nexus software version 7.0(3)I4(6) 7.0(3)I6(1). • Support of Cisco NCS 5500 (with recommended Cisco IOS XR version 6.1.33.02I or 6.5.1) with splitter cable support. • Cisco Nexus 9000 switches running ACI 3.0 (for the mechanism driver ACI)
Install or update mode	<ul style="list-style-type: none"> • Connected to the Internet or air-gap. • Support of Software Distribution Server (SDS) to mitigate the problem associated with logistics of USB distribution for air-gapped installation.
IPV6 support for management network	<ul style="list-style-type: none"> • Static IPv6 management assignment for servers. • Support of IPv6 for NTP, DNS, LDAP, external syslog server, and AD. • Support of IPv6 for the cloud API end point.
Mechanism Drivers	<p>OVS/VLAN, Linuxbridge/VXLAN, ACI/VLAN, VPP/VLAN (Fast Networking, Fast Data FD.io > VPP/VLAN, based on the FD.io VPP fast virtual switch).</p> <p>Note VPP with LACP is now the default configuration for data plane.</p>
SDN controller integration	VTS 2.6.2 with optional feature of Managed VTS; ACI (ships in the night or with Unified ACI Plugin) with Cisco VIC or Intel NIC on the UCS C-series M4 platform.
Install Methodology	Fully automated online or offline.

<p>Scale</p>	<ul style="list-style-type: none"> • GA: Full on: Total of 60 nodes (compute and OSD) with Ceph OSD max at 20. • LA: Total of 120 nodes (compute and OSD) with Ceph OSD max at 20. <p>Note It is recommended to deploy 30 nodes at a time. Also, after day-0, you can add only one ceph node at a time.</p> <ul style="list-style-type: none"> • Micropod: Supports maximum of 16 standalone compute nodes. <p>Note Ceph OSDs can be HDD or SSD based, but has to be uniform across the pod. Computes can boot off 2x1.2TB HDD or 2x1.6TB SSD). In the same pod, some computes can have SSD, while others can have HDD.</p>
<p>Automated pod life cycle management</p>	<ul style="list-style-type: none"> • Add or remove compute and Ceph nodes and replace the controller • Reconfiguration of passwords and selected optional services • Automated software update
<p>Platform security</p>	<ul style="list-style-type: none"> • Secure OS, RBAC, network isolation, TLS, source IP filtering, Keystone v3, Bandit, CSDL-compliant, hardened OS, and SELinux. • Enabling change of CIMC password post installation, for maintenance and security. • Non-root log in for Administrators. • Enabling custom policy for VNF Manager. • Option to disable the management node reachability to the cloud API network. • Read-only option for Horizon.
<p>EPA</p>	<ul style="list-style-type: none"> • Supports NUMA, CPU pinning, huge pages, and SRIOV with Intel NIC. • Ability to allocate user defined CPU (upto 6) cores to VPP. • Ability to allocate user defined CPU (upto 12) cores to Ceph for Micropod and hyper-converged nodes.
<p>HA and reliability</p>	<ul style="list-style-type: none"> • Redundancy at hardware and software level. • Automated backup and restore of the management node.

Unified Management (UM) Support	Single pane of glass in a standalone mode. Supports multi-tenancy and manages multiple pods from one instance. LDAP support for authentication to UM.
Central logging	ELK integrated with external syslog (over v4 or v6) for a log offload, with optional support of NFS with ELK snapshot.
External syslog servers	Support of multiple external syslog servers over IPv4 or IPv6. The minimum and maximum number of external syslog server that is supported is 1 and 3, respectively.
VM migration	Cold migration and resizing. Live Migration
Storage	<ul style="list-style-type: none"> • Object store with SwiftStack, and block storage with Ceph or NetApp. • Option to use Ceph for Glance and Solidfire for Cinder.
Monitoring	<ul style="list-style-type: none"> • Third-party integration with Zenoss (called NFVIMON). • Optional auto-ToR configuration of collector ToR ports, when Cisco NCS 5500 is used as ToR. • CVIMMON for monitoring, a Cisco solution available as a technical preview.
Support of External Auth System	<ul style="list-style-type: none"> • LDAP with anonymous bind option. • Active Directory (AD)
Software update	Update of Cloud software for bug fixes on the same release.
Software upgrade	Upgrade of non-VTS cloud from the release 2.2.24 to release 2.4.6.
CIMC upgrade capability	Central management tool to upgrade the CIMC bundle image of one or more servers.
VPP port mirroring	Ability to trace or capture packets for debugging and other administrative purposes.
VXLAN extension into the cloud	<p>Extending native external VXLAN network into VNFs in the cloud.</p> <p>Support of single VXLAN network or multi-VXLAN network terminating on the same compute node.</p> <p>Note Only two-VXLAN network is supported for now.</p>
Technical support for CIMC	Collection of technical support for CIMC.

Splitter cable support for Cisco NCS 5500	Automated splitter cable support for Cisco NCS 5500.
Extending auto-TOR configuration of Cisco NCS 5500	Extending autoToR configuration of Cisco NCS 5500 to include NFV1MON-Collector.
Enable TTY logging as an option	Enables TTY logging and forwards the log to external syslog server and ELK stack running on management node. Optionally, it forwards the log to remote syslog if that option is available.
Automated enablement of Intel X710/XL710 NIC's PXE configuration on Cisco UCS-C series	Utility to update Intel X710/XL710 NIC's PXE configuration on Cisco UCS-C series.
Power management of computes	Option to selectively turn OFF or ON the power of computes to conserve energy.
Disk maintenance for pod nodes	Ability to replace faulty disk(s) on the Pod node(s) without the need for add/remove/replace node operation.
Unified Management Authentication	Supports authentication through local and LDAP.
Integrated test tools	<ul style="list-style-type: none"> • Open Source Data-plane Performance Benchmarking: VMTP (an open source data plane VM to VM performance benchmarking tool), NFVBench (NFVI data plane and a service chain performance benchmarking tool) • Services Health Checks Integration: Cloudpulse and Cloudsanity.

Known Caveats

The following list describes the known caveats in Cisco VIM 2.4.6:

CSCvm63234

OVS 2.9 triggers a drop rule, when it receives an ARP response with cos/tos bit priority set to 5.

CSCve39684

Translation of vic_slot from 7 to **MLOM** fails in CIMC 2.0(13i) version.

CSCva37451

Traffic loss of 8 to 10 seconds is seen, when the active 13 agents are rebooted.

CSCva36943

Volume-attach failure errors are to be reported to the user.

CSCva36914

When a MariaDB HA event is logged, you should run the recovery playbook.

CSCva36907

Nova-compute service is down for up to two minutes, after a controller reboot.

CSCva36782

Nova HA: VM is stuck in scheduling state, while conducting HA on Nova conductor.

CSCva32195

Auto-created Layer 3 network is not cleaned up with the router or tenant deletion.

CSCva32312

Update fails, if compute is not reachable even after updating the containers on the controller node.

CSCva34476

Nova API is unavailable for few minutes, once the controller is down.

CSCva32193

The ARP entry on ToR does not get refreshed, which results in the failure of the Layer 3 ping to VM FIP.

CSCva57121

The Ceph cluster are not set to error state, when all the storage nodes are down.

CSCva66093

Rollback not supported for repo update failure.

CSCvf81055

VMs intermittently goes to 'SHUTOFF' state, after compute node reboot.

CSCve13042

Recovery play book needs to handle ceph recovery after power outage.

CSCve76157

Performance issue on IE browser.

CSCvf74264

Insight UI: The pod users cannot update the REST API password once it is changed.

CSCvf86622

When using mechanism-driver, ACI which is the command-line interface for neutron quota-update does not get enforced.

CSCvf86623

When using mechanism-driver, ACI and VMs originally in an active state on the compute node are unable to acquire an IP address from DHCP.

CSCvi98399

Representation of the service-type such as cloud-formation in OpenStack endpoint needs to be changed.

CSCvj32012

Virtual disk creation fails due to the busy state of the physical disk.

CSCvm95598

DHCP agent should be moved to new controller, when DHCP port attached controller is rebooted.

CSCvn36353

After the update from Cisco VIM 2.4.4 to Cisco VIM 2.4.7, the existing VM interface is down. This issue has been fixed in Cisco VIM release 2.4.8.

CSCvn30668

Incorrect systemctl dependency for docker-novaapi and docker-novalibv. This issue has been fixed in Cisco VIM release 2.4.8.

Using the Cisco Bug Search Tool

You can use the Bug Search Tool to search for a specific bug or to search for all bugs in a release.

Procedure

Step 1 Go to the [Cisco Bug Search Tool](#).

Step 2 In the Log In screen, enter your registered Cisco.com username and password, and then click **Log In**. The Bug Search page opens.

Note If you do not have a Cisco.com username and password, you can register for them at <http://tools.cisco.com/RPF/register/register.do>.

Step 3 To search for a specific bug, enter the bug ID in the **Search For** field and press **Enter**.

Step 4 To search for bugs in the current release:

- a) In the Search For field, enter **Cisco Network Function Virtualization Infrastructure 2.0(1)** and press **Enter**. (Leave the other fields empty.)
- b) When the search results are displayed, use the filter tools to find the types of bugs you are looking for. You can search for bugs by status, severity, modified date, and so forth.

Tip To export the results to a spreadsheet, click the **Export Results to Excel** link.

Related Documentation

The Cisco VIM documentation set consists of:

- *Cisco Virtualized Infrastructure Manager Installation Guide*
- *Cisco Virtualized Infrastructure Manager Administrator Guide*
- *Cisco Virtualized Infrastructure Manager Release Notes*

These documents are available at <https://www.cisco.com/c/en/us/support/cloud-systems-management/virtualized-infrastructure-manager/tsd-products-support-series-home.html>

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at: <http://www.cisco.com/c/en/us/td/docs/general/whatsnew/whatsnew.html>

Subscribe to the What's New in Cisco Product Documentation as an RSS feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service. Cisco currently supports RSS Version 2.0.
