

Cisco VIM REST API

The following topics explain how to use the Cisco VIM REST API to manage Cisco NFVI.

- [Overview to Cisco VIM REST API, on page 1](#)

Overview to Cisco VIM REST API

Cisco VIM provides a Representational State Transfer (REST) API that is used to install, expand, and update Cisco VIM. Actions performed using the REST APIs are:

- Install Cisco VIM on Cisco NFVI pods
- Add and delete pods to and from Cisco NFVI installations
- Update Cisco VIM software
- Replace controller nodes
- Perform cloud maintenance operations
- Run cloud validations using Virtual Machine ThroughPut (VMTP), a data path performance measurement tool for OpenStack clouds

The following figure shows the workflow of Cisco VIM REST API.

Figure 1: Workflow of Cisco VIM REST API

The Cisco VIM REST API security is provided by the Secure Sockets Layer (SSL) included on the Apache web server. The Pecan-based web application is called by `mod_wsgi`, which runs the Rest API server. The Pecan REST API server requires a username and password to authorize the REST API server requests. Apache handles the authorization process, which authorizes the request to access the Pecan web application. Use the Cisco VIM API to upload a new `setup_data.yaml` file, and start, stop, and query the state of the installation. You can use it to manage the cloud, add and remove compute and Ceph nodes, and replace the controller nodes. A REST API to launch VMTP (L2/L3 data plane testing) and CloudPulse is also provided.

The Cisco VIM REST API is enabled by default in the management node if you are using the supplied Cisco VIM `buildnode.iso`. You can access API server on the `br_api` interface on port 8445. Authentication is enabled by default in the web service.

You can access the API end points using the following URL format:

```
https://<Management_node_api_ip>:8445
```

By default, basic authentication is enabled for the API endpoints in the management node. You can find the authentication credentials in the following file in the management node:

```
/opt/cisco/ui_config.json
```

The following code shows a sample `ui_config.json` file.

```
{
  "Kibana-Url": "http://10.10.10.10:5601",
  "RestAPI-Url": "https:// 10.10.10.10:8445",

```

For more information on the Rest API for an end-point, see the *Ciscovim Client RestAPI* section in [Troubleshooting](#).

```

Add New Nodes

The nodes are in compute or block_storage type. Before adding the nodes to the system, the name of the nodes and other necessary information like cimc_ip and rackid must be updated in the setupdata object. If the setupdata object is not updated, the post call does not allow you to add the node.

Resource URI

JSON Request

```

POST /v1/nodes
Accept: application/js
{
  "name" : "compute-5"

```

Retrieve information about a particular node

Resource URI

Verb	URI
GET	/v1/nodes{id}

Property:

id—The ID of the node that you want to retrieve.

Example

JSON Request

```

POST /v1/nodes

Content-Type: application/json
{
  "status": "Active",
  "uuid": "456",
  "setupdata": "123",
  "node_data": "{
    "rack_info": {
      "rack_id": "RackA"
    },
    "cimc_info": {
      "cimc_ip": "10.10.10.10"
    },
    "management_ip": "7.7.7.10"
  }",
  "updated_at": null,
  "mtype": "compute",
  "install": "345",
  "install_logs": "logurl",
  "created_at": "2016-0710T06:17:03.761152",
  "name": " compute-1"
}

```

```
Content-Type: application/json
{
  "debuginfo": null
  "faultcode": "Client"
  "faultstring": "Node doesn't exists"
}
```

Remove a Node

The node that must be deleted must be removed from the setupdata object. Once the setupdata object is updated, you can safely delete the node. The node object cannot be deleted until it calls the remove node backend and succeeds.

Resource URI

Verb	URI
DELETE	/v1/nodes{id}

Property:

id—The ID of the node that you want to remove.

Example

JSON Request

```
DELETE /v1/nodes/456
Accept: application/js
```

JSON Response

```
204 ACCEPTED
Content-Type: application/json

404 NOT FOUND
Content-Type: application/json
{
  "debuginfo": null
  "faultcode": "Client"
  "faultstring": "Node doesn't exists"
}
```

To clear the database and delete the entries in the nodes, the delete API is called with special parameters that are passed along with the delete request. The JSON parameters are in the following format.

JSON Request

```
DELETE /v1/nodes/456
Accept: application/js
{
  "clear_db_entry": "True"
}
```

JSON Response

```
204 ACCEPTED
Content-Type: application/json
```

```

404 NOT FOUND
Content-Type: application/json
{
  "debuginfo": null
  "faultcode": "Client"
  "faultstring": "Node doesn't exists"
}

```

Note This is done only if the node is deleted from the REST API database. The failure reason of the node must be rectified manually apart from the API. True is a string and not a boolean in the preceding line.

Replace a controller

Resource URI

Verb	URI
PUT	/v1/nodes{id}

Property:

id—The ID of the controller that you want to replace.

Example

JSON Request

```

PUT /v1/nodes/456
Accept: application/js

```

JSON Response

```

200 OK
Content-Type: application/json

404 NOT FOUND
Content-Type: application/json
{
  "debuginfo": null
  "faultcode": "Client"
  "faultstring": "Node doesn't exists"
}

```

    "uuid": "bb42e4ba-c8b7-4a5c-98b3-1f384aae2b69",
    "created_at": "2016-02-03T02:05:28.384274",
    "updated_at": "2016-02-03T02:05:51.880785",
    "jsondata": "{}",
    "validationstatus": {

Use the following curl command to get the node's status, power status, reboot status, and mtype information:

```
curl -i -X GET -u admin:**** -H 'Content-Type: application/json' -H 'Accept: application/json'
  --cacert /var/www/mercury/mercury-ca.crt https://172.31.231.17:8445/v1/nodes
```

Response

```
{"nodes": [{"status": ". . . . "name": "Store-2"}]}
```

Power OFF Nodes

To get the power off status of the nodes, use the below command:

```
curl -i -X POST -H 'Content-Type: application/json' -u admin:**** -H 'Accept: application/json' --cacert /var/www/mercury/mercury-ca.crt -d '{\`status\`: \`PowerOff\`, \`force_op\`: False, \`name\`: \`<Node UUID>\`}' https://172.31.231.17:8445/v1/nodes/node_power_status
```

Note UUID of the node can be found from the above List Nodes command

Power ON Nodes

To get the power ON status of the nodes, use the following command:

Cisco VIM REST API Using curl for IPv6

Prerequisites

1. You need to copy the certificates from the management node to local machine from where you would launch the APIs.
2. Create a folder in local machine and copy the certificates.

```
# mkdir ~/certificates
```

3. Copy REST API CA Certificates (for mercury commands)

```
# scp root@<Management Node>:/var/www/mercury/mercury-ca.crt ~/certificates
```

Note The key information that you need are `br_api` and `cloud_api` (`external_lb_vip_ipv6_address`).

4. For each POD, get the REST API credentials:

```
# cat /opt/cisco/ui_config.json
{
  "Kibana-Url": "http://[2001:420:293:2440:b696:91ff:fe22:2dd8]:5601",
  "RestAPI-Username": "admin",
  "RestAPI-Password": "cfb605586d50115333c8",
  "RestDB-Password": "744ebc5feee30b733ac8",
  "RestAPI-Url": "https://[2001:420:293:2440:b696:91ff:fe22:2dd8]:8445",
  "BuildNodeIP": "2001:420:293:2440:b696:91ff:fe22:2dd8" -> br_api
}
```

Offline Validation using curl
