

Diameter

Diameter is a networking protocol which is derived from RADIUS protocol. It is considered to be the next generation Authentication, Authorization, and Accounting (AAA) protocol. This is the other core protocol used in the IP Multimedia Subsystem (IMS) architecture for IMS Entities to exchange AAA related information. Cisco Prime Access Registrar (Prime Access Registrar) supports Diameter Applications based on the Diameter Base Protocol defined in RFC 6733.

Diameter is composed of a base protocol and a set of applications which allows it to extend its services to new access technologies. The base protocol provides basic mechanisms for reliable transport, message delivery, and error handling. Each application is defined by an application identifier and associated with commands. Each command is defined with mandatory Attribute Value Pairs (AVPs) and non-mandatory AVPs including vendor-specific AVPs.

The base protocol must be used in conjunction with a Diameter application. Each application relies on the services of the base protocol to support a specific type of network access.

The following is the list of applications supported by Prime Access Registrar:

- Diameter Network Access Server Application (NASREQ, RFC 4005)
- Diameter Base Accounting (RFC 6733)
- Diameter Extensible Authentication Protocol (EAP) Application (RFC 4072)

This chapter contains the following sections:

- [SCTP Multihoming Support for Diameter Client and Remote Server, page 4-24](#)

Diameter with EAP Support

The Extensible Authentication Protocol (EAP), is an authentication framework which supports multiple authentication mechanisms. EAP may be used on dedicated links, switched circuits, and wired as well as wireless links. For more information on EAP support in Prime Access Registrar, see [Chapter 5, “Extensible Authentication Protocols.”](#)

Prime Access Registrar supports Diameter EAP application that carries EAP packets between a Network Access Server (NAS) working as an EAP Authenticator and a back-end authentication server. The Diameter EAP application is based on the Diameter Network Access Server Application [NASREQ] and is intended for environments similar to NASREQ.

In the Diameter EAP application, authentication occurs between the EAP client and its home Diameter server. This end-to-end authentication reduces the possibility for fraudulent authentication, such as replay and man-in-the-middle attacks. End-to-end authentication also provides a possibility for mutual authentication, which is not possible with PAP and CHAP in a roaming PPP environment.

This topic contains the following sections:

- [Advertising Application Support, page 4-2](#)
- [Diameter EAP Conversation Flow, page 4-2](#)

Advertising Application Support

Diameter nodes conforming to this specification must advertise support by including the Diameter EAP Application ID value of 5 in the Auth-Application-Id AVP of the Capabilities-Exchange-Request and Capabilities-Exchange-Answer command [BASE].

If the NAS receives a response with the Result-Code set to `DIAMETER_APPLICATION_UNSUPPORTED` [BASE], it indicates that the Diameter server in the home realm does not support EAP. If possible, the access device may attempt to negotiate another authentication protocol, such as PAP or CHAP. An access device must be cautious when determining whether a less secure authentication protocol will be used, since this could result from a downgrade attack.

Diameter EAP Conversation Flow

The EAP conversation between the authenticating peer and the access device begins with the initiation of EAP within a link layer, such as PPP [RFC1661] or IEEE 802.11i [IEEE-802.11i]. Once EAP has been initiated, the access device will typically send a Diameter-EAP-Request message with an empty EAP-Payload AVP to the Diameter server, signifying an EAP-Start. Prime Access Registrar routes the message to the Diameter EAP service through the rules and policy engine (and/or client, server and vendor scripting point) through which the packet is processed. The Diameter EAP Service forms a Diameter-EAP-Answer message containing an EAP-Payload AVP that includes an encapsulated EAP packet. The Result-Code AVP in the message will be set to `DIAMETER_MULTI_ROUND_AUTH`, signifying that a subsequent request is expected.

[Figure 4-1](#) describes the Diameter EAP request flow.

Figure 4-1 Diameter EAP Request Flow

The access device issues the EAP-Request/Identity message to the EAP client, and forwards the EAP-Response/Identity packet, encapsulated within the EAP-Payload AVP, as a Diameter-EAP-Request to Prime Access Registrar as shown in [Figure 4-2](#). This reduces the number of Diameter message round trips.

Figure 4-2 Diameter EAP Response Flow

The conversation continues until the Diameter server sends a Diameter-EAP-Answer with a Result-Code AVP indicating success or failure, and an optional EAP-Payload. The Result-Code AVP is used by the access device to determine whether service is to be provided to the EAP client or not. The access device must not rely on the contents of the optional EAP-Payload to determine whether service is to be provided or not.

Diameter Server Startup Log

When Prime Access Registrar starts, Diameter server also starts.

The log file shows the following:

```

09/30/2013 6:38:47.419 name/radius/1 Info Server 0 Diameter Server Started
09/30/2013 6:38:47.437 name/radius/1 Info Protocol 0 Starting diameter core

```

Diameter Stack Level Messages

The following are the stack level messages that are exchanged between the diameter peers:

- [Capabilities Exchange Message](#)
- [Watchdog Message](#)
- [Disconnect Message](#)

Capabilities Exchange Message

When Diameter peers establish a transport connection to Prime Access Registrar, they will exchange the Capabilities Exchange messages. This message allows the discovery of a peer's identity and its capabilities (protocol version number, supported Diameter applications, security mechanisms, etc.)

The log file shows the following:

```
05/14/2015 5:36:19.646 name/radius/1 Info Server 0 Starting Server

Watchdog Message

The Device-Watchdog-Request and Device-Watchdog-Answer messages are used to proactively detect transport failures. Device Watchdog message time interval is configurable in Prime Access Registrar.

Disconnect Message

Disconnect messages are initiated when Diameter peers lose transport connection to Prime Access Registrar.

Configuring Authentication and Authorization for Diameter

This section describes how to configure Prime Access Registrar to perform authentication and authorization and how to configure a local service and userlist.

See for more information on Diameter client properties.

This section contains the following topics:

- [Configuring Local Authentication and Authorization](#)
- [Configuring External Authentication Service](#)

Configuring Local Authentication and Authorization

In Diameter, an AA-Request packet is a request for authentication and authorization. Authentication checks username and password credentials, while authorization typically involves returning the correct information to allow the service a user is authorized to have. Prime Access Registrar performs AA and returns the appropriate Diameter attributes in an AA-Answer packet.

For adding a Diameter peer in Prime Access Registrar, configure a new entry in the clients (including Policy and Charging Rules Functions (PCRF), Home Subscriber Servers (HSS), Mobility Management Entities (MME), Online Charging Systems (OCS), and others) and remote server object.

The following shows an example configuration for adding a Diameter peer (NAS/Client) in Prime Access Registrar.

```

[ //localhost/Radius/Clients/70dia ]
  Name = 70dia
  Description =
  Protocol = diameter
  HostName = 10.81.79.241
  PeerPort = 3868
  Vendor =
  IncomingScript~ =
  OutgoingScript~ =
  AdvertisedHostName =

```

```

AdvertisedRealm =
InitialTimeout = 1000
MaxIncomingRequestRate = 0
WatchDogTimeout = 500
SCTP-Enabled = FALSE
TLS-Enabled = FALSE

[ //localhost/Radius/Services/diaservice ]
  Name = diaservice
  Description =
  Type = diameter
  IncomingScript~ =
  OutgoingScript~ =
  EnableSticky = FALSE
  MultiplePeersPolicy = Failover
  PeerTimeOutPolicy = FailOver
  DiaRemoteServers/
    Entries 1 to 1 from 1 total entries
    Current filter: <all>

    65/
      Name = 65
      Metric = 2
      Weight = 0
      IsActive = TRUE

```

**Note**

You should restart the Prime Access Registrar server if you change any Diameter specific configuration.

See [and](#) for more details.

Configuring a Local Service and UserList

See [for](#) more information on how to configure a local service and user list.

```

Configuring External Authentication Service

See for more information on how to configure external authentication service.

Configuring the Diameter Application in Prime Access Registrar

For proxying a diameter application message in Prime Access Registrar, ensure that you do the following:

- [Configuring the Transport Management Properties](#)
- [Registering Applications IDs](#)
- [Configuring the Diameter Peers](#)
- [Configure the Diameter Service](#)

Configuring the Transport Management Properties

You need to log into the aregcmd using the CLI interface and configure the Transport Management properties in the **Radius/Advanced/Diameter/**.

```
[ //localhost/Radius/Advanced/Diameter ]
  IsDiameterEnabled = TRUE
  General/
    Product = CPAR
    Version = 7.2.0.0
    AuthApplicationIdList = 1
    AcctApplicationIdList = 3
  TransportManagement/
    Identity = 10.77.240.69
    Realm = abc.com
    WatchdogTimeout = 500
    ValidateIncomingMessages = FALSE
    ValidateOutgoingMessages = TRUE
    MaximumNumberOfDiameterPackets = 8194
    ReserveDiameterPacketPool = 0
    DiameterPacketSize = 2048
    AdvertisedHostName/
      SCTPOptions/
        MaxInitRetry = 3
        MaxInboundStream = 4
        MaxOutboundstream = 5
        EnableHeartbeat = FALSE
        HeartbeatInterval = 500
```

You need to set the Identity and AdvertisedHostName properties to IP Address or hostname of the machine in which Prime Access Registrar is installed.

```
--> set Identity 10.77.240.69
Set Identity 10.77.240.69

--> cd AdvertisedHostName
set 1 10.77.240.69
Set the Realm in which Cisco Prime Access Registrar server is present.
--> set Realm cisco.com
Set Realm cisco.com

Save the configuration

--> save

Validating //localhost...
Saving //localhost...

ls
[ //localhost/Radius/Advanced/Diameter/TransportManagement ]
  Identity = 10.77.240.69
  Realm = cisco.com
  WatchdogTimeout = 500
  ValidateIncomingMessages = FALSE
```

```

ValidateOutgoingMessages = TRUE
MaximumNumberOfDiameterPackets = 8194
ReserveDiameterPacketPool = 0
DiameterPacketSize = 2048
AdvertisedHostName/
  1. 10.77.240.69
SCTPOptions/
  MaxInitRetry = 3
  MaxInboundStream = 4
  MaxOutboundstream = 5
  EnableHeartbeat = FALSE
  HeartbeatInterval = 500

```

The description for these properties is available at:

http://www.cisco.com/en/US/docs/net_mgmt/access_registrar/5.1/user/guide/objects.html#wp1145662

Note

Prime Access Registrar can only listen to one port for diameter connections. In the above configuration, the port number is 3868. All of the diameter clients must use this port number to communicate with the Prime Access Registrar.

Registering Applications IDs

You need to register the applications IDs for which Prime Access Registrar needs to route the Diameter Messages.

Registering the Gy application to a diameter stack

To register the Gy application to a diameter stack,

Step 1 Move to the `//localhost/Radius/Advanced/Diameter/General` directory.

```

[ //localhost/Radius/Advanced/Diameter ]
  IsDiameterEnabled = TRUE
  General/
  TransportManagement/

--> cd General/

[ //localhost/Radius/Advanced/Diameter/General ]
Product = Cisco Prime Access Registrar
Version = 7.2.0.0
AuthApplicationIdList = 1
AcctApplicationIdList =

```

For description of these properties, see .

Step 2 Set the `AuthApplicationIdList` to list of colon separated values of Application Ids.

```

--> set AuthApplicationIdList "4"

Set AuthApplicationIdList 4

```

Configuring the Diameter Peers

You need to configure the Diameter Peers such as clients and servers in the `/radius/clients` and `/radius/remoteservers` directories. The following is an example for configuring a Diameter client:

```
[ //localhost/Radius/Clients/70dia ]
Name = 70dia
Description =
Protocol = diameter
HostName = 10.81.79.241
PeerPort = 3868
Vendor =
IncomingScript~ =
OutgoingScript~ =
AdvertisedHostName =
AdvertisedRealm =
InitialTimeout = 1000
MaxIncomingRequestRate = 0
WatchDogTimeout = 500
SCTP-Enabled = FALSE
TLS-Enabled = FALSE
```

The following is an example for configuring a Diameter remote server:

```
[ //localhost/Radius/RemoteServers/lap ]
Name = lap
Description =
Protocol = diameter
HostName = 10.77.144.34
Port = 3868
DestinationRealm = cisco.com
ReactivateTimerInterval = 300000
Vendor =
IncomingScript~ =
OutgoingScript~ =
MaxTries = 3
MaxTPSLimit = 0
MaxSessionLimit = 0
InitialTimeout = 2000
LimitOutstandingRequests = FALSE
MaxPendingPackets = 0
MaxOutstandingRequests = 0
DWatchDogTimeout = 2500
SCTP-Enabled = FALSE
TLS-Enabled = FALSE
AdvertiseHostName =
AdvertiseRealm =
```

For description of these properties, see .

Note

In order to resolve the hostnames and get the IP addresses, the Prime Access Registrar should either be configured with a DNS server IP, or the client's hostnames and IP addresses should be included in the `/etc/hosts` file.

```
# Do not remove the following line, or various programs
# that require network functionality will fail.
127.0.0.1 Prime Access Registrar localhost.localdomain localhost
172.16.29.7 GGSN-Gy
::1 localhost6.localdomain6 localhost6
```

Configure the Diameter Service

To configure the Diameter Service to route the Diameter Messages,

Step 1 Add a Service of type diameter in /Radius/Services/.

```
--> cd /Radius/Services/
--> add dia-proxy

Added dia-proxy

--> cd dia-proxy

[ //localhost/Radius/Services/dia-proxy ]
  Name = dia-proxy
  Description =
  Type =

--> set Type diameter

Set Type diameter
```

Step 2 Configure the sticky properties.

```
--> set EnableSticky TRUE

Set EnableSticky TRUE

--> ls

[ //localhost/Radius/Services/dia-proxy ]
  Name = dia-proxy
  Description =
  Type = diameter
  IncomingScript~ =
  OutgoingScript~ =
  EnableSticky = TRUE
  StickySessionKey =
  StickyCreationCmdList =
  StickyDeletionCmdList =
  MultiplePeersPolicy = Failover
  PeerTimeOutPolicy = FailOver
  DiaRemoteServers/

--> set StickySessionKey Session-Id#1

Set StickySessionKey Session-Id#1

--> set StickyCreationCmdList 265

Set StickyCreationCmdList 265

--> set StickyDeletionCmdList 275

Set StickyDeletionCmdList 275

--> set MultiplePeersPolicy RoundRobin
```

```

Set MultiplePeersPolicy RoundRobin

--> ls

[ //localhost/Radius/Services/dia-proxy ]
  Name = dia-proxy
  Description =
  Type = diameter
  IncomingScript~ =
  OutgoingScript~ =
  EnableSticky = TRUE
  StickySessionKey = Session-Id#1
  StickyCreationCmdList = 265
  StickyDeletionCmdList = 275
  MultiplePeersPolicy = RoundRobin
  PeerTimeOutPolicy = FailOver
  DiaRemoteServers/

```

Step 3 Add the peers to which Prime Access Registrar needs to load balance the diameter messages.

```

[ //localhost/Radius/RemoteServers/dial ]
  Name = dial
  Description =
  Protocol = diameter
  HostName = 192.168.30.88
  Port = 3868
  DestinationRealm =
  ReactivateTimerInterval = 300000
  Vendor =
  IncomingScript~ =
  OutgoingScript~ =
  MaxTries = 3
  MaxTPSLimit = 0
  MaxSessionLimit = 0
  InitialTimeout = 2000
  LimitOutstandingRequests = FALSE
  MaxPendingPackets = 0
  MaxOutstandingRequests = 0
  DWatchDogTimeout = 2500
  SCTP-Enabled = FALSE
  TLS-Enabled = FALSE
  AdvertiseHostName =
  AdvertiseRealm =
[ //localhost/Radius/RemoteServers/dia2 ]
  Name = dia2
  Description =
  Protocol = diameter
  HostName =
  Port = 0
  DestinationRealm =
  ReactivateTimerInterval = 300000
  Vendor =
  IncomingScript~ =
  OutgoingScript~ =
  MaxTries = 3
  MaxTPSLimit = 0
  MaxSessionLimit = 0
  InitialTimeout = 2000
  LimitOutstandingRequests = FALSE
  MaxPendingPackets = 0
  MaxOutstandingRequests = 0
  DWatchDogTimeout = 2500
  SCTP-Enabled = FALSE
  TLS-Enabled = FALSE

```

```

    AdvertiseHostName =
    AdvertiseRealm =

--> cd diaRemoteServers/

[ //localhost/Radius/Services/dia-proxy/DiaRemoteServers ]
  Entries 0 to 0 from 0 total entries
  Current filter: <all>

--> add dial

Added dial

--> cd dial/

[ //localhost/Radius/Services/dia-proxy/DiaRemoteServers/dial ]
  Name = dial
  Metric = 2
  Weight = 0
  IsActive = TRUE

--> cd ..

[ //localhost/Radius/Services/dia-proxy/DiaRemoteServers ]
  Entries 1 to 1 from 1 total entries
  Current filter: <all>

  dial/

--> add dia2

Added dia2

--> cd dia2

[ //localhost/Radius/Services/dia-proxy/DiaRemoteServers/dia2 ]
  Name = dia2
  Metric = 3
  Weight = 0
  IsActive = TRUE

```

Step 4 Save the configuration details.

```

--> save
Validating //localhost...
Saving //localhost...

```

Step 5 Set DefaultAuthenticationService and DefaultAuthorizationService in /Radius directory.

```

--> set DefaultAuthenticationService dia-proxy

Set DefaultAuthenticationService dia-proxy

--> set DefaultAuthorizationService dia-proxy

Set DefaultAuthorizationService dia-proxy

--> save
Validating //localhost...
Saving //localhost...

--> exit
Logging out of localhost...

```

Step 6 Restart the Prime Access Registrar server.

```
/cisco-ar/bin/arserver restart
```

The following illustrates the diameter proxy service configuration which load balances the diameter messages to the remote peers.

```
[ /Radius/Services/dia-proxy ]
  Name = dia-proxy
  Description =
  Type = diameter
  IncomingScript~ =
  OutgoingScript~ =
  EnableSticky = TRUE
  StickySessionKey = Session-Id#1
  StickyCreationCmdList = 265
  StickyDeletionCmdList = 275
  MultiplePeersPolicy = RoundRobin
  PeerTimeOutPolicy = FailOver
  DiaRemoteServers/
    Entries 1 to 2 from 2 total entries
    Current filter: <all>

    dial/
      Name = dial
      Metric = 2
      Weight = 0
      IsActive = TRUE
    dia2/
      Name = dia2
      Metric = 3
      Weight = 0
      IsActive = TRUE
```

For description of these properties, see .

Group-Based Load Balancing in Diameter Proxy Server Configuration

Prime Access Registrar allows you to create two or more groups of Diameter remote servers in a Diameter proxy service configuration. Each of these groups will have a unique set of remote servers, i.e. no two groups will share the same remote server.

The traffic between each of these groups is load-balanced in failover mode; while traffic between remote servers within the same group is load-balanced based on round-robin or failover mode depending on the existing Diameter configuration. The priority of each of the groups is set with the help of metrics.

The workflow for group-based load balancing is as given below:

1. Traffic from Prime Access Registrar to remote server, via Diameter proxy service, is directed through the first group, till Prime Access Registrar has active communication channel with at least one remote server belonging to the first group.
2. When Prime Access Registrar loses connectivity with all the remote servers in the first group, it directs the rest of the Diameter traffic towards remote servers belonging to the second group.
3. Within a group, the load-balancing logic is chosen based on the configuration:
 - a. If the load-balancing logic is configured to be round-robin, the traffic is distributed across all the active remote servers.

- b. If the load-balancing logic is configured to be failover, the traffic is directed towards first priority remote server. When Prime Access Registrar loses connectivity with the first priority remote server, it directs the subsequent traffic towards the second priority remote server. The priority of the Diameter remote servers, in case of failover logic, is set with the help of metrics.

For more information about Diameter server group parameters, see [GroupServers](#), page 2-24.

Following is a sample configuration of the Diameter group server:

```
[ //localhost/Radius/GroupServers ]
  Entries 1 to 2 from 2 total entries
  Current filter: <all>

  Group1/
    Name = Group1
    Description =
    MultiplePeersPolicy = RoundRobin/Failover
    PeerTimeOutPolicy = FailOver/SendError/DropPacket
    DiaRemoteServers/
      Entries 1 to 2 from 2 total entries
      Current filter: <all>

      vm023/
        Name = vm023
        Metric = 1
        Weight = 0
        IsActive = TRUE
      vm045/
        Name = vm045
        Metric = 2
        Weight = 0
        IsActive = TRUE

  Group2/
    Name = Group2
    Description =
    MultiplePeersPolicy = Failover/RoundRobin
    PeerTimeOutPolicy = FailOver/SendError/DropPacket
    DiaRemoteServers/
      Entries 1 to 2 from 2 total entries
      Current filter: <all>

      vm052/
        Name = vm052
        Metric = 1
        Weight = 0
        IsActive = TRUE
      vm062/
        Name = vm062
        Metric = 2
        Weight = 0
        IsActive = TRUE

[ //localhost/Radius/Services/diapro ]
  Name = diapro
  Description =
  Type = diameter
  IncomingScript~ =
  OutgoingScript~ =
  MultiplePeersPolicy = GroupFailover(/Failover/RoundRobin/ImsiRangebased)
  ServerGroups/
    Entries 1 to 2 from 2 total entries
    Current filter: <all>

  Group1/
```

```

        Name = Group1
        Metric = 1
        IsActive = TRUE
Group2/
        Name = Group2
        Metric = 2
        IsActive = TRUE

```

Writing Diameter Application in Prime Access Registrar

Prime Access Registrar supports extensibility by allowing users to create new:

- authentication/authorization applications
- accounting applications
- command codes
- AVP's

This section contains the following topics:

- [Configuring rex script/service for Diameter](#)
- [Scripting in Diameter](#)
- [Diameter Environment Variables](#)
- [Sample rex script/service](#)
- [Traces/Logs](#)

Configuring rex script/service for Diameter

To configure script/service for diameter using aregcmd:

- Step 1** Add diameter AVPs in //localhost/Radius/Advanced/DiameterDictionary/DiameterAttributes other than Base stack AVPs.

```

[ //localhost/Radius/Advanced/DiameterDictionary/DiameterAttributes/test ]
  Name = test
  Description =
  Attribute =
  VendorID = 0
  Mandatory = May
  May-Encrypt = No
  Protected = May
  Type =

```

- Step 2** Write a rex script (C/C++) and add it in the scripting point or rex service.

```

[ //localhost/Radius/Services/diaservice ]
  Name = diaservice
  Description =
  Type = rex
  IncomingScript~ =
  OutgoingScript~ =
  OutagePolicy~ = RejectAll
  OutageScript~ =
  Filename = librexscript.so

```

```
EntryPoint = DiaService
InitEntryPoint =
InitEntryPointArgs =
```

Refer to [Sample rex script/service](#), page 4-19.

Scripting in Diameter

Prime Access Registrar supports 'rex' scripts for Diameter protocol. The script can be configured only as the server incoming script. The commands available for scripting are restricted to 'get' and 'put' on the dictionaries. While setting a value to an attribute, the following convention needs to be followed "<type number>,<value>". For example, if a 'Class' attribute needs to be added to the response dictionary with value as "classvalue", then set it as follows in the script:

```
pResponse->put( pResponse, "Class", "1,classvalue", REX_REPLACE );
```

The following is the list of supported scripting types with the respective type numbers:

```
AVP_STRING_TYPE = 1
AVP_ADDRESS_TYPE = 2
AVP_INTEGER32_TYPE = 3
AVP_UINTEGER32_TYPE = 4
AVP_UTF8_STRING_TYPE = 6
AVP_ENUM_TYPE = 7
AVP_TIME_TYPE = 11
```

Setting response attributes via a script is the only mechanism to add authorization attributes for Diameter requests.

Diameter Environment Variables

This section lists the environment variables that you can use in scripts for Diameter messages.

[Table 4-1](#) lists the Diameter Environment variables and descriptions.

Table 4-1 Diameter Environment Variables

Variable	Description
Request-Type	String value.
Response-Type	Get/Set the request and response type for diameter packet. Sample Values Diameter-Access-Request Diameter-Access-Accept Diameter-Access-Reject Diameter-Accounting-Request Diameter-Accounting-Response Diameter-Proxy-Request Diameter-Proxy-Answer
Diameter-Application-Id	String value. Get the application id for the packet. For setting in response, need to use Auth-Application-id AVPs. Sample Values 1 (NASREQ)
Diameter-Command-Code	String value. Get command code for the diameter packet. It will work only for the access-request packet, not for the accounting request. Sample Values 265 (AA-Request)

Sample rex script/service

```
int REXAPI DiaService( int iScriptingPoint,
                      rex_AttributeDictionary_t* pRequest,
                      rex_AttributeDictionary_t* pResponse,
                      rex_EnvironmentDictionary_t* pEnviron )
{
    if( iScriptingPoint == REX_START_SERVICE || iScriptingPoint == REX_STOP_SERVICE )
        return REX_OK;
    int iRetVal = REX_ERROR;
    const char* pszRequestType = pEnviron->get( pEnviron, "Request-Type" );
    const char* pszAppId = pEnviron->get( pEnviron, "Diameter-Application-Id" );
    const char* pszCmdCode= pEnviron->get( pEnviron, "Diameter-Command-Code" );
    if( !( pszRequestType && pszAppId && pszCmdCode ) )
        return iRetVal;
    // check the request type, application id and command code
    /*
Request / Response types
Diameter-Access-Request
Diameter-Access-Accept
Diameter-Access-Reject
Diameter-Accounting-Request
Diameter-Accounting-Response
*/
}
```

```

*/
    if( strcmp( pszRequestType, "Diameter-Access-Request") == 0 ) && ( strcmp(
pszAppId, "1") == 0 ) && ( strcmp( pszCmdCode, "265\
" ) == 0 ) )
    {
// our application
// example how to get DiaAttrib from the packet.
    const char* pszSessionId = pRequest ->get( pRequest, "Session-Id", 0, 0 );
// print in trace
    if( pszSessionId )
        pEnviron->trace( pEnviron, 5, "Diameter Session Id: %s", pszSessionId );
// example: how to add dia attrib in response packet
    pResponse->put( pResponse, "Calling-Station-Id", "1,00-01-02-03-05", REX_APPEND );
    pEnviron->put( pEnviron, "Response-Type", "Diameter-Access-Accept");
    iRetVal = REX_OK;
    }
return iRetVal;
}

```

Translation Framework for Diameter

Prime Access Registrar supports translation of an incoming RADIUS request to a Diameter request and vice versa.

The following services are created to set up the translation framework:

- Radius-Diameter—For translation of incoming RADIUS request to Diameter equivalent and then the Diameter response to RADIUS equivalent.
- Diameter-Radius—For translation of incoming Diameter request to RADIUS equivalent and then the RADIUS response to Diameter equivalent.

For both the translation services, Prime Access Registrar uses the following scripting points to operate on the original packet and on the newly translated packet based on request and response mapping:

- PreRequestTranslationScript—To add/modify/delete incoming RADIUS/Diameter attribute values in the request before translation
- PostRequestTranslationScript—To add/modify/delete translated Diameter/RADIUS attributes in the request after translation
- PreResponseTranslationScript—To add/modify/delete Diameter/RADIUS attribute values in the response before translation
- PostResponseTranslationScript—To add/modify/delete RADIUS/Diameter attributes in the response after translation

RADIUS to Diameter translation comes with the 3GPP reverse authorization, if the property is set as True. In that case, the request command mapping must not be defined because the new diameter request is created from the radius request by the 3GPP reverse authorization service. When the diameter response is received from the diameter proxy service, it translates the Diameter response to RADIUS response based on the response mapping configuration and sends radius response to the client.

Prime Access Registrar supports CoA and PoD translation to Re-Auth-Request (RAR) / Abort-Session-Request (ASR), which is triggered directly to Diameter Client without any DRA. Prime Access Registrar sends the translated RAR/ASR packets to client, by configuring a parameter **SendRAR-ASRToClient**. You must also configure the Diameter client to which the packet needs to be sent using the host name of the client in the translation service.

Both these translation services create and maintain appropriate states (with the necessary identifiers, packet pointers, etc) to correlate Request to Response. The states will be cleared if present beyond the 'Timeout' property value and all the retries have been exhausted. You can configure the number of retries under Diameter-RemoteServers.

For more information about the translation parameters, see [Simple Services, page 2-26](#).

CLI for RADIUS-Diameter Translation

Following is the CLI for RADIUS to Diameter translation:

```
[ //localhost/Radius/Services/rad-dia-trans ]
Name = rad-dia-trans
Description =
Type = radius-diameter
SendRAR-ASRToClient = true
ClientHostName =
```

```

DiameterApplicationId = 5
ProxyServiceName = dia
EnableRequestCommandMappings = true
PreRequestTranslationScript~ = sm
PostRequestTranslationScript~ =
PreResponseTranslationScript~ = env
PostResponseTranslationScript~ =
RequestMapping/
  CommandMappings/
    Radius-CoA-Request = Re-Auth
    Radius-PoD-Request = Abort-Session
  AVPMappings/
    Calling-Station-Id = Session-Id
  AVPsToBeAdded/
    Re-Auth-Request-Type = AUTHORIZE_AUTHENTICATE
  EnvironmentMappings/
ResponseMapping/
  ResultCodeMappings/
    Diameter-Success = Radius-PoD-ACK
    Diameter-Unable-To-Deliver = Radius-PoD-Nak
  AVPMappings/
  AVPsToBeAdded/
  EnvironmentMappings/

```

CLI for Diameter-RADIUS Translation

Following is the CLI for Diameter to RADIUS translation:

```

[ /Radius/Services/dia-rad ]
  Name = dia-rad
  Description =
  Type = diameter-radius
  ProxyServiceName = rad-proxy
  PreRequestTranslationScript~ =
  PostRequestTranslationScript~ = dia-rad-addpassword
  PreResponseTranslationScript~ =
  PostResponseTranslationScript~ = diareadwritetest
  RequestMapping/
    CommandMappings/
      AA = Radius-Access-Request
    AVPMappings/
      Origin-Host = NAS-Identifier
      User-Name = User-Name
    AVPsToBeAdded/
      NAS-Port = 1
    EnvironmentMappings/
  ResponseMapping/
    ResultCodeMappings/
      Radius-Access-Accept = Diameter-Success
      Radius-Access-Reject = Diameter-Unable-To-Deliver
    AVPMappings/
    AVPsToBeAdded/
    EnvironmentMappings/

```

TLS Support for Diameter

Prime Access Registrar supports Transport Level Security (TLS) mechanism for Diameter stack. The system provides an option to enable TLS for Diameter client and Diameter remote server. When the TLS option is disabled, communication is established directly using the transport layer without applying any

encryption. The Diameter TLS feature uses the CiscoSSL libraries, which are available as part of the Prime Access Registrar package.

Following is the CLI configuration of a Diameter client with TLS support:

```
[ /Radius/Clients/vm31 ]
  Name = vm31
  Description =
  Protocol = diameter
  HostName = ar-lnx-vm031.cisco.com
  PeerPort = 3868
  Vendor =
  IncomingScript~ =
  OutgoingScript~ =
  AdvertisedHostName =
  AdvertisedRealm =
  MaxIncomingRequestRate = 0
  WatchDogTimeout = 500
  SCTP-Enabled = FALSE
  TLS-Enabled = TRUE
  TLSoptions/
    PrivateKeyPassword = cisco
    ServerCertificateFile = /opt/CSCOar/pki/cert.pem
    ServerKeyFile = /opt/CSCOar/pki/key.pem
    CACertificateFile = /opt/CSCOar/pki/root-cert.pem
    CACertificatePath =
    PeerVerificationMode = None/Optional/RequireCertificate
    VerificationDepth = 4
    EnableAutoChaining = True
```

Following is the CLI configuration of a Diameter remote server with TLS support:

```
[ /Radius/RemoteServers/vm58 ]
  Name = vm58
  Description =
  Protocol = diameter
  HostName = ar-lnx-vm058.cisco.com
  Port = 4322
  DestinationRealm = cisco.com
  ReactivateTimerInterval = 300000
  Vendor =
  IncomingScript~ =
  OutgoingScript~ =
  MaxTries = 3
  InitialTimeout = 2000
  LimitOutstandingRequests = FALSE
  MaxPendingPackets = 0
  MaxOutstandingRequests = 0
  DWatchDogTimeout = 2500
  SCTP-Enabled = FALSE
  TLS-Enabled = TRUE
  AdvertiseHostName =
  AdvertiseRealm =
  TLSoptions/
    PrivateKeyPassword = cisco
    ServerCertificateFile = /opt/CSCOar/pki/cert.pem
    ServerKeyFile = /opt/CSCOar/pki/key.pem
    CACertificateFile = /opt/CSCOar/pki/root-cert.pem
    CACertificatePath =
    PeerVerificationMode = None/Optional/RequireCertificate
    VerificationDepth = 4
    EnableAutoChaining = True
```

For descriptions of the TLS options, see the [Network Resources, page 2-116](#) section of [Chapter 2, “Using the Graphical User Interface.”](#)

Managing Diameter Sessions

Diameter provides two kinds of services namely authentication/authorization and accounting only (optional). Diameter sessions can be created when an authentication/authorization request comes from an access point or when an accounting start comes from an access point. When a Diameter client issues an authentication request, Prime Access Registrar sends the packet with a Session-Id AVP, which can be used to correlate a Diameter message with a user-session. When a Session Termination Request (STR) message is received from the Diameter client, Prime Access Registrar releases the sessions. Also Re-authentication requests must be mapped to the corresponding user session. In case of accounting packets, the session is created when the accounting start is received from the Diameter client. The session is deleted when the accounting stop message is received.

Prime Access Registrar creates a new session when it receives an authentication or accounting request packet from a Diameter client and when a user session is not already present. It allocates the resources for the particular session from the resource manager and stores the session in a session backing store. This session backing store is a file where session information is written. When a session termination message or an accounting stop message comes from the Diameter client, the session data is deleted from the backing store. Apart from this, Prime Access Registrar maintains the session state for every session it creates. Session cache will be supported for grouped AVPs.

For more information on session manager and its support for Diameter client, see [SessionManagers, page 2-104](#).

Blacklisting Support for Diameter Remote Server

Prime Access Registrar supports blacklisting of IMSI or IP address values for Diameter remote servers.

You can choose to configure blacklisting as part of the outgoing script of a Diameter remote server with EAP-SIM or EAP-AKA service. For more information about blacklisting, see .

SCTP Multihoming Support for Diameter Client and Remote Server

Stream Control Transmission Protocol (SCTP) is an IP transport protocol that supports data exchange between exactly two endpoints. Multihoming feature of SCTP provides the ability for a single SCTP endpoint to support multiple IP addresses. With this feature, each of the two endpoints during an SCTP association can specify multiple points of attachment. Each endpoint will be able to receive messages from any of the addresses associated with the other endpoint. With the use of multiple interfaces, data can be sent to alternate addresses when failures occur and thus Prime Access Registrar runs successfully even during network failures.

Prime Access Registrar provides SCTP multihoming support for Diameter client and remote server. With this feature, you can configure multiple source and destination addresses on the Diameter client and remote server.

**Note**

When you use Prime Access Registrar with CentOS, ensure that you configure the Diameter SCTP client and remote servers with different source ports in Prime Access Registrar.

The following shows an example configuration of Diameter remote server with multiple source and destination addresses:

```
[ //localhost/Radius/RemoteServers/Diameter-SCTP-Remote-Server ]
  Name = Diameter-SCTP-Remote-Server
  Description =
  Protocol = diameter
  HostName = 10.197.66.73
  DestinationPort = 3868
  DestinationRealm = cisco.com
  ReactivateTimerInterval = 2000
  Vendor =
  IncomingScript~ =
  OutgoingScript~ =
  MaxTries = 1
  MaxTPSLimit = 0
  MaxSessionLimit = 0
  InitialTimeout = 1500
  LimitOutstandingRequests = FALSE
  MaxPendingPackets = 0
  MaxOutstandingRequests = 0
  DWatchDogTimeout = 2000
  SCTP-Enabled = TRUE
  TLS-Enabled = FALSE
