

WAE Automation Software Installation

This section describes how to install WAE Automation software in a dual-server deployment where the primary server is designated as the Planning server and the secondary server is the Automation server.

Before You Begin

- Complete the software installation on the primary (Planning) server . For more information, see the [WAE Planning Software Installation](#) chapter.
- Confirm that system requirements for a dual-server deployment have been met. For more information, see the [System Requirements](#) document.
- Confirm that a WAE user exists on all servers and has Sudo access.

See [Table 6-1](#) for a list of services and software installed on each server.

Step 1 From the primary server, run the wae-automation-deploy installer:

```
wae-automation-deploy
```

Step 2 When prompted, enter the following information:

- WAE user name—This should be the same username that was designated during software installation on the primary (local) server.
- Planning host—IP address of the primary (local) server.
- Automation host—IP address of the secondary server.
- (Optional) NTP server host—NTP server IP address or DNS resolvable name.

Wait at least 5 minutes for the deployment to complete. A confirmation message appears when the installation is successful.
