Cisco WAN Automation Engine Release Notes, Release 6.4.3

First Published: 2016-11-22
Last Updated: 2017-08-03

This document describes the features, limitations, and bugs for Cisco WAN Automation Engine (Cisco WAE) Release 6.4.3.

Contents

This document includes the following sections:

- Introduction, page 1
- New Features and Enhancements, page 2
- Open Source, page 2
- Resolved Bugs, page 2
- Using the Cisco Bug Search Tool, page 3
- Known Limitations, page 3
- Accessibility Features, page 8
- Related Documentation, page 8

Introduction

Cisco WAE is a model-driven path visibility and path computation engine that simulates, automates, and optimizes multi-vendor, multi-layer networks by leveraging time-series traffic and flow data. For more information on Cisco WAE, visit http://www.cisco.com/go/wae.
New Features and Enhancements

Smart Licensing

Cisco offers Smart Licensing, which lets you monitor Cisco WAE software licenses and endpoint license consumption easily and efficiently with a single token registration, rather than individually importing separate licenses. Details of all Cisco products and licenses that you have purchased are maintained in a centralized database called the Cisco Smart Software Manager (CSSM).

For information about Cisco Smart Licensing, see the Cisco WAE 6.4.3 Server Installation Guide.

Note

Smart Licensing is not available when using the standalone version of Cisco WAE Design.

Improvements to WAE Design View Preferences

The View Preferences dialog box has these enhancements:

- New scaling options for objects and fonts. Circuit and link widths in layouts are scaled according to the scale factors in the network plot. The valid range for scale factors is from 5% to 1000%.
- The ability to specify the color palette for background maps in geographic layouts. You can choose a grey palette or a multicolored palette.
- A Reset button that lets you reset preferences back to the default.

MAC Address Accounting on Cisco IOS XR Routers

MAC accounting is now supported on Cisco IOS XR software version 5.1.3 routers. To use this feature, run the find_bgp and snmp_poll tools with the MAC accounting option enabled.

You can then open the plan file in WAE Design to view the traffic measurement data from the Interfaces table.

Open Source

A list of open source software used in Cisco WAE can be found in Open Source Software Used in Cisco WAN Automation Engine.

Resolved Bugs

The following table lists the resolved bugs in Cisco WAE Release 6.4.3. The bug ID links you to the Cisco Bug Search tool.
Using the Cisco Bug Search Tool

You can use the Cisco Bug Search Tool to search for a specific bug or to search for all bugs in a release.

<table>
<thead>
<tr>
<th>Bug ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSCuz85830</td>
<td>WAE API calls succeed on the initial call, but fail on subsequent calls.</td>
</tr>
</tbody>
</table>
| CSCva76171 | The Events and Diagnostics Serviceability pages return the following error when opened:  
                    Warning: No default index pattern. You must select or create one to continue. |
| CSCvb59902 | The WAE Live Map does not load unless you restart the web server. The map.log file contains the following information:  
                    INFO: UiCache.getPeersTable() - getPeersTable() now retrieves new PeersTable information. |
| CSCvb89974 | External endpoints don’t behave as expected in the following configuration:  
                    In the routing of external endpoint demands, the computation for the shortest exit path is not correct. When there is an LSP setup between two nodes, the simulation follows the LSP route to obtain the metric. Instead, it should ignore the LSP and use only the IGP metric. |

Known Limitations

This section describes the limitations and restrictions for Cisco WAE.
Known Limitations

WAE Design

- macOS Sierra 10.12 implements an additional security measure for applications that are not distributed through the App Store, which includes WAE Design.

By default, WAE Design is in a quarantine state as shown by the following command on a terminal:

```
xattr Mate.app
```

The command returns the following for a quarantined application:

```
com.apple.quarantine
```

As a workaround, remove WAE Design from quarantine by entering:

```
xattr -r -d com.apple.quarantine Mate.app
```

Then, you can run WAE Design 6.4.x on macOS Sierra 10.12.

- In some Linux installations with Xfce desktop installed, the documentation does not open from the WAE Design GUI Help menu. The workaround is to do one of the following:
  - Open the help files from a terminal in the `$CARIDEN_HOME/docs` directory.
  - Install a default browser.
  - Install the following packages:
    ```
yum install evince
    yum groupinstall "X Window System"
    yum groupinstall "Desktop"
    yum groupinstall "General Purpose Desktop"
    ```

WAE Collector and WAE Network Interface (NI)

- Due to vendor MIB limitations, Collector cannot represent QoS traffic on interfaces that have more than one VLAN configured. If a network contains such interfaces, their queue traffic statistics are omitted from the collection. The total traffic on these interfaces is still measured. As a result, per class-of-service demands estimated through Demand Deduction are less accurate. Estimates of traffic totals over all classes of services, however, are not affected.

- Due to lack of MIB support, SR tunnel type is not collected for Cisco IOS XR routers through SNMP.

- Collection of interface egress shaping rate for Alcatel-Lucent devices does not support LAG interfaces.

- Shared Risk Link Groups (SRLGs) are not supported in Alcatel-Lucent Service Aware Manager (SAM) collection.

WAE NI

- The interval for continuous LSP discovery in WAE NI cannot be less than 60 seconds.

- LSP’s ActualPathHop cannot be resolved when using continuous collection. As a workaround, use interval-based collection.
Known Limitations

Collector

- Juniper MIBs do not support P2MP LSPs.
- OSPFv3 and IPv6 IS-IS databases cannot be collected. The workaround is to use a manual snapshot.
- SNMPv3 is not an available option when configuring default credentials.

  - `snmp_find_interfaces`
    - Does not support association of a GRE tunnel with the physical interface it uses to reach the tunnel destination since the IP-Tunnel MIB lacks this information.
    - Does not update LAG port status if LAGs are discovered running both `parse_configs` and `snmp_find_interfaces`. The workaround is to run only `snmp_find_interfaces`.

- Juniper routers: Signaled standby LSP path option is not available from the standard MPLS-TE MIB for Juniper routers. Only the active path option name is collected.

- Cisco IOS XR routers
  - IGP topology collected through `parse_igp` and `login_find_igp_db`
    - IS-IS link-state database with TE extensions contains incorrect interface “admin-weights” (TE metric) on Intel-based routers.
    - IPv6 IS-IS link-state database does not contain IPv6 interface addresses or parallel interfaces. This information is only available when Cisco IOS XR supports IS-IS IPv6 TE extensions. The `snmp_find_interfaces` tool collects this information.
  - `snmp_find_rsvp` does not set the Standby value in the `<LSPPaths>` table for signaled backup paths or collect named affinities configured with affinity-maps.

- BGP peers
  - `find_bgp` does not build BGP pseudo-nodes among internal ASNs.
  - `find_bgp` does not collect BGP peers under PE-CE VRFs.

- `parse_configs`
  - Does not accurately detect the bandwidth of some Juniper ‘ge’ interfaces that have a capacity of 10 Gbps.
  - Collects POS bundles, but has limitations due to unavailability of the port OperStatus property.

- TE Extended Admin Groups (EAGs), also known as extended affinities, are only supported from Juniper and `parse_configs`.

- There is no support for building port circuits for LAG members that are not within the same IGP (inter-AS circuits)

- It is not possible to distinguish between physically connected and unconnected LAG ports that are down for LAG port matching.

- `snmp_find_ospf_db` cannot be used when routers have a large number of links that cannot fit into a single PDU.

- `find_bgpls` does not support multi-area OSPF or multi-level IS-IS, non-TE-enabled interfaces, and pseudo-nodes. The workaround is to use SNMP- or login-based discovery.

- `get_inventory` does not collect Juniper multi-chassis router hardware inventory.

- Segment routing
  - SR protected adjacency SIDs are not supported.
  - Concurrent RSVP-TE and SR-TE paths are not supported on the same LSP.
SAM- OSS Integration with Snapshots

- sam_getplan does not populate the <NodeTraffic> table. This table is derived and populated when sam_getplan and SNMP tools are used together.
- sam_getplan does not populate the NetIntActivePath column in the <LSPs> table.
- If sam_getplan and SNMP tools are used together in the snapshot process for multi-vendor network collection, then Alcatel-Lucent traffic measurements cannot be aligned with those collected from other router platforms.

Cisco Open SDN Controller (OSC)

During detailed PCEP tunnel creation or when modifying PCEP tunnels, affinity values are misinterpreted if multiple affinities are specified. This limits you to specifying one affinity for IncludeAffinity, IncludeAnyAffinity, and ExcludeAffinity, and each of these values must be a number within [0,31].

NSO Controller

- LSP affinities are deployed, while interfaces affinities require separate provisioning.
- LSPs that exist in the network by another controller cannot be updated.
- Deployment of each RSVP-TE named-path or SR-TE segment-list is limited to a single LSP.
- Cisco IOS XR: WAE client specifies the XR LSP signaled-name, while NSO service and device use tunnel-id. The workaround is to deploy all Cisco IOS XR LSPs using the tunnel-id and to make sure that existing LSPs are not re-deployed.
- NEDs (NSO console)
  - For Cisco IOS XR, there is no option to give the IP address of the LSP directly; you can only specify a loopback address. There is no option to give tunnel affinity values directly; you can only specify an affinity-map name.
  - For Junos, there is no inter-domain keyword, which is used only when an inter-area LSP is created.

WAE System

Installation and Startup

- The WAE NI server and the WAE Core server cannot reside on the same device or on the same VM. Note that the Cisco WAE Server Installation Guide assumes that they are on the same device. If needed, contact your support representative for further installation details.
- If the OS is using an old CA certificate to verify the integrity of the EPEL repository, you might see this error from the OS vendor:
  Error: Cannot retrieve metalink for repository: epel. Please verify its path and try again.
  - One workaround is to perform an offline installation. For instructions, refer to the “Offline Installation” chapter in the Cisco WAE Server Installation Guide.
  - Another workaround is to change https to http.
Known Limitations

**Note** This is not a secure solution. For information on how to resolve OS security issues, contact your OS vendor.

1. In the `/etc/yum.repos.d/epel.repo` file, change the first instance of `https` to `http`.
   
   ```
   sudo vim /etc/yum.repos.d/epel.repo
   
   Change `https` to `http` in the following line:
   
   mirrorlist=[https://mirrors.fedoraproject.org/metalink-repo=epel-6&arch=$basearch]
   ```

2. Execute `yum` to clean up `makecache`.
   
   ```
   sudo yum clean all && yum makecache
   ```

3. Rerun the installer. For detailed installation instructions, see the *Cisco WAE Server Installation Guide*.
   
   ```
   sudo bash wae-k9-<version>.bin
   ```

   - The `$CARIDEN_HOME` directory is not automatically added to `$PATH` (only `$CARIDEN_HOME/bin` is). If not in `$CARIDEN_HOME/bin`, to start the WAE Design GUI from the command line, you must specify its full path.
     
     `/opt/cariden/software/mate/current/mate`

### Web Server

The `embedded_web_server` tool is deprecated. The recommendation is to use the `wae-web-server` service, which is constantly monitored to be brought up automatically.

By default, this web service starts upon installation completion. Therefore, if you stop the web server using the `embedded_web_server` tool (`embedded_web_server -action stop`), the web server does not stop. The workaround is the following:

```
service wae-svcs-mon stop
embedded_web_server -action stop
```
License Check Failures on Newer Linux Distributions

Some newer Linux distributions have started using a new way (via `biosdevname`) of naming hardware devices, including the network interfaces. This causes some software that depends on the traditional naming (for example, `eth0`, `eth1`) to fail on license checks, including MATE.

The workaround is to append `biosdevname=0` to the kernel line of the grub configuration file and reboot. (Syntax varies among distributions.)

After reboot, you should be able to use `ifconfig` to verify that the NICs are named `eth0` (or `eth1`, ...) instead of the `biosdevname` names (such as `p34p1`).

Java Memory

Certain tools (such as `sam_getplan` and `parse_configs`) might require more memory to start than what is available. The symptom is an error message similar to the following:

```
Error occurred during initialization of VM.
Could not reserve enough space for object heap.
Error: Could not create the Java Virtual Machine.
Error: A fatal exception has occurred. Program will exit.
```

The workaround is to set the maximum memory to a low enough value in the `CARIDEN_JAVA_OPTIONS` variable before calling the tool. An example setting is as follows:

```
set CARIDEN_JAVA_OPTIONS=-Xmx1000m
```

Accessibility Features

For a list of accessibility features in Cisco WAE, visit Cisco’s Voluntary Product Accessibility Template (VPAT) website, or contact accessibility@cisco.com.

All product documents are accessible except for images, graphics and some charts. If you would like to receive the product documentation in audio format, braille, or large print, contact accessibility@cisco.com.

Related Documentation

For related documentation, see the Cisco WAE 6.4 Documentation Roadmap.
