CHAPTER 6

Distributed Server Installation	6-1
Before You Begin	6-1

CHAPTER 7

Post Installation	7-1
Configurations	7-2
Log In to Web UI	7-3

CHAPTER 8

License Installation 8-1

- Cisco Smart Licensing 8-1
 - Smart Licensing Configuration Workflow 8-1
 - Enable Smart Licensing in Cisco WAE 8-2
 - Register Cisco WAE with the Cisco Smart Software Manager 8-2
 - Configure the Transport Mode Between Cisco WAE and the CSSM 8-4
 - Enable Smart Licensing in WAE Design 8-5
- Traditional Licensing 8-6
 - License Location Restrictions 8-6
 - Install License from the Web UI 8-6
 - Install License from the CLI 8-7
 - Cisco WAE Design Licenses 8-7

CHAPTER 9

WAE Design Floating License Server 9-1

- Prerequisites 9-1
- Best Practices 9-1
- Pre-Installation 9-2
- Install License Server 9-3
- Configure License Server Ports 9-3
- Start License Server 9-4
 - CLI 9-4
 - Web UI 9-4
- Post-Installation 9-5
 - Log Files 9-5
 - Port Verification 9-5
 - Distribute Information to Clients 9-6
 - Set Up Access Control List for Web Server 9-6
 - Configure Borrowing Parameters 9-7
 - Verify Licenses in Use 9-7
 - Reclaim Unused Licenses 9-8

CHAPTER 10

Cisco WAE Live Data Store 10-1

- Installing the mld Server 10-1
- Upgrading the Data Store to a New Server 10-4
- Upgrading the Data Store 10-4
- Starting and Restarting the mld Server 10-5
- Stopping the mld Server and Getting Current Status 10-5

Backing Up the Data Store	10-5
Best Practices	10-6
Backup Steps	10-6
Additional Backups	10-7
Restoring the Data Store	10-8
Prerequisites	10-8
Restoration Steps	10-9

Overview

This chapter provides an overview of what happens as a result of the installation process, such as which packages are installed and how environment variables are set. This guide explains how to install the server software used by both the web applications and the Cisco WAN Automation Engine (WAE) platform.

- [Collector Server Upgrades](#)—Describes options for migrating the Collector server files and upgrading the Collector server database.
- [Before You Begin](#)—Requirements, best practices, and pre-installation instructions.
- [Offline Installation](#)—Procedure you must perform before installing the software when you do not have access to the Internet.
- [WAE Planning Software Installation](#)—Procedure for installing WAE Planning software.
- [Distributed Server Installation](#)—Procedure for installing WAE Planning and WAE Automation software on two separate servers.
- [Post Installation](#)—Optional procedures to follow after having installed the product, including pointers on where to go for configuration information and how to log in to the web UI.
- [License Installation](#)—Procedure for installing licenses for all products.
- [WAE Design Floating License Server](#)—Procedure for installing and setting up the FlexNet Publisher license server. This is applicable only if you have WAE Design and only if you need to administer floating licenses for these end users.
- [Cisco WAE Live Data Store](#)—Procedure for installing, upgrading, backing up, and restoring a WAE Live data store.

Installer

An installer is an executable that runs a script to install the WAE software in the proper locations. Although WAE features are installed, they are active only if you have a license for them.

The installer automates the installation process by asking you a series of questions and performing the following tasks.

- Verifies the following.
 - Whether the device has the appropriate system requirements, including proper operating system, disk space, total memory, and required software packages.

If the installer sees that you do not have the appropriate system requirements, it either exits, gives a warning, or prompts you whether to continue. Since the installer might be checking for more than what your specific requirements are, you can press “y” to attempt to continue.

- Whether there are existing package installations; if there are, they are preserved
- Stops all services that are running.
- Installs RPM packages, creates the software directory structure, and creates symbolic links to the most recently installed packages.
- Sets the maximum file descriptors and processors as follows:
 - /etc/sysctl.conf file
Sets `fs.file-max=512000` if it is less than 65535.
 - /etc/security/limits.conf
Sets `nofile` to 65535 for the WAE username.
 - /etc/security/limits.d/90-nproc.conf
Sets `nproc` to 8192 for the WAE username.
- Sets the file capabilities for all binaries in `$CARIDEN_HOME/lib/ext/pmacct/sbin`, which enables you to collect flow data using `flow_manage` and `flow_get` without having to change the file capabilities for the flow collection server. This is the equivalent of executing the following command:

```
setcap 'cap_net_bind_service=+ep' $CARIDEN_HOME/lib/ext/pmacct/sbin/*
```
- Automatically starts the web server (`wae-web-server`), WAE Network Interface (NI) server (`wae-ni`) (if applicable), and all System services (`wae-svcs-*`). For detailed information on services, including how to start, stop, restart, and check their status, see the *Cisco WAE System Administration Guide*.
- Upon logging out and back in, the WAE username and associated permissions are set, and the environment variables are set.
 - For executables, the WAE user has read, write, and execute permissions. Users listed in `/etc/group` have read and execute permissions. All others have read-only permissions.
 - For non-executables, only the WAE user has read and write permissions. All other users have read-only permissions.

RPM Packages

The `jdk-7u60` package is installed in `/usr/java/latest`. All other RPM packages are installed in `/opt/cariden/software`. To list these packages, enter this command:

```
rpm -qa | grep wae-
```

Note

Table 5-1 in Chapter 5, “WAE Planning Software Installation,” lists the services and packages that are installed on each server.

Package	Description
<code>jdk-7u60</code>	Oracle Java version 7 (1.7).
<code>wae-appenginecore</code>	Service API that manages and routes requests to load the network model to the appropriate <code>wae-designapiserver</code> .
<code>wae-core</code>	WAE Core server that enables the use of WAE Core REST and Thrift APIs.
<code>wae-db</code>	WAE Core database.
<code>wae-demo</code>	Demonstration UI for applications developed for WAE Core.
<code>wae-designapiserver</code>	Service that enables <code>wae-appenginecore</code> to use the Design APIs. This wraps the Design APIs and controls Design API instances.
<code>wae-dlc</code>	WAE Design, WAE Live, and WAE Collector executables and binaries.
<code>wae-messaging</code>	WAE messaging system that uses JMS (Java Message Service).
<code>wae-ni</code>	WAE NI server that enables the northbound WAE NI APIs. WAE NI is used for continuous polling and continuous PCEP LSP collection.
<code>wae-osc</code>	Open SDN Controller.
<code>wae-platsvcs</code>	Package that distributes the Automation platform services in a high-availability environment.
<code>wae-svcs-client</code>	Component that provides the data to the aggregation server for displaying statistics, such as logs, diagnostics, and processes.
<code>wae-svcs-server</code>	Aggregation server for gathering and collating the web statistics sent to it by the <code>wae-svcs-client</code> .

Current Links

The current symbolic link for the DLC package is `/opt/cariden/software/mate/current`.

Example RPM name: `wae-dlc-1.0.2-123456789`

Corresponding current link name: `/opt/cariden/software/mate/current`

Other than the DLC package, all other packages have a current symbolic link using the package name as the link name.

Example RPM name: `wae-core-1.0.2-123456789`

Example corresponding current link name: `wae-core`

Versions

To determine the release version, enter the following command:

```
license_check -version
```

To determine the current RPM versions, enter the following command:

```
rpm -qa | grep wae
```

Environment Variables

Upon logging out and back in as the WAE user after an installation, the environment variables are automatically set using `.sh` scripts in `/etc/profile.d` directory.

Environment Variable	Default
<code>\$WAE_ROOT</code>	<code>/opt/cariden</code>
<code>\$WAE_HOME</code>	<code>/opt/cariden/software</code>
<code>\$CARIDEN_ROOT</code>	<code>/opt/cariden</code>
<code>\$CARIDEN_HOME</code>	<code>/opt/cariden/software/mate/current</code>
<code>\$CASSANDRA_HOME</code>	<code>/opt/cariden/software/wae-db</code>
<code>\$COLLECTOR_HOME</code>	<code>/opt/cariden/software/wae-ni</code>
<code>\$JAVA_HOME</code>	<code>/usr/java/latest</code>
<code>\$PYTHONPATH</code>	<code>/opt/cariden/software/wae-demo/lib/python2.7/site-packages</code> For use by the <code>/etc/profile.d/wae-demo.sh</code> script.

Collector Server Upgrades

If you are upgrading and if you use the same installation directory in both installation processes, the Collector server files located in these directories remain intact.

- `/opt/cariden/data/collector/server/file-persistence`
- `/opt/cariden/data/collector/server/snapshots`
- `/opt/cariden/etc/collector/server/configs`
- `/opt/cariden/etc/collector/server/db-persistence`

File Migration

Migrating Collector server files means copying the Collector server files (located in the preceding directories) from the previous release to the new one.

During the installation process, you are given the option to migrate the Collector server files. If you are using different installation directories and if you want these files automatically copied to their respective locations under the new installation directory, enter “Yes” when prompted. If you choose “No,” you can use the `collector_migrate` tool to migrate these files at a later time.

Note that if you are using the same installation directory, file migration is not applicable.

Database Upgrades

Upgrading the Collector server database means that the existing

`<install_directory>/etc/collector/server/db-persistence/DiscoveryEngineImplementation.db` file is upgraded with information from the new release, such as with new default values and column headings.

Except for new installations, when you start the web server, a backup directory containing the previous release's database is automatically created in

`<install_directory>/etc/collector/server/db-persistence`. Also when you start the web server, database upgrades occur automatically. Since the installation process automatically starts this server, the backup directory creation and the database upgrade both occur automatically. This can prove useful if you need to later roll back the Collector server database.

The `/opt/cariden/etc/sysconfig/wae-web-server.cfg` file contains a parameter for turning off this automatic upgrade feature. For information, see [Before You Begin](#).

Note that this database (DiscoveryEngineImplementation.db) file has the potential to be both migrated and upgraded. Table 2-1 describes what happens to the database file, depending on the combination of answers given.

- The “Autoupgrade =” column references the `autoupgrade` parameter in the `/opt/cariden/etc/sysconfig/wae-web-server.cfg` file.
- The “Migration Install =” column references the answer given during the installation process when prompted whether to migrate Collector server files.

Table 2-1 Database File Migration and Upgrade

Autoupgrade =	Migrate Install =	Same Installation Directory	Different Installation Directory
		In all cases, migrating the database file is not applicable.	
True	Yes	Database file is upgraded to a new version, and the old database file is copied to the backup directory.	Database file is copied from the db-persistence directory of the previous release to the new directory. <ul style="list-style-type: none"> • This database file is copied to the backup directory. • This database file is upgraded to the new version.
True	No	Database file is upgraded to a new version, and the old database file is copied to the backup directory.	Database file is not copied from the previous release. New database file is created.
False	Yes	Database file is not upgraded, and a backup directory is not created.	Database file is copied from the db-persistence directory of the previous release to the new directory. Database file is not upgraded, and a backup directory is not created.
False	No	Database file is not upgraded, and a backup directory is not created.	Database file is not copied from the previous release. New database file is created.

Before You Begin

Prerequisites

Note

For a list of system requirements and package dependencies, see the [System Requirements](#) document.

- **System Requirements**—The installer checks for system requirements. If they are not met and if it is something the installer cannot address, such as memory issues, the installation process stops.
- **Package Dependencies**—For online installations, the installer checks for required packages. If the installer cannot install any RPM dependency, it reports an error and skips the corresponding RPM installation. You must then install these dependencies and rerun the installer.

There is one exception to this automatic package installation. For RHEL operating systems, you must manually install an RHEL package repository (createrepo) using the Red Hat installation DVD.

- **License**—A license determines which WAE features are available to use, and is a requirement for using the products. If you have questions about obtaining a license, contact your support representative.
- **Server time synchronization**—The Network Time Protocol (NTP) must be used to synchronize times on all routers, servers used in the collection and deployment process, and servers used in high-availability clusters. Failure to synchronize these clocks can produce such issues as the following:
 - Messages might expire prematurely, which manifests as an unresponsive WAE northbound interface. Depending on where the JMS messages expire, you may or may not see indications of this in the logs.
 - Certain collection tools, such as `sam_getplan` and `flow_get`, might produce inaccurate traffic tables.
 - Collection tools will produce an inaccurate `NetIntHistory` table.
 - All lines in the collection logs will have incorrect timestamps.
- **/etc/hosts requirements**—Various web services require the server's hostname to be present in the `/etc/hosts` file. This is standard configuration practice, but some Linux systems do not have it. Both the fully-qualified domain name and hostname must be present. Make sure that the following line is present in `/etc/hosts`.

```
<server IP address> <fully-qualified domain name> <hostname>
```

Example: 192.168.0.15 wae-server.my.company.com wae-server

- **Security**—The server's SSL certificate for a domain is customer specific. The web server installation is tied to a preferred Certification Authority (CA) provider, which in turn issues valid certificates to web clients. To prevent users from seeing messages for untrusted certificates, configure the certificate to be signed by one of the client's trusted CAs. The fully-qualified domain name (FQDN) of the WAE server should match the FQDN of the certificate issued by the CA.
- **BIOS setting (if applicable)**—To improve collection performance, change or disable the power management setting to permit maximum CPU performance.
- **/etc/sysconfig/network**—We recommend to have FQDN set as the hostname:
`HOSTNAME=<fully-qualified domain name>`

These pre-installation steps are valid for both online and offline installations.

-
- Step 1** Download the WAE software package. In a web browser, go to the [Cisco download site](#), and use the Search feature to find the applicable product.
- Step 2** Log in to the server as root or a user with administrative capabilities.
- Step 3** Ensure there are no local firewalls blocking the services. This step is beyond the scope of these instructions, though following is an example. For a list of available ports, see the [System Requirements](#) document.

Example: This shows how to disable the iptables firewall as root:

```
service iptables save
service iptables stop
chkconfig iptables off
```

Change Default wae-web-server Parameters

If this is an upgrade and if you want to change the default manner in which the `wae-web-server` starts, change the manner in which it restarts, or change the size of the web server memory, edit the `/opt/cariden/etc/sysconfig/wae-web-server.cfg` file. The following are the most frequently used parameters.

Action	Parameter
Change the default HTTP port	<code>http-port=8080</code>
Change the default HTTPS port	<code>https-port=8443</code>
Enable (true) or disable (false) the automatic redirect from HTTP to HTTPS	<code>http-redirect=true</code>
Enable (true) or disable (false) the automatic upgrade of the Collector server database. For information on database upgrades, see Collector Server Upgrades .	<code>autoupgrade=true</code>
Change the maximum memory size for the web server G=gigabytes M=megabytes K=kilobytes	<code>max-memory <size></code> For example, <code>max-memory 5G</code>

**Note**

Ports 1 through 1023 are privilege ports and cannot be used without root access.

Verifying Code Signing

To verify Cisco code signing, complete the following procedures for each platform software image.

**Note**

There are no additional steps required for Windows systems. Code signing verification is automatically done during Windows installation.

Verifying Code Signing for Mac Software

Step 1 Enter the following command:

```
codesign -dvvv <path to .dmg file>
```

Example:

```
codesign -dvvv /home/builder/Downloads/MATE-k9-6.3dev-1815-g40a7ddb-MacOSX-x86_64.dmg
```

If code signing verification is successful, the following similar message will appear:

```
Executable=/home/builder/Downloads/MATE-k9-6.3dev-1815-g40a7ddb-MacOSX-x86_64.dmg
Identifier=MATE-k9-6.3dev-1815-g40a7ddb-MacOSX-x86_64.dmg
Format=generic
CodeDirectory v=20100 size=155 flags=0x0(none) hashes=1+2 location=embedded
CDHash=7f45338f9d774d1dbf5eb204884e2822b3a0a665
Signature size=4938
Authority=Cisco Systems, Inc
Authority=thawte SHA256 Code Signing CA
Authority=thawte Primary Root CA
Authority=Thawte Premium Server CA
Signed Time=Nov 24, 2015 1:03:01 PM
Info.plist=not bound
Sealed Resources=none

Internal requirements count=0 size=12
```

Verifying Code Signing for Linux Software

Prerequisites

- OpenSSL must be installed to run the command.
- Confirm that the .pem and .signature files were downloaded as part of the software .zip file.

Step 1 Enter the following command:

```
openssl dgst -sha256 -verify <path to .pem file> -signature <path to .signature file>
<path to wae-k9.bin file>
```

Example:

```
openssl dgst -sha256 -verify WAE.pem -signature  
/home/user/Downloads/wae-k9-6.3.bin.signature /home/user/Downloads/wae-k9-6.3.bin
```

If code signing verification is successful, the following message appears:

```
Verified OK
```

Offline Installation

When installing WAE Planning software, the installer connects to the Internet and downloads missing packages. If the device or VM onto which you are installing cannot access the Internet, you must manually load these packages onto the device where you are installing the product.

Prerequisites

- You must have Internet access from another device so that you can download the required packages to a memory stick. Then transfer these libraries to the devices or VMs on which you are installing the product.
- You must have the packages needed by the WAE software. Refer to the [System Requirements](#) document to obtain the list of packages required before installation. You can download a CentOS DVD or an .iso file from <http://centos.org>.
- Follow the pre-installation steps in [Before You Begin](#).

Offline Installation

Step 1 Create a /media directory.

```
mkdir /media
```

Step 2 Mount either the physical CentOS DVD or the .iso file.

- DVD:

```
mount /dev/cdrom /media
```

- .iso file:

```
mount -t iso9660 -o loop <iso_filename.iso> /media
```

Step 3 From the /media/Packages directory, enter the following **rpm -i** commands to install the following packages. (Repeat the command for each package.)

```
rpm -i libedit-<version>.x86_64.rpm  
rpm -i openssh-clients-<version>.x86_64.rpm  
rpm -i libxml2-python-<version>.x86_64.rpm  
rpm -i deltarpm-<version>.x86_64.rpm  
rpm -i python-<version>.x86_64.rpm  
rpm -i python-deltarpm-<version>.x86_64.rpm
```

```
rpm -i createrepo-<version>.noarch.rpm
```

Example:

```
rpm -i libedit-2.11-4.20080712cvs.1.el6.x86_64.rpm
```

Step 4 Create a localrepo directory in the root directory.

```
cd /root
mkdir localrepo
```

Step 5 Copy all packages from /media/Packages to /localrepo.

```
cp /media/Packages/* /root/localrepo
```

Step 6 If you are configuring the WAE Automation packages, download the following CentOS libraries to /root/localrepo. Retrieve these from an EPEL mirror, as on <https://fedoraproject.org/wiki/EPEL>.

Note If you are using WAE Planning only and not WAE Automation, skip this step and ignore errors in the wae-platsvcs section of the installation.

- ansible*<version>*.noarch.rpm
- python-babel-*<version>*.noarch.rpm
- python-crypto*<version>*.x86_64.rpm
- python-httplib*<version>*.noarch.rpm
- python-jinja*<version>*.noarch.rpm
- python-keyczar-*<version>*.noarch.rpm
- sshpass-*<version>*.x86_64.rpm

Step 7 Create a yum local repository.

```
createrepo /root/localrepo
```

Step 8 Change directories to the yum configuration directory.

```
cd /etc/yum.repos.d
```

Step 9 Create a configuration file to define the yum localrepo directory.

```
vi /etc/yum.repos.d/local-repo.repo
```

a. Add these lines:

```
[local-repo]
name=local-repo
baseurl=file:///root/localrepo/
enabled=1
gpgcheck=0
```

Step 10 Disable all *.repo files in the /etc/yum.repos.d directory except for the local-repo.repo file you created. This step forces the installer to use only /root/localrepo.

a. Open each *.repo file and change all instances of enabled=1 to **enabled=0**. To find a list of files you must edit, enter the following command:

```
grep enabled *
```

You might need to manually view and edit files, because the enabled=0 statements might be missing and must be added.

Example:

```
vi CentOS-Base.repo
```

- b. For every header, add or change `enabled=1` to **`enabled=0`**.

Step 11 Update the repository so that yum knows which repository directory and file to use.

```
yum clean all  
yum repolist
```

Step 12 Run the installer by following all instructions in [WAE Planning Software Installation](#). This process creates an `epel.repo` file `/etc/yum.repos.d` directory and sets `enabled=1`. This causes the installation to fail because it does not check `/root/localrepo` thereafter. When prompted whether to continue, choose **no** to stop the installation.

Step 13 Disable the `epel.repo` file from being used by the installer.

```
cd /etc/yum.repos.d  
vi epel.repo
```

- a. Search on `enabled=1` and change each such instance to **`enabled=0`**.

Step 14 Rerun the installation by following all instructions in [WAE Planning Software Installation](#).

WAE Planning Software Installation

This section describes the necessary steps to install WAE Planning software (Cisco WAE Design, Cisco WAE Collector, and Cisco WAE Live) and the WAE Network Interface on a single server.

- Refer to [Before You Begin](#) and the [System Requirements](#) document to obtain the list of packages required before installation.
- If you do not have Internet access, follow the steps described in [Offline Installation](#) before completing the steps documented in this section.

To install WAE Automation software, you must have another server, edit an installation template (2- or 5-server setup), and run the deploy.py installer. For more information, see [Distributed Server Installation](#).

Step 1 Log in to the server as root or a user with administrative capabilities.

Step 2 Go to the directory where you downloaded the software, extract the .zip file, and execute the installer as root using a bash command. The software package is the installer that automates the installation process.

```
sudo bash <package>.bin
```

Installer Options	Description
<code>sudo bash wae-k9-<version>.bin</code>	Be prompted through the installation process.
<code>sudo bash wae-k9-<version>.bin -d <installation_directory></code>	Specify a different installation directory. You are prompted through the remainder of the installation process.
<code>sudo bash wae-k9-<version>.bin -h</code>	Shows a usage statement for the installer.
<code>sudo bash wae-k9-<version>.bin -y</code>	Automatically respond “yes” to all questions without being prompted.

The process verifies the integrity of the installation using checksums. If a checksum fails, error messages appear and the installation process ends.

Depending on what the installation process finds, it might prompt you throughout the process to continue or not.

Step 3 When prompted, enter the following information.

Command Prompt	User Entry/Notes
Enter the installation directory	By default, the installation directory is set to <code>/opt/cariden</code> . If this is an upgrade, we recommend that you maintain the same installation directory as in the previous release. If this is a new installation, the recommendation is to keep this default. If the directory you entered does not exist, you are prompted as to whether to create it. If you answer “yes,” an installation directory with root privileges is created.
Enter the WAE username	The default is "cariden" only if that username exists; its existing password remains intact. Otherwise, the default WAE username is "wae" and the password is "ciscowae." The WAE user is created automatically during installation. We recommend that you keep the default you receive. Note If you have installed the WAE Live data store (mld), you cannot restart mld unless you start it with the same username used to install it.
Migrate WAE Collector files from previous installation?	This question is only applicable if you are upgrading or if you are using a different installation directory than in the last release. For details, see Collector Server Upgrades .
Do you want to activate the WAE Network Interface?	Activating the WAE Network Interface allows the software to perform continuous collection. You can start the WAE Network Interfaces services later by executing the following commands: <pre>service wae-ni start /sbin/chkconfig wae-ni</pre>
Do you want to uninstall the packages?	This question is only applicable if you have existing Automation software installed.

Step 4 Once the installation process stops, log out of the device or VM.

Step 5 Log back in using the WAE username.

Note

If you chose to migrate the Collector server files during the installation process, verify those files have been copied before stopping the web server. (See [Collector Server Upgrades](#).) This is particularly important when installing or upgrading the WAE Live data store, which requires that you first stop the web server.

Step 6 (Optional) If you are installing WAE Automation software, follow the steps described in [Distributed Server Installation](#).

Note

See [Table 5-1](#) for a list of services and software installed on each server.

Table 5-1 *Installed Services and Software Packages*

Service and Software Package	Planning Server	Automation / Distributed Servers
Software Packages	wae-dlc.rpm	wae-appenginecore.rpm
	wae-ni.rpm	wae-core.rpm
	wae-platsvcs.rpm	wae-db.rpm
	wae-svcs-client.rpm	wae-demo.rpm
	wae-svcs-server.rpm	wae-messaging.rpm
		wae-designapiserver
		wae-osc.rpm

Distributed Server Installation

This section describes how to install WAE Automation software in a multiple-server deployment where the primary server is designated as the Planning server. In a dual-server deployment, the secondary server is referred to as the Automation server.

Before You Begin

- Complete the software installation on the primary (Planning) server. For more information, see [WAE Planning Software Installation](#).
- Confirm that system requirements for a multiple-server deployment have been met. For more information, see the [System Requirements](#) document.
- Confirm that the same WAE user exists on all servers and has Sudo access.
- Decide on installation type: Dual-server or 5-server deployment.

See [Table 5-1](#) for a list of services and software installed on each server.

Step 1 Navigate to the appropriate installation template file from `$WAE_ROOT/software/wae-platsvcs/confmgmt/etc/`:

- `2node.yml`—Installation template file to be used in a dual-server environment.
- `5node.yml`—Installation template file to be used in a 5-server environment.

Step 2 Edit the template file by entering the following information:

- WAE user name
- (optional) NTP server address—Configures WAE client to point to the NTP server. This option assumes that NTP configuration and an NTP server exist. This option does not install NTP software or services.
- IP addresses of the planning (local) server
- IP addresses and names of additional servers in your deployment
- Services (roles) that you want to run on each server

For example,

```
# 2 node deployment template
deployment:
  template: 2node
  remote_user: cariden
  vars:
```

```

hosts:
- address: 192.169.120.101 #Please enter valid IP address these components
  name: Planning
  roles:
    - common
    - wae-dlc
    - wae-ni
    - wae-svcs-server
    - wae-svcs-client
- address: 192.169.120.102 #Please enter valid IP address
  name: Automation
  roles:
    - common
    - wae-messaging
    - wae-core
    - wae-appenginecore
    - wae-designapiserver
    - wae-db
    - wae-osc
    - wae-svcs-client

```

Step 3 Run the `wae_dist_deploy` installer:

```
wae_dist_deploy -template-file <install_template.yml> -deploy
```

For example,

```
wae_dist_deploy -template-file 2node.yml -deploy
```

Step 4 When prompted, enter the WAE user password.

Wait at least 5 minutes for the deployment to complete. A confirmation message appears when the installation is successful.

Step 5 To verify if the deployment was successful:

```
wae_dist_deploy -template-file <install_template.yml> -config-test <config_test_option>
```

where `<config_test_option>` can be one of the following:

- `services`—Lists status for applicable services running on each server.
- `wae-core`—Tests and lists bundled core services.
- `ports`—Tests and lists the TCP ports of services on the servers.
- `license`—Tests if required licenses are installed for each server.
- `:list`—Lists all available tests.
- `:all`—Runs all available tests.

For example,

```
wae_dist_deploy -template-file 2node.yml -config-test ports
```

Note To find all available options for `-config-test`, enter `wae_dist_deploy -template-file <install_template.yml> -config-test :list`.

Post Installation

- Step 1** Install the license or licenses. WAE Design, WAE Collector, and the web applications combined require one license. The WAE Core modules require that same license and an additional one. For information, see [License Installation](#).
- Step 2** If you are administering floating licenses to WAE Design users, configure the FlexNet Publisher license server. For information, see [WAE Design Floating License Server](#).
- Step 3** If using WAE Live, either start, upgrade, or install the WAE Live mld server. When starting or upgrading the mld server, you must use the same username as when you installed it. For more information, see [Cisco WAE Live Data Store](#).

Note

If you chose to migrate the Collector server files during the installation process, then verify those files have been copied before stopping the web server. (See [Collector Server Upgrades](#).)

- a. If upgrading mld, stop it now.

```
mld -action stop
```
- b. Stop all services, including the web server. For information on services, see the *Cisco WAE System Administration Guide*. The format for stopping services is as follows:

```
service <service_name> stop
```

Example: `service wae-web-server stop`
- c. Install, start, or upgrade WAE Live mld server. Note that installing and upgrading the mld server also starts it.
 - Start an existing mld server: `mld -action start`
 - Upgrade an existing mld server and start it: `mld -action upgrade`
 - Install and start mld server: `mld -action install -size [DSML]`
- d. Start or restart the web server and another services that are needed.

```
service <service_name> start
```

Example: `service wae-web-server start`

- Step 4** The `wae-web-server`, `wae-ni` (if activated) and System (`wae-svcs-*`) services are automatically started. Others may have been started, depending on how you responded when prompted during the installation process. If needed, start other services now. For information, see the *Cisco WAE System Administration Guide*.

- Step 5** The licensed features you have determines what needs to be configured. See the [Configurations](#) section for a list of these and pointers where to go for information.

Configurations

The features that are in the licenses govern which of the following configurations are required after having installed the product.

Note

For WAE Design, no further configurations are required.

- Configure system-wide parameters for clients using the local web UI—Navigate to the System > User Management page to change your credentials and set up users. See the [Log In to Web UI](#) section and the *Cisco WAE System Administration Guide* for more information.
 - Configure users and their roles.
 - If applicable, configure access to an LDAP server and mappings between LDAP groups and WAE roles.
 - Configure access to the SMTP server used for emailing WAE Live reports.

Best practice: Share the login and credential information with users so they know how to access the web UI.

- Configure the WAE platform—For information, see the *Cisco WAE Platform Configuration Guide*.
 - Configure WAE Collector to collect network data and traffic. You can configure collection using either the WAE Collector UI or using snapshot configuration files.
 - Configure other WAE platform modules, including the Deployer Module.
 - Configure WAE Network Interface (NI) server and WAE REST API passwords.
- Configure WAE Live—For information, see the *Cisco WAE Live Configuration Guide*.
 - Install and configure the data store—Applicable if using WAE Live Explore and Analytics components.
 - Configure WAE Live to collect the data from WAE Collector—Applicable if using both WAE Live and WAE Collector.
 - Customize WAE Live application for its users
- Customize the WAE Design Archive application for its users—For information, see the *Cisco WAE Design Archive User and Administration Guide*.
- Enhance network visualization—Lay out the network topology for the plan file template used in the WAE Live and WAE Design Archive applications. For information, see the *Cisco WAE Network Visualization Guide*.

Log In to Web UI

-
- Step 1** Ensure all appropriate servers are running and start them if necessary. The `wae-web-server` (web server) and all System services (`wae-svcs-*`) are automatically started by the installer. If the WAE Network Interface server was activated during installation, the `wae-ni` service is also started. For detailed information on services, including how to start, stop, restart, and check their status, see the *Cisco WAE System Administration Guide*.
- Step 2** Open the web home page in a browser.
`https://<server_IP>:8443`
- Step 3** Log in to the web server.
Default administrative credentials:
- Username: admin
 - Password: cariden
- Default user credentials:
- Username: user
 - Password: cariden
- Step 4** Navigate to the desired function in the left navigation pane: WAE Collector UI, any web application, System UI, Statistics UI.
-

License Installation

A license is required for all features except for sample plan files used in the Cisco WAE Design application. If you have questions about obtaining a license, contact your Cisco support representative or system administrator.

Cisco WAE supports Cisco Smart Licensing and traditional licensing. If you would like to convert from a traditional license to Smart Licensing, see your Cisco WAE account representative. For information on the differences between the two types of licensing, refer to the [Cisco Smart Licensing Overview](#) on Cisco.com.

Cisco Smart Licensing

Cisco offers Smart Licensing, which enables you to monitor Cisco WAE software licenses and endpoint license consumption easily and efficiently through a simple registration and license consumption reporting process instead of having to install node-locked license files. Details of all Cisco products and licenses that you have purchased are maintained in a centralized database called the Cisco Smart Software Manager (CSSM).

Smart Licensing Configuration Workflow

-
- Step 1** Create a Smart Account with Cisco Systems. To do this, go to [Smart Account Request](#) and follow the instructions on the web site.
 - Step 2** [Enable Smart Licensing in Cisco WAE.](#)
 - Step 3** [Register Cisco WAE with the Cisco Smart Software Manager.](#)
 - Step 4** (Optional) By default, the Smart License information is sent directly to the cloud. To change this, follow the steps outlined in [Configure the Transport Mode Between Cisco WAE and the CSSM.](#)
 - Step 5** (Optional) If using WAE Design, enable Smart Licensing using the WAE Design GUI or CLI in your local WAE Design setup (Windows, Mac, or Linux).
-

Enable Smart Licensing in Cisco WAE

Before You Begin

Confirm that you have a Smart Account. If not, go to [Smart Account Request](#) and follow the instructions on the web site.

Note

You can disable Smart Licensing at any time by clicking **Disable Smart Software Licensing** from the drop-down list available on the top right of the Smart Software Licensing page.

Step 1 From the Cisco WAE UI, navigate to **System > Licenses**.

Step 2 Click **Enable Smart Software Licensing**.

Step 3 Click **OK** to confirm that you are enabling Smart Licensing. The Smart Licensing page appears.

Step 4 Do one of the following:

- If you have not registered Cisco WAE with the CSSM on Cisco.com, Cisco WAE will be in evaluation mode (which expires in 90 days). Register Cisco WAE as described in [Register Cisco WAE with the Cisco Smart Software Manager](#).
- If you have registered Cisco WAE with the CSSM, select the licenses you want to use.

Note

To enable Smart Licensing for WAE Design, see the *Cisco WAE Design GUI Installation Guide*.

Register Cisco WAE with the Cisco Smart Software Manager

To register Cisco WAE with the Cisco Smart Software Manager (CSSM), you must obtain a token from the CSSM and enter it into the WAE UI. This is a one-time requirement. If Cisco WAE is already registered, you must deregister the product, then register it again. For information on how to use the CSSM, including renewing license registration and authorization, refer to the [Cisco Smart Software Manager User Guide](#). You can also access these operations within the WAE UI using the Smart Licensing page.

Before You Begin

- Confirm that you have a Smart Account. If not, go to [Smart Account Request](#) and follow the instructions on the web site.
- Confirm that Smart Licensing is enabled in Cisco WAE. If not, see [Enable Smart Licensing in Cisco WAE](#).

Step 1 Go to the [Cisco Software Central](#) web site.

Step 2 Obtain your tokens. If you already have tokens (for example, you converted traditional licensing PAKs to Smart entitlements), proceed to the next step.

Step 3 If you are re-registering your product instance, copy your token (it is listed in the CSSM user interface), and use it again. If your token is no longer valid, you can obtain a new token using this procedure.

- a. On Cisco Software Central, choose **License > Smart Software Licensing**.
 - b. Select the appropriate virtual account.
 - c. Click the **General** tab, then click **New Token**.
 - d. Follow the instructions to provide a name and duration. If you need to create a restricted token to enable export control functions, you can click the **Allow Export-Controlled Functionality** button.
 - e. Click **Create Token**.
 - f. Copy the Token ID to your clipboard and proceed to the next step.
- Step 4** From the WAE UI, click **Register**. The Smart Software Licensing Product Registration window appears.
- Step 5** Enter the Token ID you just copied in Step 3 to register the product instance. The Smart Software Licensing Status page appears.
- Step 6** Click **Choose License...**
- Step 7** Click all applicable licenses from the license table and enter the corresponding number of license instances.
- Step 8** Click **OK** to save the changes. The Smart License Usage table is updated with the changes. By default, data is refreshed every 15 seconds. You can also click the Refresh icon on the top of the page.
- Step 9** (Optional) Enable Smart Licensing for WAE Design. For information, see the *Cisco WAE Design GUI Installation Guide*.

Smart License Registration and Authorization Statuses

Registration Status

The license registration status reflects whether Cisco WAE is properly registered with Cisco Smart Software Licensing on Cisco.com.

License Registration Status	Description
Unregistered	<p>Smart Software Licensing is enabled on Cisco WAE, but Cisco WAE is not registered with the CSSM.</p> <p>By default, registration renewal happens automatically every 30 days. If you want to manually renew it, click Renew Registration Now from the drop-down list available on the top right of the Smart Software Licensing page.</p>
Registered	<p>Cisco WAE is registered with the CSSM. Cisco WAE has received an ID certificate that will be used for future communication with the Cisco licensing authority.</p> <p>To unregister, click Deregister from the drop-down list available on the top right of the Smart Software Licensing page.</p>

License Registration Status	Description
Registration Expired	Cisco WAE did not successfully renew its registration prior to the expiration date and has been removed from the CSSM.
Registration Pending	The Smart Licensing Agent is trying to automatically register the license.
Registration Failed	The Smart Licensing Agent could not register to the CSSM.

License Authorization Status

The License Authorization status reflects license usage against purchased licenses, and whether you are in compliance with Cisco Smart Licensing. If you exceed the number of purchased license, the product will be Out of Compliance.

License Authorization Status	Description
Evaluation Mode	Cisco WAE is running in evaluation mode (expires in 90 days).
Authorized	Cisco WAE has a valid Smart Account and is registered. All licenses requested by Cisco WAE are authorized for use.
Out of Compliance	Cisco WAE has exceeded the number of licenses that were purchased. (Specifically, the virtual account for the product instance has a shortage of one or more licenses types.)
Evaluation Expired	The evaluation period has expired and Cisco WAE is in the unlicensed state.
Authorization Expired	Cisco WAE did not successfully renew its license authorization prior to the authorization expiration date. To renew auzhorization, click Renew Authorization Now from the drop-down list available on the top right of the Smart Software Licensing page.
Not in Use	A license is not in use.

Configure the Transport Mode Between Cisco WAE and the CSSM

By default, the Smart License information directly to the cloud. To change this, perform the following steps:

- Step 1** From the Smart Software Licensing page, click **View/Edit** from the Transport Settings field. The Transport Settings window appears.
- Step 2** Select a communication mode:

- Direct mode—Send license information directly to the cloud. This is the default. You cannot edit this URL.
 - Transport Gateway—Use a Cisco Call Home transport gateway or a Cisco Smart Licensing Software satellite. (A satellite is installed on customer premises and provides a subset of CCSM functionality.)
 - HTTP Proxy—Use an HTTP/HTTPS proxy for communication between and the cloud. Enter the proxy IP address and port.
 - Click **Save**.
-

Enable Smart Licensing in WAE Design

This section describes how to enable Smart Licensing in your local WAE Design setup.

Enable Smart Licensing Using the WAE Design GUI

Before You Begin

- Confirm that you enabled Smart Licensing in the server. See [Smart Licensing Configuration Workflow](#).

-
- Step 1** From the WAE Design, choose **File > License > Install**.
 - Step 2** Choose the **Specify smart license service information** option. Enter the hostname (which has Smart Licensing enabled) and the port being used. The default port is 8443.
 - Step 3** Click **OK** to confirm the license installation.
-

Enable Smart Licensing Using the CLI

To enable Smart Licensing on your local WAE Design setup using the CLI, you must include the server hostname and port for the Smart License service. If a port number is not entered, the default value is 8443.

```
license_install -smart-license-service-host <smart_license_service_hostname>  
-smart-license-service-port <port_number>
```

For example:

```
license_install -smart-license-service-host sl.cisco.com -smart-license-service-port
```

Traditional Licensing

There are three methods of installing a traditional license, and the method used depends on the type of license you are installing.

- Standalone Cisco WAE Design—Use either the Cisco WAE Design GUI or the CLI method. Both methods enable you to install dedicated and floating licenses. Floating licenses are only for use by Cisco WAE Design.
- Cisco WAE Collector and web applications—Use either the web UI or the CLI method.
- Cisco WAE Core—Use the CLI method.

Note

All instructions and examples assume you used `/opt/cariden` as the default installation directory. If you did not, substitute your installation directory for `/opt/cariden`.

License Location Restrictions

The CLI gives you the option to store the license file in one of three locations.

- `$HOME/.cariden/etc`
- `/opt/cariden/etc`
- `/opt/cariden/software/mate/<package>/etc`

Both the Cisco WAE Design GUI and the web UI put licenses only in `$HOME/.cariden/etc`.

- If installing dedicated licenses for both WAE Core and non-WAE Core, you must install the licenses in the same directory and merge both license files into a single license.
- If installing a dedicated license for WAE Core and a floating license for Cisco WAE Design on the same server, you must install the licenses in different directories.
- You cannot install both a Cisco WAE Design dedicated and a Cisco WAE Design floating license.

Install License from the Web UI

Note

Do not use the web UI for WAE Core licenses or stand-alone WAE Design installations.

Step 1 Start the web server if it is not running.

```
service wae-web-server start
```

Step 2 Choose **System > Licenses**.

Step 3 Click **Upload Traditional License**.

Step 4 Click **Select Licenses**.

- Browse to the location or enter the name of the license file (.lic extension), and click **Open**.
- If there is already a license installed, the default is to overwrite the existing license. To merge the two licenses instead, select the merge option. If you are uncertain whether you have a complete set of desired features in the new license, best practice is to merge the licenses.
- Click **Upload License**.

Step 5 Verify the license installed correctly by locating it on the System > Licenses page.

Install License from the CLI

You can use the CLI to install licenses for all products.

Note

If you are installing both a WAE Core and a non-WAE Core license, you must use the default method that merges the licenses. You are given an option on where to put the license. Choose the same location for both licenses.

- For each license you are installing, run the `license_install` tool, passing it the name of the license file (.lic extension). By default, the tool merges the features granted by the new license with those in an existing license.

```
license_install -file <path>/<filename>.lic
```

When prompted, enter the number associated with the directory in which you want to install the license.

By default, when using `license_install -file`, the tool merges the features granted by the new license with those in an existing license. If you are using only non-WAE Core licenses, you can overwrite the existing license using the `-existing-lic overwrite` option. Before executing this option, be certain that the new license contains all the necessary features because previous features will no longer be available. Do not use this overwrite option if installing licenses for both non-WAE Core and WAE Core.

```
license_install -file <path>/<filename>.lic -existing-lic overwrite
```

Example: `license_install -file acme/setup/MATEDEDICATED12345678910111213.lic -existing-lic overwrite`

- If you are installing a floating license (for WAE Design only) from the license server (that is, you do not have the license file), use both the `-server-host` and `-server-mac` options. The MAC address must be a 12-digit hexadecimal number without any colon (:) separators.

```
license_install -server-host <license_server_hostname> -server-mac <license_server_MAC_address>
```

If the `-server-port` option is not specified, ports 27000-27009 are scanned to find the license server port and connect to it. Optionally, you can enter the license server's TCP port number using a range of 1024 to 65535. The default license server port is 27000.

Cisco WAE Design Licenses

To use the WAE Design GUI, you need either a dedicated license, floating license, or a Smart License subscription. **Regardless of the license type or method of installation, you need only install it one time.**

For information on enabling Smart License for WAE Design, see the *Cisco WAE Design GUI Installation Guide*.

Dedicated Licenses	Checked Out Floating Licenses	Borrowed Floating
<ul style="list-style-type: none"> Each license is unique to a specific device. Always available (until expiration). No network connectivity is required. Must be downloaded to an accessible device. 	<p>The FlexNet Publisher license server must be set up (usually by a system administrator). For information on setting up this license server, see WAE Design Floating License Server.</p> <ul style="list-style-type: none"> A single license is shared amongst users who have permission from the license server. You must have connectivity to the license server. There are a maximum number of licenses, and you cannot check out one if they are all in use. You must either download the floating license to an accessible device, or know the hostname and MAC address of the license server. To connect to a different port, you need to know the license server's port number. Regardless of the method used, you must install the license one time. Thereafter, it is automatically checked out from the server when starting the GUI or any CLI tool. When the GUI is closed or the tool stops, the license is checked in to the license server for use by others. 	<ul style="list-style-type: none"> Users borrow licenses that are stored on the license server for a user-specified number of days. Other users cannot use the borrowed license. You must install the license one time. Thereafter, it is available for borrowing. After borrowing the license file once, it is available until you return it or until the number of days for which it is borrowed expires. If you do not return it, the license expires. Connectivity to the license server is required to borrow a license, but is not required when using a borrowed license. You must also have connectivity if returning a borrowed license prior to its expiration date. You cannot borrow a license if a dedicated license is already installed.

Install License from Cisco WAE Design GUI

To use the Cisco WAE Design GUI, you need either a dedicated or a floating license. **Regardless of the license type or method of installation, you need only install it one time.** If it is a floating license, thereafter when you start Cisco WAE Design, the floating license will be available for checking out or borrowing.

To verify a license and its features, select **File > License > Check**.

Note

If you have installed a license for use by the WAE Core modules, do not use the overwrite option when installing a Cisco WAE Design license.

Before You Begin

For a dedicated or floating license, confirm that you have the license on an accessible device.

-
- Step 1** From the WAE Design, choose **File > License > Install**.
- Step 2** Choose **From license file**.
- Step 3** Browse to the location or enter the name of the license file (.lic extension), and click **Open**.

- Step 4** Click **OK** to confirm the license installation. If there is already a license installed, you are prompted to either merge or replace the existing license. If you are uncertain whether you have a complete set of desired features in the new license, the best practice is to merge the licenses.
- Step 5** Do one of the following:
- If you are installing a dedicated license, choose **From license file**. Click **Browse** to navigate to the location or enter the name of the license file (.lic extension).
 - If you are installing a floating license from the license server (that is, you do not have the license file), choose **Specify license server**. Enter both the hostname and the MAC address of the license server. The MAC address must be a 12-digit hexadecimal number without any colon (:) separators. If the port is not specified, ports 27000-27009 are scanned to find the license server port and connect to it. Optionally, you can enter the license server's TCP port number using a range of 1024 to 65535. The default license server port is 27000. If using Windows, it is recommended that you specify the port.
 - If you are enabling Smart Licensing, click **Specify smart license service information**. Enter the hostname of the server and the port being used. The default port is 8443.
- Step 6** Click **OK** to confirm the license installation.
-

Borrow and Return Floating Licenses

If you have installed a floating license, you can borrow a license from the server for up to 30 days. The license is automatically returned to the license server at 11:59 PM on the last day (based on the local time on the floating license server).

You must have connectivity to the floating license server to borrow a license or to return it prior to the specified date. Connectivity is not required, however, during the period of time for which you are borrowing the license.

The number of remaining available days for the license is listed directly in the File > License > Borrow menu. To determine the exact date on which the license will expire, use the File > License > Check menu.

Using the WAE Design GUI

To borrow a license, follow these steps.

-
- Step 1** From the Cisco WAE Design GUI, select **File > License > Borrow**.
- Step 2** Enter the number of days you want to borrow the license (integer from 1 to 30), and click **OK**.
-

To return a borrowed license, follow these steps.

-
- Step 1** From the Cisco WAE Design GUI, select **File > License > Borrow**.
- Step 2** Click **OK** in the confirmation message.
-

Using the CLI

To determine the number of days before the license expires and the exact date on which the license expires, use the `license_check` command.

To borrow a license, use the `license_borrow` command and specify the number of days (integer from 1 to 30).

Example: `license_borrow -num-days 23`

To return a license, use the `license_return` command. There are no required or optional options.

Example: `license_install -server-host lic.cisco.com -server-mac 1a2b3c4d5e6f
-server-port 27000`

To verify a license and its features, run the `license_check` tool. To see descriptions of the license features, use the `-detail` option (which defaults to `true`).

Example: `license_check -detail`

WAE Design Floating License Server

The FlexNet Publisher license server must be set up if WAE Design users are to use floating licenses. Using this server, you can control access to the licenses, monitor who has them checked out, and check log activity.

The FlexNet Publisher license server has two interfaces. One is a CLI, which requires that you start an `lmgrd` daemon so all users can access the floating licenses. The other is a web UI, wherein you must install and configure an `lmadmin` tool. Best practice is to use only one or the other interface (CLI or web) to administer the license server.

Note

For information about FlexNet Publisher and for more details on all FlexNet Publisher CLI commands and GUI, refer to the *FlexNet Publisher License Administration Guide* (`FlexLM_EndUser_LicAdmin.pdf`). This is located in `$CARIDEN_HOME/docs`, which by default is `/opt/cariden/software/mate/current/docs`. This chapter includes some FlexNet Publisher instructions for both the CLI and GUI that could change without Cisco's knowledge.

Note

All instructions and examples assume you used `/opt/cariden` as the default installation directory. If you did not, substitute your installation directory for `/opt/cariden`.

Prerequisites

- You must have the required packages installed. For a list of package dependencies, see the [System Requirements](#) document.
- You must have a WAE Design floating license installed on the same device or VM as the FlexNet Publisher floating license server, which means you must have WAE Design installed. Contact your Cisco representative for this license, and see [License Installation](#) to install this license.

Best Practices

- If you are also installing a WAE package that requires servers, install this first and install it on the same device as the FlexNet Publisher license server. Doing so simplifies administration tasks.
- Update the WAE user's `PATH` variable so you can invoke FlexNet commands without having to specify the full path.

Example: Edit `~/ .profile`.

```
export PATH=$PATH:$CARIDEN_ROOT/software/flexlm/current/bin
export PATH=$PATH:$CARIDEN_ROOT/software/flexlm/current/web
```

Pre-Installation

Note

If you are installing the FlexNet Publisher license server **on a different Linux device** than the one on which a WAE server installation resides, follow Steps 1-4. Otherwise, skip to Step 5. Follow all steps on the device where the FlexNet Publisher license server resides.

Step 1 Log in to the FlexNet Publisher license server as root or as a user with administrative capabilities.

Step 2 Create a lowercase, alphanumeric username where the first letter is an alphabetical character.

```
/usr/sbin/useradd <username>
```

Step 3 Set a password.

```
passwd <username>
```

Step 4 Create an installation directory that has root privileges. The best practice is to use the default installation directory, which is `/opt/cariden`.

```
cd ~/
mkdir -p /opt/cariden
```

Step 5 Change the owner of the installation directory to the newly created user.

```
chown <username> /opt/cariden
```

Note

Throughout this chapter, `bin` is `/opt/cariden/software/flexlm/current/bin`.

Step 6 Ensure there are no local firewalls blocking the services. This step is beyond the scope of these instructions, though following is an example. For a list of ports used, see the [System Requirements](#) document.

Example: This shows how to disable the iptables firewall as root.

```
service iptables save
service iptables stop
chkconfig iptables off
```

Step 7 If you already have a license server installed and running, gracefully stop it.

```
bin/lmdown -c <license_file>
```

Or

```
bin/lmdown -all
```

If the server is distributing borrowed licenses, use the `-force` option.

```
bin/lmdown -c <license_file> -force
```

Or

```
bin/lmdown -all -force
```

- Step 8** Download the License Server Software package from the [Cisco download site](#). Navigate to the WAE Design License Server Software page. You must download a new license package regardless of whether this is an upgrade or a new installation.

**Note**

To enable borrow licenses:

- You must download the License Server Software Release 2.1 package. From the Cisco download site, navigate to **Routers > Service Provider Infrastructure Software > MATE Design > MATE License Server Software - 2.1**.
- If you have a floating license that was generated prior to May 2015, you must acquire a new floating license.

- Step 9** The WAE Design license file's SERVER statement must be the same hostname as the output from the hostname CLI command.

- a. Determine the hostname.

```
hostname
```

- b. Edit the `/etc/sysconfig/network` file to include the hostname returned in the above step.

```
HOSTNAME=<hostname>
```

- Step 10** Ensure the `/etc/hosts` file on the client devices contains the same hostname as identified in Step 4. (Client devices are the devices that will be checking the licenses in and out of the server.)

Install License Server

The installer runs `/ladmin-i86_lsb-11_11_1_1.bin` from the installed folder (`/opt/cariden/software/wae-license-server`).

If you want to run the license server web UI, run `/ladmin-i86_lsb-11_11_1_1.bin` from the `/opt/cariden/software/wae-license-server/bin` directory.

Although the default is to install `ladmin` into `/opt/FNPLicenseServerManager`, the best practice is to install it into `/opt/cariden/software/flexlm/current/web`.

```
chmod 755 ./<ladmin_package>.bin; ./<ladmin_package>.bin
```

Example:

```
chmod 755 ./ladmin-i86_lsb-11_11_1_1.bin; ./ladmin-i86_lsb-11_11_1_1.bin
```

Configure License Server Ports

To check out or borrow a floating license, client devices must establish two TCP connections to the license server. One connection is to the floating license server daemon. Unless otherwise configured, this daemon listens on the first available port in the range of 27000 and 27009. The other connection is to the Cisco daemon, which the license server randomly selects from the ephemeral range (which often ranges from 49152 to 65535).

If firewall policies block the above ports, you can change the ports by adding the port information to the floating license server's license file. By default, the file contains the following information.

```
SERVER <hostname> <MAC address>
VENDOR Cisco
```

Modify the preceding lines as follows to change the ports that these daemons use.

Port Type	Syntax	Example
Server daemon	SERVER <hostname> <MAC address> <port>	SERVER Centos10 525400232200 5053
Cisco daemon	VENDOR cisco PORT=<port>	VENDOR cisco PORT=27010

Start License Server

Note

The following instructions are for using either the CLI or license web server, but not both. The recommended practice is to install and use one or the other.

To start the license server, you must have access to its license file. Note that this is not the same as the WAE license.

Download the floating license server file (.lic extension) to a directory of your choice on the device where the license server will be installed. Best practice is to put it in `/opt/cariden/etc`.

CLI

To start the license server daemon (`lmgrd`) and specify the `lmgrd` log file name and location, enter the following from `/opt/cariden/software/flexlm/current/bin`.

```
./lmgrd -c <license_filename> -l <log_path_filename>.log
```

Example: `/lmgrd -c /opt/cariden/etc/MATE_Floating.lic -l /opt/cariden/logs/lmgrd.log`

Note

The license filename should be renamed to `MATE_Floating.lic`.

Web UI

Step 1 Create a backup of the Cisco daemon file so that it can be easily restored in case of failure.

```
cp /opt/cariden/software/flexlm/current/bin/cisco
/opt/cariden/software/flexlm/current/bin/cisco.bak
```

Step 2 Copy the Cisco daemon files to the `flexlm/web` directory.

```
cp /opt/cariden/software/flexlm/current/bin/cisco /opt/cariden/software/flexlm/web/cisco
```

- Step 3** To start the license server using the web UI, first configure the following parameters from the `/opt/cariden/software/flexlm/web` directory. For more information, see `lmadmin -help`.
- By default, the `lmadmin` server has a user named “admin” with a password of “admin.” If needed, add another user to this `lmadmin` server.

```
./lmadmin -useradd <username> - pass <password>
```
 - Import the WAE Design license file that was installed.

```
./lmadmin -import <path>/<license_filename>
```

Example: `lmadmin -import ~/.cariden/etc/MATE_Floating.lic`
 - Start the `lmadmin` process with its default settings.

```
./lmadmin
```
- Step 4** Start the license server web UI, which by default uses a non-secure port of 8090. By entering the following in a web browser, you are redirected to the secure port.
- ```
http:<server_hostname>:8091
```
- Step 5** Click the Administration link, and log in using the an administrative username and password. Both have a default of “admin.”
- Step 6** Click the Vendor Daemon Configuration tab, click the Administer link, and then click Start.
- 

## Post-Installation

### Log Files

By default, the `lmadmin` logs are in `/opt/cariden/software/flexlm/web/logs`.

The `lmgrd` log files are located wherever you specified the `<log_path_filename>.log` when starting the `lmgrd daemon` (`lmgrd -l <log_path_filename>.log`).

### Port Verification

To verify the ports, you can use any of several methods, as follows.

- Verify the license server daemon port is running. For example, you can telnet to this port to verify that it is running.

```
telnet <license_server_IP_address> <license_server_daemon_port>
```

Example: `telnet 127.0.0.1 27000`

- Verify the license server is listening to the specified port.

Example: `netstat -a | egrep '27000[0-9]'`

|     |   |   |                 |                 |             |
|-----|---|---|-----------------|-----------------|-------------|
| tcp | 0 | 0 | *:27000         | *.*             | LISTEN      |
| tcp | 0 | 0 | localhost:48245 | localhost:27000 | ESTABLISHED |
| tcp | 0 | 0 | localhost:27000 | localhost:48245 | ESTABLISHED |

- View the `lmgrd` log file, which indicates on which ports the license server and Cisco daemons are listening.

Example:

```
13:00:14 (lmgrd) lmgrd tcp-port 27001
13:00:14 (lmgrd) cisco using TCP-port 42207
```

- For `lmadmin`, go to the admin page.
  - To verify the server daemon's port, select Administration->Server Configuration->License Server Configuration.
  - To verify the Cisco daemon's port, select Administration->Server Configuration->Vendor Daemon Configuration.

## Distribute Information to Clients

Either distribute the same floating `.lic` file that you installed to all WAE Design users who need it, or give them both the MAC address and hostname for the license server. Having users install licenses via the MAC address and port is the recommended practice since it eases administration.

After end users install the floating license once, the license is automatically validated from the server each time the user opens the WAE Design GUI or runs the CLI tools.

## Set Up Access Control List for Web Server

If you are using the web server to administer licenses, you can set up an access control list. This is optional, but doing so can improve the security of who can access the web server, as well as give you an easily maintainable list of license users. To do this, you need to know the user ID for all users who are checking out licenses from the license server. The user ID is what they use to log in to their operating systems.

---

**Step 1** Create and open a file named `cisco.opt` in `/opt/cariden/software/flexlm/current/bin`.

**Step 2** Create groups to make it easier and faster to configure inclusions and exclusions. You can then use these groups, rather than specifying individual users.

```
GROUP group_name user_name1 user_name2 user_username3..
```

Example: The group name is `akdevops`, and each name following it is a user.

```
GROUP akdevops theresa lone loretta byron patrick sharon
```

**Step 3** For each user or group that you want to grant license access, add an `INCLUDEALL` line.

```
INCLUDEALL type {user_name | group_name}
```

Example:

```
INCLUDEALL GROUP akdevops
INCLUDEALL USER gbd456
INCLUDEALL USER odd789
```

**Step 4** For each user or group you want to exclude from accessing the license server, add an `EXCLUDEALL USER` line.

```
EXCLUDEALL type {user_name | group_name}
```

Example:

```
EXCLUDEALL GROUP region_fea
EXCLUDEALL USER rgu456
EXCLUDEALL USER ilt789
```

**Step 5** Save the file.

## Configure Borrowing Parameters

### Note

If you have a floating license that was generated prior to May 2015, you must acquire a new one to enable borrow licenses.

**Step 1** Configure the `/opt/cariden/bin/cisco.opt` file to define who is permitted to borrow licenses.

Anyone not in an `INCLUDE_BORROW` statement is not permitted to borrow licenses. Thus, it is easier to use groups than user names.

The inclusion format is as follows. You must specify a line item for each feature. For a list of these features, use the `license_check` tool.

```
INCLUDE_BORROW feature type {user_name | group_name}
```

Example:

```
INCLUDE_BORROW MD_Layer1 USER ohara
INCLUDE_BORROW MD_SegmentRouting GROUP akdevops
```

**Step 2** You can refine this `INCLUDE_BORROW` list by excluding users. The `EXCLUDE_BORROW` has precedence over the `INCLUDE_BORROW` statements such that if a user or group is identified in both lists, that user or group will be excluded as specified.

```
EXCLUDE_BORROW feature type {user | group_name}
```

Example:

```
EXCLUDE_BORROW MD_VPN USER diana
EXCLUDE_BORROW MD_BGP GROUP acme
```

**Step 3** Optional: Specify the number of licenses for a feature that cannot be borrowed. This is useful for ensuring that users who need to check out licenses will have them available.

```
BORROW_LOWWATER feature number
```

Example: Save 23 `MD_Sim` licenses for use by those who are not borrowing licenses

```
BORROW_LOWWATER MD_Sim 23
```

## Verify Licenses in Use

Use the `lmstat` command to summarize how many licenses are in the original license file and how many are in use.

```
lmstat -a
```

The results show how many licenses are checked out and borrowed. The output contains \*\_Users entries and entries for each feature. The \*\_Users is determined by the users who have access to the license. Each feature lists a set of licenses checked out for that feature.

Example Output:

```
Users of MD_Users: (Total of 300 licenses issued; Total of 295 licenses in use)
"MD_Users" v5, vendor:cisco
```

Checked-out licenses are only displayed for \*\_Users, whereas borrowed licenses are shown for \*\_Users, as well as for individual features.

The output uses the following format, where <time> is the time at which the license was checked out or borrowed. The <license\_handle> is a unique ID for the license. If a user has the same license checked out twice, for example, each instance has a unique <license\_handle>.

```
<feature> <version> <vendor>
<username> <user_hostname> <display> (<license>/<port> <license_handle>) <time>
```

Example Checked-Out License:

```
dusan md1 /dev/pts/0 (v5) (matelic.cisco.com/27000 37337), start Wed 5/20 11:50
```

Licenses that are borrowed are listed with a (linger: #) notation, where # is the number of seconds for which the license is borrowed.

```
<username> <user_hostname> <display> (<license>/<port> <license_handle>) <time> <linger>
```

Example Borrowed License:

```
obi obi-mbpr /dev/pts/18 (v5) (matelic.cisco.com/27000 18848), start Fri 5/8 16:26
(linger: 2532780)
```

## Reclaim Unused Licenses

You can reclaim licenses that have been checked out or borrowed. This feature is useful when a license remains idle, such as when an employee is on vacation or accidentally has the license running on two devices.

Reclaiming licenses is only valid through the CLI `lmremove` command.

Use the `lmstat -a` command described in the [Verify Licenses in Use](#) section to identify the required inputs to the `lmremove` command.

## lmstat -a Output for Examples

In the next two sections, examples use the following `lmstat -a` output as their starting point. Compare the results of these examples to this output to see the differences between the two.

```
bin/lmstat -a
"MD_Users" v5, vendor:cisco
obi obi-mbpr /dev/pts/18 (v5) (matelic.cisco.com/27000 18848), start Fri 5/8 16:26
(linger: 2532780)
dusan md1 /dev/pts/0 (v5) (matelic.cisco.com/27000 37337), start Wed 5/20 11:50
dusan md1 /dev/pts/0 (v5) (matelic.cisco.com/27000 42295), start Wed 5/20 11:51
llonned woql077 /dev/tty (v5) (matelic.cisco.com/27000 50668), start Thu 5/14 13:53
(linger: 554760)
```

## Reclaim All Licenses for Specific User

To reclaim all licenses for a specific user, enter this command.

```
bin/lmremove <feature> <user> <user_host> <display>
```

Example: This example reclaims all licenses for the user named “dusan.”

```
bin/lmremove MD_Users dusan md1 /dev/pts/0
```

The `lmstat -a` command now shows dusan removed as a user.

```
obi obi-mbpr /dev/pts/18 (v5) (matelic.cisco.com/27000 18848), start Fri 5/8 16:26
(linger: 2532780)
llonned woql077 /dev/tty (v5) (matelic.cisco.com/27000 50668), start Thu 5/14 13:53
(linger: 554760)
```

## Reclaim License for a Specific Feature

To reclaim a license for a specific feature, enter this command.

```
bin/lmremove <feature> <server_host> <port> <license_handle>
```

Example: This example reclaims a single license from the user named “dusan.”

```
bin/lmremove MD_Users matelic.cisco.com 27000 37337
```

The `lmstat -a` command now shows the license 37337 removed for the user named dusan, though dusan still has use of license 42295.

```
obi obi-mbpr /dev/pts/18 (v5) (matelic.cisco.com/27000 18848), start Fri 5/8 16:26
(linger: 2532780)
dusan md1 /dev/pts/0 (v5) (matelic.cisco.com/27000 42295), start Wed 5/20 11:51
llonned woql077 /dev/tty (v5) (matelic.cisco.com/27000 50668), start Thu 5/14 13:53
(linger: 554760)
```

## Cisco WAE Live Data Store

This chapter describes how to install, upgrade, back up, and restore a WAE Live data store.

If you need to migrate a WAE Live data store from 5.4 or an earlier release, contact your support representative.

Many references in the documentation explicitly identify directories in which the software is installed. Otherwise, references to where the software resides are as follows:

- `$CARIDEN_ROOT`—Location of the WAE installation.  
If the defaults were used during installation, `$CARIDEN_ROOT` is the same as `/opt/cariden`.
- `$CARIDEN_HOME`—Sub-directory of `$CARIDEN_ROOT` that contains the WAE Design, WAE Live, and WAE Collector executables and binaries.  
If the defaults were used during installation, `$CARIDEN_HOME` is the same as `/opt/cariden/software/mate/current`.

### Caution

If you delete a previous `mld` installation directory, you may delete all data. To check current data location, enter the following command: `mld -diag -c | grep ROOTPATH` (This can be also be a network path)

### Note

The WAE Live data store service it is not monitored like other WAE services.

### Note

Before starting, restarting, upgrading, or installing the `mld` server, you must stop other services. If you chose to migrate the Collector server files during the installation process, verify those files have been copied before stopping the web server.

## Installing the mld Server

The `mld` tool installs both the `mld` server and an empty data store directory, and it automatically starts the `mld` server.

- The `-demo` or `-storage` and `-memory` options are required. For more information on `mld` command options, see [Table 10-1](#).
- Best practices:

- Restore to the same version and then upgrade.
- For better performance, create a separate ext2 partition for the directory specified with the `-datastore` option.

---

**Step 1** Stop the web server and all other services.

```
service <service_name> stop
```

Example: `service wae-web-server stop`

**Step 2** Enter command to install the data store. To change the default directories or view more mld option information, see [Table 10-1](#).

Example 1: To be prompted through installation and obtain sizing recommendations:

```
mld -installchk
```

Example 2: To install mld with a demo data store size, enter the following command:

```
mld -action install -demo true
```

Example 3: To install a small mld server into `$CARIDEN_ROOT/data/matelive`, reserve 2 CPUs, reserve 542 GB of disk storage and allocate 2.2 GB (2200 MB) of memory:

```
mld -action install -mldata /data/matelive -cpus 2 -storage 1:1:540 -memory 200:55:2000
```

**Step 3** Start the web server and if needed, start other services.

```
service <service_name> start
```

Example: `service wae-web-server start`

---

Table 10-1 mld Options

| Options                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Default                                                               |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| -version                                                                                  | Displays the data store version.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                       |
| -action                                                                                   | <p><code>install</code>—Installs a new mld server and data store, and start the mld server.</p> <p><code>upgrade</code>—Updates an existing mld server and start the mld server.</p> <p><code>start</code>—Alternative way to start the mld server.</p> <p><code>stop</code>—Alternative way to stop the mld server.</p> <p><code>status</code>—Alternative way to show the status of the mld server.</p> <p><code>restart</code>—Alternative way to stop and then restart the mld server.</p> | Default installation directory<br>\$CARIDEN_ROOT/software/mld/current |
| -installchk                                                                               | Prompts you through installation and gives sizing recommendations.                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                       |
| <b>Use only with -action install</b>                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                       |
| (If an option is not given, the installation will perform the same tasks as -installchk.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                       |
| -demo true                                                                                | <p>Installs a demo data store.</p> <p><b>Note</b> If both -demo and -storage options are used, -demo takes precedence.</p>                                                                                                                                                                                                                                                                                                                                                                     |                                                                       |
| -storage <n:n:n>                                                                          | <p>Allocates the disk and memory based on the anticipated data store size, where &lt;n:n:n&gt; is data:indices:timeseries in GB. For details and recommended values, use -installchk and -verbose options.</p> <p><b>Note</b> If the data store is larger than the demo size, this option is required when using -action install.</p>                                                                                                                                                          |                                                                       |
| -memory <n:n:n>                                                                           | Allocates the requested memory of the data store, where <n:n:n> is data:indices:timeseries in MB. For details and recommended values, use -installchk and -verbose options.                                                                                                                                                                                                                                                                                                                    |                                                                       |
| -mldata <directory>                                                                       | Specifies directory where all application data is stored. This includes the data store, report output, and other application data.                                                                                                                                                                                                                                                                                                                                                             | \$CARIDEN_ROOT/data/mldata                                            |
| -datastore <directory>                                                                    | <p>Specifies directory where the data store is initialized.</p> <p>Once set, this directory cannot be changed. | -cpus <#>                                                                                 | Reserves the number of CPUs for the data store and the mld server.                                                                                                                                                                                                                                                                                                                                                                                                                             | Half of the total CPUs                                                |

Table 10-1 *mld* Options (continued)

| Options                                                 | Description                                                                                                                                   | Default                             |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <b>Use only with -action install or -action upgrade</b> |                                                                                                                                               |                                     |
| -mld <directory>                                        | Specifies directory where the mld server is installed. Once set, this directory cannot be changed. You can, however, use symbolic links.      | \$CARIDEN_ROOT/software/mld/current |
| -backup <directory>                                     | Specifies directory for saving data store backups. You can override this for a single backup. See <a href="#">Backing Up the Data Store</a> . | \$CARIDEN_ROOT/data/mldata/backup   |

## Upgrading the Data Store to a New Server

### Note

The new server must have the same WAE Live software version as the original server before you upgrade.

If you are upgrading to another server, you must do the following:

- 
- Step 1** Perform a Level 0 (`m1_backup -L 0`) data store backup from the original server. For more information, see [Backing Up the Data Store](#).
  - Step 2** Restore the backup from the original server to the new server. For more information, see [Restoring the Data Store](#).
  - Step 3** Install the latest WAE software on the new server. For more information, see [WAE Planning Software Installation](#).
  - Step 4** Upgrade the data store. For more information, see [Upgrading the Data Store](#).
- 

## Upgrading the Data Store

The `mld` tool upgrades the WAE Live data store from one release to another, and also starts the `mld` server.

### Note

To upgrade the data store, you must use the same username as when you installed the `mld` server.

- 
- Step 1** Stop the web server and all other services.

```
service <service_name> stop
```

Example: `service wae-web-server stop`

- Step 2** Stop the `mld` server.

```
mld -action stop
```

**Step 3** Enter the following command to upgrade the data store. To change the default mld server directory or backup directory, use the options described in [Table 10-1](#).

Minimal requirement: `mld -action upgrade`

**Step 4** Start the web server and if needed, start other services.

```
service <service_name> start
```

Example: `service wae-web-server start`

---

## Starting and Restarting the mld Server

**Note**

To start or restart the mld server, you must use the same username as when you installed it.

---

**Step 1** Stop the web server and all other services.

```
service <service_name> stop
```

Example: `service wae-web-server stop`

**Step 2** To start or restart the mld server, enter the following commands:

Start: `mld -action start`

Restart: `mld -action restart`

**Step 3** Start the web server and if needed, start other services.

```
service <service_name> start
```

Example: `service wae-web-server start`

---

## Stopping the mld Server and Getting Current Status

To stop the data store or get its current status, enter these service commands:

Stop: `mld -action stop`

Status: `mld -action status`

## Backing Up the Data Store

WAE Live backs up the time-series derived data from plan files. It does not back up transaction logs or other WAE Live data, such as application data and report data.

The required amount of space for backups depend on the installation size and how long a system has been running.

## Best Practices

- Perform the backup to a different disk drive, or copy the backup to a different physical device once you finish the backup.
- Perform backups outside of peak traffic hours.
- Use a backup directory that is on a different physical disk, and set this when you first install the mld server and data store. Doing so sets the default backup directory for all backups.
 

```
mld -action install -backup <backup_directory>
```
- The backup process makes a copy of the data store, but it does not back up other WAE Live data, such as application data and report data. Therefore, with some regularity, copy this other data to a safe location, such as to a different physical disk.
- Perform a full backup at least weekly or monthly, with numerous incremental backups in between them.
- Rather than running manual backups, call `m1_backup` from a cron job.
- Perform only one backup at a time so that their schedules do not overlap. Running simultaneous backups are not supported. Ensure there is at least one hour between each backup. Once completed, verify that the backup was completed within the hour.

## Backup Steps

### Caution

If you delete the previous mld installation directory, you may delete all data. To check current location, enter the following command: `mld -diag -c | egrep ROOTPATH`

The `m1_backup` tool enables you to perform multiple levels of backups to save disk space. An OS file system backup cannot be used to restore the data store. You must use `m1_backup` to perform a complete backup to use for data store restoration.

You can execute `m1_backup` to run a manual backup at any time. However, the first time you use backup levels, you must perform backups in this sequence.

### Note

Keep both the data store and the web server (`wae-web-server`) running.

| Sequence | Enter                                                       | Description                                                                    |
|----------|-------------------------------------------------------------|--------------------------------------------------------------------------------|
| 1        | <code>m1_backup</code><br>or<br><code>m1_backup -L 0</code> | Level 0—Back up everything.                                                    |
| 2        | <code>m1_backup -L 1</code>                                 | Level 1—Back up everything since the most recent Level 0 backup was performed. |
| 3        | <code>m1_backup -L 2</code>                                 | Level 2—Back up everything since the most recent Level 1 backup was performed. |

**Note**

For larger systems that frequently run plan file processes, less incremental Level 1 and Level 2 backups are available in between Level 0 backups. The following error appears when a Level 1 or Level 2 backup is not available: Archive failed - The existing level-0 backup for DBspace rootdbs is too old to allow any incremental backup. When this error appears, run a Level 0 backup.

To run a backup using all defaults, you need only enter the following. This uses the default backup directory, and creates a full backup.

```
ml_backup
```

- To override the default backup directory, use the `-directory` option. The default backup directory is `$CARIDEN_ROOT/data/mldata/backup`.
- To set a different backup level, use the `-L` option.

Example: This example sets the backup directory to `$CARIDEN_ROOT/data/waelive/backups` and backs up only data that is new since the last level 0 backup was run. This assumes that you ran `ml_backup` one time using the default level of 0.

```
ml_backup -directory /data/waelive/backups -L 1
```

## Additional Backups

A best practice is to back up the following directories by making copies of them. By default, these are located in `$CARIDEN_ROOT/data/mldata`. Otherwise, they are stored in the directory specified upon installation (`mld -mldata <directory>`).

**Note**

Before copying, stop the `mld` server. Remember to immediately restart the `mld` server when you are finished copying.

- `archive`—Stores the template (`template.pln`) and plan files used in the Map. Note that files sizes can be large, depending on the size of the network and how long the collection has been running.
- `appdata`—Application data, such as report definitions, user parameters, and report history.
- `datastore`—WAE Live data store, which contains network measurements accumulated over time.
- `jobs`—Error log files for plan file insertions.
- `plans`—Queue of plan files waiting to be inserted.
- `reports`—Every report that can be run caches its output in this directory for quick retrieval.

Additionally, it is a best practice to make copies of the following:

- `config.xml` file, which is located in one of these three places: `~/.cariden/etc/config`, `$CARIDEN_ROOT/etc/config`, or `$CARIDEN_HOME/etc/config`
- `$CARIDEN_HOME/etc/user_manager`, which is the directory in which users are defined

# Restoring the Data Store

**Note**

This section references collection methods. For information on collecting data from WAE Collector, see the *Cisco WAE Platform Configuration Guide*.

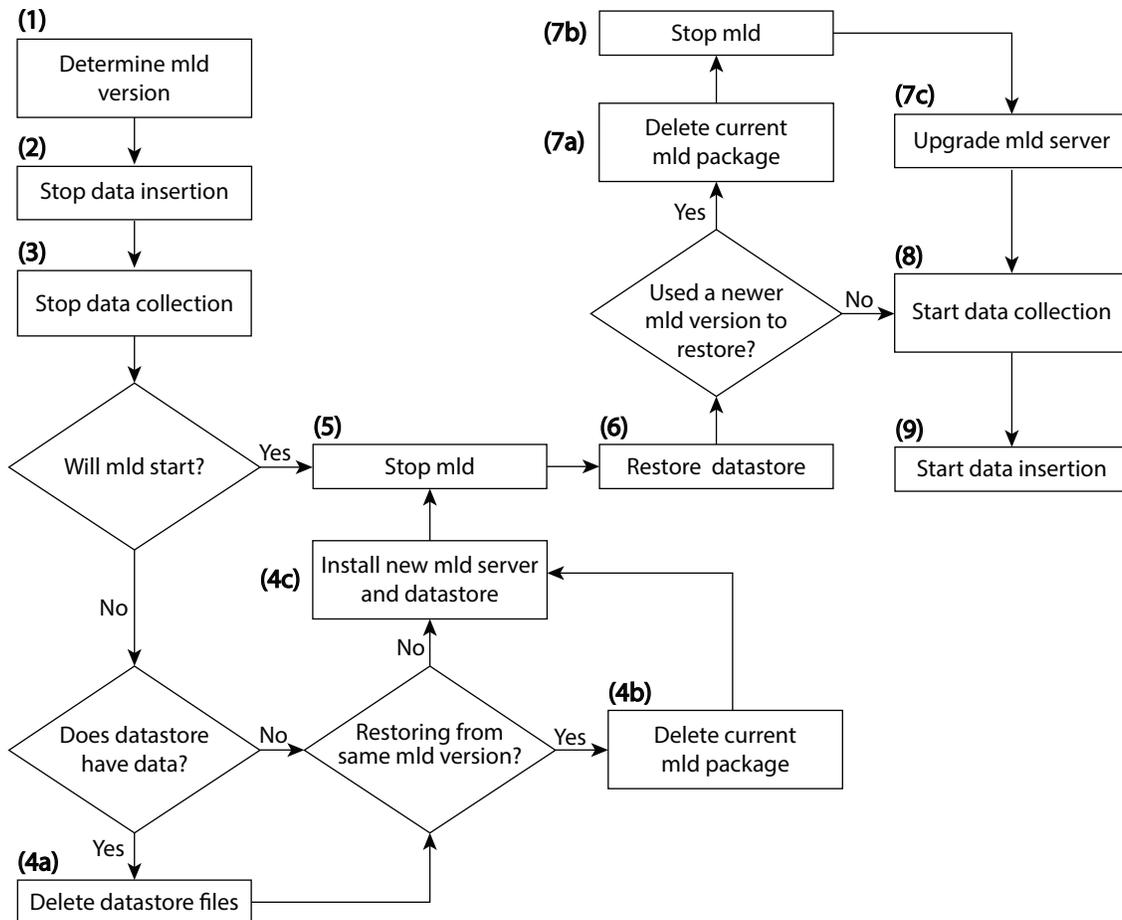

## Prerequisites

- To restore a data store, you must have a backup of it. See the [Backing Up the Data Store](#) section.
- Ensure you have a proper disk and disk space. For example, if your data was corrupted, you would need a new disk. If the restoration is due to a space issue, add more space to the existing disk.
- If you have a single-device configuration, the collection of data will be interrupted during the restoration of a WAE Live data store. Note that this affects the WAE Design Archive application if you are running it in addition to WAE Live.
- If the backup data store resides on a different device, ensure the following prerequisites are met.
  - The username and user ID (uid) of both devices must be the same.
  - The backup data store name uses a hostname as a portion of its name. This hostname portion of the backup data store name must be changed to be the same as the hostname on the device to which it is being restored.

Example: The backup data store name is akdobi.acme.com\_1\_L0. The hostname on the device on which the data store is being restored is akgudei.acme.com. In this case, change the backup data store name to akgudei.acme.com\_1\_L0.

## Restoration Steps

Figure 10-1 Data Store Restoration Workflow

383086

- Step 1** Determine the version of the mld software package. If you have only one version, it is listed in `/opt/cariden/software/mld`. If you have multiple versions, determine which one is currently being used by entering the following from `/opt/cariden/software/mld`.
- ```
ls -l | grep current
```
- Step 2** Stop the insertion of data.
- If using augmented or manual snapshots, disable the insertion using the following command within the snapshot. Note that currently running insertions continue until completion.

```
ml_insert_ctl -disable-scheduler
```
 - If insertion is configured through the WAE Live UI, open this UI and stop the insertion from the Settings page. Set the Data Collection option to None, and click Apply.
- Step 3** Stop the collection of data.

- If using augmented or manual snapshots, after the most recent snapshot has finished, stop further snapshots from running by disabling the cron job (using comments #). To determine if a snapshot has finished, check the system process table or check the log file, which by default is in `$CARIDEN_ROOT/logs`.
- If collection is configured solely through the WAE Collector UI or if using augmented snapshots, open the WAE Collector UI. Stop the collection from the Collection > Schedule page by clicking the Stop button. Then stop the web server.

```
service wae-web-server stop
```

If the mld server will start, skip to step 5.

Step 4 If the mld server will not start, follow these steps.

- If you have data, delete the data files. If there is no data, such as when restoring to a new disk, skip to step 4b.

```
rm -rf /opt/cariden/data/mldata/datastore/*
```

- If using the same mld version that was used to generate the restored data store, delete the current mld package. If using a newer mld version than was used to generate the data store, skip to Step 4c.

```
rm -rf /opt/cariden/software/mld/<package_name>
```

- Install a new mld server and data store. This action also starts the mld server.

```
mld -action install -storage <n:n:n>
```

Step 5 Stop the mld server.

```
mld -action stop
```

Step 6 Restore the data store data.

- If you used the default backup directory when setting up the backups, you do not need to give `-directory` a value.
- If you did not use the default backup directory, the `-directory` value must be the same as configured when installing the data store or the same as configured in the `config.xml` file (in `$CARIDEN_ROOT/etc/configs`).

```
mld_restore -directory <backup_data_store_directory>
```

Step 7 If you used a newer mld version than was used to generate the data store, follow these steps.

- Delete the current mld package.

```
rm -rf /opt/cariden/software/mld/<package_name>
```

- Stop the mld server.

```
mld -action stop
```

- Upgrade the mld server. See [Table 10-1](#) for information on the two available options: `-mld <directory>` and `-backup <directory>`.

```
mld -action upgrade
```

Step 8 Restart the collection of data.

- If using augmented or manual snapshots, test the snapshot process by running it as a single instance.

Augmented: `snapshot -config-file /opt/cariden/etc/snapshot_augment_collector.txt`

Manual: `snapshot -config-file /opt/cariden/etc/snapshot.txt`

If you are satisfied that the data is valid, restart the cron job. To determine if a snapshot has finished, check the system process table or check the log file, which by default is in `$CARIDEN_ROOT/logs`.

- If collection is configured solely through the WAE Collector UI or if using augmented snapshots, start the web server.

```
service wae-web-server start
```

Open the WAE Collector UI, and start the collection from the Collection > Schedule page.

Step 9 Restart the insertion of data.

- If using augmented or manual snapshots, enable the insertion using the following command within the snapshot.

```
ml_insert_ctl -enable-scheduler
```

- If insertion is configured through the WAE Live UI, open this UI and stop the insertion from the Settings page. Set the Data Collection option to the appropriate server or archive, and click Apply.
