Configuring Link Aggregation

This chapter describes how to configure link aggregation for the ML-Series cards, both EtherChannel and packet-over-SONET/SDH (POS) channel. For additional information about the Cisco IOS commands used in this chapter, refer to the *Cisco IOS Command Reference* publication.

This chapter contains the following major sections:
- Understanding Link Aggregation, page 10-1
- Understanding Encapsulation over EtherChannel or POS Channel, page 10-7
- Monitoring and Verifying EtherChannel and POS, page 10-10
- Understanding Link Aggregation Control Protocol, page 10-10

Understanding Link Aggregation

The ML-Series card offers both EtherChannel and POS channel. Traditionally EtherChannel is a trunking technology that groups together multiple full-duplex IEEE 802.3 Ethernet interfaces to provide fault-tolerant high-speed links between switches, routers, and servers. EtherChannel forms a single higher bandwidth routing or bridging endpoint and was designed primarily for host-to-switch connectivity. The ML-Series card extends this link aggregation technology to bridged POS interfaces. POS channel is only supported with LEX encapsulation.

Link aggregation provides the following benefits:
- Logical aggregation of bandwidth
- Load balancing
- Fault tolerance

Port channel is a term for both POS channel and EtherChannel. The port channel interface is treated as a single logical interface although it consists of multiple interfaces. Each port channel interfaces consists of one type of interface, either Fast Ethernet, Gigabit Ethernet, or POS. You must perform all port channel configurations on the port channel (EtherChannel or POS channel) interface rather than on the individual member Ethernet or POS interfaces. You can create the port channel interface by entering the `interface port-channel` interface configuration command.

**Note**

You must perform all IOS configurations—such as bridging, routing, or parameter changes such as an MTU change—on the port channel (EtherChannel or POS channel) interface rather than on individual member Ethernet or POS interfaces.
Port channel connections are fully compatible with IEEE 802.1Q trunking and routing technologies. IEEE 802.1Q trunking can carry multiple VLANs across a port channel.

Each ML100T-12, ML100X-8, or ML1000-2 card supports one POS channel, a port channel made up of the two POS ports. A POS channel combines the two POS port capacities into a maximum aggregate capacity of STS-48c or VC4-16c.

Each ML100T-12 supports up to six FECs and one POS channel. Each ML100X-8 supports up to four FECs and one POS channel. A maximum of four Fast Ethernet ports can bundle into one Fast Ethernet Channel (FEC) and provide bandwidth scalability up to 400-Mbps full-duplex Fast Ethernet.

Each ML1000-2 supports up to two port channels, including the POS channel. A maximum of two Gigabit Ethernet ports can bundle into one Gigabit Ethernet Channel (FEC) and provide 2-Gbps full-duplex aggregate capacity on the ML1000-2.

---

**Caution**
The EtherChannel interface is the Layer 2/Layer 3 interface. Do not enable Layer 3 addresses on the physical interfaces. Do not assign bridge groups on the physical interfaces because doing so creates loops.

**Caution**
Before a physical interface is removed from an EtherChannel (port channel) interface, the physical interface must be disabled. To disable a physical interface, use the `shutdown` command in interface configuration mode.

**Note**
Link aggregation across multiple ML-Series cards is not supported.

**Note**
Policing is not supported on port channel interfaces.

**Note**
The ML-Series does not support the routing of Subnetwork Access Protocol (SNAP) or Inter-Switch Link (ISL) encapsulated frames.

---

### Configuring EtherChannel

You can configure an FEC or a GEC by creating an EtherChannel interface (port channel) and assigning a network IP address. All interfaces that are members of a FEC or a GEC should have the same link parameters, such as duplex and speed.

To create an EtherChannel interface, perform the following procedure, beginning in global configuration mode:
Chapter 10 Configuring Link Aggregation

EtherChannel Configuration Example

For information on other configuration tasks for the EtherChannel, refer to the Cisco IOS Configuration Fundamentals Configuration Guide.

To assign Ethernet interfaces to the EtherChannel, perform the following procedure, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config)# <code>interface port-channel channel-number</code> Creates the EtherChannel interface. You can configure up to 6 FECs on the ML100T-12, 4 FECs on the ML100X-8, and 1 GEC on the ML1000-2.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(config-if)# <code>ip address ip-address subnet-mask</code> Assigns an IP address and subnet mask to the EtherChannel interface (required only for Layer 3 EtherChannel).</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Router(config-if)# <code>end</code> Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Router# <code>copy running-config startup-config</code> (Optional) Saves configuration changes to NVRAM.</td>
</tr>
</tbody>
</table>

For information on other configuration tasks for the EtherChannel, refer to the Cisco IOS Configuration Fundamentals Configuration Guide.

To assign Ethernet interfaces to the EtherChannel, perform the following procedure, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config)# <code>interface fastethernet number</code> or Router(config)# <code>interface gigabitethernet number</code> Enters one of the interface configuration modes to configure the Fast Ethernet or Gigabit Ethernet interface that you want to assign to the EtherChannel. You can assign any Ethernet interface on the system to the EtherChannel, but both interfaces must be either FEC or GEC.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(config-if)# <code>channel-group channel-number</code> Assigns the Fast Ethernet or Gigabit Ethernet interfaces to the EtherChannel. The channel number must be the same channel number you assigned to the EtherChannel interface.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Router(config-if)# <code>end</code> Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Router# <code>copy running-config startup-config</code> (Optional) Saves configuration changes to NVRAM.</td>
</tr>
</tbody>
</table>

EtherChannel Configuration Example

Figure 10-1 shows an example of EtherChannel. The associated commands are provided in Example 10-1 (Switch A) and Example 10-2 (Switch B).
**Example 10-1  Switch A Configuration**

```
hostname Switch A
!
bridge 1 protocol ieee
!
interface Port-channel 1
  no ip address
  bridge-group 1
  hold-queue 150 in
!
interface FastEthernet 0
  no ip address
  channel-group 1
!
interface FastEthernet 1
  no ip address
  channel-group 1
!
interface POS 0
  no ip routing
  no ip address
  crc 32
  bridge-group 1
  pos flag c2 1
```

**Example 10-2  Switch B Configuration**

```
hostname Switch B
!
bridge 1 protocol ieee
!
interface Port-channel 1
  no ip routing
  no ip address
  bridge-group 1
  hold-queue 150 in
!
interface FastEthernet 0
  no ip address
  channel-group 1
!
interface FastEthernet 1
  no ip address
  channel-group 1
```
Configuring POS Channel

You can configure a POS channel by creating a POS channel interface (port channel) and optionally assigning an IP address. All POS interfaces that are members of a POS channel should have the same port properties and be on the same ML-Series card.

**Note**

POS channel is only supported with LEX encapsulation.

To create a POS channel interface, perform the following procedure, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Verifying the POS channel interface details</strong></td>
</tr>
<tr>
<td>Router(config)# interface port-channel</td>
<td>Creates the POS channel interface. You can configure one POS channel on the ML-Series card.</td>
</tr>
<tr>
<td>channel-number</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Assigns an IP address and subnet mask to the POS channel interface (required only for the Layer 3 POS channel).</td>
</tr>
<tr>
<td>Router(config-if)# ip address ip-address</td>
<td></td>
</tr>
<tr>
<td>subnet-mask</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td>Router(config-if)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Saves configuration changes to NVRAM.</td>
</tr>
<tr>
<td>Router# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Caution**
The POS channel interface is the routed interface. Do not enable Layer 3 addresses on any physical interfaces. Do not assign bridge groups on any physical interfaces because doing so creates loops.

To assign POS interfaces to the POS channel, perform the following procedure, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Verifying the POS channel interface details</strong></td>
</tr>
<tr>
<td>Router(config)# interface pos number</td>
<td>Enters the interface configuration mode to configure the POS interface that you want to assign to the POS channel.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Assigns the POS interface to the POS channel. The channel number must be the same channel number that you assigned to the POS channel interface.</td>
</tr>
<tr>
<td>Router(config-if)# channel-group</td>
<td></td>
</tr>
</tbody>
</table>
**POS Channel Configuration Example**

Figure 10-2 shows an example of POS channel configuration. The associated code is provided in Example 10-3 (Switch A) and Example 10-4 (Switch B).

**Example 10-3  Switch A Configuration**

```
bridge irb
bridge 1 protocol ieee
!
interface Port-channel1
  no ip address
  no keepalive
  bridge-group 1
!
interface FastEthernet0
  no ip address
  bridge-group 1
!
interface POS0
  no ip address
  channel-group 1
  crc 32
  pos flag c2 1
!
interface POS1
  no ip address
  channel-group 1
  crc 32
  pos flag c2 1
```

**Example 10-4  Switch B Configuration**

```
bridge irb
bridge 1 protocol ieee
```
Understanding Encapsulation over EtherChannel or POS Channel

When configuring encapsulation over FEC, GEC, or POS, be sure to configure IEEE 802.1Q on the port-channel interface, not its member ports. However, certain attributes of port channel, such as duplex mode, need to be configured at the member port levels. Also make sure that you do not apply protocol-level configuration (such as an IP address or a bridge group assignment) to the member interfaces. All protocol-level configuration should be on the port channel or on its subinterface. You must configure IEEE 802.1Q encapsulation on the partner system of the EtherChannel as well.

Configuring Encapsulation over EtherChannel or POS Channel

To configure encapsulation over the EtherChannel or POS channel, perform the following procedure, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# interface port-channel &lt;channel-number&gt;.&lt;subinterface-number&gt;</td>
</tr>
<tr>
<td></td>
<td>Configures the subinterface on the created port channel.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-subif)# encapsulation dot1q &lt;vlan-id&gt;</td>
</tr>
<tr>
<td></td>
<td>Assigns the IEEE 802.1Q encapsulation to the subinterface.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router(config-subif)# bridge-group &lt;bridge-group-number&gt;</td>
</tr>
<tr>
<td></td>
<td>Assigns the subinterface to a bridge group.</td>
</tr>
</tbody>
</table>
Encapsulation over EtherChannel Example

Figure 10-3 shows an example of encapsulation over EtherChannel. The associated code is provided in Example 10-5 (Switch A) and Example 10-6 (Switch B).

**Figure 10-3 Encapsulation over EtherChannel Example**

This encapsulation over EtherChannel example shows how to set up two ONS 15454s with ML100T-12 cards (Switch A and Switch B) to interoperate with two switches that also support IEEE 802.1Q encapsulation over EtherChannel. To set up this example, use the configurations in the following sections for both Switch A and Switch B.

**Example 10-5 Switch A Configuration**

```plaintext
hostname Switch A
!
bridge irb
bridge 1 protocol ieee
bridge 2 protocol ieee
!
interface Port-channel1
  no ip address
  hold-queue 150 in
!
interface Port-channel1.1
  encapsulation dot1Q 1 native
  bridge-group 1
!
interface Port-channel1.2
  encapsulation dot1Q 2
  bridge-group 2
```

Step 4

```
Router(config-subif)# end
```

Exits to privileged EXEC mode.

**Note** Optionally, you can remain in interface configuration mode and enable other supported interface commands to meet your requirements.

Step 5

```
Router# copy running-config startup-config
```

(Optional) Saves the configuration changes to NVRAM.
! interface FastEthernet0
  no ip address
  channel-group 1
!
interface FastEthernet1
  no ip address
  channel-group 1
!
interface POS0
  no ip address
  crc 32
  pos flag c2 1
!
interface POS0.1
  encapsulation dot1Q 1 native
  bridge-group 1
!
interface POS0.2
  encapsulation dot1Q 2
  bridge-group 2

Example 10-6  Switch B Configuration

hostname Switch B
!
bridge irb
bridge 1 protocol ieee
bridge 2 protocol ieee
!
interface Port-channel1
  no ip address
  hold-queue 150 in
!
interface Port-channel1.1
  encapsulation dot1Q 1 native
  bridge-group 1
!
interface Port-channel1.2
  encapsulation dot1Q 2
  bridge-group 2
!
interface FastEthernet0
  no ip address
  channel-group 1
!
interface FastEthernet1
  no ip address
  channel-group 1
!
interface POS0
  no ip address
  crc 32
  pos flag c2 1
!
interface POS0.1
  encapsulation dot1Q 1 native
  bridge-group 1
!
interface POS0.2
  encapsulation dot1Q 2
Monitoring and Verifying EtherChannel and POS

After FEC, GEC, or POS is configured, you can monitor its status using the `show interfaces port-channel` command.

**Example 10-7 show interfaces port-channel Command**

Router# show int port-channel 1
Port-channel1 is up, line protocol is up
Hardware is FEChannel, address is 0005.9a39.6634 (bia 0000.0000.0000)
MTU 1500 bytes, BW 200000 Kbit, DLY 100 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Unknown duplex, Unknown Speed
ARP type: ARPA, ARP Timeout 04:00:00
No. of active members in this channel: 2
  Member 0 : FastEthernet0 , Full-duplex, Auto Speed
  Member 1 : FastEthernet1 , Full-duplex, Auto Speed
Last input 00:00:01, output 00:00:23, output hang never
Last clearing of "show interface" counters never
Input queue: 0/150/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue :0/80 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
820 packets input, 59968 bytes
  Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
  0 watchdog, 0 multicast
  0 input packets with dribble condition detected
32 packets output, 11264 bytes, 0 underruns
  0 output errors, 0 collisions, 0 interface resets
  0 babbles, 0 late collision, 0 deferred
  0 lost carrier, 0 no carrier
  0 output buffer failures, 0 output buffers swapped out.

Understanding Link Aggregation Control Protocol

In Software Release 8.0.0, ML100T-12, ML1000-2, ML100T-8, and CE-100T-8 cards can utilize the link aggregation control protocol (LACP) to configure and control link aggregation. LACP provides the ability to continuously monitor the configuration and take appropriate reconfiguration actions.

The cards’ ports can also transport a signal transparently (that is, without intervention or termination) when LACP is not configured for the port.
Passive Mode and Active Mode

LACP operates in two modes: active and passive mode. In the active mode, LACP packets are transmitted unconditionally. Whereas, in passive mode LACP starts transmitting packets only after it receives a LACP packet from the peer device.

LACP Functions

LACP performs the following functions in the system:

- Maintains configuration information in order to control aggregation
- Exchanges configuration information with other peer devices
- Attaches or detaches ports from the link aggregation group based on the exchanged configuration information
- Enables data flow when both sides of the aggregation group are synchronized

In addition, LACP provides the following benefits:

- Logical aggregation of bandwidth
- Load balancing
- Fault tolerance

LACP Parameters

LACP utilizes the following parameters to control aggregation:

System Identifier—A unique identification assigned to each system. It is the concatenation of the system priority and a globally administered individual MAC address.

Port Identification—A unique identifier for each physical port in the system. It is the concatenation of the port priority and the port number.

Port Capability Identification—An integer, called a key, that identifies one port’s capability to aggregate with another port. There are two types of key: administrative and operational. An administrative key is configured by the network administrator, and an operational key is assigned by LACP to a port based on its aggregation capability.

Aggregation Identifier—A unique integer that is assigned to each aggregator and is used for identification within the system.

LACP Usage Scenarios

In Software Release 8.0.0 and later, LACP functions on ML-Series cards in termination mode and on the CE-Series cards in transparent mode.

Termination Mode

In termination mode, the link aggregation bundle terminates or originates at the ML card. To operate in this mode, LACP should be configured on the Ethernet interface. One protect SONET or SDH circuit can carry the aggregated Ethernet traffic of the bundle. The advantage of termination mode over
transparent mode is that the network bandwidth is not wasted. However, the disadvantage is that there is no card protection between the CPE and UNI (ONS 15454) because all the links in the ML card bundle belong to the same card.

![LACP Termination Mode Example](image)

**Transparent Mode Scenario**

In Figure 10-5, the link aggregation bundle originates at router 1 and terminates at router 2. Transparent mode is enabled when the LACP packets are transmitted without any processing on a card. While functioning in this mode, the CE-100T-8 cards pass through LACP packets transparently so that the two CPE devices perform the link aggregation. To operate in this mode, no LACP configuration is required on the CE-100T-8 cards.

![LACP Transparent Mode Example](image)

**Configuring LACP**

To configure LACP over the EtherChannel, perform the following procedure, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config)# int port&lt;interface-number&gt;</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(config-if)# int fa&lt;facility-number&gt;</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Router(config-if)# channel-group &lt;channel-number&gt; mode ?</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Router(config-if)# channel-group &lt;channel-number&gt; mode active</td>
</tr>
</tbody>
</table>

Configure and set the LACP port’s priority. This configuration is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config-if)# exit</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(config-if)# int fa &lt;facility-number&gt;</td>
</tr>
</tbody>
</table>
Configure the LACP system priority. This configuration is optional.

**Step 1**
Router(config)# **lacp system-priority** <system priority>
Sets the LACP system priority in a range of values from 1 through 65535. For example,
lacp system-priority 100

**Step 2**
Router(config)# **exit**
Exits the global configuration mode.

**Step 3**
Router(config-if)# **lacp port-priority** <priority number>
Sets the LACP port’s priority. Range of values is from 1 through 65535. For example,
lacp port-priority 100

**Step 4**
Router(config-if)# **exit**
Exits the port’s configuration mode.

In **Example 10-8**, an interface is added to a GEC.

**Example 10-8  LACP Configuration Example**

```
#sh running-config interface gigabitEthernet 0
Building configuration...
Current configuration : 150 bytes
!
interface GigabitEthernet0
   no ip address
   no keepalive
   channel-group 5 mode active
end

Station-1#sh running-config interface port-channel 5
Building configuration...
Current configuration : 112 bytes
!
interface Port-channel5
   no ip address
   bridge-group 101
   hold-queue 300 in
end
```
