 Import Alien Wavelength to the Hierarchical Controller 96

 Create End-to-End OCH-NC Link 96

 Channel Validation Coloring 98

 Provision the IP Link 99

 Troubleshoot IP Link and OCH-NC through the Hierarchical Controller and Cisco Optical Network Controller 100

CHAPTER 1

Plan Your Network Using Cisco Optical Network Planner

This document provides instructions on how to deploy an NCS 1010 based network, using Cisco ONP, ZTP, and Cisco ONC. Cisco ONP helps with designing a topology with the required specifications, analyze it, and generate the planning data. ZTP, then sets up and brings up the devices. Cisco ONC uses the planning data from Cisco ONP to configure and manage the devices.

This chapter describes the Design and Analysis of Networks and how to Export Planning data from Cisco Optical Network Planner.

- [Plan Your Network, on page 1](#)
- [Reference Network Topology , on page 1](#)
- [Design the Topology Using Cisco ONP , on page 2](#)
- [Analyze the Network, on page 4](#)
- [Export Planning Data for Cisco Optical Network Controller, on page 5](#)

Plan Your Network

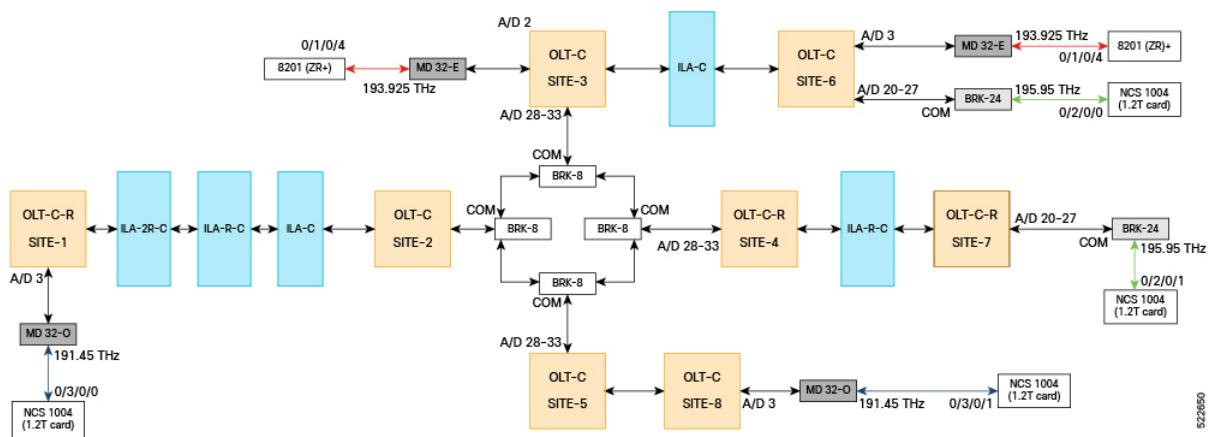

The following sections describe how to plan an NCS 1010 based network, using Cisco ONP. Cisco ONP helps with designing a topology with the required specifications, analyze it, and generate the planning data.

Reference Network Topology

The network topology that is shown in this section has been used to explain the NCS 1010 bring-up scenarios. It is a four-degree topology that uses 13 NCS 1010 nodes. The BRK-8 modules are used to create express interconnects among SITE-2, SITE-3, SITE-4, and SITE-5 using MPO cables.

Design the Topology Using Cisco ONP

Figure 1: Multi-degree Topology

Design the Topology Using Cisco ONP

Use the following steps to design the topology in Cisco ONP:

-
- Step 1** Log in to Cisco ONP Web Interface.
- Step 2** Choose **File > New**.
The **Create New Network** dialog box appears.
- Step 3** From the **L0 Network Platform** drop-down list, choose **NCS1010**.
- Step 4** Click **Create**.
You can view the map and the design palette.
- Step 5** Click the **Drawing Tool** icon (pencil and ruler crossed).
- Step 6** Add sites to the map using the drawing tool.
- Zoom into the map to the desired level.
 - Click any of the site icons (ROADM, OLA) and drag it to the sites on the map. Drag or click the map where a site has to be placed, when the cursor changes to the site icon.
- To create this topology:
- Add four ROADM sites and name them as Site1, Site6, Site7, and Site8.
 - Set the site property, **Structure** as **Terminal** for all the sites.
 - Add five OLA sites as shown in the topology.
 - Add a ROADM site in the middle of the topology and name it as Multidegree.
- Click the Fiber icon and drag it to connect from one site to another site. Continue this for all sites.
- Note** By default, the fiber length is updated as 1 km for all the fibers. If you want the length to be auto updated based on the x, y coordinates, then enable the Use Coordinates Distance property under the network Properties.

Note In CONP topology, Site-2, Site-3, Site-4 and Site-5 are not separate nodes. These are all part of a single 4-degree node and represented as Sides of a 4-degree node. In case of NCS 1010, each side is considered as a device. After you connect the site with fiber, four sides are created. Rename the sides as Site-2, Site-3, Site-4, and Site-5.

Step 7 Set the properties of OLA nodes added in the topology to convert them into ILA- C, ILA-R-C, or ILA-2R-C nodes.

- Expand the OLA site in the network tree and drill-down until the C-band.
- Under the C-Band properties, choose **Raman** from the **Raman Amp** drop-down list.
- For ILA-2R-C, repeat steps B and C for another side under the site.

To summarize:

- ILA-C: No Raman is selected.
- ILA-R-C: Raman is selected in one side.
- ILA-2R-C: Raman is selected in two sides.

Step 8 Create circuits between Site-6 to Site-7, Multidegree Site to Site 6, and Site 1 to Site 8.

- Click the **Drawing Tool** icon, and select **Circuit** (purple in color).
- Add the circuit between the sites on the map.

Step 9 To add the MD-32-E and MD-32-O Mux/Demux patch panels, set the following properties:

- Choose **Network > Entity Editor**, and click the **Service** tab.
- In the left tree panel, expand the circuit connecting the site to which patch panel is connected, and drill-down to the trail properties.
- Under the trail properties, set the **Add/Drop Type** as **Colored**.
- Click **Select Similar** to apply the properties in bulk to all the trails.
- Click **Update**.
- Click the **Site** tab.
- Expand the site interface and drill-down to the Add/Drop properties of the side and set the **Colored Add/Drop** as **MD-32-Even** or **MD-32-Odd** as per the topology.
- Click **Select Similar** to apply the properties in bulk to all the add/drops.
- Click **Update**.

Step 10 To add BRK-24 and BRK-8 breakout panels, set the following properties:

- Choose **Network > Entity Editor**, and click the **Service** tab.
- In the left tree panel, expand the circuit connecting the site to which the breakout panel is connected, and drill-down to the trail properties.
- Under the trail properties, set the **Add/Drop Type** as **Colorless**.
- Click **Select Similar** to apply the properties in bulk to all the trails.
- Click **Update**.
- Click the **Site** tab.
- Expand the site interface and drill-down to the Add/Drop properties of the side and set the **Colorless Add/Drop** as **BRK-8** or **BRK-24** as per the topology.
- Click **Select Similar** to apply the properties in bulk to all the add/drops.
- Click **Update**.

Step 11 To add NCS 1004 (1.2T card), set the following properties:

Analyze the Network

- Expand the circuit connecting the site to which NCS 1004 (1.2T card) is connected, in the left tree panel, and drill-down to the trail properties.
- Under the trail properties, set the **Card Type** as **NCS1004_16QAM_400G_27%SDFEC_69GBd**.
- Click **Select Similar** to apply the properties in bulk to all the trails.
- Click **Update**.

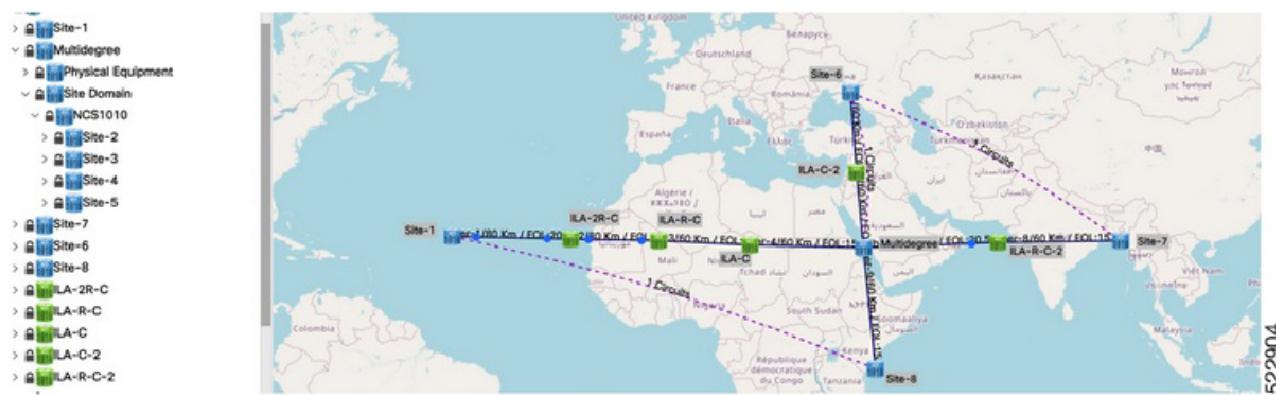

Step 12

To add 8201 (ZR+) pluggable, set the following properties:

- Expand the circuit connecting the site to which the 8201 (ZR+) pluggable is connected, in the left tree panel, and drill-down to the trail properties.
- Under the trail properties, set the **Card Type** as **CFP2_400ZR+_TXP_GUA18_OFEC_15_DE_ON_16Q_OS_BR60_1**.

The topology looks like the following in the Cisco ONP UI.

Figure 2: Cisco ONP Topology

Step 13

Choose **File > Save As**.

Step 14

Enter a network name in the **Give a Network Name** dialog box.

Step 15

Click **Save**.

Analyze the Network

Analyze the designed sample network to check the feasibility of the network using the following steps:

Step 1

Log in to Cisco ONP Web Interface.

Step 2

Choose **File > Open**.

The **Select Network To Open** dialog box appears.

Step 3

Click the sample topology network that you have created, from the list of networks.

Step 4

Choose **Network > Analyze**.

The Cisco ONP analysis progress indicator indicates the analysis status.

If there is any failure in the analysis stage, a pop-up window appears with the message, “Analysis Failed.”

- Step 5** Choose the **Elements > Messages** tab to see the list of error details in the analyzed network. By default, it shows only the key messages when the Critical Only toggle button is enabled. If you want to view the entire network message, disable the Critical Only toggle button.
- Step 6** If you find an error message under the **Messages** tab, resolve the error and analyze the network again. Repeat this step until all errors are resolved.

What to do next

Export Planning Data for Cisco Optical Network Controller

Export the network planning data which is in the form of JSON file from Cisco ONP using the following steps. This JSON file is uploaded into Cisco ONC to configure the managed devices.

-
- Step 1** Log in to Cisco ONP Web Interface.
- Step 2** Choose **File > Open**.
The **Select Network To Open** dialog box appears.
- Step 3** In the network tree panel, right-click the network name.
- Step 4** Click **Generate CONC JSON**.
- Step 5** In the **Export File** dialog box, enter the name of the JSON file.
- Step 6** Click **Export** to download the JSON file into your local system.
-

CHAPTER 2

Bring Up NCS 1010 Network

This chapter describes two ways to bring up an NCS 1010 network, Manual Bringup of NCS 1010 and Automatic Bring up of NCS 1010 using ZTP.

- [Bringup NCS 1010 Manually, on page 7](#)
- [Bringup NCS 1010 Using ZTP, on page 44](#)

Bringup NCS 1010 Manually

Perform the configurations in the following sequence to manually bring up NCS 1010.

- [DHCP Configuration, on page 7](#)
- [Manual Configuration Workflow, on page 11](#)
- [Cross-connect Configuration, on page 27](#)

Note When you boot up the NCS 1010 device for the first time, the ZTP process starts automatically and runs in the background. If the device is configured manually, the ZTP process continues to run in the background. If the ZTP process is not terminated gracefully, after an RP reload or power cycle, interfaces on the device can enter the *shutdown* state. To avoid this issue, it is suggested to disable the ZTP process gracefully. Use the following commands to disable the ZTP:

```
RP/0/RP0/CPU0:ios#ztp terminate  
"ZTP Exited"  
RP/0/RP0/CPU0:ios#ztp clean  
RP/0/RP0/CPU0:ios#ztp disable
```

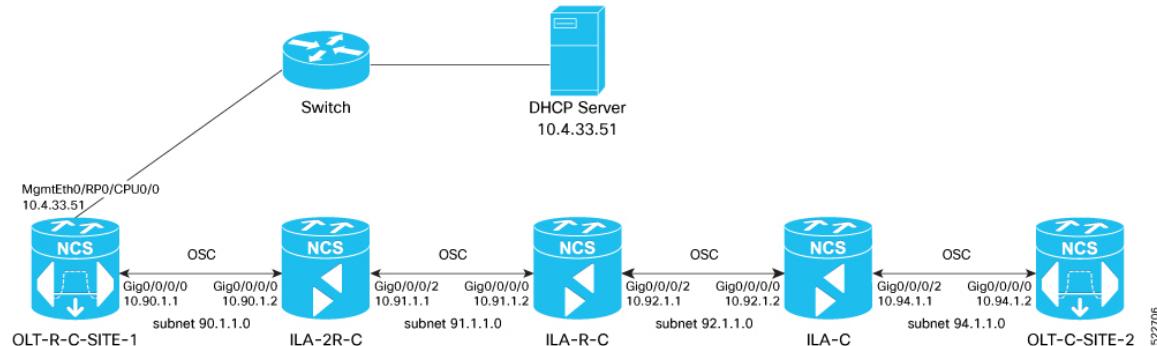

DHCP Configuration

DHCP configuration is required for both manual configuration and ZTP configuration.

To run iPXE and ZTP, you need a DHCP server. To configure a DHCP server, you must edit the `dhcpd.conf` file available at `/etc/dhcp/`. This configuration file stores the network information such as the path to the script, location of the ISO install file, location of the provisioning configuration (`.cfg`) file, and serial number or the MAC address of the chassis.

In the following example, the settings in the `dhcpd.conf` refers to the span connecting OLT-R-C-SITE-1 to OLT-C-SITE-2.

Figure 3: Network Topology Diagram

Note Restart the `dhcpd` service using the `service dhcpd restart` command every time you edit the `dhcpd.conf` file.

Add the following settings to the `dhcpd.conf` file :

Note The ZTP configuration files (*.cfg) that are referenced in the `dhcpd.conf` file are detailed in [ZTP Configuration Files Creation, on page 47](#).

```
# DHCP Server Configuration file

}
fixed-address 192.0.2.121;
}

```

To create the static routes in the DHCP server, use the following commands:

route add -net OLT-OSC-ip gw OLT-MGMT-ip netmask 255.255.255.255 dev eth3

route add -net ILA-OSC-ip gw OLT-MGMT-ip netmask 255.255.255.255 dev eth3

```

[root@vxr-ncs1010-02 ~]# route add -net 10.90.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.90.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.91.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.91.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.92.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.92.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.94.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.94.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3

```

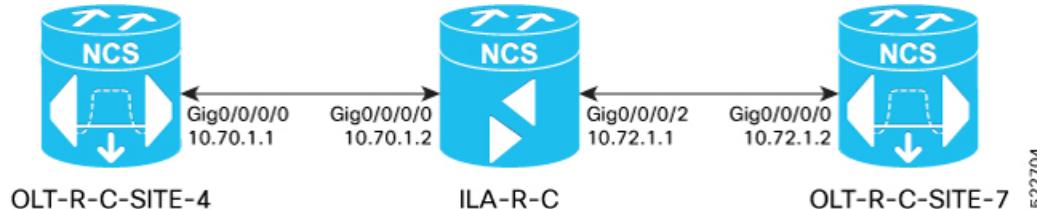

10.4.33.131 is the management IP address for the gateway node.

Manual Configuration Workflow

This section details how to manually bringup the nodes. Verification outputs have been added at various steps. The iPXE boot process via the BIOS interface has been used for this example.

The example used in this section is:

Figure 4: Network Topology Diagram

Note Before you use the iPXE boot, ensure that the DHCP server is set and is running. Create a `dhcpd.conf` file specific to the nodes in the network topology diagram. To see a sample `dhcpd.conf` file, see [DHCP Configuration, on page 7](#).

The boot process is initiated via the BIOS interface as follows:

1. The node is reloaded or can undergo a power cycle.
2. Press **Esc** to enter BIOS.
3. Select the **Save & Exit** tab of BIOS.
4. Choose **UEFI: iPXE Network Boot**.

```

RP/0/RP0/CPU0:OLT-R-C-SITE-4(config-ospf-ar-if)#end

```

10. To view the OSPF neighbours:

```

RP/0/RP0/CPU0:OLT-R-C-SITE-4#sh ospf neighbor
Mon Jul 25 09:22:58.684 UTC

```

* Indicates MADJ interface

Indicates Neighbor awaiting BFD session up

Neighbors for OSPF 1

```

Neighbor ID      Pri   State          Dead Time     Address       Interface
10.137.1.1       1     FULL/ -        00:00:38     10.70.1.2
GigabitEthernet0/0/0/0
                  Neighbor is up for 00:00:20

Total neighbor count: 1

```

Note This output is displayed when the ILA-R-C node is brought up.

11. To view the status of the OSC controller:

```

RP/0/RP0/CPU0:OLT-R-C-SITE-4#sh controllers osc 0/0/0/0
Mon Jul 25 09:24:52.753 UTC

Controller State: Up

Transport Admin State: In Service

Laser State: On

Alarm Status:
-----
Detected Alarms: None

Alarm Statistics:
-----
RX-LOS-P = 2
TX-POWER-FAIL-LOW = 0

Parameter Statistics:
-----
Total TX Power = 0.09 dBm
Total RX Power = -17.82 dBm

Configured Parameters:
-----

```

12. To view the span loss:

```

RP/0/RP0/CPU0:OLT-R-C-SITE-4#sh olc span-loss
Mon Jul 25 09:25:09.572 UTC

Controller name : Ots0/0/0/0
Neighbour RID   : 10.137.1.1
Apparent Rx Span Loss : 15.9 dB
Rx Span Loss (with pumps off) : 19.2 dB
Rx Span Loss (with pumps off) measured at : 2022-07-25 09:24:37
Estimated Rx Span Loss : NA
Apparent Tx Span Loss : 16.0 dB
Tx Span Loss (with pumps off) : 16.8 dB
Tx Span Loss (with pumps off) measured at : 2022-07-25 09:23:12
Estimated Tx Span Loss : NA

```

Note The optical applications such as Raman tuning, link tuner, gain estimator, and APC are disabled by default. To enable the optical applications, use the **automatic-link-bringup** as seen in the next step.

```

16. Repeat steps 1 through 15 to configure the ILA-R-C and OLT-R-C-SITE-7 nodes.
17. Configure the cross-connects for the OLT-R-C-SITE-4 and OLT-R-C-SITE-7 nodes. For a sample cross-connect configuration, see [Cross-connect Configuration, on page 27](#).

The following sample displays the running configuration of the OLT-R-C-SITE-4 node that was configured earlier.

```

Cross-connect Configuration

The OTS-OCH controllers are not created by default when the cards (NCS1K-ILA-2R-C, NCS1K-ILA-R-C , NCS1K-ILA-C, NCS1K-OLT-R-C , and NCS1K-OLT-C) are brought up. The LINE OTS-OCH controllers can be created using the **hw-module** command.

Optical Cross Connections can be configured only on OLT nodes. In these nodes, the OTS-OCH controller is not created automatically on the Add/Drop ports (COM side).The optical cross connect configuration defines the line side OTS-OCH channel as the source and creates an OTS-OCH controller on the ADD/Drop port to which the cross connection is made. The channel ID must be the same for both the LINE side and COM side OTS-OCH controller.

Cross-connect Configuration

To illustrate the creation of the cross-connects, we are going to create a single channel from OLT-R-C-SITE-1 to OLT-C-SITE-8 in the topology diagram. The channel is mapped to **191.45 THz**.

Configuration for OLT-R-C-SITE-1

```

After the cross-connects are created on the OLT nodes, APC regulates the power on each node. The APC status moves from WORKING to IDLE when the process completes. Use the **show olc apc** command to view the status of the operation. The following samples are for OLT-C-SITE-8.

```
RP/0/RP0/CPU0:OLT-C-SITE-8#sh olc apc
Tue Jul 26 06:57:16.020 UTC

Controller      : Ots0/0/0/0
APC Status    : WORKING
Correcting Node : 10.123.1.1

Node RID        : 10.125.1.1
Internal State   : IDLE

Node RID        : 10.123.1.1
Internal State : CORRECTING

RP/0/RP0/CPU0:OLT-C-SITE-8#sh olc apc
Tue Jul 26 06:59:11.985 UTC

Controller      : Ots0/0/0/0
APC Status    : IDLE

Node RID        : 10.125.1.1
Internal State   : IDLE

Node RID        : 10.123.1.1
Internal State : IDLE
```

After the APC process is complete, the link comes up. You can view the details using the **sh olc apc-local regulation-info controller ots** command on the near-end and far-end nodes.

Bringup NCS 1010 Using ZTP

Perform the configurations in the following sequence to bring up NCS 1010 using ZTP.

- [DHCP Configuration, on page 7](#)
- [ZTP Configuration Files Creation, on page 47](#)
- [ZTP Configuration Workflow, on page 54](#)
- [Cross-connect Configuration, on page 27](#)

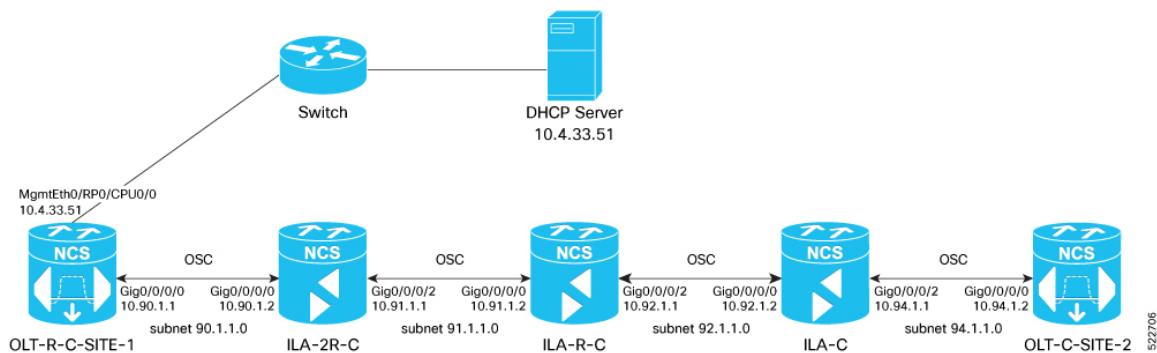

DHCP Configuration

DHCP configuration is required for both manual configuration and ZTP configuration.

To run iPXE and ZTP, you need a DHCP server. To configure a DHCP server, you must edit the `dhcpd.conf` file available at `/etc/dhcp/`. This configuration file stores the network information such as the path to the script, location of the ISO install file, location of the provisioning configuration (`.cfg`) file, and serial number or the MAC address of the chassis.

In the following example, the settings in the `dhcpd.conf` refers to the span connecting OLT-R-C-SITE-1 to OLT-C-SITE-2.

Figure 5: Network Topology Diagram

Note Restart the `dhcpd` service using the `service dhcpd restart` command every time you edit the `dhcpd.conf` file.

Add the following settings to the `dhcpd.conf` file :

Note The ZTP configuration files (*.cfg) that are referenced in the `dhcpd.conf` file are detailed in [ZTP Configuration Files Creation, on page 47](#).

```
# DHCP Server Configuration file

}

```

To create the static routes in the DHCP server, use the following commands:

route add -net OLT-OSC-ip gw OLT-MGMT-ip netmask 255.255.255.255 dev eth3

route add -net ILA-OSC-ip gw OLT-MGMT-ip netmask 255.255.255.255 dev eth3

```

[root@vxr-ncs1010-02 ~]# route add -net 10.90.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.90.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.91.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.91.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.92.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.92.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.94.1.1 gw 10.4.33.131 netmask 255.255.255.255
dev eth3
[root@vxr-ncs1010-02 ~]# route add -net 10.94.1.2 gw 10.4.33.131 netmask 255.255.255.255
dev eth3

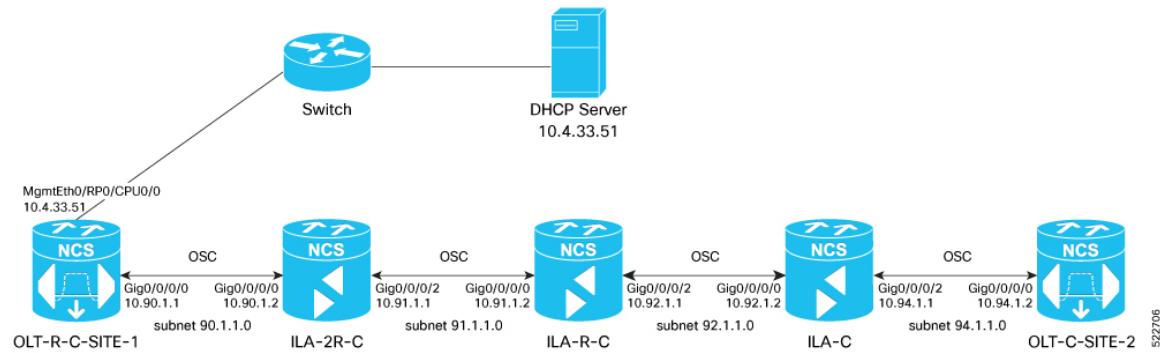

```

10.4.33.131 is the management IP address for the gateway node.

ZTP Configuration Files Creation

You can build the ZTP configuration files based on your network requirements. The sample ZTP files created below are used to configure the nodes from OLT-R-C-SITE-1 to OLT-C-SITE-2 as shown in the figure below. You can create similar ZTP configuration files for the rest of the NCS 1010 nodes.

Figure 6: Network Topology Diagram

- Note** You can remotely manage an ILA node that is not connected to a management network through an OLT gateway node via an OSC interface. ZTP can be initiated from a remote node through DHCP relay. For more information see, [Remote Node Management in NCS 1010](#).

ZTP Configuration Files Creation

Build the ZTP configuration files by typing the following in Notepad and save them as .cfg files in the DHCP server.

OLT-R-C-SITE-1 node:

```

Save this file as **OLT-C-SITE-2.cfg**.

These configuration files are referenced in the `dhcpd.conf` file.

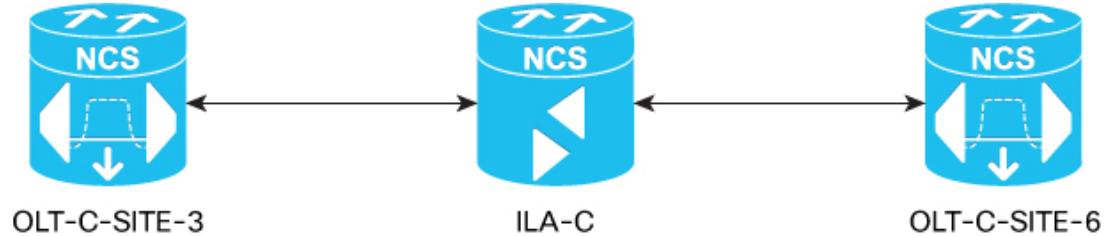

For more information on ZTP, see [Boot Using Zero Touch Provisioning](#).

ZTP Configuration Workflow

This section details how to bringup NCS 1010 nodes using ZTP. Verification outputs have been added at various steps. The iPXE CLI boot process has been used for this example.

The example used in this section is part of the overall network topology.

Figure 7: Network Topology Diagram

522705

Note Before you use the iPXE boot, ensure that the DHCP server is set and is running. Create a `dhcpd.conf` file and the required ZTP configuration files specific to the nodes in the network topology diagram shown above. For samples of the `dhcpd.conf` file and the ZTP configuration files, see [DHCP Configuration, on page 7](#) and [ZTP Configuration Files Creation, on page 47](#).

1. Run the following CLI command to invoke the iPXE boot process to reimage the chassis:

Note This command deletes the existing configuration on the node.

```
RP/0/RP0/CPU0:ios#reload bootmedia network location 0/RP0/CPU0 noprompt
Mon Aug 1 11:49:27.269 UTC
```

```
Preparing system for backup. This may take a few minutes especially for large
configurations.
```

2. To remove all the ZTP logs and saved settings, use the following command:

```

RP/0/RP0/CPU0:ios#ztp clean
Mon Aug  1 12:11:07.816 UTC
This would remove all ZTP temporary files.
Would you like to proceed? [no]: yes
2022-08-01 12:11:10.674178:          ztp[ 1900, t 1900]: ERROR: ztp_proc_start
                                         : 104: Failed to start process with error: 'processmgr' detected
                                         the 'warning' condition 'The target process is already running.'
All ZTP operation files have been removed.

```

ZTP Configuration Workflow

```
ZTP logs are present in /var/log/ztp*.log for logrotate.  

Please remove manually if needed.  

If you now wish ZTP to run again from boot, do 'conf t/commit replace' followed by reload.  

RP/0/RP0/CPU0:ios#
```

- 3.** To invoke ZTP manually, use the following command:

```
RP/0/RP0/CPU0:ios#ztp initiate  

Mon Aug 1 12:11:24.572 UTC  

Initiating ZTP may change your configuration.  

Interfaces might be brought up if they are in shutdown state  

Would you like to proceed? [no]: yes  

ZTP will now run in the background.

```

After the cross-connects are created on the OLT nodes, APC regulates the power on each node. The APC status moves from WORKING to IDLE when the process completes. Use the **show olc apc** command to view the status of the operation. The following samples are for OLT-C-SITE-3.

```
RP/0/RP0/CPU0:OLT-C-SITE-3#show olc apc
Mon Aug 1 12:33:15.671 UTC
```

```
Controller : Ots0/0/0/0
APC Status : WORKING
Correcting Node : 10.120.1.1
```

```
Node RID : 10.120.1.1
Internal State : CORRECTING
```

```
Node RID : 10.121.1.1
Internal State : DISCREPANCY
```

```
RP/0/RP0/CPU0:OLT-C-SITE-3#show olc apc
Mon Aug 1 12:39:57.187 UTC
```

```
Controller : Ots0/0/0/0
APC Status : IDLE
```

```
Node RID      : 10.120.1.1
Internal State : IDLE
```

```
Node RID      : 10.121.1.1
Internal State : IDLE
```

```
RP/0/RP0/CPU0:OLT-C-SITE-3#
```

After the APC process is complete, the link comes up. You can view the details using the **sh olc apc-local regulation-info controller ots** command on the near-end and far-end nodes.

OLT-C-SITE-3:

ASE - Noise Loaded Channel
OCH - Optical Channel

RP/0/RP0/CPU0:OLT-C-SITE6#

Cross-connect Configuration

The OTS-OCH controllers are not created by default when the cards (NCS1K-ILA-2R-C, NCS1K-ILA-R-C , NCS1K-ILA-C, NCS1K-OLT-R-C , and NCS1K-OLT-C) are brought up. The LINE OTS-OCH controllers can be created using the **hw-module** command.

Optical Cross Connections can be configured only on OLT nodes. In these nodes, the OTS-OCH controller is not created automatically on the Add/Drop ports (COM side).The optical cross connect configuration defines the line side OTS-OCH channel as the source and creates an OTS-OCH controller on the ADD/Drop port to which the cross connection is made. The channel ID must be the same for both the LINE side and COM side OTS-OCH controller.

To illustrate the creation of the cross-connects, we are going to create a single channel from OLT-R-C-SITE-1 to OLT-C-SITE-8 in the topology diagram. The channel is mapped to **191.45 THz**.

After the cross-connects are created on the OLT nodes, APC regulates the power on each node. The APC status moves from WORKING to IDLE when the process completes. Use the **show olc apc** command to view the status of the operation. The following samples are for OLT-C-SITE-8.

```

RP/0/RP0/CPU0:OLT-C-SITE-8#sh olc apc
Tue Jul 26 06:57:16.020 UTC

Controller      : Ots0/0/0/0
APC Status    : WORKING
Correcting Node : 10.123.1.1

Node RID       : 10.125.1.1
Internal State : IDLE

Node RID       : 10.123.1.1
Internal State : CORRECTING

RP/0/RP0/CPU0:OLT-C-SITE-8#sh olc apc
Tue Jul 26 06:59:11.985 UTC

Controller      : Ots0/0/0/0
APC Status    : IDLE

Node RID       : 10.125.1.1
Internal State : IDLE

Node RID       : 10.123.1.1
Internal State : IDLE
```

Cross-connect Configuration

After the APC process is complete, the link comes up. You can view the details using the **sh olc apc-local regulation-info controller ots** command on the near-end and far-end nodes.

CHAPTER 3

Network Set Up Using Cisco Optical Network Controller

This chapter describes how to Onboard devices, Import Planning data, and Monitor Connection Issues in Cisco Optical Network Controller.

- [Cisco ONC Workflow, on page 87](#)

Cisco ONC Workflow

In Cisco ONC, you import the planning data from Cisco ONP and associate the hardware brought up using CLI or ZTP to the planned devices. For this, you must first onboard the devices in Cisco ONC. After associating actual devices to planned data, you can push the necessary configurations for planned passives, connections, and optical attributes on to the devices from the Cisco ONC web interface. The following sections describe the Cisco ONC workflow to onboard devices, import planning data, associate planned devices to actual devices, and push configurations on to the devices in bulk.

Onboard Devices in Cisco ONC

Before you begin

You need an XLSX file that contains the information required to onboard the devices in Cisco ONC. See [Excel File for Onboarding Devices on Cisco ONC , on page 89](#)

Step 1 Log in to Cisco ONC Web Interface.

Step 2 Click **Devices** in the left panel

Step 3 Click **Import Devices**.

Step 4 Select the spreadsheet which has all the device details and click Open.

Cisco ONC takes a few seconds to import each device. While the import is in progress, Cisco ONC displays **XLS import in progress**.

- Note** You can manually add each device using by clicking +New from the **Devices** page and entering the device information.
-

Import Planning Data in Cisco ONC

Before you begin

You need the planning data JSON file generated using Cisco ONP.

Step 1 Log in to Cisco ONC web Interface.

Step 2 Hover over the **Import** icon in the left panel and click **Planning Data Import**.

Step 3 Click **Import**.

Step 4 Upload the JSON file from Cisco Optical Network Planner.

The Planning Data Import page displays the details of the imported devices.

- Note** Map the planning data to actual data in the next step.
-

Import Planned Passives, Connections, Optical Attributes

Step 1 Log in to Cisco ONC web Interface.

Step 2 Hover over the **Import** icon in the left panel and click **Planning Data Import**.

Step 3 Click **Edit**.

The fields Actual Site Name and Actual Device Name become editable.

Step 4 From the drop-down boxes, select the actual device and Site names for each of the planned devices and click **Apply Changes**.

Step 5 Select all the planned devices in the table.

Step 6 Click **Bulk Push**.

Step 7 Select **Equipments**, **Internal Patch Cord**, and **Optical Attributes** and click **Push**.

- Note** You can see the status of the push in the Last Push Status field for each device.
-

Connect Passives and Cables

Create port connections as seen in the [Reference Network Topology](#). For more information on port connections between the devices, see [NCS 1010 Overview](#).

Monitor Connection Issues in Cisco ONC

You can monitor the following connection issues using the Cisco ONC web interface:

- **Passive slot mismatch due to USB connection issues**

If a passive module is placed in an incorrect slot, it may cause errors. Connection Verification of all connections to the passive module in an incorrect slot fails.

To identify a module in an incorrect slot, follow these steps:

1. Log in to Cisco ONC Web Interface.
2. Click **Sites** in the left panel.
3. Click the target site.
4. Click Inventory.
5. In the inventory table, check if there are any entries where **Eqpt Type** and **Actual Eqpt Type** are different.

If there is a mismatch between Eqpt Type and Actual Eqpt Type for a passive module, the module may be in an incorrect slot.

- **Wrong patch cord connections**

To identify an incorrect patch cord connection, follow these steps:

1. Log in to Cisco ONC web Interface.
2. Click **Sites** in the left panel.
3. Click the target site.
4. Click **Optical Configurations**.
5. Under **Internal Patch Cords**, select the patch cord you want to check and click **Verify Connection**.

Cisco ONC performs connection verification. If the Forward CV Status or Reverse CV Status is **FAILED**, it may be an incorrect connection.

Excel File for Onboarding Devices on Cisco ONC

Use this Excel file to onboard devices on Cisco ONC. The information in this file is based on the sample topology and ZTP configuration discussed in previous sections of this document.

Host Name	Node IP	Password Type	User Name	Password	Product Type	Connectivity Type	Com Port
OLT-C-SITE-2	10.4.33.126	USER_NETCONF	cisco	cisco123	NCS1010	NETCONF	830

CHAPTER 4

Network Discovery and Link Provisioning in Cisco Crosswork Hierarchical Controller

This chapter describes Network Discovery in the Hierarchical Controller, Provisioning end-to-end OCH-NC and IP Links, and Troubleshooting OCH-NC and IP Links using the Hierarchical Controller and Cisco Optical Network Controller

- [Network Discovery in the Hierarchical Controller, on page 91](#)
- [Provision End-to-End OCH-NC Link, on page 95](#)
- [Provision the IP Link, on page 99](#)
- [Troubleshoot IP Link and OCH-NC through the Hierarchical Controller and Cisco Optical Network Controller, on page 100](#)

Network Discovery in the Hierarchical Controller

Prerequisite:

Verify the following Crosswork Hierarchical Controller Applications are installed and enabled.

- Explorer
- Network Inventory
- Link Assurance
- Service Manager
- Device Manager

View Installed Crosswork Hierarchical Controller Applications

Use this procedure to view the installed Crosswork Hierarchical Controller Applications.

Step 1 To view the installed Crosswork Hierarchical Controller applications:

After the installation is complete, ensure that you have root access to the OS where Crosswork Hierarchical Controller is installed, and type `sedo -h` to open the sedo utility.

Add Cisco Optical Network Controller Adapter**Step 2**

Run the following command to see which applications are installed:

```
sedo apps list
```

The output displays the installed applications with their ID, name and if they are enabled or not. All applications, except system applications (for example, Device Manager) are disabled by default.

Add Cisco Optical Network Controller Adapter

Use this procedure to add Cisco ONC adapter.

Step 1

In the applications bar in Crosswork Hierarchical Controller, select **Services > Device Manager**.

A list of the adapters appears in the **Adapters** pane.

Step 2

Click **Add new adapter**.

Step 3

Enter the adapter details:

- **Adapter Type:** Select the adapter type from the list of available adapter types currently installed in Crosswork Hierarchical Controller. The Cisco Optical Network Controller adapter is `cisco-onc-adpt`.
- **Adapter Name:** Unique user defined name of this adapter type instance (there can be several instances of the same adapter type).

Step 4

Click **Add**.

Step 5

To configure the adapter, select the adapter in the **Adapters** pane.

- **Enabled:** Whether the adapter is enabled or disabled.
- **Logging Level:** The logging level (Info, Critical, Error, Warning, Debug). Info by default.
- **Polling Cycle (sec):** The polling interval in seconds. The Polling cycle must be set to 300s or higher.
- **Number of concurrent routers collected:** The number of network elements that can be concurrently polled in a polling cycle.
- **Enable provisioning support:** Whether or not to enable provisioning support. For example, if provisioning is enabled, creating a new tunnel or service.

Step 6

Click the **General** tab.

Step 7

Configure the following options:

- **Enabled:** Whether the adapter is enabled or disabled.
- **Logging Level:** The logging level (Info, Critical, Error, Warning, Debug). Info by default.
- **Polling Cycle (sec):** The polling interval in seconds.
- **Number of concurrent routers collected:** The number of network elements that can be concurrently polled in a polling cycle.
- **Enable provisioning support:** Whether or not to enable provisioning support. For example, if provisioning is enabled, creating a new tunnel or service.

Step 8 Configure Connection Properties.

- **Host:** This is the URL to access the Cisco Optical Network Controller TAPI interface. The format is `https://<ip>:<port>/crosswork/onc-tapi/`.
- **Timeout**
- **Credentials:** The TAPI credentials that you have added using the Credentials Manager.

Step 9 Configure the FILE BRINGER PARAMETERS:

- **Enable File Bringer:** This enables the module in the adapter to transfer the files from the remote file server to Crosswork Hierarchical Controller.
- **File Server Location:** The file server location. The format is `http/sftp://<ip>:<port>/<path>`.
- **File Type:** For example, CSV, JSON.
- **Authentication**

Step 10 Configure Notifications.

- **Enabled:** Whether notifications are enabled or disabled.
- **URL Sub-part:** Set CONC_NETCONF

Step 11 Configure Stats Collection.

- **Enabled:** Whether Stats Collection is enabled or disabled.
- **Stats Interval Polling (sec):** The polling interval in seconds.

Step 12 Click Save.

Network Discovery for a New Network

Onboard Devices in Cisco Optical Network Controller

Follow the steps in [Onboard Devices in Cisco ONC](#), [Import Planning Data in Cisco ONC](#), and [Import Planned Passives, Connections, Optical Attributes](#) from Cisco Optical Network Controller workflows.

After onboarding is complete in Cisco Optical Network Controller, the devices are automatically populated in the Hierarchical Controller.

Create Sites for Network View

To add sites in Sites Manager:

Step 1 In the applications bar in Crosswork Hierarchical Controller, select **Services > Model Settings**.

Step 2 Select the **Sites** tab.

Step 3 Click **Add New Site**.

Step 4 Enter the site details. For example, ST/London.

- Step 5** Click **Save Site**.
-

Map Devices to Geographical Location

To map devices to sites in Device Manager:

- Step 1** In the applications bar in Crosswork Hierarchical Controller, select **Device Manager > Adapters > Devices**.
- Step 2** Click a device.
- Step 3** In the general tab, select the site for the device.
- Step 4** Click **Save**.
- Step 5** Repeat for all devices.

Network discovery in Crosswork Hierarchical Controller is complete. You can view devices and links in the Network Explorer app.

Network Discovery for an Existing Network

If a network has already been onboarded on to Cisco Optical Network Controller before adding the Optical Network Controller adapter to Crosswork Hierarchical Controller, the devices get automatically populated in the Hierarchical Controller after the adapter is added. After the devices are populated on the Hierarchical Controller, [Create Sites for Network View](#) and [Map Devices to Geographical Location](#). You can view devices and links in the Network Explorer app.

Network Discovery after Update of an Existing Network

In case of a network update follow the same procedure as for a new network. [Onboard Devices in Cisco ONC](#), [Create Sites for Network View](#), and [Map Devices to Geographical Location](#). You can view the new devices and links in the Network Explorer app.

Delete Devices from the Network

To delete a device from Crosswork Hierarchical Controller:

Prerequisites

You must remove all the circuits passing through that device to delete a device from the Hierarchical Controller.

Delete Device from Cisco Optical Network Controller

Use this task to delete the devices onboarded to Cisco Optical Network Controller.

Restriction Do not delete more than 10 devices in a 5 minute interval.

-
- Step 1** Log into Cisco Optical Network Controller.
- Step 2** Click **Devices** in the left panel.
- Step 3** Select the target device and click **Delete**.

Note You cannot delete a device if collection is in progress. The Cisco Optical Network Controller UI shows the device status. Verify the status is not collection in progress before deleting a device.

You cannot delete devices if they have circuits provisioned. Remove the circuits before deleting the devices. If you try to delete a device that has circuits passing through it, the delete operation fails.

Remove Device from Crosswork Hierarchical Controller

You can delete a device and unassign it from its adapters. The device is deleted from the model.

To delete a device:

- Step 1** In the applications bar in Crosswork Hierarchical Controller, select **Services > Device Manager**.
- Step 2** Select the required adapter.
- Step 3** Select the **Managed Devices** tab.
- Step 4** Click on the required device row (not on the link in the Name column).
- Step 5** Click **Delete device**.
A confirmation message appears.
- Step 6** Click **Confirm** to delete the device, unassign it from all adapters and delete the device from the mode.
You can view the updated devices and links in the Network Explorer app.
-

Provision End-to-End OCH-NC Link

Before You Begin

- [Network Discovery in the Hierarchical Controller](#)
- [Create IPC Using Cisco Optical Network Controller](#)
- [Import Alien Wavelength to the Hierarchical Controller](#)

Create IPC Using Cisco Optical Network Controller

IPCs are created between the OCH ports of the OLT device and the OMS ports of the passive device. This is needed to expose the service end points to the Hierarchical Controller.

Import Alien Wavelength to the Hierarchical Controller

To create IPC in Cisco Optical Network Controller:

-
- Step 1** Log into Cisco Optical Network Controller.
 - Step 2** Click **Sites** in the left panel.
 - Step 3** Click the site that you want to add the details of.
 - Step 4** Click **Optical Configurations**.
 - Step 5** Click **Add**.
 - Step 6** Select the source and destination devices and ports from the respective drop-down lists.
 - Step 7** Click **Add**.
-

Import Alien Wavelength to the Hierarchical Controller

Importing Alien wavelength to the Hierarchical Controller involves the following steps:

-
- Step 1** Download the optical source from an Excel sheet in Cisco Optical Network Planner, customize the excel template based on the requirements, and import the customized excel template in Cisco Optical Network Planner. See [Import Optical Sources](#).
 - Step 2** Download Optical Source in XML format in Cisco Optical Network Planner. See [Download Optical Sources](#).
 - Step 3** Import the Alien wavelength in Cisco Optical Network Controller from Cisco Optical Network Planner. See [Use Alien Import](#).
 - Step 4** Export the Alien wavelength from Cisco Optical Network Controller. See [Use Alien Import](#).
 - Step 5** Import the Alien wavelength to the Hierarchical Controller.
 - In the applications bar in Crosswork Hierarchical Controller, select **Services > Services Manager > Settings**.
A list of the service settings appears.
 - In OPTICAL TRANSCEIVERS APPLICATION CODES, click the **hamburger** icon to select an XML file with the application codes.
 - Click **Import**.
-

Create End-to-End OCH-NC Link

-
- Step 1** In the applications bar in Crosswork Hierarchical Controller, select **Services > Services Manager**.
 - Step 2** Select the **Point to Point** tab.
 - Step 3** Click **OCH-NC Link**.
The **OCH-NC Link** wizard appears.
 - Step 4** In the **GENERAL** pane of the wizard, specify the following:

- **Name:** The unique user-defined name of this link.
- **Description:** A description of the link.

Step 5 Click Next.

Step 6 In the SETTINGS pane of the wizard, specify the following:

- **Optical Feasibility Threshold:** Indicates the optical feasibility of the OCH-NC link to ensure that the link is operational after provisioning. The optical feasibility is represented by the following colors: Choose **RED**, **GREEN**, **YELLOW** or **NONE**. For more information, see the [Channel Validation Coloring](#) section.
- **Admin State:** Choose **ENABLED** or **DISABLED**.
- **Central Frequency (THz):** (Optional) The frequency for this OCH-NC link. A number in range of nine digits, with a dot after the first 3 digits (xxx.xxxxxx). The range is between 000.000000 to 999.999999 in steps of 000.000001. If the value is blank, the first suitable wavelength is automatically assigned.

Step 7 Click Next.

Step 8 In the APPLICATION CODE pane of the wizard, specify the following:

- **Vendor Name:** The vendor name.
- **Product ID:** The product ID which is the Alien wavelength.
- **FEC:** The FEC depends on the product, for example, CFEC or OFEC.
- **Data Rate:** The data rate supported by the selected product.
- **Baud Rate:** The baud rate supported by the selected product.
- **Sub Mode:** This may appear depending on the other settings.

Application code is generated from the above parameters and is unique for each interface.

Step 9 Click Next.

Step 10 In the ENDPOINTS pane of the wizard, specify the following:

- Choose **Single Channel** or **Multiple Channel**. There will be multiple endpoints for Multiple Channel.
- **Endpoint A:** Click the **Search** icon and in the **Advanced** tab, select an NMC port, or click the **3D Explorer** tab and select an endpoint.
- **Endpoint B:** Click the **Search** icon and in the **Advanced** tab, select an NMC port, or click the **3D Explorer** tab and select an endpoint.

Step 11 Click Next.

Step 12 In the PATH pane of the wizard, specify the following:

- **Optimization Goal:** The optimization goal (**Number of Hops** or **Admin Cost**).
- **Disjoint From Link:** (Optional) Click the **Search** icon and in the **Advanced** tab, select an OCH-NC link, or click the **3D Explorer** tab to select an OCH-NC link. This means that the new OCH-NC link must not traverse this path.
- **Include Nodes or Links:** (Optional) Click the **Search** icon and in the **Advanced** tab, select a link, or click the **3D Explorer** tab to select a link.

Channel Validation Coloring

- **Exclude Nodes or Links:** (Optional) Click the **Search** icon and in the **Advanced** tab, select a link, or click the **3D Explorer** tab to select a link.

Step 13

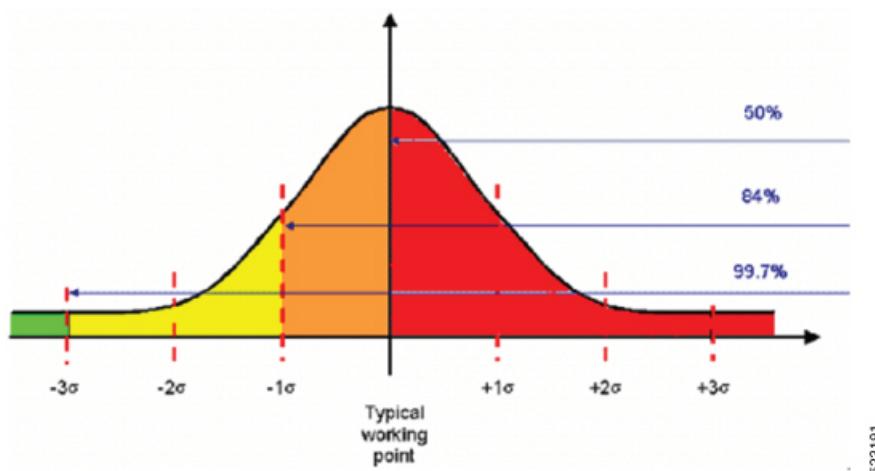

Click **Next**.

Step 14

In the **SUMMARY** pane of the wizard, review the details provided and click **Finish** to create an OCH-NC link.

Channel Validation Coloring

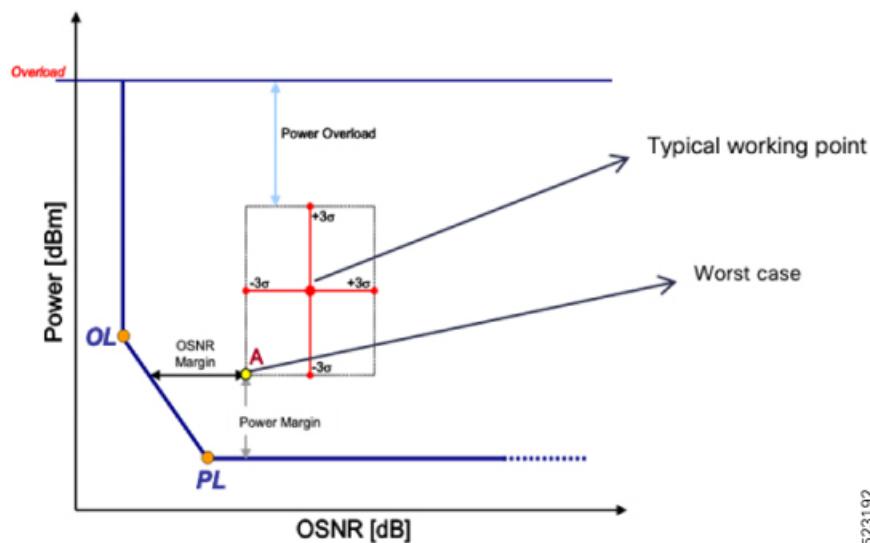

The optical power and OSNR of each channel are simulated over a specific optical path with average value (considering typical values) and variance (considering statistical propagation of variances). The simulation provides the statistical optical power and OSNR at the RX side of the optical interface. The statistical optical power and OSNR values delivered from the DWDM system are compared with the target optical power and OSNR values requested at the RX side of the optical interface for error-free post-FEC. This comparison provides channel validation coloring.

- Average-OSNR – 3σ > target-OSNR \Rightarrow GREEN or working probability > 99%
- Average-OSNR – 1σ > target-OSNR \Rightarrow YELLOW or 99% > working probability > 84%
- Average-OSNR < target-OSNR \Rightarrow RED or working probability less than 50%

For each channel, optical power and OSNR margins are calculated considering the statistical worst case.

The following figure describes the (Typical_value - 3σ) working point with respect to the optical interface working area (including penalties).

523192

Provision the IP Link

See [Provision Routed Optical Networking ML Service Using Crosswork Hierarchical Controller](#).

Troubleshoot IP Link and OCH-NC through the Hierarchical Controller and Cisco Optical Network Controller

Device Addition Failure

Reason	Description/Details	Troubleshooting	Workarounds/Remarks
Connection Failure	UI status – Disconnected	Check connectivity to the device by – Check if the user provided details like Device type, IP, Port, Protocol, and device credentials are correctly mentioned in Cisco Optical Network Controller UI.	Correct the details provided in the Cisco Optical Network Controller UI.
		Check if Ping to the device is working	Check if the device is properly configured and has proper network configuration.
		Check if the Netconf and gRPC (for NCS1010) connectivity to the device on the Netconf/gRPC port is working.	Check if the Netconf/gRPC and XR configuration is proper on the NCS1010 device
Collection Failure	UI status – Failed/Errorred	Check the release on the NCS1010/SVO device.	NCS1010 should be running Release 7.7.1. SVO should be running one of the following releases – 12.2, 12.3, 12.3.1 If the issue occurs even when the required software versions are present call TAC.

Device Deletion Failure

Reason	Description/Details	Troubleshooting	Workarounds/Remarks
Device is part of a Circuit	UI status – Circuit/Service spanning over the device - TBD	This is expected Cisco Optical Network Controller behavior.	Delete the Circuit/Connectivity-service (via NBI) and then try Device deletion.

Reason	Description/Details	Troubleshooting	Workarounds/Remarks
Collection In Progress	UI Status – Device cannot be deleted because Collection is in Progress	This is expected Cisco Optical Network Controller behavior.	Wait for the collection to be completed and then try device deletion.
Resync in Progress	UI status – Device cannot be deleted because Collection is in Progress	This is expected Cisco Optical Network Controller behavior.	Wait for the Resync to be completed and then try device deletion.
Connectivity Check in Progress	UI status – Device cannot be deleted because Waiting for Connection	This is expected Cisco Optical Network Controller behavior.	Wait for the Resync/Recollection to be completed and then try device deletion.

IPC Creation Creation/Deletion Failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Invalid Port Selected	UI status – Invalid port selected on OLT for a MPO passive type	This is expected Cisco Optical Network Controller behavior.	Select the Correct Source and Destination ports.
UI not Refreshed/Updated	UI Status – No IPC found between given source and destination ports OR Either or both the ports are already mapped!	This could be expected Cisco Optical Network Controller behavior.	Click the Refresh button on the IPC tab and try IPC creation/deletion again.
Device Not Reachable	UI Status – IPC Creation Failed	This could be expected Cisco Optical Network Controller behavior.	Please verify Device Reachability.

Resync Operation failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Device not reachable	UI status – Device – Disconnected Status – Blank/Resync pending/Resync Failed	This is expected Cisco Optical Network Controller behavior.	Check if the device is properly configured and has proper network configuration. Check if the Netconf/gRPC and XR configuration is proper on the NCS1010 device. Try Resync again Check the release on the SVO/NCS1010 device for compatibility with Cisco Optical Network Controller release.
Device credentials changed on the device	UI status – Device – Disconnected Status – Blank/Resync pending/Resync Failed	This is expected Cisco Optical Network Controller behavior.	Edit the device credentials via Optical Network Controller UI and click OK. Resync will happen automatically.

Circuit Creation Failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
No Route Available	Cisco Optical Network Controller UI status – NA	No route can be found by the Path Computation Engine. Could be expected behavior.	Check the topology and the route for the currently created services.
Wrong SIP Selection	Cisco Optical Network Controller status – NA	SIP UUIDs are not proper	Check the list of available SIPs and supply only SIPs returned from the T-API topology-context fetched by the Hierarchical Controller from Optical Network Controller as part of the get call.
Device(s) not reachable	Cisco Optical Network Controller status – NA	Circuit will move to Pending-Removal lifecycle state.	Check the device reachability and fix it Delete the connectivity-service Recreate the connectivity-service.

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Routing constraint is Invalid	Cisco Optical Network Controller status – NA	Could be due to invalid UUIDs provided in the connectivity-service request constraints.	Check the list of available constraints and supply only valid constraints.
Routing Constraint Not Feasible	Cisco Optical Network Controller status – NA	Could be expected behavior since a route may not be available meeting the Constraint provided.	Check the topology and the constraint provided.

Circuit Deletion Failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Circuit Deletion attempted before circuit creation is completed	Connectivity-service lifecycle-state is Planned and same service deletion is attempted.	This is expected behavior.	Wait till the circuit lifecycle-state is either Installed or Pending-removal .
Invalid Circuit ID	Invalid connectivity-service UUID is provided	This is expected behavior.	Connectivity-service should be of an existing connectivity-service in the T-API connectivity-context.

Planning Data Import Failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Planning data file format is not proper	UI status – Request Failed	This is expected Cisco Optical Network Controller behavior.	Please check the file format. Cisco Optical Network Controller supports JSON file format from Cisco Optical Network Planner only.
Passive cards are already connected to OLT	UI status – Error - Equipment Failed	This is expected Cisco Optical Network Controller behavior.	Please physically remove and disconnect the Passive cards before pushing the data.
IPC already created in Optical Network Controller	UI status – Error – Internal Patch cord Failed	This is expected Cisco Optical Network Controller behavior.	Please remove the IPC from Cisco Optical Network Controller before pushing the data.

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Optical attributes are not compatible with the device	UI status – Error – Optical attributes Failed	This is expected Cisco Optical Network Controller behavior.	Please check and ensure that the actual hardware connected matches with the planned devices on Cisco Optical Network Planner. You can check this on the Cisco Optical Network Planner Planning data import screen using the actual device field.

Alien import failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Alien file format is not proper	UI status – Request Failed	This is expected Cisco Optical Network Controller behavior.	Please check the file format. Cisco Optical Network Controller supports XML file format from Cisco Optical Network Planner only.

CV failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Empty tone ID	UI status – Empty Tone ID	This is expected Cisco Optical Network Controller behavior.	<p>Please remove the IPC and all related services and recreate it setting the tone ID to have CV working.</p> <p>This is a traffic affecting operation.</p> <p>Please see the connection verification workflow.</p>
Degraded or broken IPC	UI status – Failed	This is expected Cisco Optical Network Controller behavior.	<p>Please check the integrity of the IPC (physical fiber) and replace it if needed.</p> <p>To check the integrity, you need a reference power source and a power meter.</p> <p>Inject light on one end of the patch cord and measure the loss at other end of the patch cord.</p>

PM failure

Reason	Description/Details	Troubleshooting	Workaround/Remarks
Device Reachability	Cisco Optical Network Controller UI status – Device Status – Disconnected	This is expected Cisco Optical Network Controller behavior if the device is not reachable or the gRPC interface is not UP/Working on the device.	Check the device connectivity to the NCS 1010 node using Ping. Check the Telemetry Connection (gRPC for NCS1010 device) using <code>show grpc</code> and <code>show grpc status</code> on the NCS 1010 node.
