

## **Implementing Host Services and Applications**

Cisco IOS XR software Host Services and Applications features on the router are used primarily for checking network connectivity and the route a packet follows to reach a destination, mapping a hostname to an IP address or an IP address to a hostname, and transferring files between routers and UNIX workstations.

#### Prerequisites for implementing Host Services and Applications

Ensure to install the relevant optional RPM package before using the host services or applications.

• HTTP Client Application, on page 1

### **HTTP Client Application**

HTTP Client allows files to be transferred from http server to another device over a network using HTTP protocol. You can configure http client and various parameters associated with it by using the **http client** command.

#### **Configure HTTP Client**

HTTP Client application is available by default. You can configure http client settings or view and modify the existing settings. To configure the settings, use the **http client** command in XR config mode.

```
Router #configure
Router(config) #http client ?
                   Configure HTTP Client connection
connection
response
                   How long HTTP Client waits for a response from the server
                   for a request message before giving up
secure-verify-host Verify that if server certificate is for the server it is known as
secure-verify-peer Verify authenticity of the peer's certificate
source-interface Specify interface for source address
ssl
                   SSL configuration to be used for HTTPS requests
                   Set tcp window-scale factor for High Latency links
tcp-window-scale
version
                   HTTP Version to be used in HTTP requests
vrf
                   Name of vrf
```

#### Table 1: Commands used to configure HTTP Client settings

Features	Description
	Configure HTTP Client connection by using either retry or timeout options.

Features	Description
response	How long HTTP Client waits for a response from the server for a request message before giving up.
secure-verify-host	Verify host in peer's certificate. To disable verifying this, you can use the command <b>http client secure-verify-host disable</b>
secure-verify-peer	Verify authenticity of the peer's certificate.
source-interface	Specifies the interface for source address for all outgoing HTTP connections. You can enter either an ipv4 or ipv6 address or both.
ssl version	SSL version (configuration) to be used for HTTPS requests.
tcp-window-scale scale	Set tcp window-scale factor for high latency links.
version	<ul> <li>HTTP version to be used in HTTP requests.</li> <li>1.0 - HTTP1.0 will be used for all HTTP requests.</li> <li>1.1 - HTTP1.1 will be used for all HTTP requests.</li> <li>default libcurl - will use HTTP version automatically.</li> </ul>
<b>vrf</b> name	Name of vrf.

### Examples

**Example 1:** This example shows how to set the tcp window-scale to 8.

Router(config) #http client tcp-window-scale 8

**Example 2:** This example shows how to set the HTTP version to 1.0.

Router(config)#http client version 1.0

# 

Note HTTP Client uses libcurl version 7.30
