About this Publication

This guide provides instructions for *Day-0* minimum configuration that is required to bring up Cisco NCS 1010 and associated devices into a functional state. Two approaches have been detailed:

- [Bringup NCS 1010 Manually, on page 16](#)
- [Bringup NCS 1010 Using ZTP, on page 49](#)

The approaches do not address all of the possible network needs; instead, they provide models on which you can pattern your network. You can choose not to use features presented in the examples, or you can add or substitute features that better suit your needs.

Readers must be familiar with the operating system on which the NCS 1010 runs.

Overview of the NCS 1010 Optical Line System

Optical transport networks are evolving to address an exponential increase in network traffic faced by service providers. There is a growing need to support both digital coherent optics and high-performance transponders. This release introduces a new generation of Optical Line System (OLS), the Cisco Network Convergence Series 1010 (NCS 1010).

NCS 1010 OLS platform is an integral component of Routed Optical Networking solution. It provides point-to-point connectivity between routers with ZR/ZR+ optics and multiplexes signals from multiple routers over a single fiber. The OLS platform supports ROADMs nodes of up to eight degrees using the NCS 1000 Breakout Patch Panel. NCS 1010 supports C-band WDM transmission in this release.

The NCS 1010 OLS platform provides:

- Versatility by supporting multiple coherent sources such as:
 - 400 G digital coherent ZR/ZR+ optics (-10dBm output power)
 - High-performance DCO transponders such as NCS1K4-1.2T-K9 and NCS1K4-2-QDD-C-K9 cards that use high GBaud rates.
- Simplicity by using integrated optical line cards that minimize fiber patching and cabling errors in the field.
- Automation through IOS XR operating system that provides a rich suite of automation features including Zero Touch Provisioning (ZTP), open config YANG model support with NETCONF, and streaming telemetry.
- Network monitoring through a combination of probes based on OTDR, OSC, OCM, and telemetry data.

The NCS 1010 OLS platform comprises of:

- Network Convergence System (NCS 1010) chassis
- Cisco NCS 1000 Breakout Patch Panel
- Cisco NCS 1000 32-Channel Mux/Demux Patch Panels

Cisco NCS 1010

Cisco NCS 1010 is a 3 RU modular chassis that has an in-built External Interface Timing Unit (EITU) and multiple field-replaceable modules.

NCS 1010 supports different variants of the line card:

- OLT-C Line Card: C-band Optical Line Terminal without Raman
- OLT-R-C Line Card: C-band Optical Line Terminal with Raman
- ILA-C Line Card: C-band In-Line Amplifier without Raman
- ILA-R-C Line Card: C-band In-Line Amplifier with one side Raman
- ILA-2R-C Line Card: C-band In-Line Amplifier with both sides Raman

For more information about the NCS 1010 chassis, see the [data sheet](#).

Cisco NCS 1000 Breakout Patch Panel

It is a colorless breakout patch panel that enables you to implement long-haul topologies. These topologies use high TX power transponders such as the NCS1K4-1.2T-K9 or NCS1K4-2-QDD-C-K9 line card.

The patch panel supports up to 72 mux/demux channels and eight ROADMs using the following breakout modules:

- NCS1K-BRK-8 (used as express interconnects)
- NCS1K-BRK-24 (used to colorless topology)

For more information about the NCS 1000 breakout patch panel, see the [data sheet](#).

Cisco NCS 1000 32-Channel Mux/Demux Patch Panels

These patch panels support colored channels that enable you to implement metro topologies. These topologies use low TX power modules such as 400G ZR/ZR+ coherent optics. These patch panels also support the Routed Optical Networking solution.

The two Mux/Demux patch panels (NCS1K-MD-32O-C and NCS1K-MD32E-C) support 32 channels and work as an add/drop unit for the OLT-C and OLT-R-C line cards.

For more information about the NCS 1000 Mux/Demux patch panels, see the [data sheet](#).

Hardware and Software Support

Hardware Components

The hardware components supported are:

Table 1: PIDs for Cisco NCS 1010 and Its Modules

Product ID	Product Description
NCS1010-CNTLR-K9=	NCS 1010 Controller
NCS1010-SA	NCS 1010 Shelf Assembly
NCS1010-SYS	NCS 1010 Assemble to Order
NCS1010-FAN	NCS 1010 Shelf Fan Assembly
NCS1010-AC-PSU	NCS 1010 AC Power Supply Unit
NCS1010-FTF	NCS 1010 Fan Tray Filter

Product ID	Product Description
NCS1K-OLT-C	C-band Optical Line Terminal without Raman
NCS1K-OLT-R-C	C-band Optical Line Terminal with Raman
NCS1K-ILA-C	C-band In-Line Amplifier without Raman
NCS1K-ILA-R-C	C-band In-Line Amplifier with one side Raman
NCS1K-ILA-2R-C	C-band In-Line Amplifier with both sides Raman
NCS1K-BRK-SA	NCS 1000 breakout patch panel
NCS1K-BRK-8	8 ports colorless channels breakout module
NCS1K-BRK-24	24 ports colorless channels breakout module
NCS1K-MD-32O-C	32-channels spaced at 150 GHz on the Odd ITU grid
NCS1K-MD-32E-C	32-channels spaced at 150 GHz on the Even ITU grid

For more information about environmental specifications, see [System Environmental Specifications](#).

For more information about the power cables that are supported by the Cisco NCS 1010 AC and DC PSUs, see [Power Cable Specifications](#).

IOS-XR Software Components

Cisco IOS XR is a modern and flexible network operating system. XR improves operational efficiencies with management API integration to provide near real-time, actionable telemetry data. The two features supported are:

- **YANG-modeled management layer APIs:** To automate device provisioning and management.
- **Streaming telemetry capabilities:** For cadence-based or event-driven monitoring of data that is derived from YANG-modeled paths in the manageability layer over gRPC, TCP, or UDP.

For more information about data models and the supported YANG models, see [Data Models Configuration Guide for Cisco NCS 1010](#).

Software Support

The following features are supported on Cisco NCS 1010:

Table 2: Feature Support

Feature	Description
Multiple boot options	After installing the hardware, boot the Cisco NCS 1010 system using the pre-installed operating system (OS) image. You can connect to the XR console port and power on the system.
Zero touch provisioning	Zero touch provisioning (ZTP) allows you to provision the network device with day 0 configurations and supports both management ports and data ports.

Feature	Description
Disaster recovery	The Disaster Recovery feature allows the CPU replacement in the field without losing the configuration and software. The traffic is not affected.
Software and FPD upgrade	You can upgrade NCS 1010 by installing a new version of the Cisco IOS XR operating system on NCS 1010.
Datapath configuration	There are four types of controllers for Cisco NCS 1010. The controllers are the OTS, OTS-OCH, OSC, and DFB controllers. You can configure and view these controllers.
Optical channel monitoring	The Optical Channel Monitor (OCM) blocks in the OLT and ILA cards provide per-channel optical power monitoring.
Performance monitoring	You can configure and retrieve PM counters for the various controllers in flex-bin, 30-second, 15-minute, or 24-hour intervals. These parameters simplify troubleshooting operations and enhance data that can be collected directly from the equipment.
Connection verification	Connection verification checks the connection between the OLT-C line card and all the other passive modules to avoid miscabling during the node installation.
ASE loading	This feature allows to completely populate the transmission spectrum at LINE-TX independent of the actual system traffic load, thereby easing the system regulation starting from the installation.
Headless mode	Cisco NCS 1010 operates in headless mode for up to 72 hours, during process restarts, controller reload, LC warm reload, LC FPD upgrade, or removal of the controller (Online Insertion and Removal (OIR)). During this time, traffic is not impacted, although the control plane is not up and running.
Passive module support	There are two types of passive controllers for Cisco NCS 1010. The controllers are the OCH and OMS controllers. You can configure and view these controllers.
Remote node management	The remote node management feature in NCS 1010 allows you to remotely manage an ILA node that is not connected to a management network through an OLT gateway node over Optical Supervisory Channel (OSC) interface. The OLT node is connected to a management network and manages ILA node remotely.
Internode topology discovery	Optical applications on the NCS 1010 nodes must discover the OLT-OLT link topology. Span level applications must discover the adjacent nodes. Link level applications must learn the complete OLT-OLT link topology. NCS 1010 uses OSPF to discover the link topology and communicate topology information.
Span loss	The Span Loss calculation is an automatic calculation of span losses between NCS 1010 systems. The span loss verification algorithm calculates span loss by comparing power measurements at line Tx/Rx port at far end and line Rx/Tx port at near end.
Raman tuning	Raman Tuning Algorithm calculates and sets the different pump power values across 5 Raman pumps to obtain the target Raman Gain on a span.

Feature	Description
Gain estimator	Gain Estimator analyses the span loss and sets the gain mode of the EDFA amplifier and provides the initial target gain for the amplifier.
Link tuner	Link tuner computes the target Power Spectral Densities (PSD) for APC by calculating the optimal PSDs for a span.
Automatic power control	Automatic Power Control (APC) corrects the power level differences and ensures that power for different channels is according to the target power profile for the spectrum. APC compensates for the degradation of the network over time. APC is enabled if automatic link bring up is enabled.
Automatic network turn up	You can bring up an NCS 1010 DWDM link without using any external tools. NCS 1010 measures optical parameters for all the spans at power-up. It then computes different setpoints for each of the spans to ensure optimal link performance for end-to-end traffic to pass through.
OTDR	An Optical Time Domain Reflectometer (OTDR) is an electronic-optical instrument that is used to characterize optical fibers. It checks defects and faults, and determines the amount of signal loss at any point in an optical fiber. The OTDR application is a built-in functionality in ILA and OLT devices.
Multi-degree support	NCS1010 OLT devices support up to 8 degrees of ROADM express. You can set up multidegree connections using NCS1K-BRK-8 modules. Use BRK-8 modules for MPO breakout for express interconnect. For a multidegree topology, you must use as many BRK-8 modules and OLT devices as there are degrees. The BRK-8 modules help NCS 1010 nodes to achieve multidegree capability.

Network Topology

The sample network topology that is shown in this section has been used to explain the manual and ZTP bringup scenarios. It is a four degree topology that uses 13 NCS 1010 nodes. The BRK-8 modules are used to create express interconnects among SITE-2, SITE-3, SITE-4, and SITE-5 using MPO cables.

Figure 1: Multi-degree Topology

Topology Components

To build this topology, you need the following hardware:

- Cisco NCS 1010 devices
 - OLT-C (5)
 - OLT-R-C (3)
 - ILA-C (2)
 - ILA-R-C (2)
 - ILA-2R-C (1)
- NCS1K-MD32E-C modules (2)
- NCS1K-MD32O-C modules (2)
- NCS1K-BRK-8 modules (4)
- NCS1K-BRK-24 modules (2)
- Cisco 8201 routers (2)
- QDD-400G-ZR-S transceivers (2)
- NCS1K4-1.2T-K9 C-Band Line Card (4)
- LC/LC cables
- MPO cables

Create port connections as seen in the topology diagram. For more information on port connections between the devices, see [NCS 1010 overview](#).

Hardware Installation

Before you perform any task in this publication, you must review the safety guidelines in this section to avoid injuring yourself or damaging the equipment. During any installation procedure, always use caution and common sense. For more information, see [Safety Guidelines and Warnings](#).

To install the Cisco NCS 1010 chassis and optical modules:

- [Prepare to Install Cisco NCS 1010](#)
- [Install Cisco NCS 1010](#)
- [Install Cisco NCS 1010 Modules](#)

To install the Cisco NCS 1000 Breakout Patch Panel and Modules:

- [Prepare to Install Cisco NCS 1000 Breakout Patch Panel and Modules](#)
- [Install Cisco NCS 1000 Breakout Patch Panel and Modules](#)

To install the Cisco NCS 1000 32-Channel Mux/Demux Patch Panels:

- [Prepare to Install Cisco NCS 1000 32-Channel Mux/Demux Patch Panel](#)
- [Install Cisco NCS 1000 32-Channel Mux/Demux Patch Panel](#)

To install the Cisco NCS 1004 chassis:

- [Prepare to Install Cisco NCS 1004](#)
- [Install Cisco NCS 1004](#)
- [Install Cisco NCS 1004 Modules](#)

To install the Cisco 8201 routers:

- [Hardware Installation Guide for Cisco 8200 Series Routers](#)

Bootup Process

After installing the hardware, boot the Cisco NCS 1010 system. You can connect to the XR console port and power on the system. NCS 1010 completes the boot process using the pre-installed operating system (OS) image. If no image is available, NCS 1010 can be booted using the iPXE boot or an external bootable USB drive.

Use any one of the tasks to boot the NCS 1010 chassis.

- [Boot NCS 1010 using Console](#)
- [Boot NCS 1010 Using USB Drive](#)
- [Boot Using iPXE](#)
- [Boot Using Zero Touch Provisioning](#)

The boot process using iPXE has been illustrated in the following scenarios:

- **Manual Configuration Workflow:** This workflow uses iPXE as the boot process followed by a manual bringup of the node.

- **ZTP Configuration Workflow:** This workflow uses IPXE as the boot process followed by an automated bringup of the node using ZTP configuration files.

Preliminary Checks

After you successfully log into the console, you must perform some preliminary checks to verify the default setup. If any setup issue is detected, take corrective action before making further configurations.

The following samples are verification outputs of the default setup on OLT-R-C-SITE-4 node.

Similar verification steps can be performed on all the other NCS 1010 nodes.

To verify the status of all the hardware components installed on the node, use the following command:

```
RP/0/RP0/CPU0:OLT-R-C-SITE-4#sh platform
Mon Jul 25 09:55:26.206 UTC
Node                               Type                               State                               Config state
-----
0/RP0/CPU0                         NCS1010-CNTLR-K9 (Active)         IOS XR RUN                         NSHUT,NMON
0/PM0                             NCS1010-AC-PSU                   OPERATIONAL                       NSHUT,NMON
0/PM1                             NCS1010-AC-PSU                   OFFLINE                           NSHUT,NMON
0/FT0                             NCS1010-FAN                      OPERATIONAL                       NSHUT,NMON
0/FT1                             NCS1010-FAN                      OPERATIONAL                       NSHUT,NMON
0/0/NXR0                          NCS1K-OLT-R-C                   OPERATIONAL                       NSHUT,NMON
0/1                               NCS1K-BRK-8                      OPERATIONAL                       NSHUT,NMON

To view the management interface status, use the following command:

```
RP/0/RP0/CPU0:OLT-R-C-SITE-4#sh interfaces mgmtEth 0/RP0/CPU0/0
Mon Jul 25 09:56:50.171 UTC
MgmtEth0/RP0/CPU0/0 is up, line protocol is up
  Interface state transitions: 3
  Hardware is Management Ethernet, address is 38fd.f866.071b (bia 38fd.f866.071b)
  Internet address is 10.4.33.124/24
  MTU 1514 bytes, BW 1000000 Kbit (Max: 1000000 Kbit)
```

```

    reliability 255/255, txload 0/255, rxload 0/255
Encapsulation ARPA,
Full-duplex, 1000Mb/s, CX, link type is autonegotiation
loopback not set,
Last link flapped 00:39:48
ARP type ARPA, ARP timeout 04:00:00
Last input never, output 00:48:33
Last clearing of "show interface" counters never
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
  2180 packets input, 222691 bytes, 0 total input drops
  0 drops for unrecognized upper-level protocol
Received 260 broadcast packets, 1916 multicast packets
    0 runts, 0 giants, 0 throttles, 0 parity
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  29 packets output, 4635 bytes, 0 total output drops
Output 5 broadcast packets, 11 multicast packets
  0 output errors, 0 underruns, 0 applique, 0 resets
  0 output buffer failures, 0 output buffers swapped out
  3 carrier transitions

```

To verify the management interface status, use the following commands:

```
RP/0/RP0/CPU0:OLT-R-C-SITE-4#sh interfaces summary
```

```
Mon Jul 25 09:57:03.639 UTC
```

Interface	Type	Total	UP	Down	Admin Down

```

Bringup NCS 1010

There are two approaches to bring up Cisco NCS 1010 and associated devices into a functional state:

- [Bringup NCS 1010 Manually, on page 16](#)
- [Bringup NCS 1010 Using ZTP, on page 49](#)

Bringup NCS 1010 Manually

Perform the configurations in the following sequence to manually bring up NCS 1010.

- [DHCP Configuration, on page 17](#)
- [Manual Configuration Workflow, on page 20](#)
- [Cross-connect Configuration, on page 36](#)

Note

When you boot up the NCS 1010 device for the first time, the ZTP process starts automatically and runs in the background. If the device is configured manually, the ZTP process continues to run in the background. If the ZTP process is not terminated gracefully, after an RP reload or power cycle, interfaces on the device can enter the *shutdown* state. To avoid this issue, it is suggested to disable the ZTP process gracefully. Use the following commands to disable the ZTP:

```
RP/0/RP0/CPU0:ios#ztp terminate
"ZTP Exited"
RP/0/RP0/CPU0:ios#ztp clean
RP/0/RP0/CPU0:ios#ztp disable
```

DHCP Configuration

DHCP configuration is required for both manual configuration and ZTP configuration.

To run iPX and ZTP, you need a DHCP server. To configure a DHCP server, you must edit the `dhcpd.conf` file available at `/etc/dhcp/`. This configuration file stores the network information such as the path to the script, location of the ISO install file, location of the provisioning configuration (`.cfg`) file, and serial number or the MAC address of the chassis.

In the following example, the settings in the `dhcpd.conf` refers to the span connecting OLT-R-C-SITE-1 to OLT-C-SITE-2.

Figure 2: NetworkTopology Diagram

Note Restart the `dhcpd` service using the **`service dhcpd restart`** command every time you edit the `dhcpd.conf` file.

Add the following settings to the `dhcpd.conf` file :

Note The ZTP configuration files (`*.cfg`) that are referenced in the `dhcpd.conf` file are detailed in [ZTP Configuration Files Creation](#), on page 53.

```

[root@vxr-ncs1010-02 ~]# route add -net 10.94.1.2 gw 10.4.33.131 netmask 255.255.255.255 dev eth3

```

10.4.33.131 is the management IP address for the gateway node.

Manual Configuration Workflow

This section details how to manually bringup the nodes. Verification outputs have been added at various steps. The iPXE boot process via the BIOS interface has been used for this example.

The example used in this section is:

Figure 3: Network Topology Diagram

Note Before you use the iPXE boot, ensure that the DHCP server is set and is running. Create a `dhcpd.conf` file specific to the nodes in the network topology diagram. To see a sample `dhcpd.conf` file, see [DHCP Configuration, on page 17](#).

The boot process is initiated via the BIOS interface as follows:

1. The node is reloaded or can undergo a power cycle.
2. Press **Esc** to enter BIOS.
3. Select the **Save & Exit** tab of BIOS.
4. Choose **UEFI: iPXE Network Boot**.

```
Software Boot OK, Validated
```

```
iPXE initialising devices...ok

16. Repeat steps 1 through 15 to configure the ILA-R-C and OLT-R-C-SITE-7 nodes.
17. Configure the cross-connects for the OLT-R-C-SITE-4 and OLT-R-C-SITE-7 nodes. For a sample cross-connect configuration, see [Cross-connect Configuration, on page 36](#).

The following sample displays the running configuration of the OLT-R-C-SITE-4 node that was configured earlier.

Cross-connect Configuration

The OTS-OCH controllers are not created by default when the cards (NCS1K-ILA-2R-C, NCS1K-ILA-R-C , NCS1K-ILA-C, NCS1K-OLT-R-C , and NCS1K-OLT-C) are brought up. The LINE OTS-OCH controllers can be created using the **hw-module** command.

Optical Cross Connections can be configured only on OLT nodes. In these nodes, the OTS-OCH controller is not created automatically on the Add/Drop ports (COM side). The optical cross connect configuration defines the line side OTS-OCH channel as the source and creates an OTS-OCH controller on the ADD/Drop port to which the cross connection is made. The channel ID must be the same for both the LINE side and COM side OTS-OCH controller.

To illustrate the creation of the cross-connects, we are going to create a single channel from OLT-R-C-SITE-1 to OLT-C-SITE-8 in the topology diagram. The channel is mapped to **191.45 THz**.

Configuration for OLT-R-C-SITE-1

Bringup NCS 1010 Using ZTP

Perform the configurations in the following sequence to bring up NCS 1010 using ZTP.

- [DHCP Configuration, on page 17](#)
- [ZTP Configuration Files Creation, on page 53](#)
- [ZTP Configuration Workflow, on page 60](#)
- [Cross-connect Configuration, on page 36](#)

DHCP Configuration

DHCP configuration is required for both manual configuration and ZTP configuration.

To run iPXE and ZTP, you need a DHCP server. To configure a DHCP server, you must edit the `dhcpd.conf` file available at `/etc/dhcp/`. This configuration file stores the network information such as the path to the script, location of the ISO install file, location of the provisioning configuration (`.cfg`) file, and serial number or the MAC address of the chassis.

In the following example, the settings in the `dhcpd.conf` refers to the span connecting OLT-R-C-SITE-1 to OLT-C-SITE-2.

Figure 4: NetworkTopology Diagram

Note Restart the `dhcpd` service using the **`service dhcpd restart`** command every time you edit the `dhcpd.conf` file.

Add the following settings to the `dhcpd.conf` file :

Note The ZTP configuration files (`*.cfg`) that are referenced in the `dhcpd.conf` file are detailed in [ZTP Configuration Files Creation](#), on page 53.

```

To create the static routes in the DHCP server, use the following commands:

route add -net *OLT-OSC-ip* gw *OLT-MGMT-ip* netmask 255.255.255.255 dev eth3

route add -net *ILA-OSC-ip* gw *OLT-MGMT-ip* netmask 255.255.255.255 dev eth3

```

[root@vxxr-ncs1010-02 ~]# route add -net 10.90.1.1 gw 10.4.33.131 netmask 255.255.255.255 dev eth3
[root@vxxr-ncs1010-02 ~]# route add -net 10.90.1.2 gw 10.4.33.131 netmask 255.255.255.255 dev eth3
[root@vxxr-ncs1010-02 ~]# route add -net 10.91.1.1 gw 10.4.33.131 netmask 255.255.255.255 dev eth3
[root@vxxr-ncs1010-02 ~]# route add -net 10.91.1.2 gw 10.4.33.131 netmask 255.255.255.255 dev eth3
[root@vxxr-ncs1010-02 ~]# route add -net 10.92.1.1 gw 10.4.33.131 netmask 255.255.255.255 dev eth3
[root@vxxr-ncs1010-02 ~]# route add -net 10.92.1.2 gw 10.4.33.131 netmask 255.255.255.255 dev eth3
[root@vxxr-ncs1010-02 ~]# route add -net 10.94.1.1 gw 10.4.33.131 netmask 255.255.255.255 dev eth3
[root@vxxr-ncs1010-02 ~]# route add -net 10.94.1.2 gw 10.4.33.131 netmask 255.255.255.255 dev eth3

```

10.4.33.131 is the management IP address for the gateway node.

ZTP Configuration Files Creation

You can build the ZTP configuration files based on your network requirements. The sample ZTP files created below are used to configure the nodes from OLT-R-C-SITE-1 to OLT-C-SITE-2 as shown in the figure below. You can create similar ZTP configuration files for the rest of the NCS 1010 nodes.

Figure 5: Network Topology Diagram

Note You can remotely manage an ILA node that is not connected to a management network through an OLT gateway node via an OSC interface. ZTP can be initiated from a remote node through DHCP relay. For more information see, [Remote Node Management in NCS 1010](#).

Build the ZTP configuration files by typing the following in Notepad and save them as .cfg files in the DHCP server.

OLT-R-C-SITE-1 node:

```

```

Save this file as **OLT-C-SITE-2.cfg**.

These configuration files are referenced in the `dhcpd.conf` file.

For more information on ZTP, see [Boot Using Zero Touch Provisioning](#).

ZTP Configuration Workflow

This section details how to bringup NCS 1010 nodes using ZTP. Verification outputs have been added at various steps. The iPXE CLI boot process has been used for this example.

The example used in this section is part of the overall network topology.

Figure 6: Network Topology Diagram

Note Before you use the iPXE boot, ensure that the DHCP server is set and is running. Create a `dhcpd.conf` file and the required ZTP configuration files specific to the nodes in the network topology diagram shown above. For samples of the `dhcpd.conf` file and the ZTP configuration files, see [DHCP Configuration, on page 17](#) and [ZTP Configuration Files Creation, on page 53](#).

1. Run the following CLI command to invoke the iPXE boot process to reimage the chassis:

Note This command deletes the existing configuration on the node.

```
RP/0/RP0/CPU0:ios#reload bootmedia network location 0/RP0/CPU0 noprompt
Mon Aug 1 11:49:27.269 UTC

Preparing system for backup. This may take a few minutes especially for large configurations.

2. To remove all the ZTP logs and saved settings, use the following command:

```

RP/0/RP0/CPU0:ios#ztp clean
Mon Aug  1 12:11:07.816 UTC
This would remove all ZTP temporary files.
Would you like to proceed? [no]: yes
2022-08-01 12:11:10.674178:          ztp[ 1900, t 1900]: ERROR: ztp_proc_start
: 104: Failed to start process with error: 'processmgr' detected the 'warning' condition 'The target
process is already running.'
All ZTP operation files have been removed.
ZTP logs are present in /var/log/ztp*.log for logrotate.
Please remove manually if needed.
If you now wish ZTP to run again from boot, do 'conf t/commit replace' followed by reload.
RP/0/RP0/CPU0:ios#

```

3. To invoke ZTP manually, use the following command:

```

RP/0/RP0/CPU0:ios#ztp initiate
Mon Aug  1 12:11:24.572 UTC
Initiating ZTP may change your configuration.
Interfaces might be brought up if they are in shutdown state
Would you like to proceed? [no]: yes
ZTP will now run in the background.

RP/0/RP0/CPU0:OLT-C-SITE-6#

After the cross-connects are created on the OLT nodes, APC regulates the power on each node. The APC status moves from **WORKING** to **IDLE** when the process completes. Use the **show olc apc** command to view the status of the operation. The following samples are for OLT-C-SITE-3.

```
RP/0/RP0/CPU0:OLT-C-SITE-3#show olc apc
Mon Aug  1 12:33:15.671 UTC
```

```
Controller      : Ots0/0/0/0
APC Status      : WORKING
Correcting Node : 10.120.1.1
```

```
Node RID        : 10.120.1.1
Internal State   : CORRECTING
```

```
Node RID        : 10.121.1.1
Internal State   : DISCREPANCY
```

```
RP/0/RP0/CPU0:OLT-C-SITE-3#show olc apc
Mon Aug  1 12:39:57.187 UTC
```

```
Controller      : Ots0/0/0/0
APC Status      : IDLE
```

```
Node RID        : 10.120.1.1
Internal State   : IDLE
```

```
Node RID        : 10.121.1.1
Internal State   : IDLE
```

```
RP/0/RP0/CPU0:OLT-C-SITE-3#
```

After the APC process is complete, the link comes up. You can view the details using the **sh olc apc-local regulation-info controller ots** command on the near-end and far-end nodes.

OLT-C-SITE-3:

```
RP/0/RP0/CPU0:OLT-C-SITE-3#sh olc apc-local regulation-info controller ots 0/0/0/0 rx
Mon Aug  1 12:44:42.887 UTC

ASE - Noise Loaded Channel
OCh - Optical Channel

RP/0/RP0/CPU0:OLT-C-SITE6#

Cross-connect Configuration

The OTS-OCH controllers are not created by default when the cards (NCS1K-ILA-2R-C, NCS1K-ILA-R-C , NCS1K-ILA-C, NCS1K-OLT-R-C , and NCS1K-OLT-C) are brought up. The LINE OTS-OCH controllers can be created using the **hw-module** command.

Optical Cross Connections can be configured only on OLT nodes. In these nodes, the OTS-OCH controller is not created automatically on the Add/Drop ports (COM side). The optical cross connect configuration defines the line side OTS-OCH channel as the source and creates an OTS-OCH controller on the ADD/Drop port to which the cross connection is made. The channel ID must be the same for both the LINE side and COM side OTS-OCH controller.

To illustrate the creation of the cross-connects, we are going to create a single channel from OLT-R-C-SITE-1 to OLT-C-SITE-8 in the topology diagram. The channel is mapped to **191.45 THz**.

Configuration for OLT-R-C-SITE-1

```

Configured Parameters:

After the cross-connects are created on the OLT nodes, APC regulates the power on each node. The APC status moves from WORKING to IDLE when the process completes. Use the **show olc apc** command to view the status of the operation. The following samples are for OLT-C-SITE-8.

```
RP/0/RP0/CPU0:OLT-C-SITE-8#sh olc apc
Tue Jul 26 06:57:16.020 UTC
```

```
Controller      : Ots0/0/0/0
APC Status     : WORKING
Correcting Node : 10.123.1.1
```

```
Node RID        : 10.125.1.1
Internal State   : IDLE
```

```
Node RID        : 10.123.1.1
Internal State : CORRECTING
```

```
RP/0/RP0/CPU0:OLT-C-SITE-8#sh olc apc
Tue Jul 26 06:59:11.985 UTC
```

```
Controller      : Ots0/0/0/0
APC Status     : IDLE
```

```
Node RID        : 10.125.1.1
Internal State   : IDLE
```

```
Node RID        : 10.123.1.1
Internal State : IDLE
```

After the APC process is complete, the link comes up. You can view the details using the **sh olc apc-local regulation-info controller ots** command on the near-end and far-end nodes.

OLT-R-C-SITE-1:

```
RP/0/RP0/CPU0:OLT-R-C-SITE-1#sh olc apc-local regulation-info controller ots 0/0/0/0

ASE - Noise Loaded Channel
OCh - Optical Channel

Monitoring and Troubleshooting the Network

This section details processes that monitor and troubleshoot the network.

- **OTDR:** The OTDR application is a built-in functionality in ILA and OLT devices. The OTDR measurement result is available in a SOR file format and it can be exported from NCS 1010 using SCP, TFTP, and SFTP format. The results can be used to find defects and faults, and determines the amount of signal loss at any point in an optical fiber.

```
RP/0/RP0/CPU0:OLT-C-R-SITE-1#otdr-start controller ots 0/0/0/0 tx
Tue Jul 26 08:13:09.744 UTC
OTS OTDR Scan Started at TX
```

```
RP/0/RP0/CPU0:OLT-C-R-SITE-1#sh controllers ots0/0/0/0 otdr-info tx
Tue Jul 26 08:14:43.541 UTC
```

Scan Direction: TX

Scan Status: Measuring

Event Type Legend: NR:Non-Reflective R:Reflective FE:Fiber-End ER:Excess-Reflection

```
RP/0/RP0/CPU0:OLT-C-R-SITE-1#sh controllers ots0/0/0/0 otdr-info tx
Tue Jul 26 08:16:53.287 UTC
```

Scan Direction: TX

Scan Status: Data Ready

SOR file: /harddisk:/otdr/OLT-C-R-SITE-1_NCS1010_OTDR_Ots0_0_0_0_TX_20220726-081525.sor

Total Events detected: 5

Scan Timestamp: Tue Jul 26 08:15:25 2022 UTC

Event Type Legend: NR:Non-Reflective R:Reflective FE:Fiber-End ER:Excess-Reflection

Event#	Detected Event(s)	Location(m)	Accuracy(m)	Magnitude(dB)
Attenuation/km(dB)				
1	R ER	50379.9200	52.37	-15.00
0.20				
2	NR ER	50379.9200	52.37	2.57
0.20				
3	R	100711.2200	102.71	-38.21
0.14				
4	R FE ER	125778.8700	127.77	-24.35
-0.18				
5	NR FE ER	125778.8700	127.77	18.56
-0.18				

The SOR file can be viewed using third-party equipment. The following is a sample of a SOR file.

Figure 7: Sample SOR File

- **tech-support command:** Use the **tech-support** CLI command to gather logs and traces.

```
RP/0/RP0/CPU0:OLT-C-R-SITE-4#sh tech-support ncs1010 detail
Tue Jul 26 08:09:06.848 UTC
++ Show tech start time: 2022-Jul-26.080907.UTC ++
Tue Jul 26 08:09:07 UTC 2022 Waiting for gathering to complete
.....
Tue Jul 26 08:16:05 UTC 2022 Compressing show tech output
Show tech output available at 0/RP0/CPU0 :
/harddisk:/showtech/showtech-OLT-C-R-SITE-4-ncs1010-2022-Jul-26.080907.UTC.tgz
++ Show tech end time: 2022-Jul-26.081606.UTC ++
```

- **Streaming Telemetry :** Telemetry is an automated communications process that you use to collect measurements and other data at remote or inaccessible points and transmit to receiving equipment for monitoring. Model-driven telemetry(MDT) provides a mechanism to stream YANG-modeled data to a data collector. Model-driven telemetry allows network devices to continuously stream real-time configuration and operating state information to subscribers.

Applications can subscribe to specific data items they need, by using standards-based YANG data models over gRPC Network Management Interface (gNMI) protocols. Devices publish structured data at a defined cadence, or on-change, based on the subscription criteria and data type.

This telemetry data can be used for analysis and troubleshooting purposesto maintain the health of the network.

This table lists the streaming telemetry sensor paths that are supported for NCS 1010.

Table 3: Supported Sensor Paths in NCS 1010

Sensor Paths
Cisco-IOS-XR-controller-ots-oper:ots-oper/ots-ports/ots-port/ots-info

Sensor Paths
Cisco-IOS-XR-controller-ots-oper:ots-oper/ots-ports/ots-port/ots-spectrum-info
Cisco-IOS-XR-controller-osc-oper:osc-oper/osc-ports/osc-port
Cisco-IOS-XR-controller-oms-oper:oms-oper/oms-ports/oms-port
Cisco-IOS-XR-controller-och-oper:och-oper/och-ports/och-port
Cisco-IOS-XR-pmengine-oper:performance-management/optics/optics-ports/ optics-port/optics-current/optics-second30/optics-second30-optics
Cisco-IOS-XR-pmengine-oper:performance-management-history/global/periodic/ optics-history/optics-port-histories/optics-port-history/optics-second30-history/ optics-second30-optics-histories/optics-second30-optics-history/ optics-second30-optics-time-line-instances/optics-second30-optics-time-line-instance[number=1]
Cisco-IOS-XR-invmgr-oper:inventory/entities/entity/attributes
Cisco-IOS-XR-controller-dfb-oper:dfb-oper/dfb-ports/dfb-port
Cisco-IOS-XR-envmon-oper:environmental-monitoring
Cisco-IOS-XR-envmon-oper:power-management
Cisco-IOS-XR-invmgr-diag-oper:diag/racks/rack
Cisco-IOS-XR-ifmgr-oper:interface-properties/data-nodes/data-node/system-view/interfaces/interface
Cisco-IOS-XR-infra-syslog-oper:syslog/messages/message
Cisco-IOS-XR-olc-oper:olc

To enable telemetry on a node, use the following commands:

```
RP/0/RP0/CPU0:ios#config
RP/0/RP0/CPU0:ios(config)#grpc
RP/0/RP0/CPU0:ios(config-grpc)#port 57400
RP/0/RP0/CPU0:ios(config-grpc)#commit
```

Update the subscribe request for your sensor path and run the gNMI command from the terminal. Ensure the device management IP is configured and the device can be reached from the terminal.

The following is a sample of the subscription request (gnmi_sub_sample.txt)

```
subscribe: <
  prefix: <
  >
  subscription: <
  path: <
  elem: <
  name: "Cisco-IOS-XR-controller-ots-oper:ots-oper/ots-ports/ots-port/ots-info"
  >
  >
  mode: SAMPLE
  sample_interval: 10000000000
```

```

>
mode: STREAM
#mode: ONCE
encoding: PROTO
>

```

Update the subscribe request for the sensor path and run the gNMI command from the terminal.

```

-bash-4.2$ /filepath/telemetry/gnmi/gnmi_cli_latest -a 198.51.100.122:57400 -insecure -insecure_username
cisco -insecure_password cisco123 -proto "$(cat gnmi_sub_sample.txt)" -qt s -dt p

```

To save the telemetry data to a file, use the following command:

```

-bash-4.2$ /filepath/telemetry/gnmi/gnmi_cli_latest -a 198.51.100.122:57400 -insecure -insecure_username
cisco -insecure_password cisco123 -proto "$(cat gnmi_sub_sample.txt)" -qt s -dt p > telemetry-data.txt

```

The following is a sample of the telemetry data that is fetched from the device:

```

update: <
  timestamp: 1658726311307000000
  prefix: <

```

- **memory-top-consumers command:** Use this command to check memory usage on the node.

```

RP/0/RP0/CPU0:OLT-C-R-SITE-1#show memory-top-consumers location 0/RP0/CPU0
Fri Jul 22 06:33:01.285 UTC

```

Execute 'show memory-snapshots process <> location <>' to check memory usage trend.

```

#####
