

Configuring Controllers

There are three types of controllers for the line card. The controllers are the optics controller, the ethernet controller, and the coherent DSP controller. This chapter describes the procedures used to configure these controllers.

Automatic-In-Service

Automatic-In-Service (AINS) is a controller feature that:

- allows the controller to automatically transition to the in-service state after the maintenance window,
- associates a soak time period with the automatic-in-service (AINS) state, and
- suppresses alarms from propagating to EMS/NMS monitoring systems during the AINS maintenance window.

You can configure AINS on the client ports of the QXP, 1.2T, 2.4T, and 2.4TX cards.

AINS states

If there are any service-affecting alarms when AINS is running on ethernet or optics controllers, the AINS state moves to Pending state. When the alarms are cleared, the AINS state moves to Running state.

The AINS soak time period restarts when there are line card reloads, XR reloads, line card warm reloads, power cycles, or alarm conditioning.

This table lists the AINS states.

State	Description
None	AINS is not enabled on the controller or the soak time period is complete.
Pending	AINS is configured on the controller. However, the soak time period has not started because either the primary state of the controller is in Shutdown, Admin down, or Not ready state or the secondary state is in Maintenance state. AINS can also move to Pending state if alarms are raised during the soak time period.
Running	AINS is enabled on the controller. The primary state of the controller is Up and the secondary state is AINS.

Soak time periods

A soak time period is a port timing parameter that:

- suppresses alarms during the Automatic In Service (AINS) state,
- begins when all optical and Ethernet alarms on the port are cleared, and
- specifies the time before a port transitions from AINS to In Service (IS) state.

You can configure the soak time period to be between 1 minute to 48 hours.

All alarms are suppressed during the AINS state. If optical or Ethernet alarms are raised during the soak time period, the AINS state moves to Pending. These alarms are shown in the output of the `show alarms brief card location 0/RP0/CPU0 conditions` command, not in `show alarms brief card location 0/RP0/CPU0 active`. After all alarms are cleared, the soak time period initiates, and the AINS state moves to Running. When the soak time period expires, the port transitions to the IS state.

Configure Automatic In-Service (AINS)

Use this task to enable and set the soak time for Automatic In-Service (AINS) on a controller, a muxponder slice, or globally within the system.

AINS allows specific hardware components or the entire system to automatically transition to an in-service state after a defined soak time and reduces manual intervention.

Procedure

Step 1 Run the **automatic-in-service controller** *controller rate controller hours hours minutes minutes* command to configure AINS on a controller.

Example:

This is a sample to configure AINS globally.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#ains-soak hours 0 minutes 15
RP/0/RP0/CPU0:ios(config)#commit
```

Step 2 Run the **hw-module location** *location mxponder-slice slice-number client-port-ains-soak hours hours minutes minutes* command to configure AINS on a muxponder slice.

Example:

This example shows how to configure slice 0 client ports with AINS, setting the soak time to 40 minutes.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3/nxr0 mxponder-slice 0 client-port-ains-soak hours
0 minutes 40
RP/0/RP0/CPU0:ios(config)#commit
```

Step 3 Run the **ains-soak hours** *hours minutes minutes* command to configure AINS globally.

Example:

This is a sample to configure AINS globally.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#ains-soak hours 0 minutes 15
RP/0/RP0/CPU0:ios(config)#commit
```

Disable AINS

Use this task to disable the AINS on a muxponder slice, which affects all client ports within that slice.

Procedure

Step 1 Run the **hw-module location** *location* **mxponder-slice** *slice-number* **client-port-ains-soak** *hours* **minutes** *minutes* command to disable AINS on all muxponder client ports. Set the hours and minutes to 0.

Example:

This is a sample in which AINS is disabled on all client ports.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3/nxr0 mxponder-slice 0 client-port-ains-soak hours
0 minutes 0
RP/0/RP0/CPU0:ios(config)#commit
```

Step 2 Run the **hw-module location** *location* **mxponder-slice** *slice-number* **client-port-ains-soak** *hours* **minutes** *minutes* command to disable AINS on a muxponder slice. Set the hours and minutes to 0.

Example:

This is a sample in which AINS is disabled on all client ports of slice 0.

```
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3/nxr0 mxponder-slice 0 client-port-ains-soak hours
0 minutes 0
RP/0/RP0/CPU0:ios(config)#commit
```

Display AINS configuration

Use this task to view the current AINS configuration status, including the soak state and remaining duration, for various controller types.

The AINS Soak field in the output indicates the current state of AINS. The current state can be None, Pending, or Running. The Total Duration field indicates the total soak time period that is configured. The Remaining Duration field indicates the soak time that remains, after which, the AINS state moves to None.

Procedure

Run the `show controller` command for the desired interface type and location.

Example:

This example shows the Ethernet controller statistics with AINS Soak in running state.

```
RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/1/0/2

FEC

Forward Error Correction (FEC) is a method for controlling errors during data transmission that:

- adds data redundancy to the transmitted message using an algorithm, and
- enables the receiver to detect and correct a limited number of errors occurring anywhere in the message, thereby eliminating the need for the transmitter to resend the message.

This feature can be enabled on 1.2T and 2.4T cards. FEC is automatically enabled on the pluggables installed in the NCS 1014.

Note When you upgrade the software of an NCS 1014 with pluggables in the FEC disabled mode, traffic is affected.

FEC states for CoherentDSP controller

This table lists the FEC states for the coherentDSP controllers.

Table 1: FEC state for CoherentDSP controllers

State	Description
EnhancedSD15	FEC Soft-Decision 15. (Default)

Q-Margin support

Q-margin is an important optical parameter that characterizes the health of an optical link. The Q-margin value is calculated based on the average bit error rate (BER) in the optical link.

Enhanced Q-Margin support

Enhanced Q-Margin is supported for Forward Error Correction (FEC) and Performance Monitoring on CoherentDSP controllers for 2.4T cards. Enhanced Q-margin provides a better error free signal in the optical link. The enhanced Q-margin value is calculated based on the maximum number of errors per frame.

An attribute that is called instantaneous Q-margin is displayed in the output of the **show controllers coherentDSP** command. The lower the delta value between the instantaneous Q-margin value with the Q-margin value, the better the FEC performance of the NCS 1014 system.

The instantaneous Q-margin values thus help you to optimize the system with continuous error correction in subsea transport networks.

Configure FEC on the Ethernet controller

Use this task to configure FEC on the CoherentDSP controller.

Procedure

Run the **controller { HundredGigEctrlr | fourHundredGigEctrlr } R/S/I/P fec { none | standard }** command.

Example:

This sample shows how to configure FEC on the Ethernet controller.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigEctrlr 0/1/0/6/ fec standard
RP/0/RP0/CPU0:ios(config)#commit
```

This sample shows the running FEC configuration on the Ethernet controller.

```
RP/0/RP0/CPU0:BH-SIT2#show controller HundredGigEctrlr 0/1/0/6
Tue Jul 16 15:30:30.165 IST

Laser squelching

You can enable laser squelching on Ethernet controllers. Laser squelching can be enabled on QXP, 1.2T, 2.4T, and 2.4T-X cards which shuts down the laser in the event of trunk faults (LOS, LOF), and a SQUELCHED alarm is raised on the mapped client port.

Laser squelching uses an interrupt based method. Therefore, squelching occurs faster than in previous releases.

Beyond trunk faults, squelching occurs in 1.2T cards, for the client alarms Ingress LF, LOA, and CSF (ingress only).

Configure laser squelching

Enable or disable the laser squelch feature for specific optical cards, enhancing operational control and safety.

Laser squelch disables the laser output on designated ports/faults to prevent unwanted signal transmission during error conditions or maintenance.

Procedure

Step 1 Configure laser squelching for the desired card type:

For 1.2T cards, enter **controller HundredGigECtrlr** *Rack/Slot/Instance/Port/Lane* **laser-squelch** command.

For 2.4T or 2.4TX cards, enter **controller HundredGigECtrlr** | **controller fourHundredGigECtrlr** *Rack/Slot/Instance/Port/Lane* **laser-squelch** command.

Example:

This is a sample where laser squelching is enabled on the Ethernet controller of a 2.4T card and a 2.4TX card.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller fourHundredGigECtrlr 0/1/0/1
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#laser-squelch
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#commit
```

This is a sample to view the laser squelch status on the controller of a 2.4T card and a 2.4TX card.

Example:

Note

In case of muxponder configuration on the 2.4T-X card, and if laser squelch is configured on the split port, whenever a fault is received on any one trunk, the corresponding split port will be squelched.

Step 2 Verify the laser squelch status on the controller of a 2.4T card or a 2.4TX card.

Example:

```
RP/0/RP0/CPU0:ios#show controllers fourHundredGigECtrlr 0/0/0/4
Fri Nov 17 14:26:43.213 UTC
Operational data for interface FourHundredGigECtrlr0/0/0/4:

Forward error correction: Standard (Reed-Solomon)
Holdoff Time: 0ms

```

Laser squelching is enabled on the specified optical card(s). The system disables laser output in response to faults or based on maintenance needs.

Protection switching use cases for Fast-Squelching

Table 2: Feature History

Feature Name	Release Information	Description
Client side PSM support for NCS1K14-2.4T-K9 and NCS1K14-2.4T-X-K9 cards configured with fast -squelching	Cisco IOS-XR Release 26.2.1	<p>In addition to the NCS1K4-1.2T-K9 cards, now protection switching is supported on NCS1K14-2.4T-K9, and NCS1K14-2.4T-X-K9 cards with the client pluggables QDD-400G-FR4-S and the QDD-400G-LR4-S pluggables that are configured with fast-squelching.</p> <p>The supported datapath configurations for NCS1K14-2.4T-K9 and NCS1K14-2.4T-X-K9 cards include:</p> <ul style="list-style-type: none"> • Slice mode (only for 400GE client rate) • Bundle mode configuration <p>This update enhances network reliability by providing automated failover and signal protection for 2.4T and 2.4T-X cards, ensuring consistent uptime for high-bandwidth services.</p>

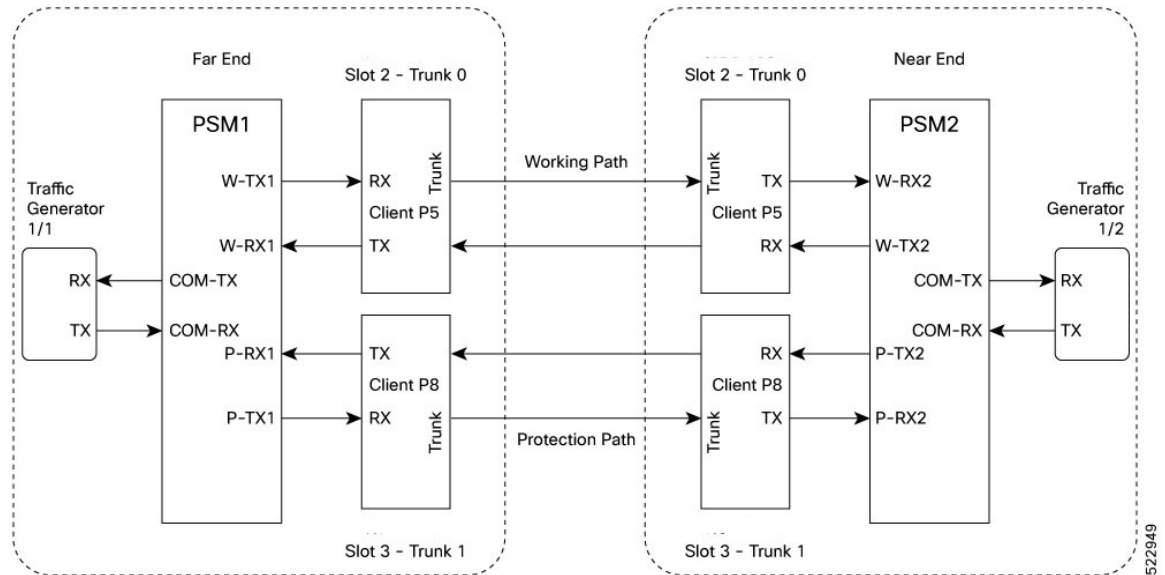

When implementing protection switching in NCS 1014 deployments that have Fast-Squelching configured, fast-squelching increases protection switching speed during trunk or client faults.

Note Protection Switching is supported on 1.2T cards and not supported on 2.4T line cards.

This sample topology includes a Far End station (FE station) and a Near End station (NE station). Each station includes an NCS 1014 node with two line cards. The nodes are connected to the respective traffic generators through a Protection Switching Module (PSM).

Figure 1: Reference topology for protection Switching

Protection switching principle (Trunk fault)

If there is a fiber cut in the trunk working path from the FE station to the NE station, an LOS alarm is raised on the NE working trunk. This results in the squelching of all client ports mapped to the working NE trunk port. As the laser of the client port is squelched, LOS is reported on the W-RX2 port of the PSM2. As the received optical power on the W-RX2 port of PSM is below the threshold, PSM2 switches to receive the optical signal in the P-RX2 port instead of the W-RX2 port. Hence switching happens for traffic from work to protect in FE station to NE station direction.

In the case of a unidirectional trunk fault, switching happens in one direction as explained above. In the other direction, when LOS is received at the W-RX2 port of PSM2, W-TX2 sends LOS for 25 milliseconds. When LOS is reported on the NE client port, fault gets propagated over the trunk, resulting in the squelching of FE station client ports. Finally, the LOS on the PSM port results in switching in this direction as well. In this way, bidirectional switching is implemented.

Protection switching principle (Client fault)

When a client failure happens on the FE station, a Client Signal Failure (CSF) alarm is raised on the NE station trunk. The CSF on the trunk results in the squelching of the corresponding client port, and the PSM switching happens. In summary, a fault on the NE station client RX port results in CSF on the FE station trunk, and the switching happens. And, a fault on the NE station client TX port results in LOS on the PSM ports, and the switching happens.

Guidelines and limitations:

- PSM must be in the standalone mode.
- PSM alarm threshold must be set to +/- 3 dBm from the actual power received in the PSM RX port.
- If line card protection is required, the working and protect path must be configured in two different line cards.
- If only client protection is required, the working and protection path can be configured in the same line card.

- If the LC trunk configuration is x50 rate, then you cannot use a single line card for work and protection due to x50 coupled mode limitations (coupled trunk)..
- Manual switch, force switch, and lock-out protection on PSM result in bidirectional switching.

Hold-off timer

When a fault occurs on the trunk port, you can hold the propagation of local faults using the hold-off time feature. This feature can be enabled on the Ethernet controllers of 1.2T and 2.4T 1.2T, 2.4T, 2.4Tx, and QXP-K9 cards by configuring the hold-off timer.

When the fault occurs on the trunk, idles are inserted in the traffic stream from the trunk port to the client port for the duration of the configured holdoff-time. If the trunk port remains faulty beyond the configured holdoff-time, a local fault is transmitted towards the client device. If the trunk recovers from the fault before the holdoff-time expires, traffic resumes.

This feature can be used on customer deployments to prevent reset of client ports during a PSM switchover.

Configure holdoff-time on QXP Card

Use this task to configure holdoff-time on 100GE or 400GE controllers for the QXP card.

Procedure

- Step 1** Run the **controller HundredGigECtrlr Rack/Slot/Instance/Port holdoff-time trunk-fault time-value** command to configure holdoff-time on the 100GE controllers for the QXP card.

The range of *timevalue* is from 0 ms to 3000 ms.

Example:

This is a sample where holdoff-time is enabled on the 100GE controller for the QXP card.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/1/0/1
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#holdoff-time trunk-fault 3000
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#commit
```

Example:

This is a sample to view the holdoff-time status on the 100GE controller.

```
RP/0/RP0/CPU0:ios#show controller hundredGigECtrlr 0/1/0/1

Idle Insertion for Ethernet controllers

Idle insertion for Ethernet controllers feature allows you to perform end-to-end link verification between 100GE or 400GE or Ethernet controllers before bringing up the actual traffic. This feature enables you to perform pre-provisioning checks to isolate link errors in advance without any Ethernet testers.

Note OTU4 client rate is not supported.

Idle frames can be inserted in both the ingress and egress directions on Ethernet controllers and the LOCAL-FAULT and REMOTE-FAULT alarms are cleared. The performance monitoring counters on the pcs layer are monitored to check for any errors on the link.

Note Do not configure the Idle insertion for Ethernet controllers feature on the link that carries live traffic.

Recommended topology for link verification

This diagram describes the recommended topology for link verification.

Figure 2: Topology for link verification

These steps describe the sequence for link verification using this topology:

1. Both the near-end and far-end clients have the LOCAL-FAULT alarm if the trunk is up on both the ends.
2. Enable idle ingress on the near-end client. The idle frame transmits toward the trunk link and reaches the far-end client. The LOCAL-FAULT alarm is then cleared on the far-end client.
3. As the far-end client has fiber loop, the idle frame is inserted again into the same client RX toward the trunk link and reaches the near-end client. The LOCAL-FAULT alarm is then cleared on the near-end client as well.

4. When you enable idle insertion on any client and in any direction, the idle frame transmits in loop similar to this topology and all the LOCAL-FAULT and the REMOTE-FAULT alarms are cleared.
5. The link can be monitored after all the alarms are cleared. The link has a problem if any alarm is reported during the link test.

Configure idle insertion on Ethernet controllers

Use this task to configure or disable idle insertion on Ethernet controllers.

Note Do not configure idle frame insertion with hold-off timer.

Procedure

Step 1 Run the **controller hundredGigECtrlr** *Rack/Slot/Instance/Port***insert-idle ingressinsert-idle egress** command to enable this feature.

Example:

This is a sample for enabling the idle ingress and idle egress in 100GE controllers.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller hundredGigECtrlr 0/2/0/2
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#insert-idle ingress
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#insert-idle egress
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#commit
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#end
```

Step 2 Run the **controller hundredGigECtrlr** *Rack/Slot/Instance/Port***no insert-idle ingressno insert-idle egress** command to disable this feature.

After disabling the idle frame insertion feature, the LOCAL-FAULT or REMOTE-FAULT alarm may not appear again because the idle frames are in loop. Hence, you must break the idle frame loop in the link by performing either one of the following.

These are the limitations:

- Perform fiber OIR on either the near-end or far-end client port.
- Perform shut and unshut operation on any client port.

Verify idle insertion configuration for Ethernet controllers

Use this task to verify idle insertion for Ethernet controllers.

Note Do not configure idle frame insertion with hold-off timer.

Procedure

Run the **show controllers hundredGigEctr1r Rack/Slot/Instance/Port** command to verify the *idle ingress* and *idle egress* that is configured on the Ethernet controllers of a 1.2T card.

Example:

This is a sample to verify idle insertion for 800GE controllers.

Example:

This is a sample to verify idle insertion for 100GE controllers.

```
RP/0/RP0/CPU0:ios#show controllers hundredGigEctr1r 0/2/0/2
Wed Mar 30 06:56:58.878 UTC

```

FlexO GID and IID

The 2.4T and 2.4TX cards use are equipped with flexible OTN (flexO) interfaces on their trunk ports. These flexO interfaces enable the efficient and interoperable transport of OTU signals by aggregating multiple standard lower-rate interfaces.

Each group of flexO interfaces is assigned a unique flexO group identification (GID) number, which can range from 1 to 1,048,576. Within each group, individual interfaces are identified by a flexO instance identification (IID) number. Note that the IID for each member is fixed and cannot be modified.

Configure FlexO GID and IID

Use this task to configure flexO GID and IID on the coherentDSP controller.

Procedure

Step 1 Run the **configure** command to enter the global configuration mode.

Example:

This sample shows how to configure flexO GID on the CoherentDSP controller.

```
RP/0/RP0/CPU0:ios#configure terminal
Mon Feb  5 05:14:42.919 UTC
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/0
RP/0/RP0/CPU0:ios(config-CoDSP)#flexo gid 1048575
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
```

Step 2 Run the **show controllers** command to verify the configuration.

Example:

This sample shows the flexO GID configuration on the CoherentDSP controller.

```
RP/0/RP0/CPU0:ios#show controllers coherentDSP 0/0/0/0
Mon Feb  5 05:20:01.660 UTC

Step 3 Run the **commit** command to apply the changes.

Link Layer Discovery Protocol (LLDP) support on management interface

The LLDP can be configured on management interface of 1.2T, 2.4T, and 2.4TX cards. It requires a system to form LLDP neighborhood over the system management interface, through which it advertises and learns LLDP neighbor information. This information about neighbors is used to learn about the neighbors and in turn the topology of the devices for Operations, Administration, and Maintenance (OAM) purposes.

Advantages of LLDP

- Provides support on non-Cisco devices.
- Enables neighbor discovery between non-Cisco devices.

Limitation

- When you disable LLDP globally, the LLDP gets disabled on all the interfaces.

Note By default, LLDP is enabled for NCS 1014. But when you enable and disable LLDP in the global configuration mode, LLDP gets disabled on all the interfaces.

Workaround : You must enable LLDP globally or reload the Router.

Cisco Discovery Protocol (CDP) vs LLDP

The CDP is a device discovery protocol that runs over Layer 2. Layer 2 is also known as the data link layer that runs on all Cisco devices, such as routers, bridges, access servers, and switches. This protocol allows the network management applications to automatically discover and learn about other Cisco devices that connect to the network.

The LLDP is also a device discovery protocol that runs over Layer 2. This protocol allows the network management applications to automatically discover and learn about other non-Cisco devices that connect to the network.

Interoperability between non-Cisco devices using LLDP

LLDP is also a neighbor discovery protocol that is used by network devices to advertise information about themselves to other devices on the network. This protocol runs over the data link layer, which allows two systems running different network layer protocols to learn about each other.

With LLDP, the user can also access the information about a particular physical network connection. If the user uses a non-Cisco monitoring tool (through SNMP), LLDP helps you identify the Object Identifiers (OIDs) that the system supports. The following OIDs are supported:

- 1.0.8802.1.1.2.1.4.1.1.4
- 1.0.8802.1.1.2.1.4.1.1.5
- 1.0.8802.1.1.2.1.4.1.1.6
- 1.0.8802.1.1.2.1.4.1.1.7
- 1.0.8802.1.1.2.1.4.1.1.8
- 1.0.8802.1.1.2.1.4.1.1.9
- 1.0.8802.1.1.2.1.4.1.1.10
- 1.0.8802.1.1.2.1.4.1.1.11
- 1.0.8802.1.1.2.1.4.1.1.12

Neighbor discovery

System advertises the LLDP TLV (Type Length Value) details over the management network using which other devices in the management network can learn about this device.

Configuring LLDP

- LLDP full stack functionality is supported on all three management interfaces supported in NCS 1014.
- You can selectively enable or disable LLDP on any of the management interfaces on demand.
- You can selectively enable or disable LLDP transmit or receive functionality at the management interface level.

- Information gathered using LLDP can be stored in the device Management Information Database (MIB) and queried with the Simple Network Management protocol (SNMP).
- LLDP operational data are available in both Command Line Interface and netconf-yang interface.

Enabling LLDP globally

When you enable LLDP globally, all interfaces that support LLDP are automatically enabled for both transmit and receive operations.

Note You can override this default operation at the interface to disable receive or transmit operations.

This table describes the global LLDP attributes that the user can configure:

Table 3: Global LLDP attributes

Attribute	Default	Range	Description
Holdtime	120	0–65535	Specifies the hold time (in sec). Hold time refers to the time or duration that an LLDP device maintains the neighbor information before discarding.
Reinit	2	2–5	Delay (in sec) for LLDP initialization on any interface
Timer	30	5–65534	Specifies the rate at which LLDP packets are sent (in sec)

Debugging LLDP issues

These commands are used for debugging issues in the LLDP functionality.

- **show lldp traffic**
- **debug lldp all**
- **debug lldp errors**
- **debug lldp events**
- **debug lldp packets**
- **debug lldp tlvs**
- **debug lldp trace**
- **debug lldp verbose**

Configure LLDP

Use this task to configure LLDP globally.

Before you begin

- LLDP full stack functionality is supported on all three management interfaces supported in NCS 1014.
- You can selectively enable or disable LLDP on any of the management interfaces on demand.
- You can selectively enable or disable LLDP transmit or receive functionality at the management interface level.
- Information gathered using LLDP can be stored in the device Management Information Database (MIB) and queried with the Simple Network Management protocol (SNMP).
- LLDP operational data are available in both Command Line Interface and netconf-yang interface.

Procedure

Run the `configure terminal` command to enter the configuration mode.

Example:

This example shows the commands to configure LLDP globally. The global LLDP configuration enables LLDP on all the three management interfaces.

```
RP/0/RP0/CPU0:regen#configure terminal
RP/0/RP0/CPU0:regen(config)#lldp management enable
RP/0/RP0/CPU0:regen(config)#lldp holdtime 30
RP/0/RP0/CPU0:regen(config)#lldp reinit 2
RP/0/RP0/CPU0:regen(config)#commit
```

Example:

This example shows the commands to configure LLDP at the management interface level.

```
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/X
RP/0/RP0/CPU0:ios(config-if)#lldp enable
RP/0/RP0/CPU0:ios(config-if)#commit
```

Example:

This example shows the commands to disable the LLDP transmit operations at the specified management interface.

```
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/X
RP/0/RP0/CPU0:ios(config-if)#lldp transmit disable
RP/0/RP0/CPU0:ios(config-if)#commit
```

Example:

This example shows the commands to disable the LLDP receive operations at the specified management interface.

```
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/X
RP/0/RP0/CPU0:ios(config-if)#lldp receive disable
RP/0/RP0/CPU0:ios(config-if)#commit
```

Verify LLDP configuration

Use this task to verify LLDP configuration.

Procedure

Step 1 Run the **show running-config lldp** command to verify the LLDP configuration.

Example:

```
RP/0/RP0/CPU0:regen#show running-config lldp
Tue Dec 10 10:36:11.567 UTC
lldp
timer 30
reinit 2
holdtime 120
management enable
!
```

Step 2 Run the **show lldp interface** and **show lldp neighbors** commands to verify the LLDP data.

Example:

```
RP/0/RP0/CPU0:regen#show lldp interface
Thu Nov 7 08:45:22.934 UTC
MgmtEth0/RP0/CPU0/0:
  Tx: enabled
  Rx: enabled
  Tx state: IDLE
  Rx state: WAIT FOR FRAME
MgmtEth0/RP0/CPU0/1:
  Tx: enabled
  Rx: enabled
  Tx state: IDLE
  Rx state: WAIT FOR FRAME
```

Example:

```
RP/0/RP0/CPU0:M-131#show lldp neighbors
Mon Dec 2 11:01:20.143 CET
Capability codes:
  (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
  (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
Device ID      Local Intf          Hold-time  Capability  Port ID
[DISABLED]    MgmtEth0/RP0/CPU0/0  120       B           gi19
MYS-130       MgmtEth0/RP0/CPU0/1  120       R           MgmtEth0/RP0/CPU0/1
```

where [DISABLED] shows that the LLDP is disabled on the interface MgmtEth0/RP0/CPU0/0.

When you enable LLDP drop on the client controller ports of the muxponder or muxponder slice, the LLDP frames drop on the ports without forwarding.

Note

LLDP on 400GE is not supported on the OTN-XP card.

MAC address snooping on client ports

A MAC address snooping on client ports feature is a network monitoring capability that:

- learns the MAC address of the connected neighbor on 1.2T cards at client ports
- enables ARP snooping across all client ports through CLI, and
- helps overcome environments where LLDP cannot be used for neighbor discovery.

This feature overcomes the limitation, where LLDP (Link Layer Discovery protocol) cannot be enabled in some networks.

Limitations

- When you enable or disable MAC address snooping on any slice, few packets are dropped during configuration.
- Open config interface for enabling or disabling MAC address snooping is not supported.
- SNMP MIB is not supported for the MAC address attribute.

Note When you enable MAC address snooping on client ports, it overrides LLDP.

Configure MAC address snooping on client ports

Use this task to configure MAC address or ARP snoop on slice in muxponder slice mode.

Procedure

Run the **hw-module location *location* mxponder-slice *slice-number* client-rate 100GE trunk-rate 600G { 100G | 150G | 200G | 250G | 300G | 350G | 400G | 450G | 500G | 550G | 600G } arp-snoop** command.

Example:

This is a sample in which, MAC address or ARP snoop is configured on the client ports of slice 0 in Muxponder slice mode.

```
RP/0/RP0/CPU0:ios#configure
Mon Mar 16 19:30:33.933 UTC
RP/0/RP0/CPU0:ios(config)#hw-module location 0/3/nxr0 mxponder-slice 0
RP/0/RP0/CPU0:ios(config-hwmod-mxp)#client-rate 100GE
RP/0/RP0/CPU0:ios(config-hwmod-mxp)#trunk-rate 600G
RP/0/RP0/CPU0:ios(config-hwmod-mxp)#arp-snoop
RP/0/RP0/CPU0:ios(config-hwmod-mxp)#commit
Mon Mar 16 19:30:52.636 UTC
RP/0/RP0/CPU0:ios(config-hwmod-mxp)#end
```

This is a sample in which, MAC address or ARP snoop is configured in Muxponder mode.

```
RP/0/RP0/CPU0:ios#configure
Mon Mar 16 19:08:17.154 UTC
RP/0/RP0/CPU0:ios(config)#hw-module location 0/1 mxponder arp-snoop
RP/0/RP0/CPU0:ios(config)#commit
```

This sample shows the output of **show controllers hundredGigEctr1r** command, before configuring MAC address or ARP snoop on client ports.

```
RP/0/RP0/CPU0:ios#show controllers HundredGigEctr1r 0/1/0/2/1
Mon Mar 16 19:40:37.434 UTC
Operational data for interface HundredGigEctr1r0/1/0/2/1:

  Holdoff Time: 0ms
```

View neighbor MAC address

Use this task to view the neighbor's physical address after enabling MAC address or ARP snoop.

MAC address snoop output is enabled after ARP packets are received on the respective 100G client.

Procedure

Run the **show controllers hundredGigEctr1r R/S/I/P** command.

Example:

This sample shows the neighbor's MAC address after configuring MAC address or ARP snoop on client ports.

```
RP/0/RP0/CPU0:ios#show controllers HundredGigEctr1r 0/1/0/2/1
Mon Mar 16 19:41:08.047 UTC
Operational data for interface HundredGigEctr1r0/1/0/2/1:

  Maintenance: Disabled
  AINS Soak: None
```

```

    Total Duration: 0 hour(s) 0 minute(s)
    Remaining Duration: 0 hour(s) 0 minute(s) 0 second(s)
    Laser Squelch: Disabled
    Neighbor Address:
    0010.9400.5502
Phy:
    Media type: Not known
    Autonegotiation disabled.
Operational values:
    Speed: 100Gbps
    Duplex: Full Duplex
    Flowcontrol: None

```

Transmit shutdown

Transmit shut on trunk optics controller brings down the CIM8 and PICO transmit power. You can configure transmit shut on optics controller of a 1.2T, 2.4TX, or 2.4T card.

Configure transmit shutdown on trunk optics controller

To perform transmit shutdown, enter these commands:

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:chassisA164(config)#controller optics 0/1/0/0
RP/0/RP0/CPU0:chassisA164(config-Optics)#transmit-shutdown
RP/0/RP0/CPU0:chassisA164(config-Optics)#commit
RP/0/RP0/CPU0:ios(config-Optics)#exit
RP/0/RP0/CPU0:ios(config)#exit

```

Verify transmit shutdown on trunk optics controller

Use this task to verify the transmit shutdown details on the trunk optics controller.

Procedure

Run the **show controllers opticsR/S/I/P** command to view the transmit shutdown details.

Example:

```

RP/0/RP0/CPU0:ios#show controllers optics 0/0/0/0
Tue Dec 12 05:38:32.416 UTC
Controller State: Up
Transport Admin State: In Service
Laser State: Off
LED State: Green
Optics Status
    Optics Type: CIM8 DWDM
    DWDM carrier Info: C BAND, MSA ITU Channel=61, Frequency=193.10THz,
    Wavelength=1552.524nm

Alarm Status:

```

Loopback

You can configure loopback on the CoherentDSP and Ethernet controllers of QXP, 1.2T, 2.4TX and 2.4T cards to identify connection problems. The loopback can be configured only in the maintenance mode. Use the **controller controller-type** and the **secondary-admin-state maintenance** commands to place the controllers in the maintenance mode.

Loopback configuration alarm details for each controller are triggered whenever there is a change in the loopback configuration. Details such as, location of the controller, severity, configuration date and time, and description are available in the output of the **show alarms brief system active** and **show alarms brief history** commands.

Configure loopback

Use this task to configure loopback on a 1.2T, 2.4T, and 2.4TX card.

Procedure

Step 1 Run the **controller controller-type Rack/Slot/Instance/Portsec-admin-state maintenance loopback [internal]** command to configure the loopback on a 1.2T card.

Example:

This example shows how a internal loopback is configured on the Ethernet controller of a 1.2T card.

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/1/0/1
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback internal
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#commit
RP/0/RP0/CPU0:ios(config)#exit

```

Note

Line loopback is not supported on CoherentDSP controller of 1.2T card.

Example:

This example shows how to verify a internal loopback configured on the Ethernet controller of 1.2T card.

```
RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/1/0/1
Fri Nov 17 10:01:22.840 UTC
Operational data for interface HundredGigECtrlr0/1/0/1:
```

State:

```
Administrative state: enabled
Operational state: Up
LED state: Green On
Maintenance: Enabled
AINS Soak: None
  Total Duration: 0 hour(s) 0 minute(s)
  Remaining Duration: 0 hour(s) 0 minute(s) 0 second(s)
Laser Squelch: Disabled
Insert Idle Ingress: Disabled
Insert Idle Egress: Disabled
```

Phy:

```
Media type: Not known
```

	PCS:		
	Total BIP errors: 0	Valid: True	Start time: 15:53:12
Thu Nov 16 2023			
	Total frame errors: 0	Valid: False	Start time: 15:53:12
Thu Nov 16 2023			
	Total Bad SH: 0	Valid: False	Start time: 15:53:12
Thu Nov 16 2023			

```
Autonegotiation disabled.
```

Operational values:

```
Speed: 400Gbps
Duplex: Full Duplex
Flowcontrol: None
Loopback: Internal
BER monitoring:
  Not supported
Forward error correction: Standard (Reed-Solomon)
Holdoff Time: 0ms
```

Step 2 Run the controller `{HundredGigECtrlr Rack/Slot/Instance/Port/Lane | fourHundredGigECtrlrRack/Slot/Instance/Port}` `sec-admin-state maintenance loopback[line | internal]` command to configure the loopback on 2.4T card and 2.4TX card.

Example:

This example shows how a line loopback is configured on coherentDSP controller of a 2.4T card and 2.4TX card.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/1/0/0
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback line
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#commit
RP/0/RP0/CPU0:ios(config)#exit
```

Note

In case of muxponder configuration on the 2.4TX card, internal loopback must be applied on both trunk ports for the loopback behaviour to reflect on the split ports. For direct ports, the corresponding trunk internal loopback works as expected.

Example:

This example shows how to configure internal loopback on a coherent DSP controller.

```
RP/0/RP0/CPU0:ios#configure
Fri Jul 8 10:42:51.329 UTC
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/0
RP/0/RP0/CPU0:ios(config-CoDSP)#secondary-admin-state maintenance
RP/0/RP0/CPU0:ios(config-CoDSP)#loopback internal
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
Fri Jul 8 10:43:48.644 UTC
RP/0/RP0/CPU0:ios(config-CoDSP)#end
```

This example shows how to verify the internal loopback configured on a coherent DSP controller.

Restore factory settings

Note Perform this operation only on the console port.

Use this task to restore NCS 1014 to factory settings.

You can perform this operation only through the console port and not on the management interface.

Procedure

Run the **commit replace** command.

Example:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#commit replace
Tue Sep 24 09:36:59.430 UTC
```

```
This commit will replace or remove the entire running configuration. This
operation can be service affecting.
Do you wish to proceed? [no]: yes
RP/0/RP0/CPU0:ios(config)#exit
```

Restore factory settings

```

RP/0/RP0/CPU0:ios#reload
Tue Sep 24 09:38:12.881 UTC

Standby card not present or not Ready for failover. Proceed? [confirm]

Preparing system for backup. This may take a few minutes especially for large configurations.
  Status report: node0_RP0_CPU0: BACKUP INPROGRESS

  Status report: node0_RP0_CPU0: BACKUP HAS COMPLETED SUCCESSFULLY

```

After the **commit replace** operation completes, you must perform the IOS XR reload operation.

The **commit best-effort** command merges the target configuration with the running configuration and commits only valid changes (best effort). Some configuration changes might fail due to semantic errors.

Headless mode

A headless mode is a system operation mode that

- enables Cisco NCS 1014 to continue forwarding traffic when the controller card is absent, failed, or being restarted
- allows fault propagation for client and trunk ports, and
- maintains errorless operation unless there is any line-level activity or the traffic is encrypted and the keys have expired beyond a predefined maximum duration.

During headless mode, the control plane will be unavailable. You cannot provision new configurations, view operational data, or perform performance monitoring without a functional controller.

Trail Trace Identifier

A trail trace identifier (TTI) is a feature that:

- helps identify a signal from its source to its destination within a network,
- supports configuration of sent or expected identifiers in both ASCII and HEX formats, and
- triggers a controller shutdown and a TIM alarm when an expected TTI string does not match the received trace string.

Configure Trail Trace Identifier

Use this task to configure TTI on the coherent DSP controllers of a 1.2T, 2.4T, or 2.4TX card.

Procedure

Step 1 Run the **controller coherentDSP R/S/IP tti {sent | expected} ascii | hextti-string** command.

Note

The *tti-string* can have a maximum of 64 characters for ASCII and 128 characters for HEX.

Example:

This sample shows how to configure TTI on a coherent DSP controller with the sent and expected strings set to the same ASCII string. The state of the controller is up.

```
RP/0/RP0/CPU0:ios#config
RP/0/RP0/CPU0:ios(config)#controller coherentDSP
RP/0/RP0/CPU0:ios(config-CoDSP)#tti sent ascii hello
RP/0/RP0/CPU0:ios(config-CoDSP)#tti expected ascii hello cisco
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
Thu Dec 7 14:25:43.391 IST
RP/0/RP0/CPU0:ios(config-CoDSP)#end
```

This is a sample to view the TTI details on a coherentDSP controller.

```
RP/0/RP0/CPU0:ios#show controllers coherentDSP 0/3/0/0
Thu Dec 7 14:26:37.345 IST
```

```

```

This sample shows how to configure TTI on a coherent DSP controller with the sent and expected strings set to HEX strings.

```
RP/0/RP0/CPU0:ios#config
RP/0/RP0/CPU0:ne(config)#controller coherentDSP 0/0/0/0
RP/0/RP0/CPU0:ne(config-CoDSP)#tti sent hex 6E6E6E2A2A2A
RP/0/RP0/CPU0:ne(config-CoDSP)#tti expected hex 3F4B4B4B3D3E3A
RP/0/RP0/CPU0:ne(config-CoDSP)#commit
RP/0/RP0/CPU0:ios(config)#exit
```

Step 2 Run the **commit** command to apply the changes.

Configure Trail Trace Identifier on QXP card

Use this task to configure the TTI sent or expected string in the full ASCII format, or Source Access Point Identifier (SAPI)/Destination Access Point Identifier (DAPI) format on ODU-flex, ODU4, and coherentDSP controllers for the QXP card.

Note TTI operates only in **trunk mode OR**.

This table lists the ASCII format that is supported for TTI:

ASCII with character string	Controller
Full ASCII 64-character	CoherentDSP,odu4,odu-flex
SAPI ASCII 15-character	CoherentDSP,odu4,odu-flex
DAPI ASCII 15-character	CoherentDSP,odu4,odu-flex
Operator-specific ASCII 32-character	CoherentDSP,odu4,odu-flex

Procedure

Step 1 Run the **controller** *controller-type R/S/I/P* **tti** {sent | expected} {ascii | sapi ascii | dapi ascii | operator-specific ascii} *tti-string* to configure TTI.

Example:

This is a sample configuration for FULL TTI for coherentDSP controller.

```
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/8
RP/0/RP0/CPU0:ios(config-CoDSP)#tti sent ascii cisco
RP/0/RP0/CPU0:ios(config-CoDSP)#tti expected ascii cisco123
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
```

This is a sample configuration for TTI HEX for coherentDSP controller.

```
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/8
RP/0/RP0/CPU0:ios(config-CoDSP)#tti sent hex 6E6E6E2A2A2A
RP/0/RP0/CPU0:ios(config-CoDSP)#tti expected hex 3F4B4B4B3D3E3A
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
```

This is a sample configuration for Operator specific TTI for coherentDSP controller.

```
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/8
RP/0/RP0/CPU0:ios(config-CoDSP)#tti sent operator-specific ascii hellooo
RP/0/RP0/CPU0:ios(config-CoDSP)#tti expected operator-specific ascii hellooo
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
```

This is a sample configuration for Operator specific TTI HEX for coherentDSP controller.

```
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/8
RP/0/RP0/CPU0:ios(config-CoDSP)#tti sent operator-specific hex 6E6E6E2A2A2A3D3E3A3A6E6E6E2A2A2A3D
RP/0/RP0/CPU0:ios(config-CoDSP)#tti expected operator-specific hex 5A5A6D3A3B3C3F4B4B4B3D3E3A
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
```

This a sample configuration for SAPI for coherentDSP controller.

```
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/8
RP/0/RP0/CPU0:ios(config-CoDSP)#tti sent operator-specific ascii hellooo
RP/0/RP0/CPU0:ios(config-CoDSP)#tti expected operator-specific ascii hellooo
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
```

This is a sample configuration for DAPI for coherentDSP controller.

```
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/0/0/8
RP/0/RP0/CPU0:ios(config-CoDSP)#tti sent dapi ascii cisco123
RP/0/RP0/CPU0:ios(config-CoDSP)#tti expected dapi ascii hello
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
```

Step 2 Run the **commit** command to apply the changes.

Configure chromatic dispersion

Use this task to configure chromatic dispersion on optics controllers of 1.2T, 2.4TX, and 2.4T cards.

When you configure the maximum and minimum values for chromatic dispersion for any data rate, ensure the minimum difference between the configured values is equal to or greater than 1500 ps/nm.

This table lists the default CD search range for a 1.2T card.

Data rate	BPS	Card support	Default CD search range
200G to 500G	BPS <= 3	1.2T, 1.2TL	-10,000 to 100,000 ps/nm
	3 < BPS <= 4	1.2T, 1.2TL	-10,000 to 80,000 ps/nm
	4 < BPS <=5	1.2T	-5,000 to 20,000 ps/nm
600G	BPS=5.2578125	1.2T	-2000 to 2,000 ps/nm

This table lists the default CD search range for 2.4T, 2.4TX, cards.

Line rate				
	138GBd	128GBd	118GBd	108GBd
1200G	4000 to -5000	4000 to -5000	—	—
1000G	20000 to -5000	20000 to -5000	20000 to -5000	—
800G	48000 to -10000	48000 to -10000	48000 to -10000	35000 to -10000
600G	74000 to -10000	74000 to -10000	74000 to -10000	60000 to -10000
500G	90000 to -10000	90000 to -10000	90000 to -10000	72000 to -10000
400G	—	90000 to -10000	90000 to -10000	72000 to -10000

Note The cd-min and cd-max values must be set for BPS values that are greater than 4 in the 1.2T card.

Note When the user provisions the cd-min and cd-max values that are outside the range through CLI, the provisioned values are accepted; however, only the actual values supported by the hardware are applied.

Procedure

Step 1 Enter the `controller optics` command in the global configuration mode.

Example:

This is a sample where chromatic dispersion is configured on the optics controller.

```
RP/0/RP0/CPU0:ios#configure
Mon Aug 19 19:31:42.115 UTC
RP/0/RP0/CPU0:ios(config)#controller optics 0/1/0/1
RP/0/RP0/CPU0:ios(config-Optics)#cd-max 4000
RP/0/RP0/CPU0:ios(config-Optics)#cd-min -1000
RP/0/RP0/CPU0:ios(config-Optics)#commit
Mon Aug 19 19:35:24.697 UTC
RP/0/RP0/CPU0:ios(config-Optics)#exit
RP/0/RP0/CPU0:ios(config)#exit
```

```
RP/0/RP0/CPU0:ios#show run controller optics 0/1/0/*
Mon Aug 19 19:57:41.859 UTC
controller Optics0/1/0/0
  transmit-power -15
  dwdm-carrier 50GHz-grid itu-ch 55
  enh-sop-tol-mode 1
  cross-pol-gain-mode 10
  lbc-high-threshold 5
!
controller Optics0/1/0/1
  description trunk power UP
  cd-min -1000
  cd-max 4000
  enh-colorless-mode 2
  enh-sop-tol-mode 3
  nleg-comp-mode 4
  cross-pol-gain-mode 2
  cross-pol-weight-mode 3
  cpr-win-mode 3
  cpr-ext-win-mode 8
  rx-voa fixed-ratio 1200
  filter-roll-off-factor 0.035
!
controller Optics0/1/0/5
  soak-time 10
!
```

Step 2 Run the **commit** command to apply the changes.

Configure chromatic dispersion threshold

Use this task to configure the minimum and maximum acceptable chromatic dispersion for the trunk optics controllers.

The CD alarm is raised if the chromatic dispersion goes below the minimum or exceeds the maximum value.

Procedure

Step 1 Enter the **controller optics**/*R/S/I*/**Pcd-high-threshold**/*cd-high*/**cd-low-threshold**/*cd-low* command in the global configuration mode to configure the minimum and maximum chromatic dispersion threshold.

Example:

This sample configures the maximum and minimum acceptable CD on the controller optics:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller optics 0/0/0/7
RP/0/RP0/CPU0:ios(config-Optics)#cd-high-threshold 2400
RP/0/RP0/CPU0:ios(config-Optics)#cd-low-threshold -2400
RP/0/RP0/CPU0:ios(config-Optics)#commit
```

This sample shows the maximum and minimum acceptable CD configured on the controller optics:

```
RP/0/RP0/CPU0:ios#show controllers optics 0/0/0/7
Fri Nov 12 10:58:50.595 UTC
```

```

```

Step 2 Run the **commit** command to apply the changes.

Configure Transmit Power

Use this task to configure transmit power on the trunk (CIM8 and PICO) optics within the -190 to +50 range (in units of 0.1dBm)

Procedure

Enter the `controller optics` command in the global configuration mode.

Example:

```

RP/0/RP0/CPU0:ios#configure
Mon Aug 19 19:31:42.115 UTC
RP/0/RP0/CPU0:ios(config)#controller optics 0/1/0/7
RP/0/RP0/CPU0:ios(config-Optics)#transmit-power -1.50
RP/0/RP0/CPU0:ios(config-Optics)#commit
Mon Aug 19 19:35:24.697 UTC
RP/0/RP0/CPU0:ios(config-Optics)#exit
RP/0/RP0/CPU0:ios(config)#exit

```

This is a sample in which transmit power of -1.50 dBm is configured on the CIM8 optics.

Configure laser bias current high threshold

Use this task to laser bias current high threshold.

Procedure

Step 1 Run the **controller optics R/S/I/P lbc-high-threshold/lbc-value** command to configure the laser bias current threshold.

Example:

This is a sample which configures the high laser bias threshold on the controller optics.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller optics 0/0/0/7
RP/0/RP0/CPU0:ios(config-Optics)#lbc-high-threshold 55
RP/0/RP0/CPU0:ios(config-Optics)#commit
```

This is a sample which shows the high laser bias threshold configured on the controller optics.

```
RP/0/RP0/CPU0:ios#show controllers optics 0/0/0/7

```

Step 2 Run the **commit** command to apply the changes.

Configure differential group delay threshold

Use this task to configure the threshold value for the maximum acceptable differential group delay (DGD) on the trunk optics controllers.

- The DGD alarm is raised if DGD exceeds this value.
- The range is 0–18000 (in the units of 0.01 ps).

Procedure

Step 1 Run the **controller opticsR/S/I/Pdgd-high-thresholddgd-value** command to configure to configure the maximum acceptable DGD.

Example:

This sample configures the minimum acceptable DGD on the controller optics.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller optics 0/0/0/7
RP/0/RP0/CPU0:ios(config-Optics)#dgd-high-threshold 30
RP/0/RP0/CPU0:ios(config-Optics)#commit
```

This sample shows the maximum acceptable DGD configured on the controller optics.

```

AINS remaining time : 0 seconds

```

Step 2 Run the **commit** command to apply the changes.

Configure optical signal to noise ratio

Use this task to configure the minimum acceptable Optical Signal to Noise ratio (OSNR) value on the 1.2T, 2.4TX, and 2.4T cards.

The OSNR alarm is raised if OSNR goes below this value.

The range is 0–4000 (in units of 0.01db).

Procedure

Step 1 Enter the **controller optics R/S/I/Posnr-low-threshold osnr-value cd-low** command to configure the minimum acceptable OSNR.

Example:

This sample configures the minimum acceptable OSNR on the controller optics.

```

RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller optics 0/0/0/7
RP/0/RP0/CPU0:ios(config-Optics)#osnr-low-threshold 40
RP/0/RP0/CPU0:ios(config-Optics)#commit

```

This sample shows the minimum acceptable OSNR configured on the controller optics.

```

AINS remaining time      : 0 seconds

```

Step 2 Run the **commit** command to apply the changes.

Frequency

Use this task to configure the frequency on trunk ports of the transponder line cards.

This table lists the frequency range with grid spacing supported on the line card.

Line card	Frequency range (THz)	Default frequency (THz)	Grid spacing
1.2T	191.25 to 196.1	193.1	50GHz and 100MHz
1.2TL 1	186.1 to 190.85	188.5	100MHz
2.4T	191.25 to 196.1	193.1	50GHz and 100MHz
2.4TX using C band trunk pluggables	191.25 to 196.1	193.1	50GHz and 100MHz
2.4TX using L band trunk pluggables	186.15 to 190.925	No default frequency	100MHz

¹ Only non-ITU channels are supported

Procedure

Step 1 Run the **controller opticsRack/Slot/Instance/Portdwdm-carrier** `{100MHz-grid frequency frequency} | {50GHz-grid [frequency frequency]}` command to configure the wavelength.

Step 2 Run the **commit** command to apply the changes.

Baud rate

You can configure the baud rate on trunk ports of the 2.4T and 2.4TX line cards.

During baud rate configuration, any changes or configurations must differ by at least 0.5 from the current baud rate. For example, if the current baud rate on the node is 130.525, the new configuration must be set to a value greater than 131.

This table lists the baud range supported on the line card.

Line rate	Min BR [GBd]	Min BR [GBd]	Approx.max net bpS	Approx.min net bpS	Default baud rate
400G	62	128	4.1	2.1	127.931418
500G	62	138	5	2.5	137.834059
600G	72	138	5.1	2.8	137.738007
700G	88	138	5	3.2	138.081665
800G	98	138	5.1	3.5	137.978388
900G	108	138	5.2	3.8	137.898168
1000G	118	138	5.3	4.3	137.834059
1100G	128	138	5.3	4.7	137.78165
1200G	128	138	5.7	5.3	137.738007

CCMD-16 controllers

The NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L cards have two types of controllers.

- OCH controllers
- OMS controllers

When the NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L cards become operational, both the OMS and OCH controllers are automatically created by default.

View OCH controller and parameters

Use this task to view an OCH controllers and parameters.

When you bring up the nodes with NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L cards, the OCH controllers are automatically created by default. The OCH controllers for the NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L cards are:

Table 4: Supported interfaces

Card	Port type	OCH ports	Interfaces
NCS1K14-CCMD-16-C	LC Ports	16	och R/S/I/1 to och R/S/I/16
NCS1K14-CCMD-16-L	LC Ports	16	och R/S/I/1 to och R/S/I/16

Note R/S/I/P stands for Rack/Slot/Instance/Port.

Procedure

Step 1 Run the **show controllers och** command to view the OCH controllers.

Example:

This output shows the active OCH controllers in *Slot 0* from *port 1 to 16*.

Output Example

```

0/0/0/1          Och Interface Instance
  0/0/0/10       Och Interface Instance
  0/0/0/11       Och Interface Instance
  0/0/0/12       Och Interface Instance
  0/0/0/13       Och Interface Instance
  0/0/0/14       Och Interface Instance
  0/0/0/15       Och Interface Instance
0/0/0/16       Och Interface Instance
  0/0/0/2        Och Interface Instance
  0/0/0/3        Och Interface Instance
  0/0/0/4        Och Interface Instance
  0/0/0/5        Och Interface Instance
  0/0/0/6        Och Interface Instance
  0/0/0/7        Och Interface Instance
  0/0/0/8        Och Interface Instance
  0/0/0/9        Och Interface Instance
    
```

Step 2 Run the **show controllers** command to view the parameters of an OCH controller.

Example:

This output shows the parameters of the OCH controller.

Output Example

```

RP/0/RP0/CPU0:ios#show controllers och 0/1/0/1
Thu Oct 12 09:26:38.555 UTC

Controller State: Up

Transport Admin State: In Service

Parameter Statistics:
-----
Tx Power = -2.30 dBm
Rx Power = -0.70 dBm

```

View OMS controller and parameters

Use this task to view an OMS controller and parameters.

When you bring up the nodes with NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L cards, the OMS controllers are automatically created by default.

The OMS controllers for the NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L cards are:

Table 5: Supported interfaces

Card	Port type	OMS ports	Interfaces
NCS1K14-CCMD-16-C	LC Ports	1	oms R/S/I/0
NCS1K14-CCMD-16-L	LC Ports	1	oms R/S/I/0

Note R/S/I/P stands for Rack/Slot/Instance/Port.

Procedure

Step 1 Run the **show controllers oms ?** command to view the OMS controllers.

Example:

This output shows the active OMS controller in *Slot 0*.

Step 2 Run the **show controllers** command to view the parameters of an OMS controller.

Example:

This output shows the parameters of the an OMS controller.

Output Example

```
RP/0/RP0/CPU0:ios#show controllers oms 0/1/0/0
```

```

Configure Controller Parameters for NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L Cards

Table 6: Feature History

Feature Name	Release Information	Feature Description
Supported Functionalities of CCMD-16-C and CCMD-16-L Line Cards	Cisco IOS XR Release 7.11.1	Supported Functionalities of CCMD-16-C and CCMD-16-L Line Cards: The software supports Variable Optical Attenuator (VoA), power monitoring and reporting of parameters to the controllers at the OCH and OMS level. It helps in configuring the amplifier parameters for optimizing signal transmissions. The software also supports in-band and out-of-band tone detection and monitoring and reporting of alarms.

This chapter describes the controller configuration using EDFA, VoA, optical safety, and photodiode parameters which are supported on NCS1K14-CCMD-16-C and NCS1K14-CCMD-16-L line cards.

Table 7: Basic Controller Configuration Parameters

Parameter	CLI	Description
EDFA-ADD Control Mode	<code>controller oms R/S/I/P egress-ampli-mode power-control</code>	Here the default mode is gain-control. Use this command to change the mode to power-control mode. You can delete this configuration to revert to gain-control mode.
EDFA-ADD Power	<code>controller oms R/S/I/P egress-ampli-power <val in 0.1 dBm></code>	This is the target output power configuration for the EDFA located on COM-Tx. If the output power is not configured, then a default value is used by the system. You can find the applied target output power by using the show controller oms output.

<p>EDFA-ADD Gain Range</p>	<pre>controller Oms R/S/I/P egress-ampli-gain-range <normal extended></pre>	
---------------------------------------	---	--

If you change the gain range from Normal to Extended or the opposite way, without updating the proper gain value for the new gain range, then the following may happen:

- The EDFA switches to the preconfigured or default value of the gain causing a mismatch between the operational and configured gain.
- The gain configuration is lost during the reload of software or line card, as the configured gain mismatches with the latest gain-range. This may result in traffic interruption during these reload operations.

Hence, we recommend that you explicitly configure the gain range mode as normal or extended, and the corresponding gain values for each mode to get the expected results.

The following are a few example scenarios that may not work as expected:

- Scenario 1:

Current running config:

```
controller Oms R/S/I/P
  egress-ampli-gain-range extended
  egress-ampli-gain <gain value in
  extended mode>
```

New applied config:

```
controller Oms R/S/I/P
  no egress-ampli-gain-range extended
  commit
```

- Scenario 2:

Current running config:

```
controller Oms R/S/I/P
  egress-ampli-gain-range extended
  egress-ampli-gain <gain value in
  extended mode>
```

New applied config:

```
controller Oms R/S/I/P
  egress-ampli-gain-range Normal
  commit
```

- Scenario 3:

Current running config:

```
controller Oms R/S/I/P
  egress-ampli-gain <gain value in normal
  mode>
```

		<p>New applied config:</p> <pre>controller Oms R/S/I/P egress-ampli-gain-range extended commit</pre> <p>The following is another example scenario that involves commit-replace command where you replace the existing gain configuration that does not have explicitly configured gain-range, with new gain-range and gain value.</p> <p>Scenario 4:</p> <p>Current running config:</p> <pre>controller Oms R/S/I/P egress-ampli-gain <gain value in normal mode></pre> <p>New applied config:</p> <pre>..... controller Oms R/S/I/P egress-ampli-gain-range extended egress-ampli-gain <gain value in extended mode> commit replace</pre>
EDFA-ADD Gain	<pre>controller Oms R/S/I/P egress-ampli-gain <val in 0.1 dB></pre>	<p>This is used for configuring gain for the EDFA located on the COM-Tx port. If the gain is not configured, then a default value is used by the system. The show controller oms output can be used for finding the applied gain.</p>
EDFA-DROP Control Mode	<pre>controller Oms R/S/I/P ingress-ampli-mode power-control</pre>	<p>The default mode is gain-control.</p> <p>Use this command to change the mode to power-control mode.</p> <p>You can delete this configuration to revert to gain-control mode.</p>
EDFA-DROP Power	<pre>controller Oms R/S/I/P ingress-ampli-power <vale in 0.1 dBm></pre>	<p>This is the target output power configuration for the EDFA located on COM-Rx. If the output power is not configured, then a default value is used by the system. You can find the applied target output power by using the show controller oms output.</p>
EDFA-DROP Gain	<pre>controller Oms R/S/I/P ingress-ampli-gain <val in 0.1 dB></pre>	<p>This is used for configuring gain for the EDFA located on the COM-Rx port. If the gain is not configured, then a default value is used by the system. The show controller oms output can be used for finding the applied gain.</p>

VoA Attenuation	<pre>controller Oms R/S/I/P tx-voa-attenuation <val in 0.1 dB> rx-voa-attenuation <val in 0.1 dB></pre>	This is used to configure VoA attenuation for COM-Tx and COM-Rx ports. The system picks a default value if the gain is not configured. The show controller oms output can be used for finding the applied attenuation.
Shutdown (COM Port)	<pre>controller Oms R/S/I/P shutdown</pre>	COM-Tx and Rx ports are put in Out of Service (OOS) when this command is executed. This turns off the EDFA devices on both COM-Tx and COM-Rx ports and the respective alarms are masked. Here the default value is 'unshut'.
Shutdown (Ch Ports)	<pre>controller Och R/S/I/P shutdown</pre>	The channel port will be marked as out-of-service.

Configure Operational Parameters

The different operational parameters supported are given below.

Table 8: Operational Parameters

Parameter	CLI	Description
Photo Diodes (COM Port)	<p>OMS Controller</p> <pre>Tx Power and Rx Power</pre>	<p>Rx Power = Inband power + OOB Tx Power = Inband power + OOB</p> <p>It reports the power transmitted and received on the OMS port. The OOB power received on COM-Rx is looped back to COM-Tx with some loss due to the insertion-loss on the loop back path.</p>
Photo Diodes (CH Ports)	<p>OCH Controller</p> <pre>Tx Power and Rx Power</pre>	It reports the power transmitted and received on the channel ports.
Amplifier Parameters	<p>OMS Controller</p> <pre>Ingress Ampli Mode Ingress Ampli Gain Ingress Ampli Tilt Ingress Ampli OSRI Egress Ampli Mode Egress Ampli Gain Egress Ampli Tilt Egress Ampli Gain Range Egress Ampli OSRI Egress Ampli BR Power Egress Ampli BR Ratio</pre>	Egress and ingress amplifier parameters.

VoA Parameters	OMS Controller Tx VoA Attenuation and Rx VoA Attenuation	VoA attenuation parameters.
----------------	--	-----------------------------

Configure Optical Safety Parameters

Use the following parameters for configuring optical safety.

Table 9: Optical Safety Parameters

Parameter	CLI	Description
OSRI	controller oms R/S/I/P egress-ampli-osri ingress-ampli-osri	Use this configuration to enable or Disable Optical Safety Remote Interlock (OSRI) on the amplifiers located on COM-Tx and COM-Rx ports. The default value is 'Off'. The show controller oms output can be used for finding the OSRI configuration and status.
