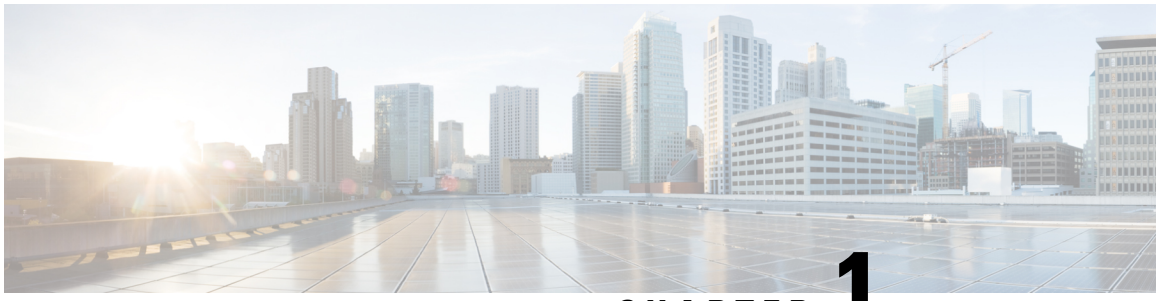
CONTENTS



CHAPTER 1

Bring-up Cisco NCS 1014

After installing the hardware, boot the Cisco NCS 1014 system. You can connect to the XR console port and power on the system. NCS 1014 completes the boot process using the pre-installed operating system (OS) image. If no image is available, NCS 1014 can be booted using the iPXE boot or an external bootable USB drive.

After booting, create the root username and password, and then use it to log on to the XR console.

Boot Using Zero Touch Provisioning

ZTP allows you to provision the network device with day 0 configurations and supports both management ports and data ports.

ZTP provides multiple options such as:

- Automatically apply specific configuration in a large-scale environment.
- Download and install specific IOS XR image.
- Install specific application package or third-party applications automatically.
- Deploy containers without manual intervention.
- Upgrade or downgrade software versions effortlessly on thousands of network devices at a time.

Benefits Using ZTP

ZTP helps you manage large-scale service provider infrastructures effortlessly. Following are the added benefits of using ZTP:

- ZTP helps you to remotely provision a router anywhere in the network. This eliminates the need for an expert to deploy network devices and reduces IT cost.

- Automated provisioning using ZTP removes delay, increases accuracy, provides better customer experience and is cost-effective.

  By automating repeated tasks, ZTP allows network administrators to concentrate on more important stuff.

- ZTP process helps you to quickly restore service. Rather than troubleshooting an issue on hand, you can reset a system to a well-known working status.

Prerequisites:

ZTP does not execute, if a username is already configured in the system.

ZTP is initiated in one of the following ways:

- **Automated Fresh Boot**: When you boot the device, the ZTP process initiates automatically if the device does not have a prior configuration. During the process, the router receives the details of the configuration file from the DHCP server. Use this method for devices that has no pre-loaded configuration. For more information, see Fresh Boot Using DHCP, on page 2.

  You must define the configuration file or the bootscript that is downloaded from the DHCP server.

- **Configuration File**: The first line of the file must contain **!! IOS XR configuration"**, to process the file as a configuration. If you are trying to bring up ten new nodes, you have to define ten configuration files. See Build your Configuration File, on page 4.

- **ZTP Bootscript**: Define the script to be executed on every boot. See Configure ZTP BootScript, on page 8 .

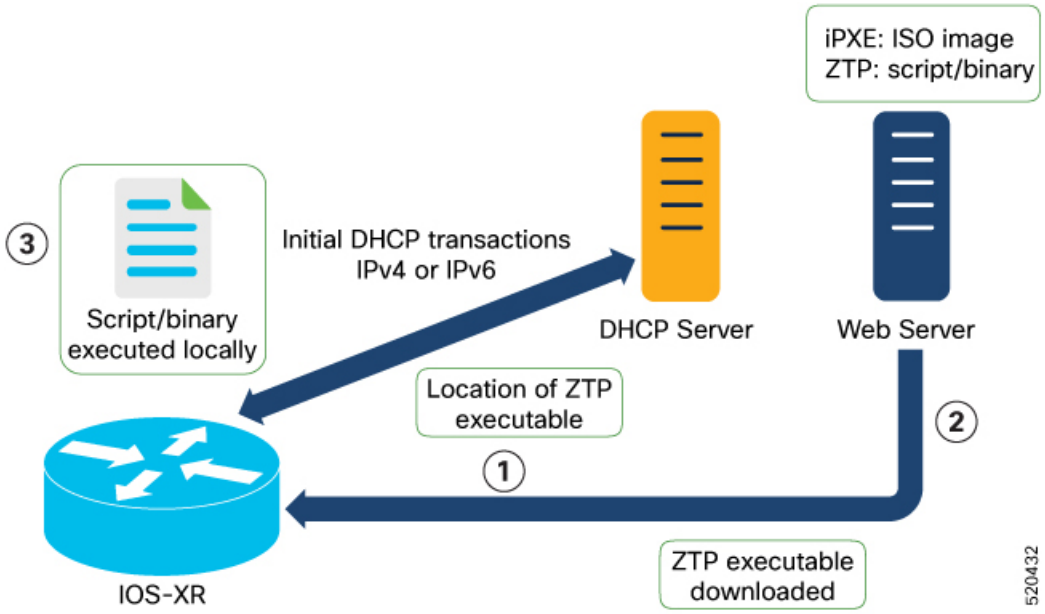
- **Manual Invocation using CLI:** Use this method when you want to forcefully initiate ZTP on a fully configured device using CLI. See Invoke ZTP Manually through CLI, on page 10.

- **Invocation using Reload Command:** Use this method when you want to forcefully initiate ZTP on a fully configured device using the **reload** command. See Invoke ZTP Through Reload, on page 11.

Fresh Boot Using DHCP

The ZTP process initiates when you boot the network device with an IOS XR image. The ZTP process starts only on a device without prior configuration.

This figure depicts the high-level workflow of the ZTP process:



1. ZTP sends DHCP request to fetch the ZTP configuration file or user script. To help the Bootstrap server uniquely identify the device, ZTP sends below DHCP option.
   - DHCP(v4/v6) client-id=Serial Number
   - DHCPv4 option 124: Vendor, Platform, Serial-Number
   - DHCPv6 option 16: Vendor, Platform, Serial-Number

   The following is the default sequential flow of the ZTP process defined in the configuration file. You can modify this sequence in the configuration file, if required.
   - ZTP sends IPv4 DHCP request first on all the management ports. If the request fails, then ZTP sends IPv6 DHCP request on all the management ports.
   - ZTP sends IPv4 DHCP request first on all the data ports. If the request fails, then ZTP sends IPv6 DHCP request on all the data ports.

2. DHCP server identifies the device and responds with DHCP response.

   DHCP server should be configured to respond with DHCP response and supply script/config location with one of the following DHCP options:
   - DHCPv4 using BOOTP filename.
   - DHCPv4 using Option 67 (bootfile-name).
   - DHCPv6 using Option 59 (OPT_BOOTFILE_URL).

3. The network device downloads the file from the web server using the URL location provided in the DHCP response.
4. The device receives a configuration file or script file from the HTTP server.

Note

- If the downloaded file content starts with *!! IOS XR*, it is considered as a configuration file.
- If the downloaded file content starts with *#! /bin/bash*, *#! /bin/sh*, or *#!/usr/bin/python*, it is considered as a script file.

5. The device applies the configuration file or executes the script or binary in the default bash shell.
6. The Network device is now up and running.

Build your Configuration File

Based on the business need, you can use a configuration or script file to initiate the ZTP process.

The configuration file content starts with *!! IOS XR*.

The following is the sample configuration file. You can automate all the configurations. For more information on creating ZTP configuration file, refer ZTP Configuration Files Creation.

```

Configure ZTP BootScript

ZTP downloads and executes the script files. These script files include a programmatic approach to complete a task. For example, scripts created using IOS XR commands to perform patch upgrades. The first line of the file must contain **#! /bin/bash** or **#! /bin/sh** for ZTP to process the file as script.

You can either use the ZTP bash script or the ZTP configuration file.

To manually execute a script during every boot, use the following configuration:

```
Router#configure
Router(config)#ztp bootscript /disk0:/myscript
Router(config)#commit
```

To ensure that we have connectivity in the third-party namespace for applications to use, the above configuration waits for the first data plane interface to be configured and wait an extra minute for the management interface to be configured with an IP address. If the delay is not desired, use:

```
Router#configure
Router(config)#ztp bootscript preip /disk0:/myscript
Router(config)#commit
```

Note When the above command is first configured, you will be prompted if you wish to invoke it now. The prompt helps with testing.

This is the example content of **/disk0:/myscript**:

```
host ncs1010_P1B_DT_08_ETH0 {
#hardware ethernet 68:9e:0b:b8:6f:5c ;
option dhcp-client-identifier "FCB2437B05N" ;
if exists user-class and option user-class = "iPXE" {
filename "http://10.33.0.51/P1B_DT_08/ncs1010-x64.iso";
} else {
filename "http://10.33.0.51/P1B_DT_08/startup.cfg";
}
fixed-address 10.33.0.19;
}
```

The following is the sample content of the ZTP bash script.

```
#! /bin/bash
#
# NCS1014 Demo Sample
# ZTP installation of config and day-0 SMU's
#
source ztp_helper

wget http://downloads.sourceforge.net/project/yourcode/application.tgz
#install the downloaded application.tgz

#Run XR CLI's from the script
`xrcmd "show version"`
```

The following is the sample content of the ZTP configuration file.

```

Invoke ZTP Manually through CLI

Manual ZTP can be invoked through CLI commands. This manual way helps you to provision the router in stages. Ideal for testing out ZTP configuration without a reboot. If you want to invoke a ZTP on an interface (data ports or management ports), you need not bring up and configure the interface first. You can execute the **ztp initiate** command, even if the interface is down, so that the ZTP script brings it up and invoke *dhclient*. ZTP can run on all interfaces irrespective of whether the interfaces are up or not.

Use the **ztp initiate**, **ztp terminate**, and **ztp clean** commands to force ZTP to run on more interfaces.

- **ztp initiate**—Invokes a new ZTP DHCP session. Logs can be found in the */disk0:/ztp/ztp.log* location.
- **ztp terminate**—Terminates current ZTP sessions.
- **ztp clean**—Removes only the ZTP state files.

The log file *ztp.log* is saved in the */var/log/ztp.log* folder, and a copy of log file is available in the */disk0:/ztp/ztp.log* location using a soft link. However, executing **ztp clean** clears files saved on disk and not from the **/var/log/ztp.log** folder where current ZTP logs are saved. To get a log from current ZTP run, you must manually remove the ZTP log file from **/var/log/ztp.log**.

Procedure

Step 1 (optional) **ztp clean**

Example:

```
RP/0/RP0/CPU0:ios#ztp clean
Fri Sep 15 17:12:33.477 IST
This would remove all ZTP temporary files.
Would you like to proceed? [no]: yes
All ZTP operation files have been removed.
ZTP logs are present in /var/log/ztp*.log for logrotate.
Please remove manually if needed.
If you now wish ZTP to run again from boot, do 'conf t/commit replace' followed by reload.
RP/0/RP0/CPU0:ios#
```

Removes all the ZTP logs and saved settings.

Step 2 **ztp initiate**

Example:

```
RP/0/RP0/CPU0:ios#ztp initiate
Fri Sep 15 17:13:28.580 IST
Inititaing ZTP may change your configuration.
Interfaces might be brought up if they are in shutdown state
Would you like to proceed? [no]: yes
ZTP will now run in the background.
```

```
Please use "show logging" or look at /var/log/ztp.log to check progress.
RP/0/RP0/CPU0:ios#
```

Reboots the Cisco NCS 1014 system.

Use the **show logging** command or see the */var/log/ztp.log* to check progress.

Step 3 (Optional) **ztp terminate**

Example:

```
RP/0/RP0/CPU0:ios#ztp terminate
Fri Sep 15 17:15:04.592 IST
This would terminate active ZTP session if any (this may leave your system in a partially
configured state)
Would you like to proceed? [no]: yes
Terminating ZTP
RP/0/RP0/CPU0:ios#
```

Terminates the ZTP process.

Invoke ZTP Through Reload

The ZTP process can be automatically invoked using the **reload** command.

Procedure

Step 1 **configure**

Example:

```
RP/0/RP0/CPU0:P2B_DT_02#configure
```

Enters the configuration mode.

Step 2 **commit replace**

Example:

```
RP/0/RP0/CPU0:ios(config)#commit replace
Fri Sep 15 11:47:31.746 UTC

This commit will replace or remove the entire running configuration. This
operation can be service affecting.
Do you wish to proceed? [no]: yes
RP/0/RP0/CPU0:ios(config)#
```

Removes the entire running configuration.

Step 3 **ztp clean**

Example:

```
RP/0/RP0/CPU0:ios#ztp clean
Fri Sep 15 11:48:13.669 UTC
This would remove all ZTP temporary files.
Would you like to proceed? [no]: yes
All ZTP operation files have been removed.
ZTP logs are present in /var/log/ztp*.log for logrotate.
```

```
Please remove manually if needed.
If you now wish ZTP to run again from boot, do 'conf t/commit replace' followed by reload.
RP/0/RP0/CPU0:ios#
```

Removes all the ZTP logs and saved settings.

Step 4 **reload**

Example:

```
RP/0/RP0/CPU0:ios#reload
Fri Apr 29 06:50:12.312 UTC
Proceed with reload? [confirm]

RP/0/RP0/CPU0:ios#
Preparing system for backup. This may take a few minutes especially for large configurations.

 Status report: node0_RP0_CPU0: BACKUP INPROGRESS
 Status report: node0_RP0_CPU0: BACKUP HAS COMPLETED SUCCESSFULLY
[Done]
```

After the node comes up, you can see that the ZTP is initiated and the configuration has been restored successfully.

```
RP/0/RP0/CPU0:Sep 25 17:29:19.875 UTC: pyztp2[325]: %INFRA-ZTP-4-START : ZTP has started.

User Access Verification

Username: cisco
Password:
ios con0/RP0/CPU0 is now available
```

Reboots the Cisco NCS 1014 system.

ZTP Logging

ZTP logs its operation on the flash file system in the */disk0:/ztp/* directory. ZTP logs all the transactions with the DHCP server and all the state transitions.

The following example displays the execution of a simple configuration script downloaded from a data interface using the command **ztp initiate interface MgmtEth 0/RP0/CPU0/0 verbose**. This script unshuts all the interfaces of the system and configures a load interval of 30 seconds on all of them.

Generate Tech Support Information for ZTP

When you have a problem that you cannot resolve in the ztp process, contact the Cisco Systems technical support representative. To analyze a problem, your technical support representative needs certain information about the situation and the symptoms that you are experiencing. To speed up the resolution, collect the necessary data before you contact your representative.

Use the **show tech-support ztp** command to collect all debugging information of ztp process.

Example:

```
RP/0/RP0/CPU0:ios#show tech-support ztp
Thu Jul 28 08:33:27.531 UTC
++ Show tech start time: 2022-Jul-28.083327.UTC ++
Thu Jul 28 08:33:28 UTC 2022 Waiting for gathering to complete
..
Thu Jul 28 08:33:34 UTC 2022 Compressing show tech output
Show tech output available at 0/RP0/CPU0 :
/harddisk:/showtech/showtech-R1-ZTP-2022-Jul-28.083327.UTC.tgz
++ Show tech end time: 2022-Jul-28.083334.UTC ++
RP/0/RP0/CPU0:ios#
```

In the above example, the tech support information is saved as .tgz file in the specified location. This information can be shared with the Cisco Technical Support representatives for troubleshooting the ztp process.

Configure Management Interface

The management interface can be used for system management and remote communication. To use the management interface for system management, you must configure an IP address and subnet mask. To use the management interface for remote communication, you must configure a static route.

Before you begin

- Consult your network administrator to procure IP addresses and a subnet mask for the management interface.
- Ensure that the management interface is connected to the management network.

Procedure

Step 1 **configure**

Example:

```
RP/0/RP0/CPU0:ios#configure
```

Enters IOS XR configuration mode.

Step 2 **interface mgmtEth** *rack/slot/instance/port*

Example:

```
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/0
```

Enters interface configuration mode for the management interface.

Step 3 **ipv4 address** *ipv4-address subnet-mask*

Example:

```
RP/0/RP0/CPU0:ios(config-if)#ipv4 address 10.1.1.1 255.0.0.0
```

Assigns an IP address and a subnet mask to the management interface.

Step 4 **no shutdown**

Example:

```
RP/0/RP0/CPU0:ios(config-if)#no shutdown
```

Places the management interface in an "up" state.

Step 5 **exit**

Example:

```
RP/0/RP0/CPU0:ios(config-if)#exit
```

Exits the management interface configuration mode.

Step 6 **router static address-family ipv4 unicast** *0.0.0.0/0 default-gateway*

Example:

```
RP/0/RP0/CPU0:ios(config)#router static address-family ipv4 unicast 0.0.0.0/0 12.25.0.1
```

Specifies the IP address of the default gateway to configure a static route. This IP address must be used for communication with devices on other networks.

Step 7 Use the **commit** or **end** command.

commit-Saves the configuration changes and remains within the configuration session.

end-Prompts user to take one of these actions:

- **Yes**-Saves configuration changes and exits the configuration session.
- **No**-Exits the configuration session without committing the configuration changes.
- **Cancel**-Remains in the configuration session without committing the configuration changes.

Boot NCS 1014

Use the console port to connect to NCS 1014. By default, the console port connects to the XR mode. If necessary, you can establish subsequent connections through the management port, after it is configured.

Procedure

Step 1 Connect a terminal to the console port of the RP.

Step 2 Start the terminal emulation program on your workstation.

The console settings are 115200 bps for NCS1K14-CNTLR-K9, 9600 bps for NCS1K14-CTLR-B-K9, 8 data bits, 1 stop bit and no parity.

Step 3 Power on the NCS 1014.

To power on the shelves, install the AC or DC power supplies and cables. As NCS 1014 boots up, you can view the boot process details at the console of the terminal emulation program.

Step 4 Press **Enter**.

The boot process is complete when the system prompts you to enter the root-system username. If the prompt does not appear, wait for a while to give NCS 1014 more time to complete the initial boot procedure; then press **Enter**.

If the boot process fails, it may be because the preinstalled image on the NCS 1014 is corrupt. In this case, you can boot NCS 1014 using an external bootable USB drive.

Boot NCS 1014 Using USB Drive

The bootable USB drive is used to reimage NCS 1014 for system upgrade or to boot the NCS 1014 in case of boot failure. A bootable USB drive is created by copying a compressed boot file into a USB drive. The USB drive becomes bootable after the contents of the compressed file are extracted.

You can complete this task using the Windows, Linux, or MAC operating systems available on your local machine. The exact operation to be performed for each generic step that is outlined here depends on the operating system in use.

Use this task to boot the NCS 1014 using the USB drive.

Before you begin

- You need a USB drive with a storage capacity of at least 4 GB.
- The USB drive should have a single partition.
- Copy the compressed boot file from the software download page at Cisco.com to your local machine. The filename for the compressed boot file is in the format *ncs1010-x64-usb-(release_number).zip*.

Procedure

Step 1 Connect the USB drive to your local machine and format it with the FAT32 file system.

Step 2 Copy the compressed boot file to the USB drive.

Step 3 Verify that the copy operation is successful. To verify, compare the file size at source and destination. Also, verify the MD5 checksum value.

Step 4 Extract the content of the compressed boot file by unzipping it in the USB drive. This makes the USB drive a bootable drive.

Note You must extract the contents of the zipped file ("EFI" and "boot" directories) directly in the root folder of the USB drive. If the unzipping application places the extracted files in a new folder, move the "EFI" and "boot" directories to the root folder of the USB drive.

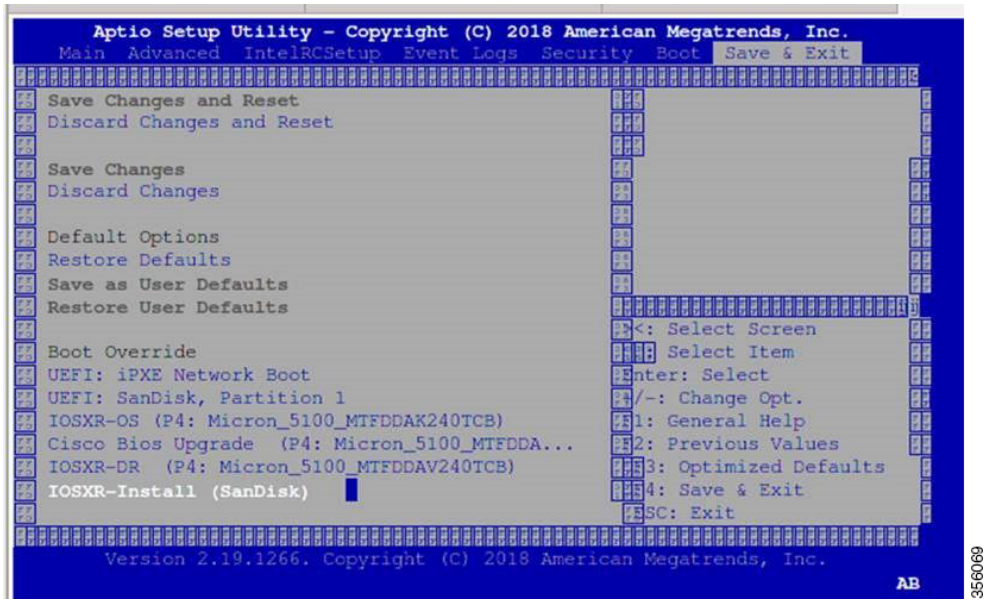
Step 5 Insert the USB drive in one of the USB ports of NCS 1014.

Step 6 Reboot NCS 1014 using power cycle or console.

Note Use the **reload bootmedia usb noprompt** command to boot the NCS1010 from the USB. If you are using the **reload bootmedia usb noprompt** command, then you can skip the remaining steps.

Step 7 Press **Esc** to enter BIOS.

Step 8 Select the **Save & Exit** tab of BIOS.



Step 9 Select **IOS -XR Install**.

The BIOS UI displays the USB drive vendor in the brackets, in this case, SMART USB 1084.

The system detects USB and boots the image from USB.

```
Booting from USB..
Loading Kernel..
Verifying (loop)/boot/bzImage...
(loop)/boot/bzImage verified using attached signature.
Loading initrd..
Verifying (loop)/boot/initrd.img...
```

Step 10 Remove the USB drive after the `Rebooting the system after installation` message is displayed. The NCS 1014 reboots automatically.

Note The USB must be removed only after the image is loaded successfully.

Boot Using iPXE

iPXE is a pre-boot execution environment that is included in the network card of the management interfaces and works at the system firmware (UEFI) level of the chassis. iPXE is used to reimage the system, and boot

the chassis in case of boot failure or in the absence of a valid bootable partition. iPXE downloads the ISO image, proceeds with the installation of the image, and finally bootstraps inside the new installation.

Note The time taken for iPXE to download the ISO image depends on the network speed. Ensure that the network speed is sufficient to complete the image download in less than 10 minutes. The chassis reloads if the image is not downloaded by 10 minutes.

iPXE acts as a bootloader and provides the flexibility to choose the image that the system will boot based on the Platform Identifier (PID), the Serial Number, or the management mac-address. You must define iPXE in the DHCP server configuration file.

Note To initiate the iPXE boot process, perform one of the following methods:

- Use the **reload bootmedia network location all** command. This method is the preferred method.

```
RP/0/RP0/CPU0:ios#
RP/0/RP0/CPU0:ios#reload bootmedia network location all
Mon Dec 4 09:49:14.220 UTC
Proceed with reload? [confirm]
```

- Power cycle the NCS 1014 chassis and start the iPXE boot process in the BIOS interface.

Note Software installation using iPXE boot with IPv6 is not supported.

Setup DHCP Server

A DHCP server must be configured for IPv4, IPv6, or both communication protocols.

Note For DHCPv6, a routing advertisement (RA) message must be sent to all nodes in the network that indicates which method is to be used to obtain the IPv6 address. Configure Router-advertise-daemon (radvd, install using yum install radvd) to allow the client to send the DHCP request. For example:

```
interface eth3
{
        AdvSendAdvert on;
        MinRtrAdvInterval 60;
        MaxRtrAdvInterval 180;
        AdvManagedFlag on;
        AdvOtherConfigFlag on;
        prefix 2001:1851:c622:1::/64
        {
                AdvOnLink on;
                AdvAutonomous on;
                AdvRouterAddr off;
        };
};
```

To setup a DHCP server:

1. Create the `dhcpd.conf` file (for IPv4, IPv6 or both communication protocols), `dhcpv6.conf` file (for IPv6) or both in the `/etc/` directory. This configuration file stores the network information such as the path to the script, location of the ISO install file, location of the provisioning configuration file, serial number, MAC address of the chassis.
2. Test the server when the DHCP server is running:

   For example, for ipv4:

   a. Use MAC address of the chassis:

      Ensure that the above configuration is successful.

   b. Use serial number of the chassis:

      ```
      host demo {
      option dhcp-client-identifier "<chassis-serial-number>";
        filename "http://<IP-address>/<hardware-platform>-mini-x.iso";
        fixed-address <IP-address>;
      }
      ```

      The serial number of the chassis is derived from the BIOS and is used as an identifier.

      Example

      ```
      host 10.89.205.202 {
             hardware ethernet 40:55:39:xx:xx:xx;
              option dhcp-client-identifier "<FCB2437B066>";
                if exists user-class and option user-class = "iPXE" {
                filename "http://10.89.205.127/box1/ncs1010-x64.iso";
             } else {
                 filename "http://10.89.205.127/box1/StartupConfig.cfg";
             }
             fixed-address 10.89.205.202;
          }
      ```

Boot Using iPXE

Before you use the iPXE boot, ensure that:

- DHCP server is set and is running.
- Management port of the NCS 1014 chassis is in *UP* state.

Use anyone of the following methods to invoke the iPXE boot process:

- via CLI terminal:

  Run the following command to invoke the iPXE boot process to reimage the chassis:

  ```
  reload bootmedia network location all
  ```

  Example:

  ```
  RP/0/RP0/CPU0:ios# reload bootmedia network location all
  Wed Jul  6 15:11:33.791 UTC
  Reload hardware module ? [confirm]
  ```

  The following example shows the output of the command:

```
RP/0/RP0/CPU0:ios#reload bootmedia network location all
Mon Dec  4 09:49:14.220 UTC
Proceed with reload? [confirm]

Bring-Up Line Card

Use the following procedure to bring-up the NCS1014 line cards:

Procedure

Step 1 Insert the line card into slot.

Step 2 Wait until the line card LED turns Green.

Step 3 Check the PID is in **OPERATIONAL** status using the **show platform** command.

Example:

CCMD-16-C and CCM-16-L line cards

```
RP/0/RP0/CPU0:ios#show platform
Fri Sep 22 06:56:28.653 UTC
Node              Type                       State                     Config state
--------------------------------------------------------------------------------
0/RP0/CPU0        NCS1K14-CNTLR-K9(Active) IOS XR RUN                NSHUT,NMON
0/PM0             NCS1K4-AC-PSU            OPERATIONAL               NSHUT,NMON
0/FT0             NCS1K14-FAN              OPERATIONAL               NSHUT,NMON
0/FT1             NCS1K14-FAN              OPERATIONAL               NSHUT,NMON

0/FT1             NCS1K14-FAN              OPERATIONAL               NSHUT,NMON
0/FT2             NCS1K14-FAN              OPERATIONAL               NSHUT,NMON
0/2/NXR0          NCS1K14-2.4T-K9          OPERATIONAL               NSHUT,NMON
0/3/NXR0          NCS1K14-BLANK             PRESENT                  NSHUT,NMON
```

Step 4 Check the line card environment parameters using the command **show environment [power | voltage | current | temperature] [location |** *location* **]**.

Example:

```
RP/0/RP0/CPU0:ios#show environment power
================================================================================
CHASSIS LEVEL POWER INFO: 0
================================================================================
   Total output power capacity (Group 0 + Group 1) :    2500W +     0W

                              Allocated           Used
                              Watts               Watts
==============================================================================
0/RP0/CPU0   NCS1K14-CNTLR-K9   73                  20               ON
0/FT0        NCS1K14-FAN        170                 167              ON
0/FT1        NCS1K14-FAN        170                 85               ON
0/FT2        NCS1K14-FAN        170                 159              ON
0/0/NXR0     NCS1K14-2.4T-L-K9  460                 38               ON
0/2/NXR0     NCS1K14-2.4T-X-K9  410                 0                ON
0/3/NXR0     NCS1K14-CCMD-16-C  110                 16               ON
0/Rack       NCS1014            73                  14               ON
```

Note

- When a slot is not in use, we recommend inserting a filler to allow proper airflow across the line cards to maintain an optimal system temperature.
- When a port is not in use, we recommend inserting a clip to maintain an optimal card temperature.
- Ensure to secure the line card in the chassis by tightening the top and bottom screws.

Step 5 Upgrade the FPDs of the line card depending on the output of **show hw-module location 0**/*line-card-slot* **fpd** command.

Configure NTP Server

Understand NTP

Table 1: Feature History

Feature Name	Release Information	Feature Description
NTP Support	Cisco IOS XR Release 7.11.1	Network Time Protocol (NTP) allows devices to synchronize clocks with the NTP servers, maintaining the most accurate time. NCS 1010 now supports time synchronization. In modern and large networks, time synchronization is critical because every aspect of managing, securing, planning, and debugging a network depends on the time of occurrence of events. Commands added: • **ntp server** • **show ntp associations** • **show ntp status**

NTP uses the User Datagram Protocol (UDP) as its transport protocol. All NTP communication uses Coordinated Universal Time (UTC). An NTP network usually receives its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP distributes this time across the network.

NTP uses the concept of a “stratum” to describe how many NTP hops away a machine is from an authoritative time source. A “stratum 1” time server typically has an authoritative time source (such as a radio or atomic clock, or a GPS time source) directly attached, a “stratum 2” time server receives its time through NTP from a “stratum 1” time server, and so on.

The communications between machines running NTP (known as associations) are usually statically configured; each machine is given the IP address of all machines with which it should form associations. Accurate timekeeping is made possible by exchanging NTP messages between each pair of machines with an association.

An NTP broadcast client listens for broadcast messages sent by an NTP broadcast server at a designated IPv4 address. The client synchronizes the local clock using the first received broadcast message.

Synchronize Clock with NTP Server

There is an independent system clock for IOS XR. To ensure that this clock does not deviate from true time, it must be synchronized with the clock of an NTP server.

Before you begin

Configure Management Interface

Procedure

Step 1 **configure**

Example:

```
RP/0/RP0/CPU0:ios#configure
```

Enters the configuration mode.

Step 2 **ntp**

Example:

```
RP/0/RP0/CPU0:ios(config)#ntp
```

Enters NTP configuration mode.

Step 3 **server** [**ipv4** | **ipv6**] *ntp-server-ip-address* [**version** *version-number*] [**key** *key-id*] [**minpoll** *interval*] [**maxpoll** *interval*] [**source** *type interface-path-id*] [**prefer**] [**burst**] [**iburst**]

Example:

IPv4:

```
RP/0/RP0/CPU0:ios(config-ntp)#server 4.33.0.51 version 4 prefer iburst
```

IPv6:

```
RP/0/RP0/CPU0:ios(config-ntp)#server 2001:DB8::1 version 4 prefer iburst
```

Synchronizes the console clock with the specified NTP server.

Note The NTP server can also be reached through a VRF if the management interface is in a VRF.

Step 4 Use one of the following commands:

- **end**
- **commit**

Example:

```
RP/0/RP0/CPU0:ios(config-ntp)#end
```

or

```
RP/0/RP0/CPU0:router(config-ntp)#commit
```

Saves configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:

```
Uncommitted changes found, commit them before
  exiting(yes/no/cancel)?
[cancel]:
```

  - Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns to EXEC mode.

- Entering **no** exits the configuration session and returns to EXEC mode without committing the configuration changes.
- Entering **cancel** leaves the system in the current configuration session without exiting or committing the configuration changes.

- Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.

Step 5 **show running-config ntp**

Example:

```
RP/0/RP0/CPU0:ios#show running-config ntp

Sun Nov  5 15:14:24.969 UTC

ntp

 server 4.33.0.51 burst iburst

!
```

Displays the running configuration.

Verify the Status of the External Reference Clock

This task explains how to verify the status of NTP components.

Note The commands can be entered in any order.

Procedure

Step 1 **show ntp associations [detail] [location** *node-id***]**

Example:

```
RP/0/RP0/CPU0:ios#show ntp associations
Sun Nov 5 15:14:44.128 UTC

address ref clock st when poll reach delay offset disp
*~4.33.0.51 10.64.58.50 2 81 128 377 1.84 7.802 2.129
* sys_peer, # selected, + candidate, - outlayer, x falseticker, ~ configured
```

Displays the status of NTP associations.

Example:

```
RP/0/RP0/CPU0:ios#show ntp associations detail
Sun Nov 5 15:14:48.763 UTC

4.33.0.51 configured, our_master, stratum 2
ref ID 10.64.58.50, time E8F22BB9.79D4A841 (14:56:57.475 UTC Sun Nov 5 2023)
```

```
our mode client, peer mode server, our poll intvl 128, peer poll intvl 128
root delay 0.6866 msec, root disp 1.04, reach 377, sync dist 6.2590

rcv time E8F23563.E07C296D (15:38:11.876 UTC Sun Nov 5 2023)
xmt time E8F23563.E07C296D (15:38:11.876 UTC Sun Nov 5 2023)
filtdelay = 2.006 1.865 1.936 1.762 1.932 1.875 1.881 2.011
filtoffset = 7.210 7.305 7.372 7.226 7.298 7.258 7.251 7.224
filterror = 0.000 2.025 2.085 4.035 4.095 6.060 6.120 8.070
```

Step 2 **show ntp status [location** *node-id***]**

Example:

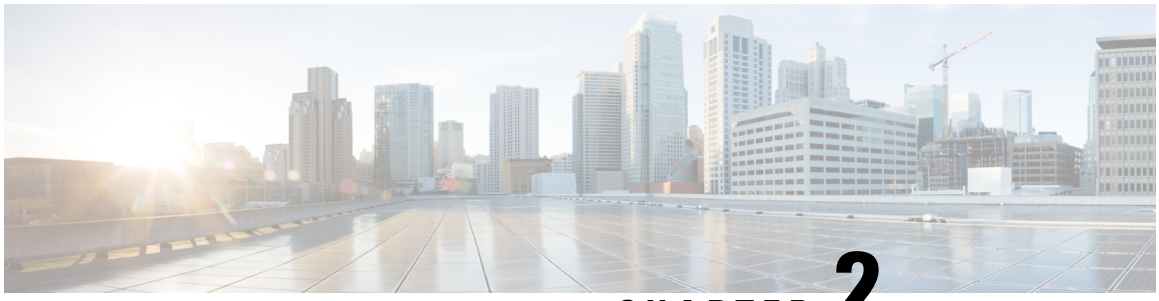
```
RP/0/RP0/CPU0:ios#show ntp status
Sun Nov 5 15:14:36.949 UTC

Clock is synchronized, stratum 3, reference is 4.33.0.51
nominal freq is 1000000000.0000 Hz, actual freq is 44881851.3383 Hz, precision is 2**24
reference time is E8F22D7A.AB020D97 (15:04:26.668 UTC Sun Nov 5 2023)
clock offset is 9.690 msec, root delay is 2.553 msec
root dispersion is 24.15 msec, peer dispersion is 2.13 msec
loopfilter state is 'CTRL' (Normal Controlled Loop), drift is 0.0000212807 s/s
system poll interval is 128, last update was 610 sec ago
authenticate is disabled, panic handling is disabled,
hostname resolution retry interval is 1440 minutes.
```

Verifies that the clock is synchronized with the NTP server.

NTP Troubleshooting Information

For NTP troubleshooting information, see here.



CHAPTER 2

Perform Preliminary Checks

After successfully logging into the console, you must perform some preliminary checks to verify the default setup. If any setup issue is detected, take corrective action before making further configurations.

Note

- Refer to System Health Check for monitoring systems in a network to proactively prevent potential issues and take preventative steps.

Inventory Support in NCS 1014

Table 2: Feature History

Feature Name	Release Information	Description
Inventory Support	Cisco IOS XR Release 7.11.1	Inventory support and pluggable optics support for QSFP28,QSFP-DD and Coherent Interface Module (CIM 8) are enabled in NCS 1014 system.

The NCS 1014 inventory model consists of the following components.

- One NCS 1014 controller card.
- NCS 1014 chassis.

- Two AC or DC power supply units (PSU) of 2KW and 2.5KW.
- Three FAN trays.
- Four line cards.

The components are connected to a 2RU chassis. NCS 1014 can support upto four line cards at once at any given point in time. The line cards supported are 1.2T, NCS1K4-2.4T-K9, CCMD-16-C and CCMD-16-L cards.

Note **CCMD-16-C**: refers to the NCS1K14-CCMD-16-C card.

CCMD-16-L: refers to the NCS1K14-CCMD-16-L card.

1.2T : refers to the NCS1K4-1.2T-K9 C-band card.

2.4T: refers to the NCS1K4-2.4T-K9 C-band card.

The show inventory command retrieves and displays the inventory information about each Cisco product in the form of a Unique Device Identifier (UDI). The UDI is a combination of three separate data elements: a product identifier (PID), a version identifier (VID), and the serial number (SN). The PID is the name by which the product is ordered. It is also known as product name or part number.

The VID is the version of the product. Whenever a product is upgraded the VID gets incremented according to the changes added. The SN is the vendor based unique serial number assigned to any product. It is used to identifying any specific product.

Verify Inventory

The **show inventory** command displays the details of the hardware inventory of NCS 1014.

To verify the inventory information for all the physical entities, use the following command.

show inventory [all | details | fan | power | vendor-type | raw | chasis | word] [location | *location* **]**.

Note The various options available under **show inventory** command are listed below.

- **Word**: Partially qualified location specification
- **All**: Inventory information for all the physical entities
- **Chassis**: Inventory information about chassis
- **Details**: Detailed entity information
- **Fan**: Inventory information about fan
- **Location**: Location of node for inventory
- **Power**: Inventory information about power
- **Raw**: Raw information
- **Vendor-type**: Vendor type information

Example

```
RP/0/RP0/CPU0:ios#show inventory ?
  WORD         Partially qualified location specification
  all          Inventory information for all the physical entities
  chassis      Inventory information about chassis
  details      detailed entity information
  fan          Inventory information about fan
  location     Location of node for inventory
  power        Inventory information about power
  raw          raw information
  vendor-type  vendor-type information
  |            Output Modifiers
  <cr>
```

Procedure

show inventory

When you execute this command in the Cisco IOS XR EXEC mode, it displays the summary of NCS 1014 inventory based on different card and optics pluggables on all the slots or ports.

Example:

```

Verify Status of Hardware Components

To verify the status of all the hardware components installed on NCS 1014, perform the following procedure.

Before you begin

Ensure that all the required hardware components are installed on NCS 1014. For installation details, see *Cisco Network Convergence System 1014 Hardware Installation Guide*.

Procedure

Step 1 **show platform**

When you execute this command from the Cisco IOS XR EXEC mode, the status of Cisco IOS XR is displayed.

Example:

```
RP/0/RP0/CPU0:ios#show platform
Node              Type                       State                     Config state
--------------------------------------------------------------------------------
0/RP0/CPU0        NCS1K14-CNTLR-K9(Active) IOS XR RUN                NSHUT,NMON
0/PM0             NCS1K4-AC-PSU            OPERATIONAL               NSHUT,NMON
0/PM1             NCS1K4-AC-PSU            OPERATIONAL               NSHUT,NMON
0/FT0             NCS1K14-FAN              OPERATIONAL               NSHUT,NMON
0/FT1             NCS1K14-FAN              OPERATIONAL               NSHUT,NMON
0/FT2             NCS1K14-FAN              OPERATIONAL               NSHUT,NMON
0/0/NXR0          NCS1K4-1.2T-K9           OPERATIONAL               NSHUT,NMON
0/1/NXR0          NCS1K14-2.4T-K9          OPERATIONAL               NSHUT,NMON
```

```
0/2/NXR0          NCS1K4-1.2T-K9           OPERATIONAL              NSHUT,NMON
0/3/NXR0          NCS1K4-1.2T-K9           OPERATIONAL              NSHUT,NMON
```

Step 2 **show inventory**

Displays details of the physical entities of NCS 1014 along with the details of QSFPs when you execute this command in Cisco IOS XR EXEC mode.

Example:

```
RP/0/RP0/CPU0:ios#show platform
Node              Type                       State                    Config state
--------------------------------------------------------------------------------
0/RP0/CPU0        NCS1K14-CNTLR-K9(Active) IOS XR RUN               NSHUT,NMON
0/PM0             NCS1K4-AC-PSU            OPERATIONAL              NSHUT,NMON
0/PM1             NCS1K4-AC-PSU            OPERATIONAL              NSHUT,NMON
0/FT0             NCS1K14-FAN              OPERATIONAL              NSHUT,NMON
0/FT1             NCS1K14-FAN              OPERATIONAL              NSHUT,NMON
0/FT2             NCS1K14-FAN              OPERATIONAL              NSHUT,NMON
0/0/NXR0          NCS1K4-1.2T-K9           OPERATIONAL              NSHUT,NMON
0/1/NXR0          NCS1K14-2.4T-K9          OPERATIONAL              NSHUT,NMON
0/2/NXR0          NCS1K4-1.2T-K9           OPERATIONAL              NSHUT,NMON
0/3/NXR0          NCS1K4-1.2T-K9           OPERATIONAL              NSHUT,NMON

Step 2 show inventory

RP/0/RP0/CPU0:ios#show inventory

NAME: "Rack 0", DESCR: "Network Convergence System 1014 chassis with timing support"

```

Verify Software Version

NCS 1014 is shipped with the Cisco IOS XR Software preinstalled. Verify that the latest version of the software is installed.

Procedure

show version

Displays the software version and details such as system uptime.

Example:

```
RP/0/RP0/CPU0:ios#sh version
Cisco IOS XR Software, Version 7.11.1.49I LNT
Copyright (c) 2013-2023 by Cisco Systems, Inc.

Build Information:
 Built By     : sajshah
 Built On     : Sun Nov 19 20:31:06 UTC 2023
 Build Host   : iox-ucs-077
 Workspace    :
/auto/ioxdepot6/GISO/giso_build_lindt/giso_eng_create/yshivapp_2023-11-20_04-28-49_UTC
 Version      : 7.11.1.49I
 Label        : 7.11.1.49I-Weekly

cisco NCS1010 (C3758R @ 2.40GHz)
cisco NCS1014 (C3758R @ 2.40GHz) processor with 32GB of memory
KEPLER_PF6 uptime is 1 hour, 40 minutes
NCS 1014 - Chassis
```

Verify Environmental Parameters

The **show environment** command displays the environmental parameters of NCS 1014.

To verify the environmental parameters use the following commands **show environment [all | altitude | fan | power | voltage | current | temperature] [location |** *location* **]**.

The following example shows sample output of the **show environment** command with the **fan** keyword.

```
RP/0/RP0/CPU0:ios#show environment fan
==============================================================
                                                Fan speed (rpm)
Location      FRU Type                          FAN_0    FAN_1
--------------------------------------------------------------

0/PM0         NCS1K4-DC-PSU-2                    11520   11216
0/PM1         NCS1K4-DC-PSU-2                    12256   12128
0/FT0         NCS1K14-FAN                        11400    9960
0/FT1         NCS1K14-FAN                        11340    9960
0/FT2         NCS1K14-FAN                        11400    9960
```

The following example shows sample output of the **show environment** command with the **power** keyword.

```
RP/0/RP0/CPU0:ios#sh environment power

Verify Management Interface Status

To verify the management interface status, perform the following procedure.

Procedure

show interfaces mgmtEth *instance*

Displays the management interface configuration.

Example:

```
RP/0/RP0/CPU0:ios#show interfaces MgmtEth 0/RP0/CPU0/0
MgmtEth0/RP0/CPU0/0 is up, line protocol is up
  Interface state transitions: 3
  Hardware is Management Ethernet, address is 4014.82ba.d26e (bia 4014.82ba.d26e)
  Internet address is 10.105.57.37/25
  MTU 1514 bytes, BW 1000000 Kbit (Max: 1000000 Kbit)
     reliability 255/255, txload 0/255, rxload 0/255
  Encapsulation ARPA,
  Full-duplex, 1000Mb/s, CX, link type is autonegotiation
  loopback not set,
  Last link flapped 00:09:12
  ARP type ARPA, ARP timeout 04:00:00
  Last input 00:00:00, output 00:00:00
  Last clearing of "show interface" counters never
  5 minute input rate 1000 bits/sec, 2 packets/sec
  5 minute output rate 5000 bits/sec, 1 packets/sec
     6715 packets input, 640515 bytes, 0 total input drops
     0 drops for unrecognized upper-level protocol
     Received 2213 broadcast packets, 4430 multicast packets
              0 runts, 0 giants, 0 throttles, 0 parity
     0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
     944 packets output, 355004 bytes, 0 total output drops
     Output 94 broadcast packets, 114 multicast packets
     0 output errors, 0 underruns, 0 applique, 0 resets
     0 output buffer failures, 0 output buffers swapped out
     3 carrier transitions
```

In the previous output, the management interface is administratively down.

You can also use the **show interfaces summary** and **show interfaces brief** commands in the Cisco IOS XR EXEC mode to verify the management interface status.

The following example shows sample output from the **show interfaces summary** command.

```
RP/0/RP0/CPU0:ios#show interfaces summary
Interface Type          Total    UP       Down     Admin Down
--------------          -----    --       ----     ----------
ALL TYPES               5        2        0        3
--------------
IFT_ETHERNET            2        1        0        1
IFT_NULL                1        1        0        0
IFT_PTP_ETHERNET        2        0        0        2
```

The following example shows sample output from the **show interfaces brief** command.

```
RP/0/RP0/CPU0:KEPLER_PF6#show interfaces brief

               Intf       Intf        LineP              Encap  MTU        BW
               Name       State       State               Type (byte)    (Kbps)
-------------------------------------------------------------------------------
                Nu0          up          up               Null  1500          0
     Mg0/RP0/CPU0/0          up          up               ARPA  1514    1000000
     Mg0/RP0/CPU0/1  admin-down  admin-down               ARPA  1514    1000000
     PT0/RP0/CPU0/0  admin-down  admin-down               ARPA  1514    1000000
     PT0/RP0/CPU0/1  admin-down  admin-down               ARPA  1514    1000000
```

What to do next

If the management interface is administratively down, perform the following steps:

- Check the Ethernet cable connection.
- Verify the IP configuration of the management interface. For details on configuring the management interface, see Configure Management Interface.
- Verify whether the management interface is in the no shut state using the **show running-config interface mgmtEth** command.

  The following example shows sample output from the **show running-config interface mgmtEth** command.

  ```
  RP/0/RP0/CPU0:ios#show running-config interface mgmtEth 0/RP0/CPU0/0
  interface MgmtEth0/RP0/CPU0/0
   ipv4 address 10.105.57.37 255.255.255.128
  !
  ```

Verify Firmware Version

The firmware on various hardware components of NCS 1014 must be compatible with the installed Cisco IOS XR image. Incompatibility may cause the NCS 1014 to malfunction.

To verify the firmware version, perform the following procedure.

Before you begin

Procedure

Step 1 **show hw-module fpd**

Example:

```
RP/0/RP0/CPU0:ios#show hw-module fpdAuto-upgrade:Enabled

```

- Status—Upgrade status of the firmware. The different states are:
  - CURRENT—The firmware version is the latest version.
  - NOT READY—The firmware of the FPD is not ready for upgrade.

- NEED UPGD—A newer firmware version is available in the installed image. We recommended that upgrade be performed.
- UPGD PREP—The firmware of the FPD is preparing for upgrade.
- RLOAD REQ—The upgrade is completed, and the card requires a reload.
- UPGD DONE—The firmware upgrade is successful.
- UPGD FAIL—The firmware upgrade has failed.
- UPGD SKIP—The upgrade is skipped because the installed firmware version is higher than the version available in the image.
- Running—Current version of the firmware running on the FPD.

Step 2 **show fpd package**

Use the **show fpd package** command to display the FPD image version available with this software release for each hardware component.

Example:

```
RP/0/RP0/CPU0:ios#show fpd package

================================ ============================================
                                          Field Programmable Device Package

```

What to do next

Upgrade all the FPDs using the **upgrade hw-module location all fpd all** command in the Cisco IOS XR EXEC mode. After upgrade is completed, the Status column shows RLOAD REQ if the software requires reload.

If Reload is required

If the FPGA location is 0/RP0, use the **admin hw-module location 0/RP0 reload** command. This command reboots only the CPU. As a result, traffic is not impacted. If the FPGA location is 0/0, use the **admin hw-module location all reload** command. This command reboots the chassis. As a result, traffic is impacted. After the reload is completed, the new FPGA runs the current version.

If Firmware Upgrade Fails

If firmware upgrade fails, use the **show logging** command to view the details and upgrade the firmware again using the above commands.

Note You can upgrade the firmware version of power modules, only when both the power modules are present and powered on.

Verify Alarms

You can view the alarm information using the **show alarms** command.

Procedure

show alarms [**brief** [**card** | **rack** | **system**] [**location** *location*] [**active** | **history**] | **detail** [**card** | **rack** | **system**] [**location** *location*] [**active** | **clients** | **history** | **stats**]]

Displays alarms in brief or detail.

Example:

```
RP/0/RP0/CPU0:ios#show alarms brief card location 0/RP0/CPU0 active

------------------------------------------------------------------------------------------

0/3             Major        Ethernet         11/21/2023 11:12:05 UTC
HundredGigECtrlr0/3/0/10 - Local Fault
```

Note In the maintenance mode, all the alarms are suppressed and the **show alarms** command will not show the alarms details. Use the **show controllers** *controllertype R/S/I/P* command to view the client and trunk alarms.

Verify Context

The **show context** command displays core dump context information of NCS 1014.

Procedure

show context

When you excecute the **show context** command in Cisco IOS XR EXEC mode, the output displays the core dump context information of any process on the NCS 1014 as well as up to 10 last instances.

Example:

```
RP/0/RP0/CPU0:ios#sh context

node: node0_RP0_CPU0
Context number: 1
------------------------------------------------------------------
Core location: 0/RP0/CPU0:/misc/disk1

Core for pid = 6232 (Terminal_Device)
Core for process: opt_terminal_device_6232.by.11.20231204-170249.node0_RP0_CPU0.877b9.core.gz
Core dump time: 2023-12-04 17:02:50.144240146 +0000

Process:
Core was generated by `opt_terminal_device'.

Verify Core Files

The **dir harddisk:/*core.gz** command checks for core files of NCS 1014.

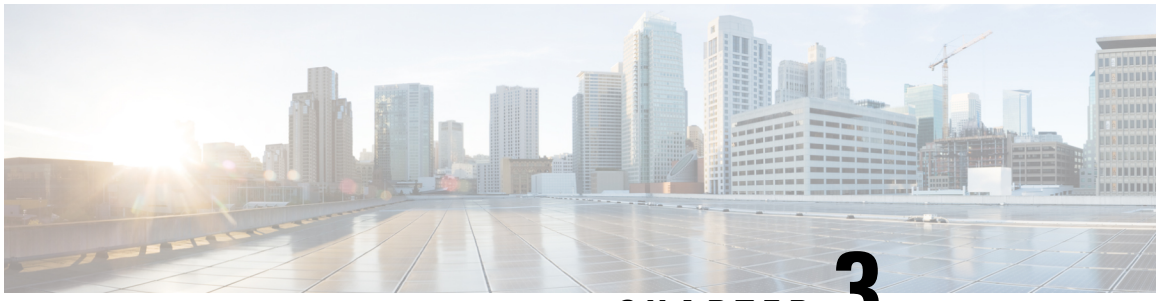
Procedure

dir harddisk:/*core.gz

Example:

```
RP/0/RP0/CPU0:ios#dir harddisk:/*core.gz
Wed Dec 6 04:54:16.336 UTC

Directory of harddisk:/*core.gz
2476 -rw-r--r--. 1 8120038 Oct 30 15:08
cma_server_41264.by.6.20231030-150817.node0_RP0_CPU0.502a7.core.gz
```



CHAPTER 3

Perform System Upgrade and Install Feature Packages

You can execute the system upgrade and package installation processes using the **install** commands on NCS 1014. The processes involve adding and activating the ISO images (*.iso*) and feature packages (*.rpm*) on NCS 1014. You can accesss these files from a network server and then activate on NCS 1014. If the installed package or SMU causes any issue, you can uninstall it.

Note We recommend that you collect the output of **show tech-support ncs1014** command before performing operations such as a reload or CPU OIR on NCS 1004. The command provides information about the state of the system before reload or before the CPU OIR operation is performed. This information is useful in debugging.

Upgrade Software

Upgrading the software is the process of installing a new version of the Cisco IOS XR operating system on NCS 1014. NCS 1014 is preinstalled with the Cisco IOS XR image. However, you can install a new version to keep features up to date. You can perform the software upgrade operation using an ISO image from the XR mode.

Note NCS1014 and NCS1014 platform uses the same IOS-XR packaging image. Nomenclature of ISO image of IOS-XR base image example: "ncs1010-x64-[sw-rel-ver].iso'.

Before you begin

- Configure Management Interface
- Copy the ISO image to be installed either on the NCS 1014 hard disk or on a network server to which NCS 1014 has access.

Procedure

Step 1 Execute one of these commands:

Installs the new ISO image from the harddisk or from the network server. The install operation takes between 20–40 minutes to complete.

- **install replace /harddisk:/***iso-image-name*
- **install package replace** *<ftp or http or https protocol>/package_path/ filename1 filename2 ...*

Note The **install package replace** command upgrades the ISO image but doesn't reload the RP automatically. But the **install replace** command upgrades the ISO image and reloads the RP.

Example:

```
RP/0/RP0/CPU0:ios#install replace /harddisk:/ncs1010-x64-7.11.1.iso
Wed Nov 15 09:44:44.491 UTC
Once the packaging dependencies have been determined, the install operation may have to
reload the system.
If you want to control the timing of system reload, you must not continue, but use the
'install package replace' command instead, followed by 'install apply'.
Continue? [yes/no]:[yes]
Install replace operation 1.1 has started
Install operation will continue in the background
.......................
.......................
ios con0/RP0/CPU0 is now available
```

Note Boot time FPD upgrade happens before XR boot. All the FPDs belonging to the RP location are upgraded during the boot time FPD upgrade.

Note Automatic Field Programmable Device(FPD) upgrade is enabled by default.. When the automatic FPD upgrade is enabled, the install operation also upgrades the FPDs (except the Golden FPDs and Power modules) that need to be upgraded.

Step 2 **show install request**

Displays the current status of the install operation.

Example:

```
RP/0/RP0/CPU0:ios#show install request
Wed Nov 15 10:00:35.713 UTC
User request: install replace /harddisk:/ncs1010-golden-x86_64-7.11.1.48I-Weekly.iso
Operation ID: 1.1
State:In progress since 2023-11-15 09:50:23 UTC
Current activity:    Package add or other package operation
Next activity:       Apply
Time started:        2023-11-15 09:55:24 UTC
Timeout in:          84m 43s
```

```
Locations responded: 0/1
Location          Packaging operation stage Notification Phase Clients responded
----------------- ------------------------- ------------------ -----------------
0/RP0/CPU0        Package operations        None in progress                N/A
```

When the install operation completes successfully, the device automatically reloads.

Note In case of the **install package replace** command, you'll be prompted to enter the next command (**install apply reload** command).

Step 3 **install commit**

Commits the new ISO image.

Example:

```
RP/0/RP0/CPU0:ios#install commit
Wed Nov 15 10:38:00.592 UTC
Install commit operation 1 has started
Install operation will continue in the background
```

Example:

Note It is the mandatory to commit the install successfully to upgrade the software, missing this step followed by any controller reload/restart/power cycle will result in rollback to previously installed committed software/RPM package version.

Step 4 **show install committed**

Displays the commited package information.

Example:

```
RP/0/RP0/CPU0:ios#show install committed
Wed Nov 15 10:41:20.454 UTC
Software Hash: ec69dcceb81c0da69b297aa7de1d00f56b8aef52403c5e0ffe6e5db098bd83b8
Package                                                                      Version
-------------------------------------------------------------------------------------
xr-aaa                                                                 7.11.1.48Iv1.0.0-1
xr-acl                                                                 7.11.1.48Iv1.0.0-1
xr-apphosting                                                          7.11.1.48Iv1.0.0-1
xr-appmgr                                                              7.11.1.48Iv1.0.0-1
xr-bcdl                                                                7.11.1.48Iv1.0.0-1
xr-bfd                                                                 7.11.1.48Iv1.0.0-1
xr-bgp                                                                 7.11.1.48Iv1.0.0-1
xr-bgputil                                                             7.11.1.48Iv1.0.0-1
xr-bng-stubs                                                           7.11.1.48Iv1.0.0-1
xr-bundles                                                             7.11.1.48Iv1.0.0-1
```

Install Packages and RPMs

Complete this task to install additional packages or rpm files. The rpm files that need to be installed must be placed in a folder.

Note This task can be used to install SMUs as well.

Before you begin

- Configure and connect to the management interface. You can access the installable file through the management interface. For details about configuring the management interface, see Workflow for Install Process.
- Copy the package or rpm to be installed either on the NCS 1014 hard disk or on a network server to which NCS 1014 has access.

Procedure

Step 1 **install package add source /harddisk:/** *iso-image-name or rpm-folder-name*

Example:

```
RP/0/RP0/CPU0:ios#install package add source harddisk:/rpm
Wed Nov 15 18:10:14.784 UTC

Install add operation 2.1.2 has started
Install operation will continue in the background
```

```
RP/0/RP0/CPU0:ios#install package add source harddisk:/rpm/
Thu Apr 20 18:09:49.582 UTC
Install add operation 7.1.1 has started
Install operation will continue in the background
```

Ensure to add the respective packages or rpm files as appropriate. This operation may take time depending on the size of the files that are added. The operation takes place in an asynchronous mode. The **install package add source** command runs in the background, and the EXEC prompt is returned.

Step 2 **show install request**

Example:

```
RP/0/RP0/CPU0:ios#show install request

Thu Apr 20 18:13:00.720 UTC

User request: install package add source file:///harddisk:/rpm
Operation ID: 7.1.1
State:        Success since 2023-04-20 18:13:04 UTC

Current activity:    Await user input
Time started:        2023-04-20 18:13:04 UTC

The following actions are available:
    install package add
    install package remove
    install package upgrade
    install package downgrade
    install package abort latest
    install package abort all-since-apply
    install apply restart
    install apply reload
    install replace reimage

Least impactful apply method: install apply restart
```

Displays the current status of the install operation.

Step 3 **install apply reload**

Example:

```
RP/0/RP0/CPU0:ios#install apply

Thu Apr 20 18:13:18.514 UTC
Once the packaging dependencies have been determined, the install operation may have to
reload the system.
If you want more control of the operation, then explicitly use 'install apply restart' or
'install apply reload' as reported by 'show install request'.
Continue? [yes/no]:[yes] yes
Install apply operation 7.1 has started
Install operation will continue in the background
```

Enables NCS 1014 to reload.

Step 4 **show install request**

Example:

```
RP/0/RP0/CPU0:ios#show install request
Thu Apr 20 18:15:06.876 UTC

User request: install apply restart
Operation ID: 7.1
State:        Success since 2023-04-20 18:14:41 UTC

Current activity:    Await user input
Time started:        2023-04-20 18:14:41 UTC

The following actions are available:
install package add
install package remove
install package upgrade
install package downgrade
install package replace
install package rollback
install replace
install rollback
install source
install commit
install replace reimage
```

Displays the current status of the install operation.

Step 5 **install commit**

Example:

```
RP/0/RP0/CPU0:ios#install commit
Thu Apr 20 18:15:17.620 UTC
Install commit operation 7 has started
Install operation will continue in the background
```

Commits the package or rpm files.

Step 6 **show install request**

Example:

```
RP/0/RP0/CPU0:ios#show install request

User request: install commit
Operation ID: 2
State:        In progress since 2022-07-04 11:48:48 UTC

Current activity:    Commit transaction
```

```
Next activity:       Transaction complete
Time started:        2022-07-04 11:48:48 UTC

No per-location information.
```

Displays the current status of the install operation. The above output indicates that the install operation is in progress.

Example:

```
RP/0/RP0/CPU0:ios#show install request

User request: install commit
Operation ID: 2
State:        Success since 2022-07-04 11:50:32 UTC

Current activity:    No install operation in progress

The following actions are available:
    install package add
    install package remove
    install package upgrade
    install package downgrade
    install package replace
    install package rollback
    install replace
    install rollback
    install source
```

Displays the current status of the install operation. The above output indicates that the install operation is complete.

Step 7 **show install request**

Example:

```
RP/0/RP0/CPU0:ios#show install request

User request: install commit
Operation ID: 2
State:        Success since 2022-07-04 11:50:32 UTC

Current activity:    No install operation in progress

The following actions are available:
    install package add
    install package remove
    install package upgrade
    install package downgrade
    install package replace
    install package rollback
    install replace
    install rollback
    install source
```

Displays the current status of the install operation. The above output indicates that the install operation is complete.

Step 8 **show install active summary**

Example:

```
RP/0/RP0/CPU0:ios#show install active summary
Wed Nov 15 18:20:38.783 UTC
Active Packages: XR: 160 All: 1318
Label: 7.11.1.48I-Weekly
```

```
Software Hash: ec69dcceb81c0da69b297aa7de1d00f56b8aef52403c5e0ffe6e5db098bd83b8

Optional Packages                                   Version
--------------------------------------------------- ----------------------------
xr-bgp 7.11.1.48I                                   v1.0.0-1

xr-track 7.11.1.48I                 v1.0.0-1

--------------------------------------------------- ----------------------------
```

Displays the list of committed packages and rpm files.

Related Commands

The following commands can be used to track the status of the install operation.

Related Commands	Purpose
show install active	Displays the list of active packages.
show install committed	Displays the list of committed packages.
show install log	Displays the log information for the install operation. This information is used for troubleshooting in case of installation failure.
show install package	Displays the details of the packages that are added to the repository. Use this command to identify individual components of a package.
show install request	Displays the current status of the install operation.
show install which	Displays the package information on an installed file.

Upgrade FPD

A Field Programmable Device (FPD) refers to any programmable hardware device on a system which includes a Field Programmable Gate Array (FPGA). You can use the following tasks to verify and upgrade the FPDs of line cards, which are critical for chassis operation.

The following table lists the NCS 1014 FPDs that are distributed across Route Processor (RP), Power Modules (PM), Line Cards (LC), and Rack.

Table 3: NCS 1014 FPDs

Location	FPDs
RP	• ADM-DB • ADM-MB • BIOS • BIOS-Golden • CpuFpga • CpuFpgaGolden • SsdIntelS4510 • SsdIntelSC2KB • SsdMicron5300 • TamFw • TamFwGolden
PM0 and PM1	• PO-PriMCU • PO-SecMCU
LC	• CpuModFw • OptModFw
Rack	• ADM-CHASSIS • IoFpga • IoFpgaGolden • SsdIntelSC2KB

Golden FPDs serve as backup FPDs for the primary FPDs. For example, **BIOS-Golden** is the backup Golden FPD for the **BIOS** primary FPD. If a primary FPD is corrupted, NCS 1014 boots with the corresponding Golden FPD. The Golden FPDs cannot be upgraded.

Retrieve FPD Information

There are multiple types of FPDs for each type of module. The **show hw-module fpd** command provides information about each FPD.

```
RP/0/RP0/CPU0:ios#show hw-module fpd
Wed Nov 15 19:29:37.061 UTC

Auto-upgrade:Enabled
Attribute codes: B golden, P protect, S secure, A Anti Theft aware

```

The following table describes the significant fields in the output of the **show hw-module fpd** command.

Table 4: Description of Fields in show hw-module fpd Command

Field	Description
Location	Location of the FPD.
Card type	PID of the modules such as chassis, card, CPU, and PSU.
HWver	Hardware version where the FPD resides.
FPD device	Name of the FPD.
ATR	Attribute codes. The possible values are: • B - Golden Image • S - Secure Image • P - Protect Image The attribute code of the primary FPDs is S and the Golden FPDs is BS.
Status	Status of the FPD. See Table 5: Description of FPD Status Values in show hw-module fpd Command Output, on page 65.
Running	FPD image version that has been activated and currently running in the FPD device.

Field	Description
Programd	FPD image version that has been programmed into the FPD device, but might not be activated.
Reload Loc	Indicates whether reload of the location is required or not.

The following table describes the possible values of the **Status** field in the output of the **show hw-module fpd** command.

Table 5: Description of FPD Status Values in show hw-module fpd Command Output

FPD Status	Description
NOT READY	The driver that owns the FPD device has not initialized the FPD client to handle this device.
CURRENT	FPD version is up-to-date and upgrade is not required.
NEED UPGD	Upgrade is required for this FPD. Check the output of the **show fpd package** command to determine the recommended FPD version.
UPGD PREP	FPD is preparing for upgrade.
IN QUEUE	Upgrade of this FPD is in queue.
UPGD SKIP	FPD upgrade is not required. For example, • FPD version is up-to-date and compatible. • FPD image is protected.
UPGRADING	FPD upgrade has started and the driver has not reported the upgrade progress information yet.
%UPGD	Percentage of FPD upgrade completion.
RLOAD REQ	FPD upgrade is successful and the FPD must be reloaded for the new version to take effect.
UPGD FAIL	FPD upgrade has failed.Check the syslog for any timeout messages or any failure reported by the driver.
UPGD DONE	FPD upgrade is successfull.

Verify if an FPD Upgrade is Required

Procedure

Step 1 Use the **show hw-module fpd** command to check whether all the FPDs are in the Current state.

If the status of any FPD is **NEED UPGD**, then the upgrade is required for that FPD.

Step 2 Use the **show fpd package** command to determine the FPDs that are supported with the current software release and the minimum hardware requirements for each FPD.

```
RP/0/RP0/CPU0:ios#show  fpd package
Mon Dec  4 15:37:36.521 UTC

```

The following table describes the fields in the output of the **show fpd package** command.

Table 6: Description of Fields in show fpd package Command

Field	Description
Card Type	PID of the modules such as chassis, card, CPU, and PSU.
FPD Description	Description of the FPD.
Req Reload	Determines whether reload is required to activate the FPD image.
SW Ver	Recommended FPD software version for the associated module running the current Cisco IOS XR Software.
Min Req SW Ver	Minimum required FPD software version to operate the module.
Min Req Board Ver	Minimum required hardware version for the associated FPD. A minimum hardware requirement of version 0.0 indicates that all the hardware can support this FPD version.

FPD can be upgraded using two methods:

- Manual FPD Upgrade
- Automatic FPD upgrade

Manual FPD Upgrade

Use the following procedure to upgrade the FPDs manually.

Procedure

Step 1 Use the **upgrade hw-module location** *[location-id]* **fpd** *[fpd name]* command to upgrade a specific FPD.

Note FPD upgrades are non-traffic affecting.

Example:

```
RP/0/RP0/CPU0:ios#upgrade hw-module location 0/0/NXR0 fpd CPUModFw
```

Step 2 Use the **show hw-module fpd** command to display information about the completed FPD upgrade.

Step 3 (Optional) Use the **upgrade hw-module location** *[location-id]* **fpd** *[fpd name]* **force** command toforcibly upgrade a specific FPD irrespective of whether the upgrade is required or not.

Example:

```
RP/0/RP0/CPU0:ios#upgrade hw-module location 0/0/NXR0 fpd CPUModFw force
```

Step 4 Use the **reload location** *location-id* to reload the FPDs belonging to a specific location with the new version.

The **Reload Loc** field in the output of **show hw-module fpd** command indicates whether the reload is required or not.

Example:

```
RP/0/RP0/CPU0:ios#reload location 0/RP0/CPU0
```

Step 5 (Optional) Use the **upgrade hw-module location all fpd all** command to upgrade all the FPDs concurrently.

Example:

```
RP/0/RP0/CPU0:ios#upgrade hw-module location all fpd all
```

Note You cannot upgrade PSU FPD using **location all fpd all** command. You can excecute **Step 6** command to upgrade PSU FPD.

Step 6 (Optional) Use the **upgrade hw-module [location** [*location-id* | **all**]] **fpd** [*fpd name*] | **all**] command to upgrade a specific FPD, all the FPDs, or the FPDs belonging to a specific location.

Note You cannot forcefully upgrade FPDs of power modules and SSDs.

Automatic FPD upgrade

The automatic FPD upgrade automatically upgrades the firmware with the **NEED UPGD** status to **CURRENT** status. Use the **show hw-module fpd** command to view the latest status after the automatic upgrade is completed.

In NCS 1014, automatic FPD upgrade is enabled by default.

Procedure

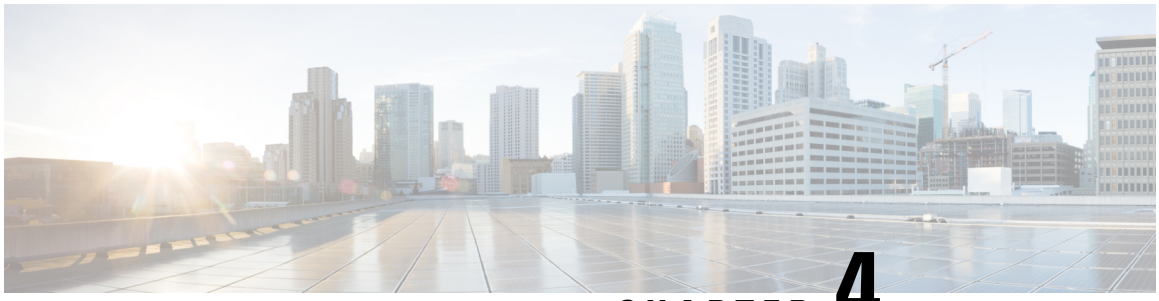
Use the following commands to disable automatic FPD upgrade.

Example:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#fpd auto-upgrade disable
RP/0/RP0/CPU0:ios(config)#commit
RP/0/RP0/CPU0:ios(config)#end
```

Note

- CpuModFw is upgraded during the automated FPD upgrade for cards NCS1K14-2.4T-K9 and NCS1K14-2.4T-L-K9.
- OptModFw is upgraded first followed by CpuModFw during automated FPD upgrade for the cards NCS1K14-CCMD-16-C, NCS1K14-CCMD-16-L, and NCS1K4-1.2T-K9.
- You cannot do an automatic upgrade for the FPD power module.



CHAPTER 4

Disaster Recovery

This chapter describes the disaster recovery process and the health check feature.

Overview

There are two partitions in NCS 1014: RP SSD (CPU partition) and chassis SSD (Disaster Recovery partition). The Disaster Recovery partition contains all the backup configurations such as ISO images, RPMs, and system configuration files. When the node is corrupted, the Disaster Recovery feature allows the CPU to be replaced with the existing configuration. After replacing the CPU, the node reboots and comes up by restoring the software and configuration files from the chassis SSD without traffic loss.

Note When Chassis SSD is corrupted and replaced, chassis SSD takes backup of the running software and configuration files from the RP SSD without traffic loss.

CPU Replacement Considerations

You must consider the following points for CPU replacement.

- When the CPU is removed from the chassis, NCS 1014 chassis runs in headless mode which is non-traffic impacting.
- When the CPU is replaced with another CPU having the same software and RPMs as in the chassis SSD, the configuration is restored from the chassis SSD.
- When the CPU is replaced with another CPU having different software and RPMs as in the chassis SSD, the Disaster recovery process starts. In this case, the node boots with the software from the chassis SSD and the configuration is also restored from the chassis SSD.

Chassis SSD Replacement Considerations

The chassis SSD can be removed in NCS 1014.

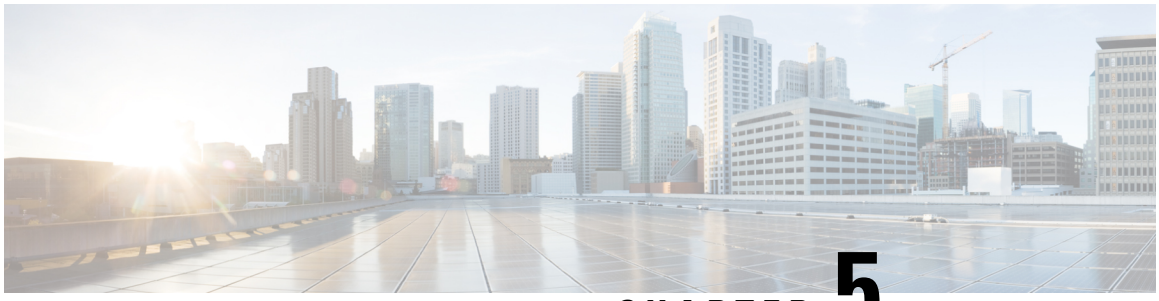
You must consider the following points for chassis SSD replacement.

- When the chassis SSD is removed while the RP is running, Disaster Recovery boot is disabled and an alarm is raised.
- When the chassis SSD is removed, the Disaster Recovery Unavailable alarm is raised.
- When the chassis SSD is replaced with another chassis SSD having the same software and RPMs as in the CPU SSD, the configuration is backed up from the CPU SSD.
- When the Chassis SSD is replaced with another chassis SSD having different software and RPMs as in the CPU SSD, software, RPMs, and the configuration are backed up from the CPU SSD.
- When the Chassis SSD is replaced with a spare received from Cisco manufacturing or RMA process, software, RPMs, and the configuration are backed up from the CPU SSD.

Health Check of Backup ISO Image

The Health Check feature ensures error-free booting of NCS 1014 chassis during disaster recovery operations. NCS 1014 has a partition for disaster recovery where the backup ISO image is stored. The backup ISO image is stored in the chassis SSD.

The chassis SSD content is audited against the running software by the install process in the background every 12 hours to detect corruption. If the ISO image is corrupted, the software will recover it by copying from the backup location. If the software fails to synchronize with the chassis SSD, then the **Disaster Recovery ISO Image Corruption** alarm is raised. See the *Troubleshooting Guide for Cisco NCS 1014* to clear the alarm.



CHAPTER 5

Connection Verification

This chapter describes the tasks to verify connection between the OLT Line Card of NCS 1010 and NCS1K14-CCMD-16-C line card.

Power Data Reading

Photodiodes (PDs) are optical power monitors available on all input and aggregated output ports to monitor power levels. Tone detection is enabled on some PD monitors.

Table 7: NCS1K-CCMS-16 Calibrated Port References

Photodiode	Port Calibrated	Port Label (Direction)	Minimum Power (dBm)	Maximum Power (dBm)	Dynamic Range (dBm)
PD 21	MPO-16 input ports	(TX)	–50	30	80
PD 22	MPO-16 output ports	(RX)	–50	30	80

Connection Verification

Connection verification checks the connection between the OLT line card and the CCMD-16 line cards to avoid miscabling during the node installation. The dedicated Connection Verification Tunable Laser (CV-TL) available at the OLT card generates a specific probe signal at a given frequency and power. This signal is detected by the CCMD-16 line card that is connected to the OLT line card.

For more information on the connection verification process, see Cisco NCS 1010 Datapath Configuration guide.

CCMD-16 Connection Verification with OLT

The OLT line card generates the tone and connection verification is performed using the OOB channel with CV-TL tuned at 191.175 THz. To univocally identify the optical path under test, the CV-TL is modulated with a low-frequency pattern including the Cable ID of the connection.

For connection verification toward the CCMD-16 card, the CV-TL is routed to the PD21 inside the CCMD-16 card. The out-of-band (OOB) connection is verified at PD21 and the in-band (IB) connection is verified at PD22 on the CCMD-16 line cards.

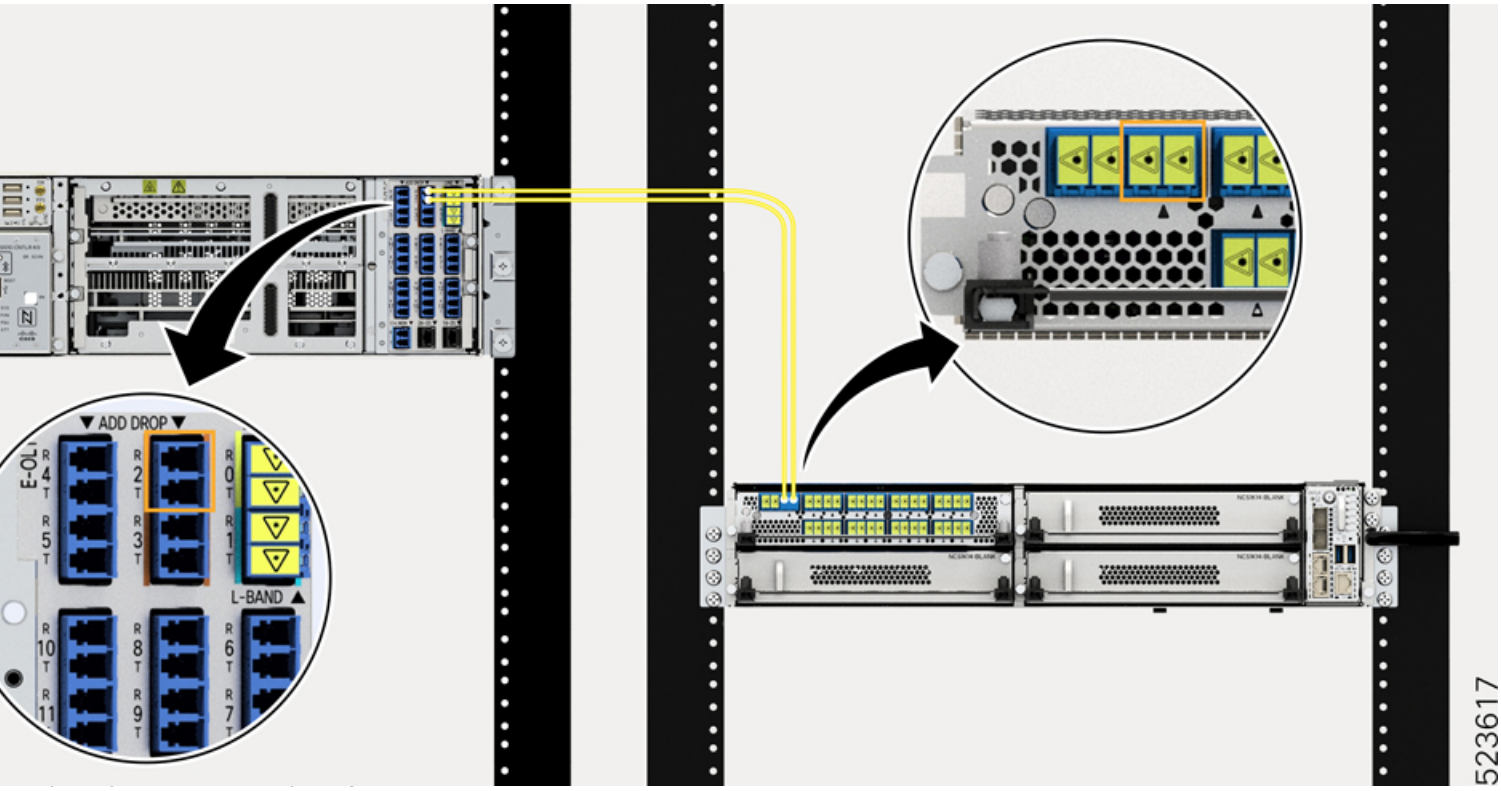
The PD monitors receiving a connection verification signal detect and buffer the Cable-ID pattern encoded in the tone to allow the connection verification process by the node controller.

Verify Connection for CCMD-16 Line Card

The connection verification procedure checks the connection between the OLT line card and CCMD-16 line cards to match the different instances with respect to the OLT LC connectors.

The OLT-C line card and the NCS1K-CCMD-16 line card are connected as shown in the following image:

Figure 1: NCS 1010 and NCS1K-CCMD-16



The OLT-C line card performs connection verification between the OLT-C line card and the NCS1KCCMD-16 line card panels as described in CCMD-16 Connection Verification with OLT, on page 74.

The identification/verification of the NCS1K-CCMD-16 line card is performed by checking the connection verification signal at the monitor present on the OOB and IB loops (PD21 and PD22 for the NCS1K-CCMD-16 line card respectively).

This task describes on how to verify the connection between the NCS 1010 OLT-C line card and NCS1K-CCMD-16 line card.

Before you begin

Configure the OTS controller in NCS 1010 to generate the tone for connection verification. See Cisco NCS 1010 Datapath Configuration Guide.

Procedure

Step 1 Configure the OMS controller to detect the tone for connection verification.

Example:

```
RP/0/RP0/CPU0:(config)#controller oms 0/1/0/0
RP/0/RP0/CPU0:(config-Oms)#tone-rate 2
RP/0/RP0/CPU0:(config-Oms)#tone-pattern-expected aabbccdd
RP/0/RP0/CPU0:(config-Oms)#tone-detect-oob
RP/0/RP0/CPU0:(config-Oms)#commit
```

tone-detect-oob must be configured on the OMS x/x/x/0 for NCS1K-CCMD-16.

Step 2 Use the **tone-pattern-detect** command to start the detection of tone pattern.

Example:

The following is a sample on starting the tone pattern detection on the OMS controller.

```
RP/0/RP0/CPU0:#tone-pattern-detect controller oms 0/1/0/0 start
Tue May 10 11:38:03.775 UTC
Tone pattern detect started
```

Step 3 Use the **tone-info** command to check for successful connection verification.

Example:

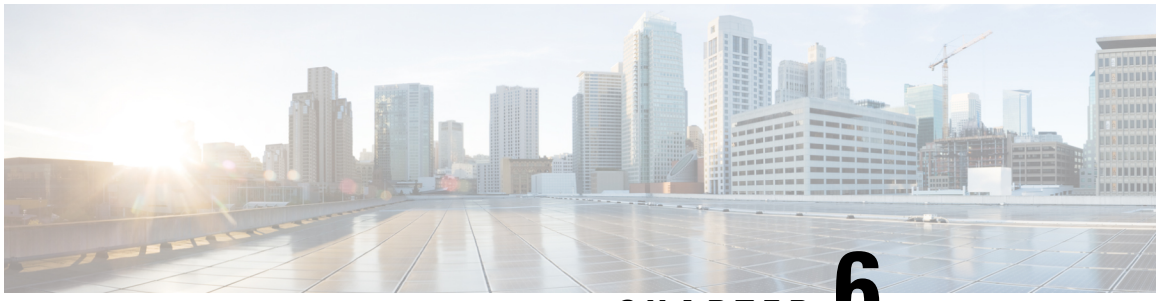
The following is a sample to view the Tone Info for successful connection verification on the OMS controller.

```
RP/0/RP0/CPU0:#show controllers oms 0/1/0/0 tone-info
Fri Sep 22 06:04:03.787 UTC
Tone Info:
Tone Rate : 2 bits/second
Tone Pattern Expected(Hex value) : aabbccdd
Tone Pattern Received(Hex value) : aabbccdd
Tone Detected OOB :  Enabled
Detection State: Success
```

Step 4 After successful connection verification, stop **tone-pattern-detect** on the OMS controller.

Example:

```
RP/0/RP0/CPU0:#tone-pattern-detect controller oms 0/1/0/0 stop
Fri Sep 22 06:23:15.165 UTC
Tone pattern detect stopped
```



CHAPTER 6

System Health Check

Monitoring systems in a network proactively helps prevent potential issues and take preventive actions. This chapter describes the tasks to configure and monitor system health check.

System Health Check

Proactive network monitoring systems play a pivotal role in averting any issues. NCS 1014 health check service lets you monitor physical characteristics, current processing status, and the curently utilized resources to quickly assess the condition of the device at any time. This service helps to analyze the system health by monitoring, tracking and analyzing metrics that are critical for functioning of the NCS 1014. The system health metrics are thresholds set on the device in order to monitor the usage of CPU and other system resources. The health check service is installed with the NCS 1014 RPM.

You can evaluate the system's health by examining the metric values. If these values cross or approach the set thresholds, it suggests potential problems. By default, metrics for system resources are configured with preset threshold values. You can customize the metrics to be monitored by disabling or enabling metrics of interest based on your requirement.

Each metric is tracked and compared with that of the configured threshold, and the state of the resource is classified accordingly.

The system resources metrics can be in one of these states:

- **Normal:** The resource usage is less than the threshold value.
- **Minor:** The resource usage is more than the minor threshold, but less than the severe threshold value.
- **Severe:** The resource usage is more than the severe threshold, but less than the critical threshold value.
- **Critical:** The resource usage is more than the critical threshold value.

The infrastructure services metrics can be in one of these states:

- **Normal:** The resource operation is as expected.
- **Warning:** The resource needs attention. For example, a warning is displayed when the FPD needs an upgrade.

Supported System Health Check Metrics

NCS 1014 supports the following system health check metrics:

- communication-timeout
- cpu
- filesystem
- fpd
- free-mem
- hw-monitoring
- lc-monitoring
- pci-monitoring
- platform
- process-resource
- process-status
- shared-mem
- wd-monitoring

Enable Health Check

To enable health check, perform the following steps:

Before you begin

Before enabling health check, ensure that:

- An IP address and subnet mask is assigned to the management interface.
- The IP address of the default gateway is configured with a static route.

For more details, see the Configure Management Interface section of the *Cisco NCS 1014 System Setup and Software Installation Guide*.

Procedure

Step 1 Enter into the configuration mode using the **configuration** command.

Step 2 Enable health check using the **healthcheck enable** command.

Example:

```
RP/0/RP0/CPU0:ios(config)# healthcheck enable
```

Step 3 Run the **netconf-yang agent ssh** command.

Example:

```
RP/0/RP0/CPU0:ios(config)# netconf-yang agent ssh
```

Step 4 Enable Google Remote Procedure Call (gRPC) using the **grpc local-connection** command.

Example:

```
RP/0/RP0/CPU0:ios(config)# grpc local-connection
```

Step 5 Commit the changes using the **commit** command.

Change Health Check Refresh Time

Cadence is the time interval, in seconds, at which the health check status is refreshed. By default, this time is 60 seconds which means that health check status is updated every 60 seconds. You can change this time using the **healthcheck cadence** *cadence-value* command.

The following example shows to change the health check cadence value to 50 seconds so that health check status is updated every 50 seconds.

```
RP/0/RP0/CPU0:ios(config)#healthcheck cadence 50
```

View Status of All Metrics

You can view the status of all the supported metrics with the associated threshold and configured parameters in the system. To check the status of all the metrics, perform these steps:

Procedure

Step 1 Run the **show healthcheck status** command.

Example:

```
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios#show healthcheck status
Sat Jun 12 02:00:25.204 UTC

Healthcheck status: Enabled
Time started: 12 Jun 02:00:22.392972

Collector Cadence: 30 seconds

METRICS STATS

System Resource metrics
   cpu
       Thresholds: Minor: 20%
                   Severe: 50%
                  Critical: 75%
```

```
        Tracked CPU utilization: 15 min avg utilization

    free-memory
        Thresholds: Minor: 10%
                    Severe: 8%
                  Critical: 5%

    filesystem
        Thresholds: Minor: 80%
                    Severe: 95%
                  Critical: 99%

    shared-memory
        Thresholds: Minor: 80%
                    Severe: 95%
                  Critical: 99%

Infra Services metrics
    platform

    fpd

Install Custom Metrics
    process-status

    process-resource

    communication-timeout

    pci-monitoring

    hw-monitoring

    wd-monitoring

    lc-monitoring

Use case
 Use cases are disabled
```

Step 2 To view the health state of the health check manager, use the **show healthcheck internal states** command.

Example:

```
RP/0/RP0/CPU0:ios#show healthcheck internal states
Sat Jun 12 02:00:55.425 UTC

 Internal Structure INFO

 Current state: Enabled

 Reason: Success

 Netconf Config State: Enabled

 Grpc Config State: Enabled

 Nosi state: Initialized

 Appmgr conn state: Connected

 Nosi lib state: Not ready

 Nosi client: Valid client
```

Step 3 To view the health state for each enabled metric, use the **show healthcheck report** command.

Example:

```
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios#show healthcheck report
Sat Jun 12 02:02:54.417 UTC

Healthcheck report
Last Update Time: 12 Jun 02:02:46.955241
METRICS REPORT

cpu
  State: Normal

free-memory
  State: Normal

filesystem
  State: Normal

shared-memory
  State: Normal

platform
  State: Warning
  Reason: One or more devices are not in operational state

fpd
  State: Warning
  Reason: One or more FPDs are not in CURRENT state

process-status
  State: Normal

process-resource
  State: Normal

communication-timeout
  State: Normal

pci-monitoring
  State: Normal

hw-monitoring
  State: Normal

wd-monitoring
  State: Normal

lc-monitoring
  State: Normal
```

In the above output, the state of the FPD shows a warning message that indicates an FPD upgrade is required.

Change Threshold Value for a Metric

You can customize the health check threshold value for a metric using the following command:

healthcheck metric *metric-name* **threshold** *threshold-value*

Example to Change Preset Metric Value

The following example shows to change the threshold value of CPU metric to 25%.

```
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios(config)#healthcheck metric cpu minor threshold 25%
```

View Health Status of Individual Metric

You can view the health status of a system resource or infrastructure service metric in the system.

Procedure

Run the **show healthcheck metric** *metric-name* command.

Example:

The following example shows how to obtain the health-check status for the *filesystem* metric:

```
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios#show healthcheck metric filesystem
Sat Jun 12 02:01:32.432 UTC
Filesystem Metric State: Normal
Last Update Time: 12 Jun 02:01:04.446619
Filesystem Service State: Enabled
Number of Active Nodes: 1
Configured Thresholds:
   Minor: 80%
   Severe: 95%
   Critical: 99%

Node Name: 0/RP0/CPU0
    Partition Count: 5

    Partition Name: tftp:
        Partition Access Attribute: rw
        Partition Type: network
        Partition Size: 0
        Partition Free Bytes: 0
        Partition Free Space in %: 0

    Partition Name: disk0:
        Partition Access Attribute: rw
        Partition Type: flash-disk
        Partition Size: 20024897536
        Partition Free Bytes: 19978481664
        Partition Free Space in %: 99

    Partition Name: /misc/config
        Partition Access Attribute: rw
        Partition Type: flash
        Partition Size: 151314698240
        Partition Free Bytes: 146903269376
        Partition Free Space in %: 97

    Partition Name: harddisk:
        Partition Access Attribute: rw
        Partition Type: harddisk
```

```
        Partition Size: 150114078720
        Partition Free Bytes: 144962641920
        Partition Free Space in %: 96

    Partition Name: ftp:
        Partition Access Attribute: rw
        Partition Type: network
        Partition Size: 0
        Partition Free Bytes: 0
        Partition Free Space in %: 0
```

Example:

The following example shows how to obtain the health-check status for the *platform* metric:

```
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios#show healthcheck metric platform
Sat Jun 12 02:01:51.922 UTC
Platform Metric State: Warning
Last Update Time: 12 Jun 02:01:38.650003
Platform Service State: Enabled
Number of Racks: 1

Rack Name: 0
    Number of Slots: 5

    Slot Name: RP0
        Number of Instances: 1

    Instance Name: CPU0
        Node Name 0/RP0/CPU0
        Card Type NCS1K14-CNTLR-K9
        Card Redundancy State Active
        Admin State NSHUT,NMON
        Oper State IOS XR RUN

    Slot Name: PM1
        Number of Instances: 0

        Node Name 0/PM1
        Card Type NCS1K4-AC-PSU-2
        Card Redundancy State None
        Admin State NSHUT,NMON
        Oper State OPERATIONAL

    Slot Name: FT1
        Number of Instances: 0

        Node Name 0/FT1
        Card Type NCS1K14-FAN
        Card Redundancy State None
        Admin State NSHUT,NMON
        Oper State OPERATIONAL

    Slot Name: FT2
        Number of Instances: 0

        Node Name 0/FT2
        Card Type NCS1K14-FAN
        Card Redundancy State None
        Admin State NSHUT,NMON
        Oper State OPERATIONAL

    Slot Name: 2
        Number of Instances: 1
```

```
Instance Name: NXR0
    Node Name 0/2/NXR0
    Card Type NCS1K4-1.2T-K9
    Card Redundancy State None
    Admin State NSHUT,NMON
    Oper State CARD FAILED
```

Disable Health Check

You can disable health check service or disable health check for an individual metric. By default, health check of all the metrics is enabled.

Disable Health Check Service

To disable health check service, use the following command:

no healthcheck enable

Note When the health check service is enabled, other configuration changes are not permitted. Disable the service before committing configuration changes.

The following example shows to disable the health check service.

```
RP/0/RP0/CPU0:#configure
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios(config)#no healthcheck enable
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios(config)#commit
```

Disable Health Check for a Metric

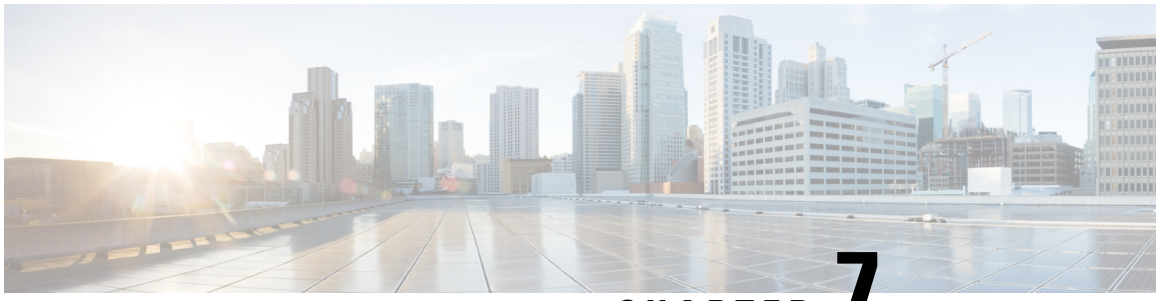
To disable health check for an individual metric, use the following command:

healthcheck metric *metric-name* **disable**

Example to Disable Health Check of a Metric

The following example shows to disable the free memory (*free-mem*) metric.

```
RP/0/RP0/CPU0:RP/0/RP0/CPU0:ios(config)#healthcheck metric free-mem disable
```



CHAPTER 7

Configure AAA

This chapter describes the implementation of the administrative model of *task-based authorization* used to control user access in the software system. The major tasks required to implement task-based authorization involve configuring TACACS+ and RADIUS servers and groups.

About TACACS+

The Terminal Access Controller Access Control System Plus (TACACS+) application is designed to enhance the security of router or network access server by centralizing user validation. It uses AAA commands and can be enabled and configured on NCS 1014 for improved security. TACACS+ provides detailed accounting information and flexible administrative control over user access.

When TACACS+ server is configured and protocol is enabled on the node, the user credentials are authenticated through TACACS+ server. When the user attempts to log into the node, the username and password is forwarded to the configured TACACS+ servers and get authentication status. If the authentication fails through TACACS+ server, the credentials are sent to the node and are authenticated against the node. If the authentication fails against the node, the user is not allowed to log into the node.

Configure TACACS+ Server

Enabling the AAA accounting feature on a switch allows it to track the network services that users are accessing and the amount of network resources they are using. The switch then sends this user activity data to the TACACS+ security server in the form of accounting records. Each record contains attribute-value pairs and is saved on the security server for analysis. This data can be used for network management, client billing, or auditing purposes.

To configure TACACS+ server, perform these steps:

Procedure

Step 1 **configure**

Example:

```
RP/0/0RP0RSP0/CPU0:KEPLER_PSB(config)# configure
```

Enters mode.

Step 2 **aaa accounting exec** *default* **start-stop tacacs+**

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config)#aaa accounting exec default start-stop group TACACS_ALL
```

Enables TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.

Step 3 **aaa accounting commands** *default* **start-stop tacacs+**

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config)#aaa accounting exec default start-stop group TACACS_ALL
```

Defines a default command accounting method list, where accounting services are provided by a TACACS+ security server, set for privilege level commands with a stop-only restriction.

Configure TACACS+ Server Groups

Configuring NCS 1014 to use AAA server groups provides a way to group existing server hosts. This allows you to select a subset of the configured server hosts and use them for a particular service. A server group is used in conjunction with a global server-host list. The server group lists the IP addresses of the selected server hosts.

You can enter one or more **server** commands. The **server** command specifies the hostname or IP address of an external TACACS+ server. Once configured, this server group can be referenced from the AAA method lists (used while configuring authentication, authorization, or accounting).

To configure TACACS+ server groups, perform these steps:

Before you begin

For successful configuration, the external server should be accessible at the time of configuration. When configuring the same IP address for global configuration, server-private parameters are required.

Procedure

Step 1 **configure**

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB# configure
```

Enters global configuration XR Config mode.

Step 2 **aaa group server tacacs+** *group-name*

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config)# aaa group server tacacs+ tacgroup1
```

Creates an AAA server-group and enters server group subconfiguration mode.

Step 3 **server-private** { *ip-address in IPv4 or IPv6 format*} [**port** *port-number*]

Example:

```
 Router(config-sg-tacacs+)# server-private 10.1.1.1 port 49 key a_secret
```

Configures the IP address of the private TACACS+ server for the group server.

Note
- You can configure a maximum of 10 TACACS+ private servers in a server group.
- If private server parameters are not specified, global configurations are used. If global configurations are not specified, default values are used.

Step 4 **key** *string*

Example:

```
 RP/0/RP0/CPU0:ios(config-sg-tacacs+)# key 7 08984B1A4D0C19157A5F57
```

Specifies the authentication and encryption key that is used between the router and the TACACS+ daemon running on the TACACS+ server. If no key string is specified, the global value is used.

Step 5 **timeout** *seconds*

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config-sg-tacacs-private)# timeout 4
```

Configures the timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server.

Step 6 Repeat steps 3 to 5 for every private server to be added to the server group.

Step 7 **aaa authorization** {**exec**}{**default**} **group** *group-name* **local**

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config-sg-tacacs-private)#aaa authorization exec default group
TACACS_ALL local
```

Configures certificate-based authentication for users configured in the TACACS+ server or server groups.

Step 8 **aaa authentication** {**login**}{**default**} **group** *group-name* **local**

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config-sg-tacacs-private)#aaa authentication login default group
TACACS_ALL local
```

Specifies the default method list for authentication, and also enables authentication for console in global configuration mode.

Step 9 Use the **commit** or **end** command.

Step 10 (Optional) **show tacacs server-groups**

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB# show tacacs server-groups
```

Displays information about each TACACS+ server group configured in the system.

About RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a distributed client/server system that provides security against unauthorized access in distributed client/server networks. In Cisco's implementation, RADIUS clients operate on Cisco NCS 1014 and send requests for authentication and accounting to a central RADIUS server that contains all user authentication and network service access information.

Cisco's AAA security paradigm supports RADIUS, which can be used alongside other security protocols like TACACS+, Kerberos, and local username lookup.

Configure RADIUS Server Groups

You can enter one or more **server** commands. The **server** command specifies the hostname or IP address of an external RADIUS server along with port numbers. When configured, this server group can be referenced from the AAA method lists (used while configuring authentication, authorization, or accounting).

You can configure a maximum of 30 servers and private servers each per RADIUS server group. To configure RADIUS server groups, perform these tasks:

Before you begin

Ensure that the external server is accessible at the time of configuration.

Procedure

Step 1 **configure**

Example:

```
RP/0/RP0/CPU0:hostname# configure
```

Enters mode.

Step 2 **aaa group server radius** *group-name*

Example:

```
RP/0/RP0/CPU0(config)# aaa group server radius radgroup1
```

Groups different server hosts into distinct lists and enters the server group configuration mode.

Step 3 **radius-server** {*ip-address*}

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config)# radius-server host 192.168.20.0
```

Specifies the hostname or IP address of the RADIUS server host.

Step 4 **auth-port** *port-number*

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config)#auth-port 1812
```

Specifies the User Datagram Protocol (UDP) destination port for authentication requests; the host is not used for authentication if set to 0. If unspecified, the port number defaults to 1645.

Step 5 **acct-port** *port-number*

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config)# acct-port 1813
```

Specifies the UDP destination port for accounting requests; the host is not used for accounting if set to 0. If unspecified, the port number defaults to 1646.

Step 6 **key** *string*

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config-radius-host)#key 7 08984B1A4D0C19157A5F57
```

Specifies the authentication and encryption key used between the router and the RADIUS server. This key overrides the global setting of the **radius-server key** command. If no key string is specified, the global value is used.

The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the **radius-server host** command syntax. This is because the leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks themselves are part of the key.

Step 7 Repeat steps 4 to 6 for every external radius server to be added to the server group.

—

Step 8 **aaa authentication** {**login**} {**default**} **group** *group-name* **local**

Example:

```
RP/0/RP0/CPU0:KEPLER_PSB(config-radius-host)#aaa authentication login default group radius
 local
```

Specifies the default method list for authentication, and also enables authentication for console in global configuration mode.

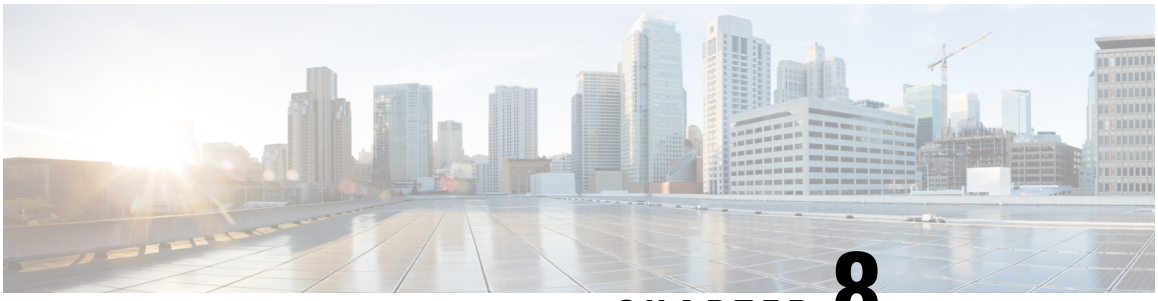
Step 9 Use the **commit** or **end** command.

Step 10 **show radius server-groups** [*group-name* [**detail**]]

Example:

```
 RP/0/0RP0RSP0/CPU0:router:hostname# show radius server-groups
```

(Optional) Displays information about each RADIUS server group that is configured in the system.



CHAPTER 8

Configure ACL

This chapter describes the procedures to configure access control lists (ACL).

Understand Access Control Lists

Table 8: Feature History

Feature Name	Release Information	Feature Description
ACL on Management Port	Cisco IOS XR Release 7.11.1	Access Control List (ACL) feature enables you to permit or deny specific devices to connect to the management port and access NCS 1010 devices. This control enhances network security. Both IPv4 and IPv6 ACLs are supported on the management port. Commands added: • **ipv4-access-list** • **ipv4-access-group** • **show access-lists-ipv4** • **ipv6-access-list** • **ipv6-access-group** • **show access-lists-ipv6**

Access Control Lists (ACLs) perform packet filtering to control the packets that move through the network. These controls allow to limit the network traffic and restrict the access of users and devices to the network. ACLs have many uses, and therefore many commands accept a reference to an access list in their command syntax. An ACL consists of one or more access control entries (ACE) that collectively define the network traffic profile. Access control entries (ACE) are entries in an ACL that describe the access rights related to a particular security identifier or user.

There are 2 types of ACLs:

- Standard ACLs-Verifies only the source IP address of the packets. Traffic is controlled by the comparison of the address or prefix configured in the ACL, with the source address found in the packet.
- Extended ACLs-Verifies more than just the source address of the packets. Attributes such as destination address, specific IP protocols, User Datagram Protocol (UDP) or Transmission Control Protocol (TCP) port numbers, Differentiated Services Code Point (DSCP), and so on are validated. Traffic is controlled by a comparison of the attributes stated in the ACL with those in the incoming or outgoing packets.

Purpose of ACLs

ACLs allow you to perform the following:

- Filter incoming or outgoing packets on an interface.
- Restrict the contents of routing updates.

- Limit debug output that is based on an address or protocol.
- Control vty access.

How an ACL Works

An ACL is a sequential list consisting of permit and deny statements that apply to IP addresses and upper-layer IP protocols. The ACL has a name by which it is referenced. Many software commands accept an ACL as part of their syntax.

An ACL can be configured and named; however, it does not take effect until the ACL is referenced by a command that accepts an ACL. Multiple commands can reference the same ACL. An ACL can control traffic arriving at the router or leaving the router, but not traffic originating at the router.

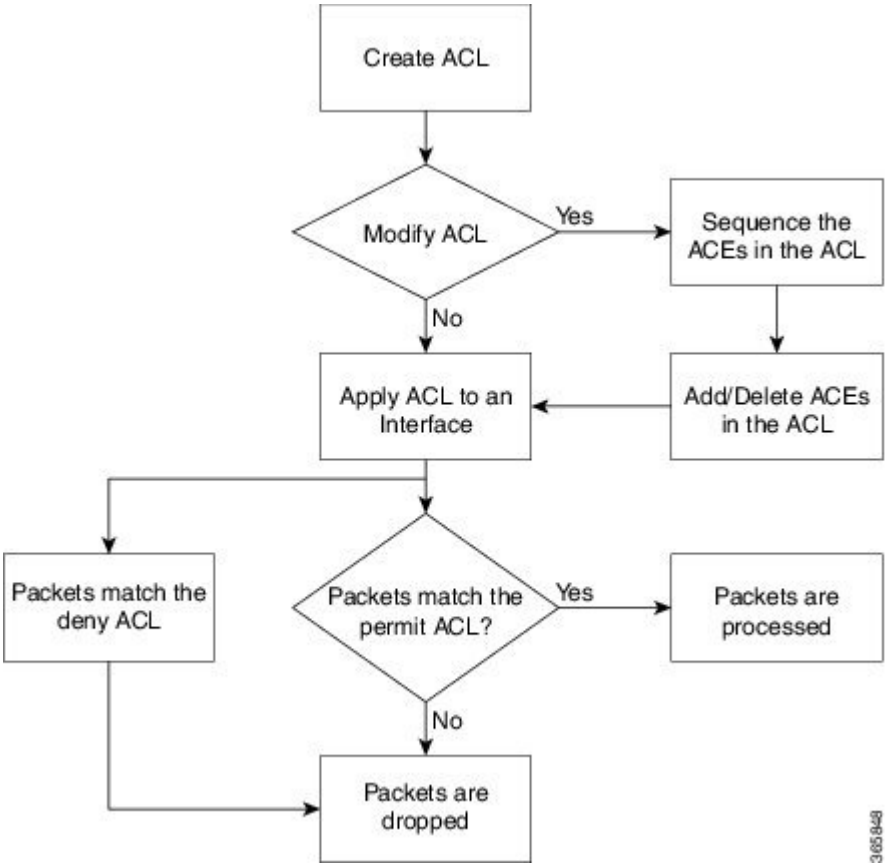
Source address and destination address are two of the most typical fields in an IP packet on which to base an ACL. Specify source addresses to control packets from certain networking devices or hosts. Specify destination addresses to control packets that are sent to certain networking devices or hosts.

You can also filter packets on the basis of transport layer information, such as whether the packet is a TCP, UDP, Internet Control Message Protocol (ICMP), or Internet Group Management Protocol (IGMP) packet.

ACL Workflow

The following image illustrates the workflow of an ACL.

Figure 2: ACL Workflow



Helpful Hints for Creating ACLs

Consider the following when creating ACLs:

- Create the access list before applying it to an interface.
- Organize your access list so that more specific references in a network or subnet appear before more general ones.
- To make the purpose of individual statements more easily understood at a glance, you can write a helpful remark before or after any statement.

Guidelines and Restrictions for Configuring ACLs

You must be aware of the following restrictions for configuring ACLs.

- Modifying an ACL when it is attached to the interface is supported.
- You can configure an ACL name with a maximum of 64 characters.
- You can configure an ACL name to comprise of only letters and numbers.

Apply ACLs

After you create an ACL, you must reference the ACL to make it work. ACL can be applied on *either* outbound or inbound interfaces. This section describes guidelines on how to accomplish this task for both terminal lines and network interfaces.

For inbound ACLs, after receiving a packet, Cisco IOS XR software checks the source address of the packet against the ACL. If the ACL permits the address, the software continues to process the packet. If the ACL rejects the address, the software discards the packet and returns an ICMP host unreachable message. The ICMP message is configurable.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the software checks the source address of the packet against the ACL. If the ACL permits the address, the software sends the packet. If the ACL rejects the address, the software discards the packet and returns an ICMP host unreachable message.

When you apply an ACL that has not yet been defined to an interface, the software acts as if the ACL has not been applied to the interface and accepts all packets. Note this behavior if you use undefined ACLs as a means of security in your network.

Configure an Ingress IPv4 ACL on Management Ethernet Interface

Use the following configuration to configure an ingress IPv4 ACL on mgmtEth interface.

```
/* Configure mgmtEth interface with an IPv4 address */
RP/0/RP0/CPU0:ios#configure
Thu Oct 19 17:30:23.719 UTC
RP/0/RP0/CPU0:ios(config)#
RP/0/RP0/CPU0:ios(config)#interface mgmtEth 0/RP0/CPU0/0
RP/0/RP0/CPU0:ios(config-if)#interface mgmtEth 0/RP0/CPU0/2
RP/0/RP0/CPU0:ios(config-if)#ipv4 address 4.33.0.57 255.255.255.0
RP/0/RP0/CPU0:ios(config-if)#no shutdown
RP/0/RP0/CPU0:ios(config-if)#commit
Thu Oct 19 17:31:25.127 UTC
RP/0/RP0/CPU0:ios(config-if)#exit

/* Verify if the interface is up */
RP/0/RP0/CPU0:ios(config)#do show ipv4 interface brief
Thu Oct 19 17:32:10.998 UTC

Interface                      IP-Address      Status          Protocol Vrf-Name
Loopback0                      3.3.3.16        Up              Up       default
GigabitEthernet0/0/0/0         7.1.11.5        Up              Up       default

```

You have successfully configured an IPv6 egress ACL on the mgmtEth interface.

Configure Extended Access Lists

Use Extended Access Lists to verify more than just the source address of the packets. Attributes such as destination address, specific IP protocols, UDP or TCP port numbers, DSCP, and so on are validated. Traffic is controlled by a comparison of the attributes stated in the ACL with those in the incoming or outgoing packets.

To configure Extended Access Lists, you must create an access list and specify the condition to allow or deny the network traffic.

```
/* Enter the global configuration mode and create the access list*/
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#ipv4 access-list acl_1
RP/0/RP0/CPU0:ios(config-ipv4-acl)#10 remark Do not allow user1 to telnet out
```

```
/*Specify the condition to allow or deny the network traffic.*/
RP/0/RP0/CPU0:ios(config-ipv4-acl)#10 permit 172.16.0.0 0.0.255.255
RP/0/RP0/CPU0:ios(config-ipv4-acl)#20 deny 192.168.34.0 0.0.0.255
RP/0/RP0/CPU0:ios(config-ipv4-acl)#commit
```

Running Configuration

```
RP/0/RP0/CPU0:ios#show running-config
Fri Oct 20 06:21:11.024 UTC
!! Building configuration...
!! IOS XR Configuration 24.1.1.23I
!! Last configuration change at Fri Oct 20 06:19:08 2023 by cisco

!
ipv4 access-list acl_1
 10 permit ipv4 172.16.0.0 0.0.255.255 any
 20 deny ipv4 192.168.34.0 0.0.0.255 any
!
```

Verification

```
RP/0/RP0/CPU0:ios#show access-lists ipv4 acl_1
Fri Oct 20 06:22:17.223 UTC
ipv4 access-list acl_1
 10 permit ipv4 172.16.0.0 0.0.255.255 any
 20 deny ipv4 192.168.34.0 0.0.0.255 any
```

Modify ACLs

This section describes a sample configuration to modify ACLs.

```
*/ Create an Access List*/
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#ipv4 access-list acl_1

*/Add entries (ACEs) to the ACL*/
RP/0/RP0/CPU0:ios(config-ipv4-acl)#10 permit ip host 10.3.3.3 host 172.16.5.34
RP/0/RP0/CPU0:ios(config-ipv4-acl)#20 permit icmp any any
RP/0/RP0/CPU0:ios(config-ipv4-acl)#30 permit tcp any host 10.3.3.3
RP/0/RP0/CPU0:ios(config-ipv4-acl)#end

*/Verify the entries of the ACL*/:
Router#show access-lists ipv4 acl_1
ipv4 access-list acl_1
10 permit ip host 10.3.3.3 host 172.16.5.34
20 permit icmp any any
30 permit tcp any host 10.3.3.3

*/Add new entries, one with a sequence number "15" and another without a sequence number
to the ACL. Delete an entry with the sequence number "30":*/
RP/0/RP0/CPU0:ios(config)#ipv4 access-list acl_1
RP/0/RP0/CPU0:ios(config-ipv4-acl)# 15 permit 10.5.5.5 0.0.0.255
RP/0/RP0/CPU0:ios(config-ipv4-acl)# no 30
RP/0/RP0/CPU0:ios(config-ipv4-acl)# permit 10.4.4.4 0.0.0.255
RP/0/RP0/CPU0:ios(config-ipv4-acl)# commit
```

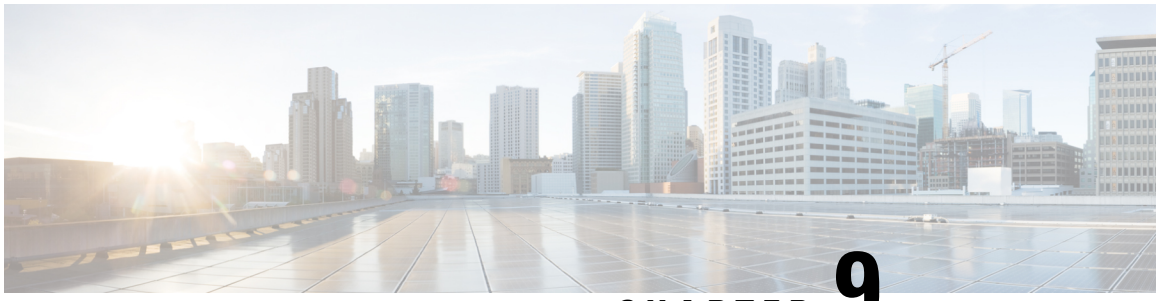
/When an entry is added without a sequence number, it is automatically given a sequence number that puts it at the end of the access list. Because the default increment is 10, the entry will have a sequence number 10 higher than the last entry in the existing access list/

```
*/Verify the entries of the ACL:*/
RP/0/RP0/CPU0:ios#show access-lists ipv4 acl_1
ipv4 access-list acl_1
 10 permit ipv4 host 10.3.3.3 host 172.16.5.34

15 permit 10.5.5.5 0.0.0.255---*/newly added ACL (with the sequence number)*/
20 permit icmp any any
30 permit ipv4 10.4.4.0 0.0.0.255 any ---*/newly added ACL (without the sequence number)*/

*/The entry with the sequence number 30, that is, "30 permit tcp any host 10.3.3.3" is
deleted from the ACL*/
```

You have successfully modified ACLs in operation.



CHAPTER 9

Smart Licensing

This chapter describes the smart licensing configuration on Cisco NCS 1010.

Understanding Smart Licensing

Smart Licensing is a cloud-based, software license management solution that enables you to automate time-consuming, manual licensing tasks. The solution allows you to easily track the status of your license and software usage trends.

Smart Licensing helps you simplify three core functions:

- **Purchasing**: The software that you have installed in your network can be registered, without Product Activation Keys (PAKs).
- **Management**: You can automatically track activations against your license entitlements. Also, there is no need to install the license file on every node. You can create license pools (logical grouping of licenses) to reflect your organization structure. Smart Licensing offers you Cisco Smart Software Manager, a centralized portal that enables you to manage all your Cisco software licenses from one centralized website.
- **Reporting**: Through the portal, Smart Licensing offers an integrated view of the licenses you have purchased and what has been deployed in your network. You can use this data to make better purchasing decisions, based on your consumption.

Smart Licensing Features

- Your device initiates a call home and requests the licenses it needs.

- Pooled licenses - Licenses are company account-specific, and can be used with any compatible device in your company. You can activate or deactivate different types of licenses on the device without actually installing a license file on the device.
- Licenses are stored securely on Cisco servers.
- Licenses can be moved between product instances without license transfer. This greatly simplifies the reassignment of a software license as part of the Return Material Authorization (RMA) process.
- It provides a complete view of all the Smart Software Licenses used in the network using a consolidated usage report of software licenses and devices in one easy-to-use portal.

Cisco Smart Account

Cisco Smart Account is an account where all products enabled for Smart Licensing are deposited. Cisco Smart Account allows you to manage and activate your licenses to devices, monitor license use, and track Cisco license purchases. Through transparent access, you have a real-time view into your Smart Licensing products. IT administrators can manage licenses and account users within your organization's Smart Account through the Smart Software Manager.

When creating a Smart Account, you must have the authority to represent the requesting organization. After you submit the request, it goes through a brief approval process. Access http://software.cisco.com to learn about, set up, or manage Smart Accounts.

Cisco Smart Software Manager enables you to manage all your Cisco Smart software licenses from one centralized website. With Cisco Smart Software Manager, you organize and view your licenses in groups called virtual accounts (collections of licenses and product instances). Use the Cisco Smart Software Manager to do the following tasks:

- Create, manage, or view virtual accounts.
- Create and manage Product Instance Registration Tokens.
- Transfer licenses between virtual accounts or view licenses.
- Transfer, remove, or view product instances.
- Run reports against your virtual accounts.
- Modify your email notification settings.
- View overall account information.

Virtual Accounts

A Virtual Account exists as a subaccount tithing the Smart Account. Virtual Accounts are a customer-defined structure based on organizational layout, business function, geography, or any defined hierarchy. They are created and maintained by the Smart Account administrator. Smart Licencing allows you to create multiple license pools or virtual accounts within the Smart Software Manager portal. Using the Virtual Accounts option that you can aggregate licenses into discrete bundles that are associated with a cost center so that one section of an organization cannot use the licenses of another section of the organization. For example, if you segregate your company into different geographic regions, you can create a virtual account for each region to hold the licenses and product instances for that region.

All new licenses and product instances are placed in the default virtual account in the Smart Software Manager, unless you specify a different one during the order process. After you access the default account, you may choose to transfer them to any other account, provided you have the required access permissions.

Use the Smart Software Manager portal to create license pools or transfer licenses.

Product Instance Registration Tokens

A product requires a registration token until you have registered the product. On successful registration, the device receives an identity certificate. This certificate is saved and automatically used for all future communications with Cisco. Registration tokens are stored in the Product Instance Registration Token Table that is associated with your enterprise account. Registration tokens can be valid 1–365 days.

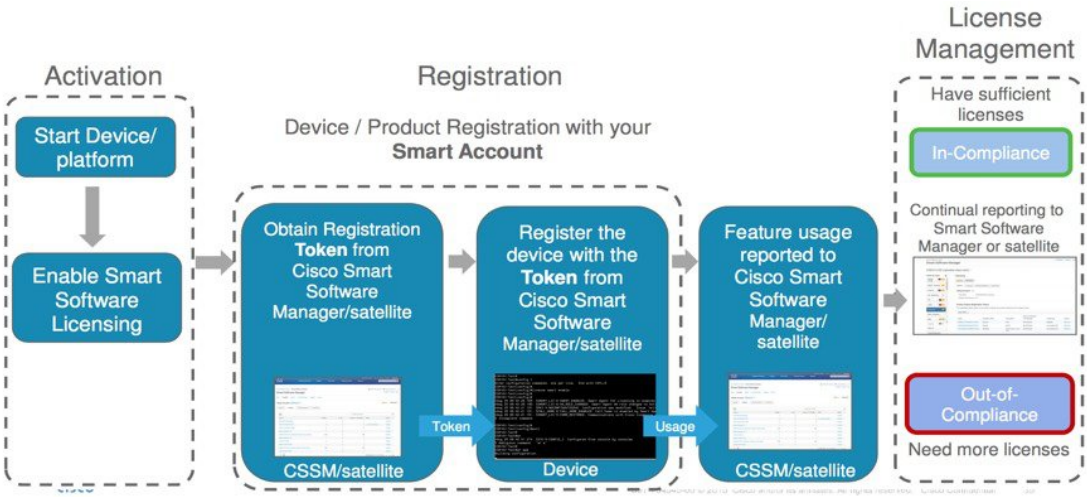
Product Instances

A product instance is an individual device with a unique device identifier (UDI) that is registered using a product instance registration token (or registration token). You can register any number of instances of a product with a single registration token. Each product instance can have one or more licenses residing in the same virtual account. Product instances must periodically connect to the Cisco Smart Software Manager servers during a specific renewal period. If you remove the product instance, its licenses are released and made available within the virtual account.

Smart Licensing Work Flow

The following figure depicts a working model of smart licensing that involves a three-step procedure.

Figure 3: Smart Licensing Work Flow



1. **Setting up Smart Licensing**: You can place the order for Smart Licensing, to manage licenses on the Cisco.com portal. You agree to the terms and conditions governing the use and access of Smart Licensing in the Smart Software Manager portal.

2. **Enabling and Use Smart Licensing**: Smart Licensing is enabled by default. You can use either of the following options to communicate:

    - **Smart Call Home**: The Smart Call Home feature is automatically configured when Smart Licensing is enabled. Smart Call Home is used by Smart Licensing as a medium for communication with the Cisco license service. Call Home feature allows Cisco products to periodically call-home and perform an audit and reconciliation of your software usage information. This information helps Cisco efficiently track your install base, keep them up and running, and effectively pursue service and support contract renewals. For more information on Smart Call Home feature, see http://www.cisco.com/c/dam/en/us/td/docs/switches/lan/smart_call_home/SCH_Deployment_Guide.pdf.

3. **Manage and Report Licenses**: You can manage and view reports about your overall software usage in the Smart Software Manager portal. Compliance reporting describes the types of Smart Licensing reports.

Create a Token

To create a new token using Cisco Smart Software Manager, perform the following tasks:

Before you begin

Procedure

Step 1 Log in to the Cisco Smart Software Manager.

https://software.cisco.com/software/csws/ws/platform/home#SmartLicensing-Inventory

Step 2 Click the **Inventory** tab, and select your virtual account from the **Virtual Account** drop-down list.

Step 3 Click the **General** tab, and click **New Token**.

The **Create Registration Token** window is displayed.

Step 4 Enter the token description. Specify the number of days the token must be active.

Step 5 Check the **Allow export-controlled functionality on the products registered with this token** check box.

Step 6 Click **Create Token**.

Step 7 Copy the token and register NCS1014 with the same token ID.

An example of the token ID:
YzY2ZjYyNjktY2NlOS00NTc4LWIxNTAtMjZkNmNiNzMxMTY1LTE2NjAzNjQ3
%0ANzY4Njl8ZVJSckxKN2pFV2tIeHVoMUkxbGxTazFDVm9kc1B5MGlHQmlFWUJi%0Ac3VNRT0%3D%0A

Configure Smart Licensing

To configure smart licensing in Cisco NCS 1014, perform the following steps:

Procedure

Step 1 Configure the domain name server for the smart license server.

Example:

```
RP/0/RP0/CPU0:ios#configure
Sat Dec 15 15:25:14.385 IST
RP/0/RP0/CPU0:ios(config)#domain name-server 64.102.6.247
```

Step 2 Set up the CiscoTAC-1 profile and destination address for Smart Call Home, using the following commands:

call-home

service active

contact smart-licensing

profile CiscoTAC-1

active

destination address http {http|https}://{FQDN}/its/service/oddce/services/DDCEService

destination transport-method http

Note FQDN must be either Cisco Smart Software Manager FQDN (tools.cisco.com) or Smart Licensing satellite server FQDN. You must configure the DNS server before setting-up the call-home destination address as FQDN. Use the **domain name-server {DNS server IP}** command to configure the DNS server on the device.

Example:

```
 RP/0/RP0/CPU0:ios#domain name-server 64.102.6.247
 RP/0/RP0/CPU0:ios#call-home
 RP/0/RP0/CPU0:ios#service active
 RP/0/RP0/CPU0:ios#contact smart-licensing
 RP/0/RP0/CPU0:ios#profile CiscoTAC-1
 RP/0/RP0/CPU0:ios#active
 RP/0/RP0/CPU0:ios#destination address http
https://tools.cisco.com/its/service/oddce/services/DDCEService
 RP/0/RP0/CPU0:ios#destination transport-method http
```

Note **CiscoTAC-1** profile is the default profile for smart licensing and it must not be deleted.

Step 3 Configure the crypto ca Trust point profile, if CRL distribution point is not defined in the Satellite server certificate or if the device is not able to reach the host mentioned in the CRL distribution point.

Example:

```
RP/0/RP0/CPU0:ios(config)#crypto ca trustpoint Trustpool crl optional
```

Step 4 Create and copy the registration token ID using Cisco Smart Software Manager.

For more details about creating a token, see Create a Token, on page 106.

Step 5 In the privileged EXEC mode, register the token ID in Cisco NCS 1014, using the following command:

license smart register idtoken *token-ID*

The registration may fail if the token is invalid or there is communication failure between the device and the portal. If there is a communication failure, there is a wait time of 24 hours before the device attempts to register again. To force the registration, use the **license smart register idtoken** *token-ID* **force** command.

When your device is taken off the inventory, shipped elsewhere for redeployment, or returned to Cisco for replacement using the return merchandise authorization (RMA) process, you can use the **license smart deregister** command to cancel the registration on your device. All smart licensing entitlements and certificates on the platform are removed.

ID certificates are renewed automatically after six months. In case, the renewal fails, the product instance goes into unidentified state. You can manually renew the ID certificate using the **license smart renew id** command.

Authorization periods are renewed by the Smart Licensing system every 30 days. As long as the license is in an 'Authorized' or 'Out-of-Compliance' (OOC), the authorization period is renewed. Use the **license smart**

renew auth command to make an on-demand manual update of your registration. Thus, instead of waiting 30 days for the next registration renewal cycle, you can issue this command to instantly find out the status of your license.

After 90 days, the authorization period expires and the status of the associated licenses display "AUTH EXPIRED". Use the **license smart renew auth** command to retry the authorization period renewal. If the retry is successful, a new authorization period begins.

Configure Smart Transport

You can use the smart transport as an alternative option to Call Home, to connect to the CSSM. To configure smart transport in Cisco NCS 1014, perform the following steps:

Procedure

Step 1 Remove the Call Home configuration by deregistering the device.

Example:

```
RP/0/RP0/CPU0:ios#license smart deregister
```

Step 2 Configure smart transport registration:

Example:

```
RP/0/RP0/CPU0:ios#license smart transport smart
RP/0/RP0/CPU0:ios#commit
```

Step 3 Restart the license process.

Example:

```
RP/0/RP0/CPU0:ios(config)#process restart smartlicserver location 0/RP0/CPU0
```

Note Use the process restart option only when you change between Call Home and Smart Transport options. It is not required when you configure Smart Transport at the time of fresh bring-up.

Step 4 Register the token ID in Cisco NCS 1014.

Example:

```
RP/0/RP0/CPU0:ios(config)#license smart register ODZhNmQ4MjMtYWUzYS00Yjg5LTk5NjgtYmU1NTJkMW
NhMGM4LTE2OTQwNjcx%0AOTE2OTN8OUFVTmI2NUt0emVkUHVTallYdXVFWGx0R3dLSHZDNGFFa3RBVGFa%0AY095Yz0%3D%0A
```

Reserve Specific Licenses for NCS 1014

Specific License Reservation (SLR) lets you reserve a license for your product instance from the CSSM. To reserve specific licenses for NCS 1014, perform the following steps:

Procedure

Step 1 Deregister the device, if it was already registered for the license, using the **license smart deregister** command.

Example:

```
RP/0/RP0/CPU0:iso#license smart deregister
Thu Jul 19 13:33:30.048 UTC
RP/0/RP0/CPU0:iso# Jul 19 13:17:33.126 UTC: http_client[232]
%SECURITY-XR_SSL-6-CERT_VERIFY_INFO : SSL Certificate verification:
 Certificate can be used for purpose it was meant to be
License command "license smart deregister " completed successfully.
```

Step 2 Generate the request code using the **license smart reservation request** local command.

Example:

```
RP/0/RP0/CPU0:iso#license smart reservation request local
Thu Jul 19 13:33:47.241 UTC

Enter this request code in the Cisco Smart Software Manager portal:
CB-ZNCS1014-SA:FCB2546B08T-BBTQDthRu-BA
```

Step 3 Use the generated code and generate the authorization code through Cisco Smart Software Manager. See Reserve Licenses Using Cisco Smart Software Manager, on page 110.

Step 4 Enter the **run** command to launch the iso XR Linux bash shell.

Example:

```
RP/0/RP0/CPU0:iso#run

RP/0/RP0/CPU0:Jul 19 13:35:20.236: run_cmd[67213]: %INFRA-INFRA_MSG.5-RUN_LOGIN : User Cisco
 logged into shell from con0/RP0/CP0
```

Step 5 Create a file using the **vim** *file name* command.

Example:

```
[node0_RP0_CPU0:~]$vim smart1
```

Step 6 Copy the authorization code in the file and type **:wq** to save and exit the file.

Step 7 Use the **exit** command to exit the shell.

Example:

```
[node0_RP0_CPU0:~]$exit
logout
RP/0/RP0/CPU0:Jul 19 13:45:21.146 UTC run-cmd[67213] %INFRA_MSG-5-LOGOUT : User cisco logged
 out of shell from con0/RP0/CPU0
```

Step 8 Install the authorization code using the **license smart reservation install file** command.

Example:

```
RP/0/RP0/CPU0:iso#license smart reservation install file /disk0:/smart1
Thu Jul 19 13:46:22.877 UTC
RP/0/RP0/CPU0:Jul 19 13:46:22.946 UTC: plat_sl_client[368]:
%LICENSE-PLAT_CLIENT-6-STATE_CHANGE : Licensing platform state changing from UNREGISTERED
to REGISTERED
RP/0/RP0/CPU0:Jul 19 13:46:22.946 UTC: smartlicserver[247]:
%LICENSE-SMART_LIC-6-AGENT_REG_SUCCESS : Smart Agent for Licensing Registration successful.
 udi PID:NCS1014-SA,SN:FCB2546B08T
```

```
Reservation install file successful
Last Confirmation code 8572aa81
```

Note You can verify the number of reservations in the Cisco smart software manger portal and can view the product instance name changed to a UDI.

Step 9 Verify the udi using the **show license udi** command.

Example:

```
RP/0/RP0/CPU0:iso#show license udi
Thu Jul 19 13:43:19.731 UTC
UDI: PID:NCS1014-SA,SN:FCB2546B08T
```

Step 10 Verify the license reservation using the command **show license status**.

Example:

```
RP/0/RP0/CPU0:P2A_DT_08#show license status
Thu Jul 19 15:45:27.137 UTC

Smart Licensing is ENABLED

Utility:
  Status: DISABLED
License Reservation is ENABLED

Data Privacy:
  Sending Hostname: yes
    Callhome hostname privacy: DISABLED
    Smart Licensing hostname privacy: DISABLED
  Version privacy: DISABLED

Transport:
  Type: Transport Off

Registration:
  Status: REGISTERED - SPECIFIC LICENSE RESERVATION
  Export-Controlled Functionality: ALLOWED
  Initial Registration: SUCCEEDED on Jul 19 2022 15:21:24 UTC

License Authorization:
  Status: AUTHORIZED - RESERVED on Jul 19 2022 15:21:24 UTC

Export Authorization Key:
  Features Authorized:
    <none>

Miscellaneous:
  Custom Id: <empty>
```

Reserve Licenses Using Cisco Smart Software Manager

To reserve the required number of licenses using the Cisco Smart Software Manager, perform the following steps:

Procedure

Step 1 Log in to the Cisco Smart Software Manager.

https://software.cisco.com/software/csws/ws/platform/home#SmartLicensing-Inventory

Step 2 Click the **Inventory** tab. From the **Virtual Account** drop-down list, select your smart account.

Step 3 Click **Licenses** and click **License Reservation**.

The **Smart License Reservation** wizard is displayed.

Step 4 In the **Enter Request Page** tab, paste the reservation code that you had generated from NCS 1014 in the **Reservation Request Code** area and click **Next**.

Step 5 In the **Select Licenses** tab, click the **Reserve a specific License** radio button.

The list of surplus licenses available in your virtual account is displayed.

Step 6 Enter the number of licenses that you want to reserve for the required license, in the **Quantity to Reserve** field, and click **Next**.

Step 7 In the **Review and Confirm** tab, click **Generate Authorization Code**.

Step 8 Click **Download as File** to download the authorization code and use the code to register the NCS 1014 device.

Reuse Licenses Using SLR Deactivation Method

You can release some of the purchased licenses belonging to a common license pool, and reuse the same to upgrade new devices that are added into your network, for a temporary period. Later on, you must purchase the licenses for the new devices.

Procedure

Step 1 Deregister the device for which you want to release the licenses, and enable Flexible Consumption Model (FCM) (if not enabled)

Example:

```
RP/0/RP0/CPU0:ios#smart license deregister
RP/0/RP0/CPU0:ios#config
RP/0/RP0/CPU0:ios(config)#license smart flexible-consumption enable
RP/0/RP0/CPU0:ios(config)#commit
RP/0/RP0/CPU0:ios#end
```

Step 2 Generate the request code using the **license smart reservation request** local command.

Example:

```
RP/0/RP0/CPU0:ios(config)#license smart reservation request local
Fri Jul  1 07:11:56.541 UTC
Enter this request code in the Cisco Smart Software Manager portal:
CC-ZNCS1014-SA:FCB2530B11E-BBTQDthRu-BE
```

Step 3 Use the generated code and generate the authorization code through Cisco Smart Software Manager. See Reserve Licenses Using Cisco Smart Software Manager, on page 110.

Note While reserving licenses in CSSM, under the **Select Licenses** tab, enter the number of licenses only for the RTU licenses, and leave the number of licenses as 0 for SIA licenses.

Step 4 Enter the **run** command to launch the iso XR Linux bash shell.

Example:

```
RP/0/RP0/CPU0:iso#run

RP/0/RP0/CPU0:Jul 1 7:35:20.281: run_cmd[67213]: %INFRA-INFRA_MSG.5-RUN_LOGIN : User Cisco
 logged into shell from con0/RP0/CP0
```

Step 5 Create a file using the **vim** *file name* command.

Example:

```
[node0_RP0_CPU0:~]$vim smart1
```

Step 6 Copy the authorization code in the file and type **:wq** to save and exit the file.

Step 7 Use the **exit** command to exit the shell.

Example:

```
[node0_RP0_CPU0:~]$exit
logout
RP/0/RP0/CPU0:Jul 1 7:45:21.146 UTC run-cmd[67213] %INFRA_MSG-5-LOGOUT : User cisco logged
 out of shell from con0/RP0/CPU0
```

Step 8 Install the authorization code using the **license smart reservation install file** command.

Example:

```
RP/0/RP0/CPU0:iso#license smart reservation install file /disk0:/smart1
Thu Jul 19 13:46:22.877 UTC
RP/0/RP0/CPU0:Jul 1 7:46:22.946 UTC: plat_sl_client[368]: %LICENSE-PLAT_CLIENT-6-STATE_CHANGE
 : Licensing platform state changing from UNREGISTERED to REGISTERED
RP/0/RP0/CPU0:Jul 1 7:46:22.946 UTC: smartlicserver[247]:
%LICENSE-SMART_LIC-6-AGENT_REG_SUCCESS : Smart Agent for Licensing Registration successful.
 udi PID:NCS1014-SA,SN:FCB2546B08T
Reservation install file successful
Last Confirmation code 8572aa81
```

Note You can verify the number of reservations in the Cisco smart software manger portal.

Step 9 Verify the license reservation using the command **show license platform summary**.

Example:

```
RP/0/RP0/CPU0:test#show license platform summary
Fri Jul  1 07:24:07.016 UTC
Collection: LAST: Fri Jul 01 2022 07:48:34 UTC
            NEXT: Fri Jul 01 2022 07:48:34 UTC
Reporting:  LAST: Fri Jul 01 2022 07:48:34 UTC
            NEXT: Fri Jul 01 2022 07:48:34 UTC
SIA Status: Node is in deactivated state
```

Step 10 After the node is deactivated and the licenses are freed on the CSSM server, use those licenses to perform software upgrade on another node for a temporary period.

Verify Smart Licensing Configuration

After enabling Smart Licensing, you can use the **show** commands to verify the default Smart Licensing configuration. If any issue is detected, take corrective action before making further configurations.

- **show license all**
- **show license trace all**
- **show license status**
- **show license summary**
- **show license tech**
- **Show license udi**
- **show license usage**
- **show license platform detail**
- **show license platform summary**
- **show license platform trace**
- **Show license platform trace all**
- **show tech-support smartlic**
- **show call-home detail**
- **show call-home trace all**
- **show tech-support call-home**

The following table defines the available license authorization status in Cisco NCS 1014:

Table 9: License Authorization Status

License Authorization Status	Description
Unconfigured	Smart Software Licensing is not configured.
Unidentified	Smart Software Licensing is enabled but is not registered.
Registered	Device registration is completed and an ID certificate is received that is used for future communication with the Cisco licensing authority.
Authorized	Registration is completed with a valid Smart Account and license consumption has begun. This indicates compliance.
Out of Compliance	Consumption exceeds available licenses in the Smart Account.
Authorization Expired	The device is unable to communicate with the Cisco Smart Software Manager for an extended period. This state occurs after 90 days of expiry. The device attempts to contact the CSSM every hour to renew the authorization until the registration period expires.

Example 1:

The following example shows the sample output of the **show license all** command.

```
RP/0/RP0/CPU0:iso#show license all
Fri Jul 15 05:32:02.678 UTC

Smart Licensing Status
======================

Smart Licensing is ENABLED
